The Turkish Navy was offered four 'Knox' class frigates in late 1992 and an official proposal was put to Congress in June 1993. Four were approved for transfer on a five-year lease, followed by a second batch of four in 1994. A ninth 'Knox' class ship, *Elmer Montgomery* (FF 1082), was transferred on a grant basis under the Foreign Assistance Act to replace the former destroyer *Muavenet* (scrapped after being hit by a Sea Sparrow missile) and is used as a source of spares.

MODERNISATION

The purchase of ASW helicopters has been authorised.

OLIVER HAZARD PERRY

OVERVIEW

The 'Perry' class was designed in the early 1970s to provide a successor to the 'Knox' class and to meet a requirement for a large number of escorts at a reduced unit price, although it was recognised from the start that such an approach would inevitably reduce their overall capabilities. Strict limits were set on cost, displacement and manpower to produce the cheaper component in a high/low technology mix of ships and thus act as a counterbalance to the very expensive and sophisticated specialised ASW and AAW ships, which were being built to protect carrier and surface action groups.

The primary mission for these new ships was to serve as ocean escorts, protecting amphibious forces, merchant ship convoys and underway replenishment groups. A further factor was that it was intended that they should be produced in smaller yards and so a deliberate effort was made to require simpler construction techniques, with maximum use being made of flat panels and bulkheads, with internal passageways being kept as straight as possible. Also in the interest of simplicity and economy, propulsion was by two gas turbines and, as with earlier US frigates, there is only one propeller. The ships can attain 25 knots on one engine and 28 knots on both, although Perry actually achieved 31 knots on trials. One unusual feature is that two small, retractable propulsion pods are fitted to provide a 'get you home' facility and to assist in docking. Each pod has a 325 hp engine and can propel the ship at 6 knots.

The weapon fit reflects the design philosophy. There is a single Mk 13 launcher on the foredeck with the magazine below containing 40 missiles, usually 36 Standard SM-1MR and four Harpoon. The gun is an OTOBREDA 76 mm Compact and is located atop the superstructure, just forward of the stack. A CIWS mount was not fitted initially, but all ships now have a single Mk 15 Phalanx mount in the hangar roof.

ASW capability includes two triple torpedo tubes and two helicopters (LAMPS I in the earlier ships, LAMPS III in others), but, unlike previous frigate classes, ASROC missiles are not carried.

A total of 70 has been built with more under construction. Of these 55 were built in the USA, 51 for the US Navy and four for Australia. A further two were later built in Australia, and six were built in Spain. In Taiwan seven have been completed to the standard 'Perry' class design, while construction is about to start on a further number to a considerably modified design.

Mahlon S Tisdale *(FFG 27) one of the very successful 'Oliver Hazard Perry' class frigates. 70 were built for four navies (Australia — six, Spain — six, Taiwan — seven, USA — 51) and more, to a somewhat modified design are under construction in Taiwan. A number of US Navy ships have however, already been sold to foreign navies and more are likely to follow* (H & L van Ginderen Collection)

GENERAL SPECIFICATIONS

Operator: Australia
Type: Oliver Hazard Perry

Class: ADELAIDE

Purchased: 4
Built: 2
Active: 6

Displacement:
standard: 3,073 t
full load: 4,100 t

Dimensions
Length: 138.1 m (453 ft)
Beam: 13.7 m (45 ft)
Draught: 7.5 m (24.5 ft) (sonar); 4.5 m (14.8 ft) (keel)

Speed: 29 kts (4 kts on propulsors)
Range: 4,500 n miles at 20 kts

Complement: 184 (15 officers) plus aircrew

SHIPS

WEAPONS SYSTEMS

MISSILE LAUNCHER

Mk 13 Mod 4 launcher

There is a single Mk 13 Mod 4 launcher located on the foredeck, used to launch both Harpoon SSM and Standard SM-1MR SAMs. There are 40 missiles (a mix of Harpoon and Standard SM-1MR) stored vertically in a below-decks magazine in two concentric rings. Launching rate is one missile every 10 seconds. Mod 4 introduced solid-state technology, replacing the electromechanical relays in Mods 1-3.

ANTI-SHIP MISSILES (ASM)

McDonnell Douglas UGM-84B Harpoon

The missile magazine contains eight Harpoon Block 1C anti-ship missiles. This missile can either fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses or it can approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. It can also use selectable seeker search expansion patterns and, for the terminal phase, can use either a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg (11,905 kg) thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR-MISSILES (SAM)

Standard Missile-1 Medium Range (SM-1MR)

Main air defence armament is the SM-1MR, of which 32 are normally carried in the magazine and are launched from the Mk 13 Mod 4 launcher on the foredeck. SM-1MR Block IV missiles have a Naval Weapons Center Mk 51 expanding rod warhead, while Block V missiles have a Naval Weapons Center Mk 90 blast fragmentation warhead.

Specifications
Length: 4.48 m (14.7 ft)

Diameter: 34.3 cm (13.5 in)
Wing span: 1.06 m (3.48 ft)
Weight: 642.3 kg (1,416 lb)
Speed: Mach 2
Range: 20.5 n miles (38 km)
Altitude: 19,800 m (65,000 ft)

Manufacturers/Contractors
Hughes Missile Systems, Tucson, Arizona, USA.
Raytheon, Missile Systems Division, Bedford, Maryland, USA.

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited amidships, one on either beam. Mk 46 Mod 5 torpedoes are normally used, although a small stock of Mk 44 is still held.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

Manufacturer/Contractor
GEC-Marconi Naval Systems, UK.

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 76 mm (3 in)/62 Mk 75 Compact
There is one OTOBREDA 76 mm (3 in) gun sited amidships atop the superstructure. It should be noted that the guns for ships *Melbourne* (05) and *Newcastle* (06) were manufactured in Australia.

Specifications
Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/sec
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range: 8.6 n miles (16 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Hughes Mk 15 CIWS Phalanx
There is one Hughes Mk 15 CIWS Phalanx close in weapons system (CIWS) situated at the after end of the hangar roof. These were installed in ships 03-06 during construction and were retrofitted to the first two in 1985.

The mount consists of a 20 mm M61A1 six-barrel, Gatling-principle gun with a cylindrical magazine and feeding mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,380 ft/s)
Rate of fire: 3,000 rds/min (Block 0, Block 1 Baseline 0), 4,500 rds/min (Block 1 Baseline 1)
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor
Hughes Missile Systems, Tucson, Arizona, USA.

M2HB 12.7 mm (0.50 in) machine guns
Up to six M2HB 12.7 mm machine guns are carried and can be mounted on flexible mounts.

Specifications
Calibre: 12.7 mm (0.50 in)
Muzzle velocity: 883 m/s (2,900 ft/s)
Rate of fire: 450-550 rds/min
Max effective range:
anti-surface: 6,700 m (7,400 yd)
anti-air: 1,380 m (4,500 ft)

Newcastle *(06) launching a Standard SM-1MR SAM with the onlookers standing at a respectful distance on the quarterdeck.* Newcastle *was the last of the six to be commissioned and the second of the two to be built in Australia* (RAN)

ELECTRONIC WARFARE SYSTEMS

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launchers
There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)
Barrels: 6

Rounds
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

Nulka expendable rocket-launched hovering decoy system
Four Nulka launchers are being mounted. This is an expendable, active decoy, providing all-weather self-protection for naval vessels against anti-ship missiles and is designed for use either as part of a multilayer defence system or for stand-alone ship protection. The Winnin rocket is held in a hermetically sealed canister which acts both as storage container and launch tube. Control of the decoy's hovering flight is achieved by a thrust-control mechanism, which acts on the motor's efflux, and a spin-control unit mounted on top of the decoy. The combination of thrust- and flight-control enables successful launches to be made in severe sea states and high winds. Once launched, the decoy operates autonomously and, following its stored flight demands, moves away from the ship at its programmed height and speed to present an alternative and more attractive target to incoming missiles.

Manufacturers/Contractors
AWA Defence Industries (AWADI) Pty Ltd (system).
Sippican, USA (payload).

AN/SLQ-25A Nixie noisemaker
One AN/SLQ-25A Nixie electroacoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit which selects the appropriate cable or load and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch

and two towed bodies are located in a stern compartment, with the towed bodies being deployed through the transom. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. Each winch can stream and recover the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed bodies, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, are 95 cm (3.10 ft) long, 15.24 cm (6 in) in diameter and weigh 18 kg (40 lb). They receive amplifier outputs, convert them into acoustic signals and project them. Usually one towed body at a time is deployed.

Manufacturer/Contractor
Aerojet ElectroSystems, Sacramento, California, USA.

AN/SLQ-32(V)2 ESM suite
The Australian ships have the Raytheon AN/SLQ32(V)2 ESM-only suite, which gives radar warning on B to J-bands, but has no ECM (jamming) capability.

Manufacturer/Contractor
Raytheon Company, Electromagnetic Systems Division, Goleta, California.

Elbit EA-2118 jammer
The jammer is the Israeli Elbit EA-2118.

Manufacturer/Contractor
Elbit, Israel.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

ACDS Advanced Combat Direction System
The Australian ships are fitted with ACDS, an enhanced version of the Naval Tactical Data System (NTDS) tactical data handling and target designation system. This uses two AN/UYK-43B processors and features software modules similar to those in the original NTDS, with a software package containing a database of approximately 1 million lines of code with an additional dedicated ship-fit of code. The Block 0 system also features improvements in the Link 11 interface, interfaces to new weapon and sensor systems as well as the replacement of the Hughes Video Signal Simulator (VSS) by the Republic Electronics AN/USQ-93 Radar Environmental Simulator System (RESS). Like NTDS, ACDS Block 0 provides Link 4A, Link 11 and Link 14 communications.

Manufacturers/Contractors
Unisys (computers).
Hughes Aircraft Company (displays).
Collins (radios).

COMMUNICATIONS AND DATALINKS

Satcom: OE-2
Datalink: Link 11
IFF: AIMS Mk XII.
Tacan: URN-25.

WEAPONS CONTROL

Mk 92 Mod 2 fire-control system
Mk 92 is an Americanised version of the Signaal WM28 system, produced under licence by Unisys, with Mk 92 Mod 2 being installed in all ships 'as built.' The Mk 92 Mod 2 system uses a combined antenna system with its distinctive egg-shaped housing, together with the STIR (Signaal Track and Illuminating Radar) and provides continuous air and surface search around a ship even in an ECCM environment. It has a fast reaction time and is capable of simultaneous engagement of up to four surface targets, or two air and two surface targets. The system can engage air, surface or shore targets with guns or missiles. It is fully compatible with NTDS and interfaces with the Mk 13 Mod 4 missile handling/launching system, the Mk 75 gun and the Mk 15 Phalanx CIWS.

The Mk 92 consists of a combined antenna system, a separate track illuminating radar, a computer system, weapon control consoles, and ancillary equipment, and has a crew of four. The Mk 53 Combined Antenna System (CAS) consists of a monopulse track radar with CW injection above and a track-while-scan (TWS) radar. Their antennas share a stabilised mount with the monopulse antenna above and the TWS antenna below. The monopulse radar can detect, track and illuminate one target in the air or on the surface. The TWS radar can detect and track up to two surface or shore targets simultaneously, as well as low-altitude targets.

The Lockheed STIR (in American terminology 'Separate' Track Illuminating Radar) is an I/K-band monopulse tracking radar with CW injection which is designed to provide an additional channel of fire for a single air or surface target. It consists of a Mk 54 director with antenna.

There are two 32-bit AN/UYK-7 computers, each with 256 k memory and an optimum operating speed of 667 Kops, the second computer having been added to improve the processing of ASW data. There are two Weapons Control Consoles in the CIC to provide an MMI for acquiring and tracking targets, engagement control, launcher assignment, missile firing and post-engagement evaluation. The Mk 106 WCC supports the CAS and the Mk 107 WCC supports the STIR, but both also receive video data from ship search radars. Between the WCCs are the CIWS and Harpoon control stations and the CIC also has five consoles from the AN/UYA-4 family.

Manufacturer/Contractor
Unisys Corporation, Government Systems Group.

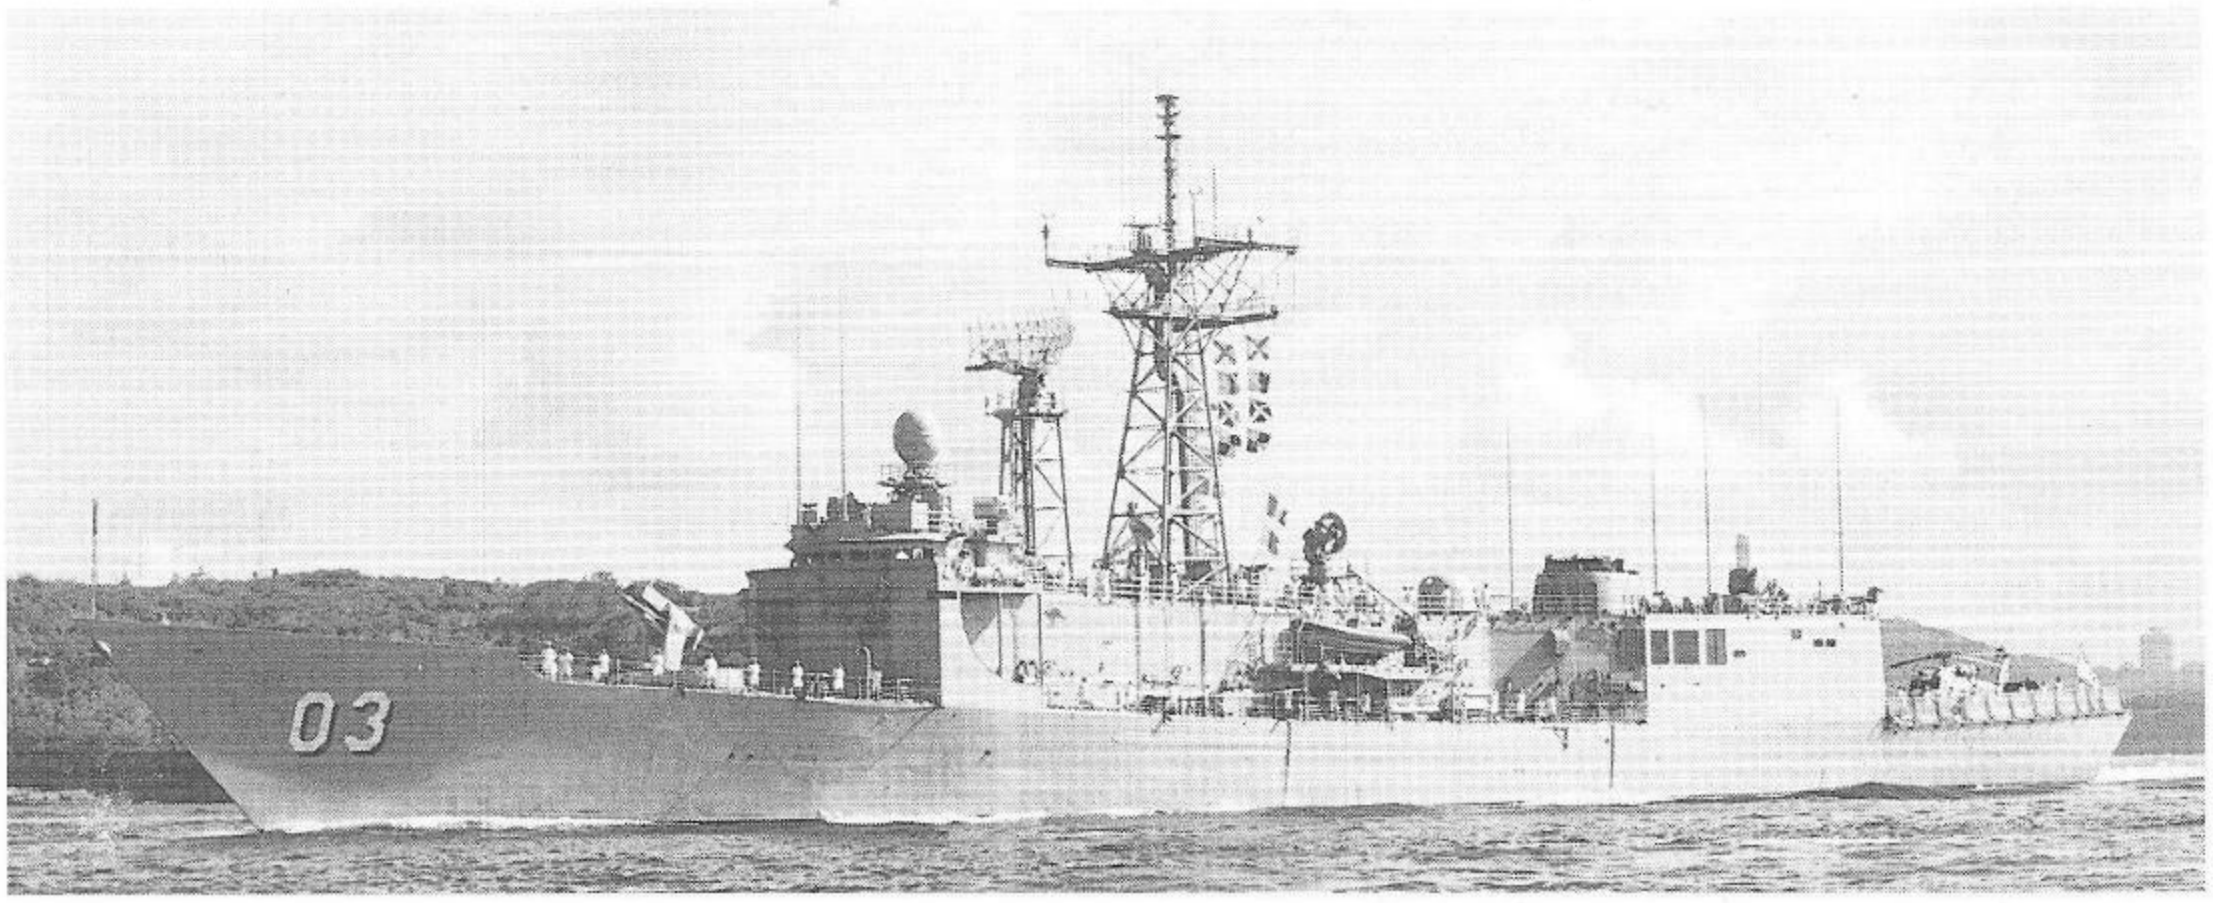
NMMS electro-optic surveillance system
The RAN purchased two sets of NMMS which are permanently installed in *Adelaide* and *Sydney* only. This US Navy equipment is designed to detect mines, low-flying aircraft and small boats by day or night in all weather conditions. It can also be used to support gunfire missions and to assist in helicopter landing control. NMMS consists of a systems electro-optronic package housed in a composite casing and mounted on a pedestal. The sensor package comprises multiplexer electronics, the boresight assembly and the sensors (a Si-Vidicon television camera and a thermal imager), which float on high-energy, rare-earth magnets which create an energy field designed to produce unblurred images. The thermal imager is based upon the US MCTNS (Man-portable Common Thermal Night Sights) modules and has 120 elements with split Stirling cooling system. The sensor package also includes a Litton MMS Laser RangeFinder/Designator (LRF/D) operating in the 1.06 micron range. Supporting the sensor package is a video tracker which can be used for manual or automatic tracking of targets. There is also a digital scan converter which enhances the thermal imager picture and also provides freeze frame and ×2 zoom capabilities. The system is used for both manual and automatic tracking but can also conduct continuous horizon scanning of designated sectors.

It should be noted that the designation 'Mast Mounted Sight' derives from the device's US Army title and it does not necessarily follow that in naval use the device is mounted on the ship's mast. The control console can be collocated with the sight, installed in the bridge or the combat information centre according to the operational requirement.

Specifications
Weight (sensor head): 72.57 kg (160 lb)
Diameter: 64.77 cm (25.5 in)
Stabilisation: Less than 20 mrad
Fields of view
thermal imager: 2 × 10°
television: 2 × 8°

Manufacturers/Contractors
McDonnell Douglas Electronic Systems Company (system).
Northrop Electronics Division, Electronics Systems Group (sensor package).

Radamec 2500 electro-optic director
One Radamec 2500 director is being fitted in each ship. This director includes TV, laser and IR imagers.



Sydney *(03), one of four built in the USA for the RAN, was originally intended for the US Navy as FG 35* (H & L van Ginderen Collection)

SONARS

Raytheon AN/SQS-56 hull-mounted sonar

The first four Australian ships (which were also those built in the USA) all have the AN/SQS-56 hull-mounted sonar, which was developed specifically for the US Navy's 'Perry' (FFG 7) class frigates. This equipment has been provided by the US Navy to various foreign navies, including that of Australia, via the FMS programme under the designation AN/SQS-56. (Note that identical sets exported as a commercial sale from Raytheon are designated DE 1160.) Digital implementation allows packaging of the complete multifunction active and passive sonar in five medium-size electronics cabinets and one operator's console. System control uses a built-in mini-computer and an advanced display system. The sonar is an active/passive, preformed beam, digital sonar providing panoramic echo ranging and panoramic (DIMUS) passive surveillance. All signal processing, except transducer-received signal amplification and linear transducer transmit drive, is accomplished in digital hardware, most of which is implemented using US Navy SEMP (Standard Electronic Module Programme) components in compact water-cooled cabinets small enough to allow installation through standard size hatches.

The basic system includes the transducer array, transducer junction box, five electronics cabinets (array interface, transmitter(s), receiver and controller), operator console, sonar dome and control unit. Options in production include a loudspeaker/intercom, a water-cooling unit, a remote display and a performance prediction subsystem.

A single operator can search, track, classify and designate multiple targets from the active system while simultaneously maintaining anti-torpedo surveillance on the passive display.

Computer-assisted system control permits the operator to concentrate on the sonar data being displayed rather than on the system control. Operating frequencies are 5.6, 7.5 and 8.4 kHz.

Manufacturer/Contractor

Raytheon Company, Submarine Signal Division, Portsmouth, Rhode Island.

Mulloka hull-mounted scanning sonar system

Mulloka is installed in *Melbourne* (05) and *Newcastle* (06). This is an Australian-developed, lightweight, hull-mounted scanning sonar, which was designed especially for use in coastal waters around Australia. It operates at relatively high frequencies: active — 6-11 kHz; passive — 3.4-14 kHz. The cylindrical transducer array consists of 96 staves, each with 25 transducers, which are driven in differing combinations and phases under computer control to form the required sonar beams. The length of the transmit period is selectable over a range of 1 to 4 seconds. The formation of the beam transmit pattern is random in nature from one transmission to the next in order to prevent the submarine commander having any indication of detection. Immediately following the transmission, the sonar reverts to the listening mode for a period determined by the range scale selected by the operator. Range is about 10,000 yd.

Manufacturer/Contractor

EMI/Honeywell.

Kariwara towed passive array

Under current plans it is intended to install the Kariwara towed array in due course.

AVIATION

AVIATION FACILITIES

Specifications

Helicopters: 2 Sikorsky S-70B-2 Seahawks or 1 Seahawk and 1 Squirrel

Sikorsky S-70B-2(RAN) Seahawk

Specifications

Dimensions:
- **main rotor diameter:** 16.36 m (53.66 ft)
- **tail rotor diameter:** 3.35 m (11.00 ft)

Performance:
- **never-exceed speed (VNE) at sea level:** 155 kts (287 km/h)
- **max cruising speed:** 133 kts (246 km/h)
- **max rate of climb:** 456 m (1,500 ft)/min

Power plant: 1 546 kW (732 shp) Turbomeca Arriel 1D1

Accommodation: 6 (pilot, co-pilot, four passengers)

Avionics: VHF/AM radios, HF/SSB transponder and ICS

Armament: There is provision for a wide range of weapons, including machine guns and rockets

S-70B-2 of the RAN (Scott Connolly, RAN)

PROPULSION

Specifications
System: Gas turbine
Main machinery: 2 General Electric LM-2500 gas turbines; 30.6 MW (41,000 hp) sustained

Shafts: 1
Propeller: cp
Auxiliary propulsion: 2 retractable electrical propulsors; 650 hp (490 kW)

FURTHER INFORMATION

PROGRAMME

The RAN planned to build a class of three light destroyers (DDL) in the 1970s and undertook a joint design study with the UK Royal Navy, starting in 1966. The ship would have resembled the British Type 42, but with a broader beam, US weapons, and some Australian equipment. The project was, however, postponed in 1973 and cancelled in 1974, and then replaced by the order for the US 'Perry' class.

The first four ships were built in the USA and were, in fact, taken from the US Navy programme. Thus, *Adelaide* was originally the US Navy's FFG 17; *Canberra,* FFG 18; *Sydney,* FFG 35; and *Darwin,* FFG 44.

It was then planned to build six ships in Australia, bringing the total in service to ten. However, the last four were cancelled, leaving only *Melbourne* (05) and *Newcastle* (06) to be built in the AMECON yard in Melbourne, Australia.

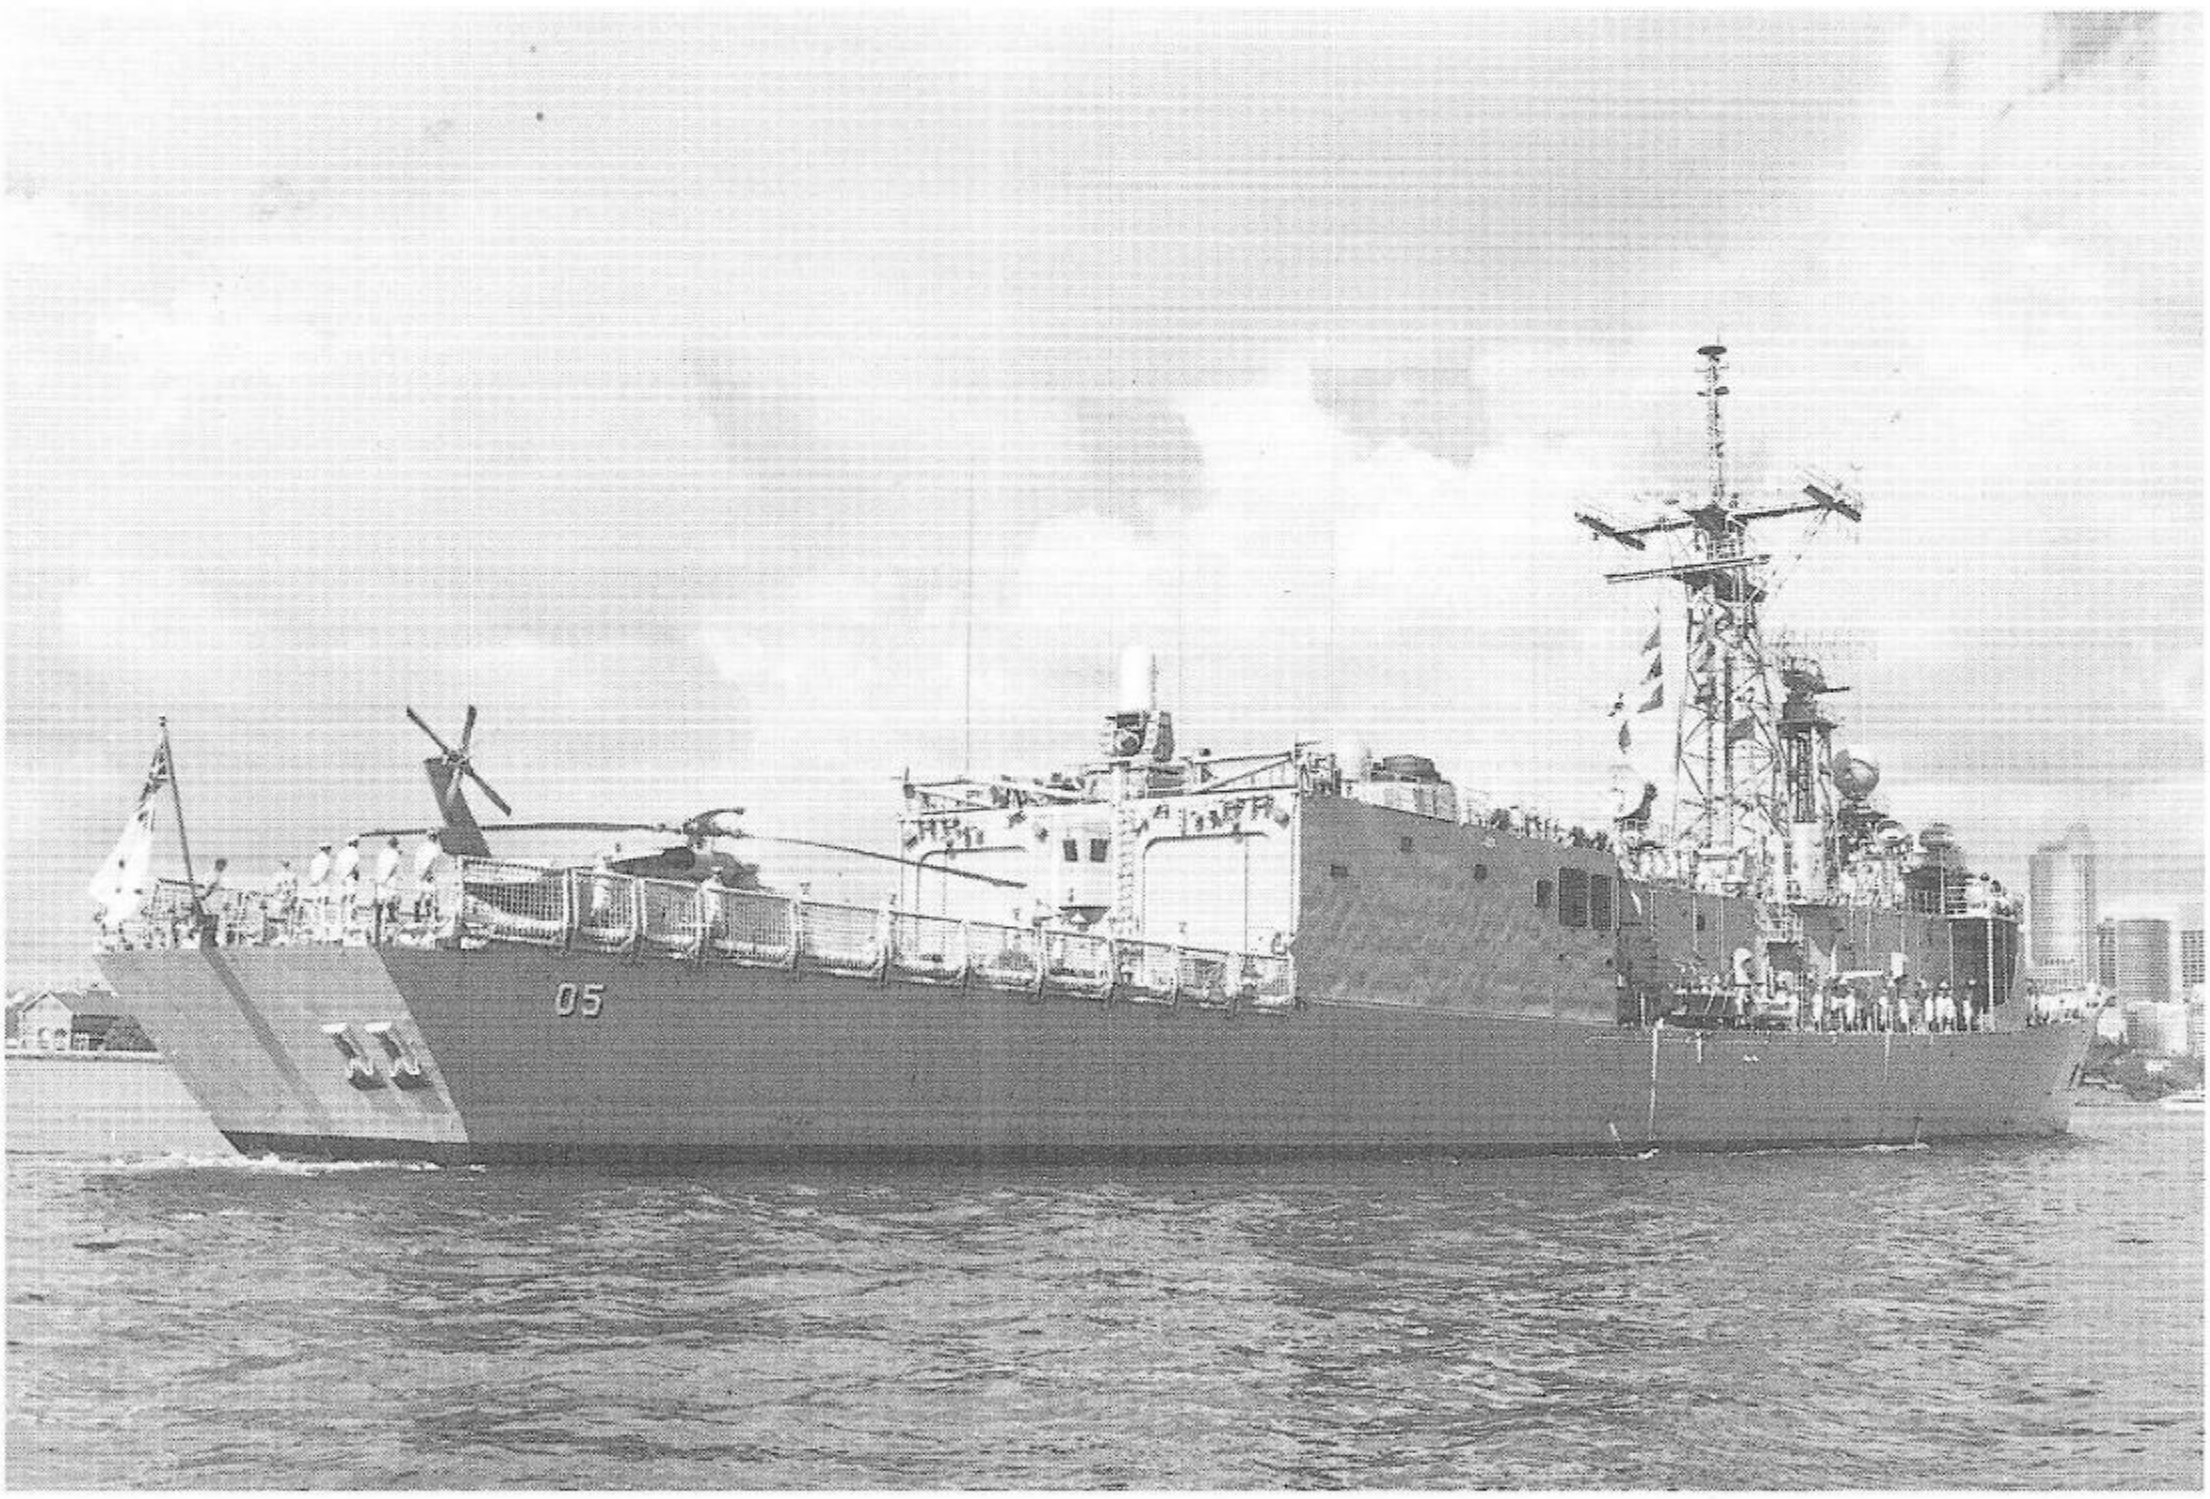
MODERNISATION

The first three ships were built to the original 'Perry' class design with a perpendicular transom. Thus, when the RAN selected the Sikorsky SH-70B-2 helicopter it became necessary to angle out the transom which was then being done in the US Navy's ships. This modification involved 12 months' work and was completed in *Sydney* in February 1989, in *Adelaide* in November 1989, and in *Canberra* in December 1991. For the remaining three ships the modification was incorporated into the building programme. The complete helicopter modification programme included angling the transom to 45°, which increased the ship's overall length by 2.4 m (8 ft), fitting the RAST helicopter recovery system, longitudinal strengthening and buoyancy upgrades.

Several options are under consideration for the Progressive Upgrade Project which was originally scheduled to start in 1996 but has slipped, with contracts now due to be let in 1997 and the work due to be done over the period 1998-2003. Options under consideration include obtaining SM-2 missiles (for which improved radars would be required), or installing a VLS Mk 41 launcher for a mix of Standard SM-1 Block IV and Evolved Sea Sparrow missiles. Other possibilities include towed arrays, updated combat data systems and a mine avoidance sonar.

OPERATIONAL

Adelaide and *Darwin* are based at Fleet Base West, while the other four are at Fleet Base East. For operational tasks such as deployment to the Gulf, the ships are fitted with enhanced communications, electro-optical sights, rigid inflatable boats (RIBs) and portable RAM panels. All ships are capable of exercising a fighter-control function.



Melbourne *(05). The two fairleads in the transom are for the current towed decoys and will be used, in due course, for the Australian-designed Kariwara towed array*

GENERAL SPECIFICATIONS

Operator: Spain
Type: Oliver Hazard Perry

Class: SANTA MARIA (FFG)

Built: 6
Active: 6

Displacement:
standard: 3,610 t
full load: 4,017 full load

Dimensions
Length: 137.7 m (451.2 ft)
Beam: 14.3 m (46.9 ft)

Draught: 7.5 m (24.6 ft)

Speed: 29 kts; 4.5 kts on auxiliary
Range: 4,500 n miles at 20 kts

Complement: 223 (13 officers)

SHIPS

SANTA MARIA (F 81)
Builder Bazan, Ferrol, Spain
Laid down 23 May 1982
Launched 24 Nov 1984
Commissioned 12 Oct 1986

VICTORIA (F 82)
Builder Bazan, Ferrol, Spain
Laid down 16 Aug 1983
Launched 23 Jul 1986
Commissioned 11 Nov 1987

NUMANCIA (F 83)
Builder Bazan, Ferrol, Spain
Laid down 8 Jan 1986
Launched 30 Jan 1987
Commissioned 8 Nov 1988

REINA SOFIA (F 84)

Laid down 12 Dec 1987
Launched 19 Jul 1989
Commissioned 18 Oct 1990

NAVARRA (F 85)
Builder Bazan, Ferrol, Spain
Laid down 15 Apr 1991
Launched 23 Oct 1992
Commissioned 30 May 1994

CANARIAS (F 86)
Builder Bazan, Ferrol, Spain
Laid down 15 Apr 1992
Launched 21 Jun 1993
Commissioned 14 Dec 1994

WEAPONS SYSTEMS

MISSILE LAUNCHER

Mk 13 Mod 4 launcher

There is a single Mk 13 Mod 4 launcher located on the foredeck, used to launch both Harpoon SSM and Standard SM-1MR SAMs. There are 40 missiles stored vertically in a below-decks magazine in two concentric rings. Launching rate is one missile every 10 seconds. Mod 4 introduced solid-state technology, replacing the electromechanical relays in Mods 1-3.

ANTI-SHIP MISSILES (ASM)

McDonnell Douglas UGM-84B Harpoon

The missile magazine contains eight Harpoon Block 1C anti-ship missiles. This missile can either fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses or it can approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. It can also use selectable seeker search expansion patterns and, for the terminal phase, can use either a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Navarra *(F 85)* (H & L van Ginderen Collection)

Specifications

Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors

McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

Standard Missile-1 Medium Range (SM-1MR)

Main air defence armament is the SM-1MR which is launched from the Mk 13 Mod 4 launcher on the foredeck. The magazine normally contains 32 rounds. SM-1MR Block IV missiles have a Naval Weapons Center Mk 51 expanding rod warhead, while Block V missiles have a Naval Weapons Center Mk 90 blast fragmentation warhead.

Specifications

Length: 4.48 m (14.7 ft)
Diameter: 34.3 cm (13.5 in)
Wing span: 1.06 m (3.48 ft)
Weight: 642.3 kg (1,416 lb)
Speed: Mach 2
Range: 20.5 n miles (38 km)
Altitude: 19,800 m (65,000 ft)

Manufacturers/Contractors

Hughes Missile Systems, Tucson, Arizona, USA.
Raytheon, Missile Systems Division, Bedford, Maryland, USA.

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited amidships, one set on either beam.

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

Manufacturer/Contractor

GEC-Marconi Naval Systems, UK.

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications

Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 76 mm (3 in)/62 Mk 75 Compact

There is one OTOBREDA 76 mm (3 in) gun sited amidships atop the superstructure.

Specifications

Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/sec
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range: 8.6 n miles (16 km)

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy.

Bazan Meroka

One Bazan Meroka Mod 2A/2B 12-barrelled 20 mm/120 close in weapons system (CIWS) is mounted at the after end of the hangar roof. This Spanish-designed weapon is unique in its configuration and operation. The weapon itself consists of 12 Oerlikon 20 mm KAA barrels and uses standard Oerlikon 20 mm ammunition, but these barrels are arranged in a single unit of two superimposed rows of six with a common breech block. All operations, such as loading, feeding and unlocking, are carried out using compressed air from reservoirs on the mounting, which are recharged from an onboard compressor. Ammunition is brought to the barrels by two belt feeds, supplied by a hydraulically powered, rotating, 72-round magazine.

Specifications

Calibre: 20 mm
Length of barrel: 120 calibres
Muzzle velocity: 1,215 m/s (3,986 ft/s)
Traverse: 360° at 90°/s
Elevation: −20 to +85°
Crew: 0
Range: 0.75 n miles (1.5 km)
Rate of fire: 2,700-3,600 rds/min
Ammunition: 337 g (11.9 oz) (TP-T, HEI, SAPHEI-T, AP-T); 310 g (10.9 oz) (APDS-T)

Manufacturer/Contractor

Fabrica de Artilleria de Bazan, Spain.

Part of the Spanish Navy's 'Group Alfa' at sea including the flagship, the carrier Principe de Asturias *and two 'Santa Maria' class frigates* (Bazan)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Elettronica Nettunel

Nettunel is the Spanish name for the Elettronica Nettuno system, which is made under licence in Spain. Nettuno is an integrated radar ESM/ECM system claimed to have a 100 per cent intercept of emitters, using passive surveillance based on environmental synthesis. A very high level of automation ensures immediate and automatic identification based on a powerful threat library, and accurate tracking of emitters. Computer-controlled processing employs structured modular software using a high-level language. There is full, interactive integration with the command and control systems, and also with the flare/chaff launcher systems. Roll-stabilised, multibeam DF antennas provide high bearing accuracy and feature high sensitivity, wide dynamic range logarithmic amplifiers and completely digital processing. The ECM section provides self-protection by environment adaptive instant-by-instant automatic jamming, even against simultaneous multiple threats. However, command and control, or the operator, can override the system if necessary. The high-power jammer antennas are roll-stabilised and consist of linear arrays that electronically steer a precise and narrow high-gain beam. Jamming implementation follows automatic instructions provided by the ESM section and by the power management computer. High ERP is achieved by using a transmitter design employing paralleled matched high-power Elettronica-designed TWTs.

Manufacturer/Contractor

Elettronica SpA, Rome, Italy.

Mk 3000

F 84 to F 86 are fitted with a new intercept/jammer suite, the Mk 3000.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launchers

There are two Mk 37 Mod 1 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications

Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)
Barrels: 6

Rounds
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

Manufacturers/Contractors

Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

AN/SLQ-25 Nixie noisemaker

One AN/SLQ-25 Nixie (Phase 1), solid-state, modular design electroacoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit which selects the appropriate cable or load and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed through the transom. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. Each winch can stream and recover the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed bodies, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, are 95 cm (3.10 ft) long, 15.24 cm (6 in) in diameter and weigh 18 kg (40 lb). They receive amplifier outputs, convert them into acoustic signals and project them. Usually one towed body at a time is deployed.

Manufacturer/Contractor

Aerojet ElectroSystems, Sacramento, California, USA.

Prairie Masker noise suppression systems

The ships are fitted with Prairie Masker radiated noise suppression systems in which air is passed down the propeller shaft and ejected from a groove in the leading edge of the blade, thus delaying the onset of cavitation.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

IPN-10

IPN-10 is the export version of SADOC 2 *(Systema Direzione della Operazioni di Combattimento),* which was developed by Selenia (now Alenia Elsag Sistemi Navali) in the late 1970s. The SADOC 2/IPN-10 data handling system is designed to produce an up-to-date picture of the tactical situation within the vicinity of both the ship and its task group. SADOC 2/IPN-10 is a mainframe system, designed primarily to acquire, process and present data acquired by the ship's principle sensors, but can also be used for other functions, including evaluation, threat evaluation, weapons control, ECM management, aircraft control, conducting ASW operations, and datalink databank management. In addition to the data received from onboard sensors the system is also capable of receiving and processing data received from offboard sensors via datalinks such as Link 11.

There are several Selenia (now Alenia) 32-bit CDG-3032 central processing units (CPU), each with a 128 K memory, one of which normally acts as the primary, with another acting as an immediate back-up in the event of system failure. Each of the consoles also contains a Selenia (now Alenia) 16-bit NDC-160 minicomputer, with 64 K memory. Both types possess mass memory modules for handling programmes and large amounts of data and interface with each other via a 10 Mbit/s serial databus. The basic software of the latter is under the control of two TAVITAC operating systems; the disk operating system and a time-sharing executive.

Manufacturer/Contractor

Alenia Elsag Sistemi Navali, Rome, Italy.

COMMUNICATIONS AND DATALINKS

Datalink: Link 11
Helo datalink: AN/SSQ-28 LAMPS III
Satcom: Saturn 3S (SCOT 3 Satcom may also be fitted in due course)
Tacan: AN/URN-25.

WEAPONS CONTROL

Enosa electro-optic tracker

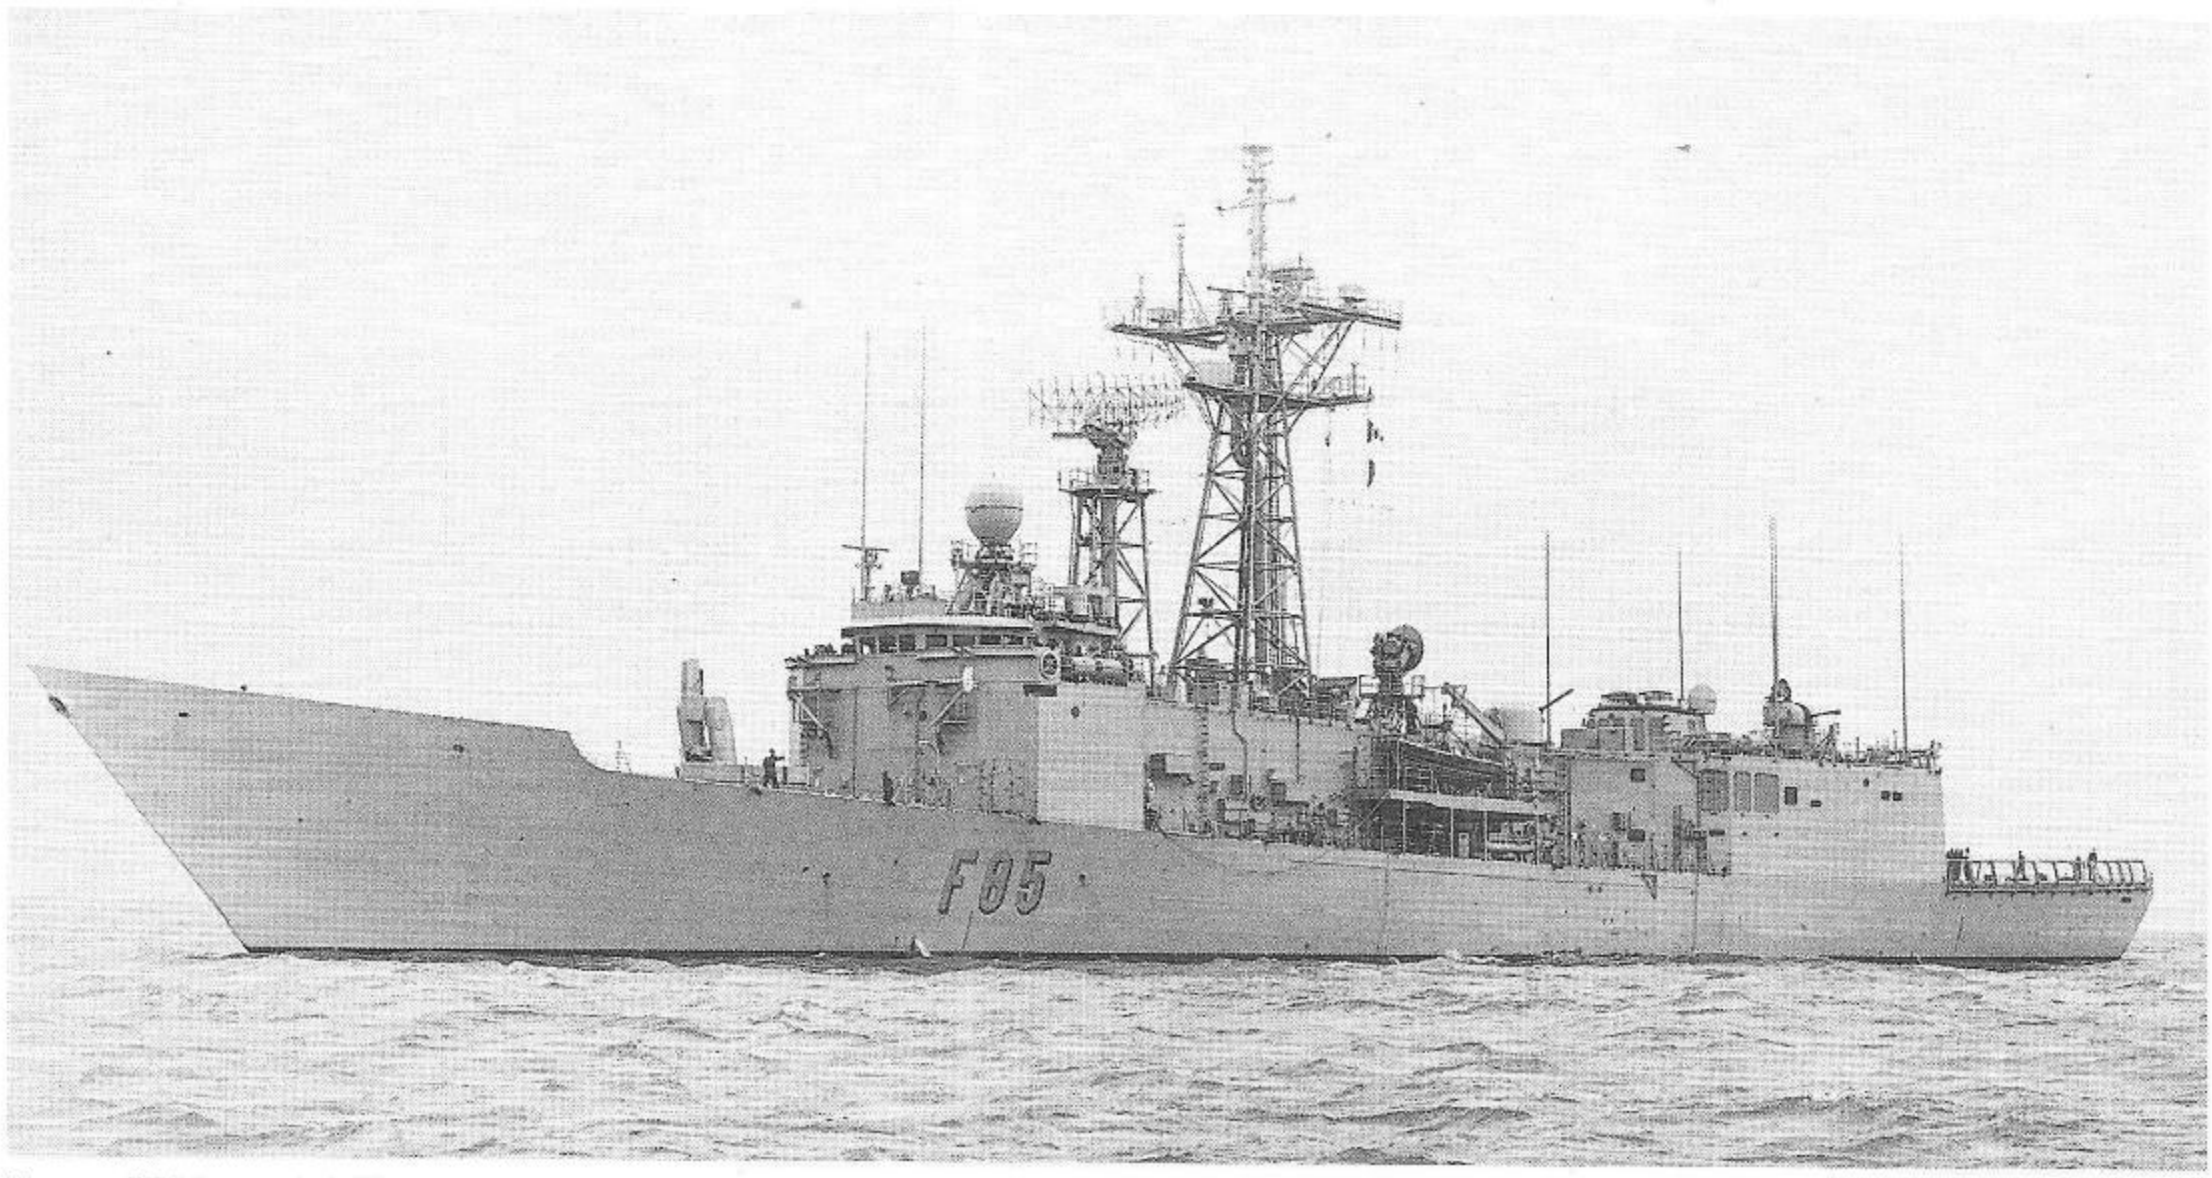
There is an Enosa electro-optic tracker for Meroka 2B.

Mk 92 Mod 2/6 fire-control system

F 81 to F 84 are fitted with the Mk 92 Mod 2 fire-control system, while the last two ships, F 85 and F 86, have the Mod 6 version with CORT (COherent Receive/Transmit). Mk 92 is an Americanised version of the Signaal WM28 system, produced under licence by Unisys. Mk 92 Mod 2 uses a combined antenna system with its distinctive egg-shaped housing, together with the STIR (Signaal Track and Illuminating Radar) and provides continuous air and surface search around a ship even in an ECCM environment. It has a fast reaction time and is capable of simultaneous engagement of up to four surface targets, or two air and two surface targets. The system can engage air, surface or shore targets with guns or missiles. It is fully compatible with IPN-10 and interfaces with the Mk 13 Mod 4 missile handling/launching system, the 76 mm gun and the Meroka CIWS. The Mk 92 consists of a combined antenna system, a separate track illuminating radar, a computer system, weapon control consoles, and ancillary equipment, and has a crew of four. The Mk 53 Combined Antenna System (CAS) consists of a monopulse track radar with CW injection above and a track-while-scan radar. Their antennas share a stabilised mount with the monopulse antenna above and the TWS antenna below. The monopulse radar can detect, track and illuminate one target in the air or on the surface. The TWS radar can detect and track up to two surface or shore targets simultaneously, as well as low-altitude targets.

The Signaal STIR is an I/K-band monopulse tracking radar with CW injection which is designed to provide an additional channel of fire for a single air or surface target. It consists of a Mk 54 director with antenna. There are two 32-bit AN/UYK-7 computers, each with 256 k memory and an optimum operating speed of 667 Kops, the second computer having been added to improve the processing of ASW data. There are two Weapons Control Consoles in the CIC to provide an MMI for acquiring and tracking targets, engagement control, launcher assignment, missile firing and post-engagement evaluation. The Mk 106 WCC supports the CAS and the Mk 107 WCC supports the STIR, but both also receive video data from ship search radars. Between the WCCs are the CIWS and Harpoon control stations and the CIC also has five consoles from the AN/UYA-4 family.

Mk 92 Mod 6 fitted in the last two ships is an improved version, which provides earlier detection and longer tracking ranges. The system includes improved clutter and ECCM performance and the track-while-scan element has six air target channels. The prime modification is the replacement of the CAS and STIR



Navarra *(F 85) one of six 'Oliver Hazard Perry' class frigates built in Spain. The Spanish ships are 0.6 m (2 ft) wider than any others in the 'Perry' class to enable additional topweight to be carried. Note the Meroka CIWS on the hangar roof which is also unique to the Spanish ships*

* To be replaced by Signaal STING in due course.
** All are being modified with a combined RAN 12L and RAN 30X fire-control radar for Meroka. The combined system is called RAN 30L/X.

transmitter-receivers with COherent Receiver Transmitters (CORT) which incorporate test sets. A Unisys AN/UYK-44B is added to the computer system to act as a converter control processor; it has a core memory of 256,000 words or a semiconductor memory of 4 million words, together with up to 16 input-output channels.

Manufacturer/Contractor
Unisys Corporation, Government Systems Group.

SONARS

Raytheon AN/SQS-56 hull-mounted sonar
The AN/SQS-56 hull-mounted sonar was originally developed specifically for the 'Oliver Hazard Perry' (FFG 7) class frigates. Digital implementation allows packaging of the complete multifunction active and passive sonar in five medium-size electronics cabinets and one operator's console. System control uses a built-in mini-computer and an advanced display system. The sonar is an active/passive, preformed beam, digital sonar providing panoramic echo ranging and panoramic (DIMUS) passive surveillance. All signal processing, except transducer-received signal amplification and linear transducer transmit drive, is accomplished in digital hardware, most of which is implemented using US Navy SEMP (Standard Electronic Module Programme) components in compact water-cooled cabinets small enough to allow installation through standard size hatches.

The basic system includes the transducer array, transducer junction box, five electronics cabinets (array interface, transmitter(s), receiver and controller), operator console, sonar dome and control unit. Options in production include a loudspeaker/intercom, a water-cooling unit, a remote display and a performance prediction subsystem.

A single operator can search, track, classify and designate multiple targets from the active system while simultaneously maintaining anti-torpedo surveillance on the passive display. Computer-assisted system control permits the operator to concentrate on the sonar data being displayed rather than on the system control. Operating frequencies are 5.6, 7.5 and 8.4 kHz.

Manufacturer/Contractor
Raytheon Company, Submarine Signal Division, Portsmouth, Rhode Island.

AN/SQR-19(V)2
The AN/SQR-19(V)2 towed sonar array is a passive, long-range omnidirectional system for detecting and classifying submarine targets. Its OA-9056/SQR-19 towed array group consists of an array 244 m (800 ft) long and 82 mm (3.2) in diameter, which is towed on a 1 n mile (1.85 km) cable. The array can reach depths of up to 365 m (1,200 ft), but is so designed that it can achieve this without needing a 'fish' to depress it. The other two major subsystems are the Ship-based Electronic Subsystem (SES) and the OK-410/SQR-19 Handling and Stowage Group (H&SG). Early versions of AN/SQR-19 use the AN/UYK-20 Data Processing Set (DPS) but systems produced from FY87 onwards use the AN/UYK-44-based Signal Data Processing Unit (SDPU).

AVIATION

AVIATION FACILITIES

Specifications

Shafts: 1
Propeller: cp
Auxiliary motors: 2—1.18 MW (1,600 hp(m)); 1 retractable prop

FURTHER INFORMATION

PROGRAMME

The first three hulls were ordered on 29 June 1977, but there was considerable delay in starting construction due to the priority being given to the *Principe de Asturias* carrier programme. The fourth ship was ordered on 19 June 1986, followed by the fifth and sixth on 26 December 1989. F 85 and F 86 were delayed by a shortage of funds, not being commissioned until 1994 and 1995, respectively. The original plan to build four more has been shelved in favour of the F 100 air defence frigate programme.

DESIGN

The design is based on that of the later 'Perry' class, with the lengthened stern, but in a feature unique to these six Spanish ships, the beam has been increased by 0.6 m (2 ft) to enable them to carry more topweight. Also, as in the later US ships, fin stabilisers are fitted.

The last two ships, *Navarra* (F 85) and *Canarias* (F 86) have the indigenous CONAM combat data system, which increases the national input to 75 per cent. They also have improved fire-control systems.

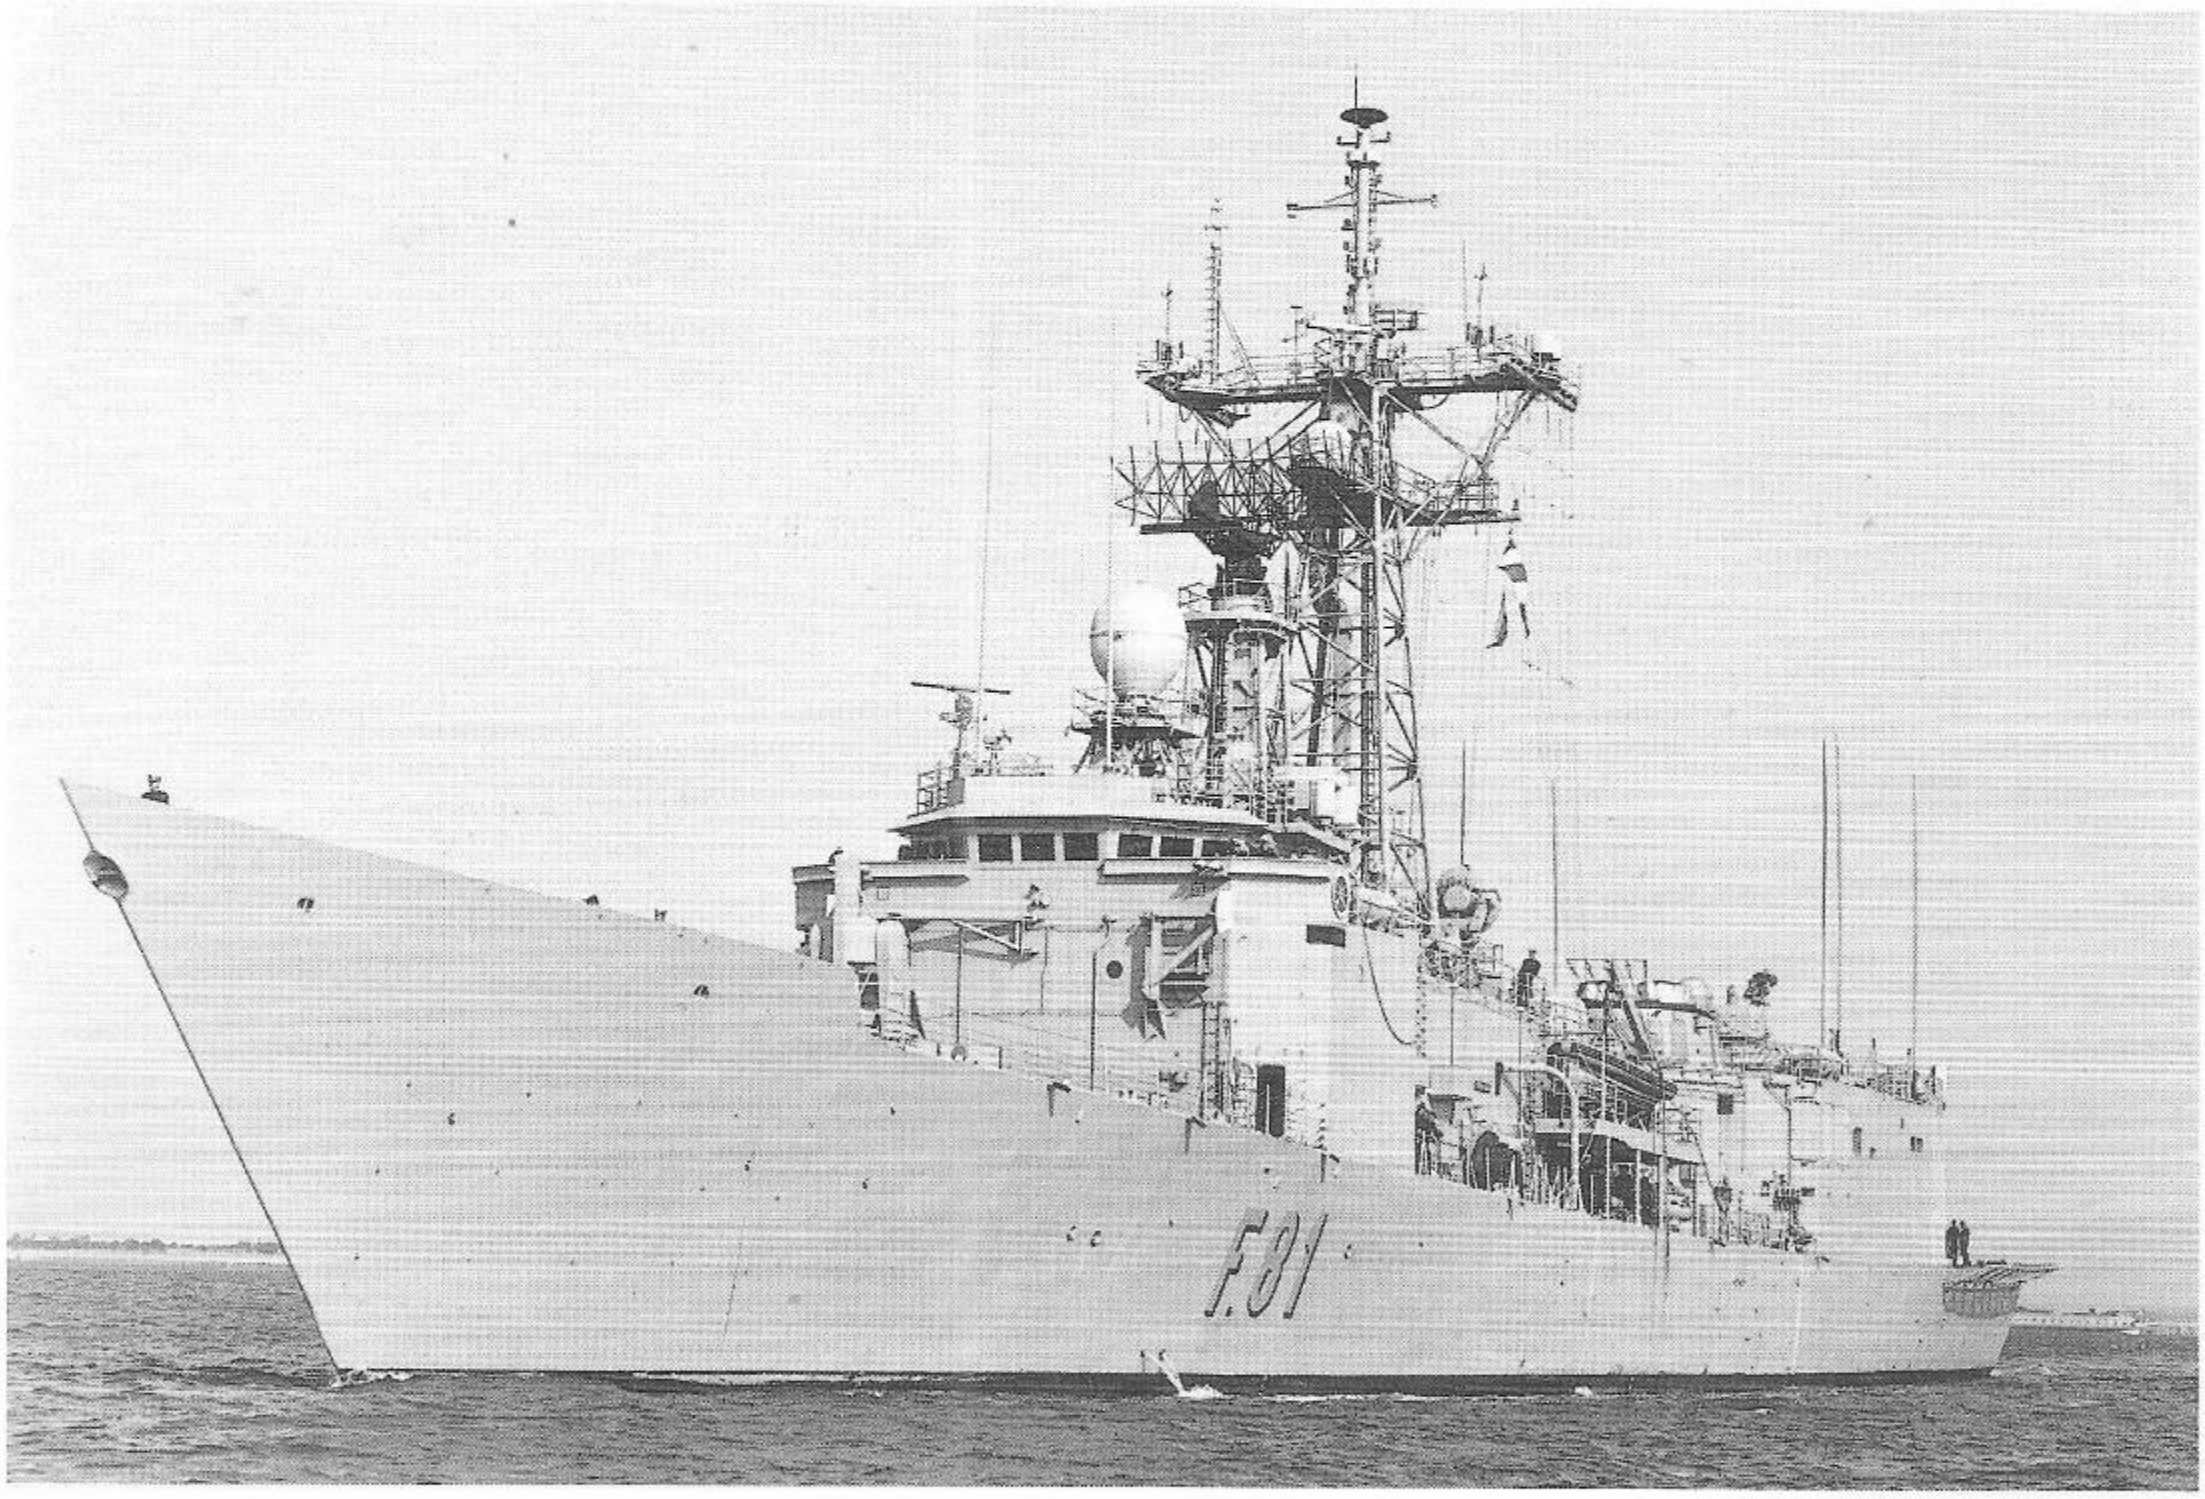
All six ships carry the Spanish Meroka CIWS, with the last two ships mounting the latest Mod 2B version.

MODERNISATION

The new FABA DORNA *(Direccion de tiro Optronica y Radarica Naval)* electro-optic director and fire-control radar, which includes the Signaal STING has been under test since 1995 for the 76 mm gun. All ships are receiving advanced ESM/ECM suites and the Meroka fire-control radars are being upgraded.

OPERATIONAL

All six ships are based at Rota as the 41st Squadron and on deployment form the escort/ASW element of the Spanish Navy's Group Alfa.



Name ship of the class, Santa Maria *(F 81)* (H & L van Ginderen Collection)

GENERAL SPECIFICATIONS

Operator: Taiwan

Class: 'CHENG KUNG' (KWANG HUA PROJECT) (FLIGHT I) (FFG)

Active: 5
Building: 2

Displacement:
light: 2,750 t
full load: 4,105 t

Dimensions
Length: 138.1 m (453 ft)
Beam: 13.7 m (45 ft)

Draught: 4.5 m (14.8 ft) (hull); 7.5 m (24.5 ft) (sonar)

Speed: 29 kts
Range: 4,500 n miles at 20 kts

Complement: 234 (15 officers) including 19 aircrew

SHIPS

CHENG KUNG (1101)
Builder China SB Corporation, Kaohsiung, Taiwan
Laid down 7 Jan 1990
Launched 5 Oct 1991
Commissioned 7 May 1993

CHENG HO (1103)

Builder China SB Corporation, Kaohsiung, Taiwan
Laid down 4 Oct 1991
Launched 27 Sep 1993
Commissioned Mar 1995

YUEH FEI (1106)
Builder China SB Corporation, Kaohsiung, Taiwan
Laid down 5 Sep 1992
Launched 26 Aug 1994
Commissioned Feb 1996

TZU-I (1107)
Builder China SB Corporation, Kaohsiung, Taiwan
Laid down 7 Aug 1994
Launched Jul 1995
Commissioned Jan 1997

Chi Kuang *(1105) departs Simon's Town in June 1996 at the end of a visit to South Africa. Note the launch canisters for the Hsiung Feng II missiles immediately before the mast. Using such launchers frees the main magazine to accommodate its full load of 40 Standard SM-1MR SAMs* (H & L van Ginderen Collection)

PAN CHAO (1108)
Builder China SB Corporation, Kaohsiung, Taiwan
Laid down Jan 1995
Launched Dec 1995
Commissioned Dec 1997

CHANG CHIEN (1109)
Builder China SB Corporation, Kaohsiung, Taiwan
Laid down Dec 1995
Launched Nov 1996
Commissioned Nov 1998

WEAPONS SYSTEMS

MISSILE LAUNCHER

Mk 13 Mod 4 launcher

There is a single Mk 13 Mod 4 launcher located on the foredeck, but since the Hsiung Feng II ASMs have their own launch canisters the Mk 13 launcher and the associated magazine are devoted entirely to Standard SM-1MR SAMs. There are 40 missiles stored vertically in a below-decks magazine in two concentric rings. Launching rate is one missile every 10 seconds.

ANTI-SHIP MISSILES (ASM)

Hsiung Feng II short/medium-range anti-ship missile

There are two quad launchers for Hsiung Feng II short-range anti-ship missiles, which are derived from the Israeli Gabriel, and are powered by a turbojet cruise engine with rocket boosters for take-off. The fire-control system is similar to that used in Gabriel with a radar tracker, a display control and processing unit, a vertical reference unit and an optical sight which is usually the Kollmorgen Mk 35 or Model 985. The launcher-containers are also identical to those used in Gabriel and are generally similar to the Harpoon's Mk 141.

The launcher operation is likely to follow that of most conventional medium-range anti-ship missiles with the target acquired by long-range surface search radars with over-the-horizon targeting facilities through a Ta Chen datalink. The launcher and target locations are inserted into the inertial guidance system, the missile is launched and adopts a low-level cruising altitude. The target is acquired by both the radar and the IR sensors and the returns are compared with an onboard library. If significant deviations in one sensor's returns occur then the guidance system assumes it is being jammed and gives priority to the other as the missile enters the sea-skimming terminal phase.

Specifications

Hsiung Feng II
Length: 3.9 m (12.8 ft)
Diameter: 34 cm (13.4 in)
Wing span: 1.35 m (4.4 ft)
Weight: 540 kg (1,190 lb)
Speed: Mach 0.85
Range: 32 n miles (60 km)
Guidance: Semi-active radar, manual or IR homing
Warhead: 150 kg (330 lb) HE
Engine: Microturbo TRI-60 single spool turbojet

SURFACE-TO-AIR MISSILES (SAM)

Standard Missile-1 Medium Range (SM-1MR)

Main air defence armament is the SM-1MR which is launched from the Mk 13 Mod 4 launcher on the foredeck. All 40 rounds in the magazine are SM-1MR Block IV missiles and have a Naval Weapons Center Mk 51 expanding rod warhead.

Specifications

Length: 4.48 m (14.7 ft)
Diameter: 34.3 cm (13.5 in)
Wing span: 1.06 m (3.48 ft)
Weight: 642.3 kg (1,416 lb)
Speed: Mach 2
Range: 20.5 n miles (38 km)
Altitude: 19,800 m (65,000 ft)

Manufacturers/Contractors

Hughes Missile Systems, Tucson, Arizona, USA.
Raytheon, Missile Systems Division, Bedford, Maryland, USA.

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited amidships, one set on either beam.

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

Manufacturer/Contractor

GEC-Marconi Naval Systems, UK.

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications

Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 76 mm (3 in)/62 Mk 75 Compact

There is one OTOBREDA 76 mm (3 in) gun sited amidships atop the superstructure.

Specifications

Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range: 8.6 n miles (16 km)

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy.

Bofors 40 mm/70

All have two single Bofors 40 mm mountings, which are on small platform decks immediately below the 76 mm mounting.

Specifications

Traverse: 360° (nominal) at 90°/s
Elevation: −3 to +85° at 60°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Max range:
anti-surface: 6.5 n miles (12 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

Type 75 20 mm

Three of these weapons are mounted on the hangar roof. The Type 75 is a Taiwanese-produced weapon, which combines a Pontiac M39E 20 mm aircraft cannon with a locally produced mount. The M39E was developed from the German Second World War Mauser MG213C revolver cannon and is the weapon installed in the Northrop F-5E fighter aircraft operated by the RoC Air Force. This has, apparently, been modified for use as a naval close in weapons system (CIWS), and fires 1,600 rds/min with a muzzle velocity of 870 m/s (2,850 ft/s).

M2HB 12.7 mm (0.50 in) machine guns

All ships carry up to six M2HB 12.7 mm machine guns, which can be mounted on the ship's rails on flexible mounts.

Specifications

Calibre: 12.7 mm (0.50 in)
Rate of fire: 450-550 rds/min
Muzzle velocity: 883 m/s (2,900 ft/s)
Max effective range:
anti-surface: 6,700 m (7,400 yd)
anti-air: 1,380 m (4,500 ft)

Hughes Mk 15 CIWS Phalanx

There is one Hughes Mk 15 CIWS Phalanx close in weapons system (CIWS) situated at the after end of the hangar roof. The mount consists of a 20 mm, six-barrel, Gatling-principle gun with a cylindrical magazine and feeding mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

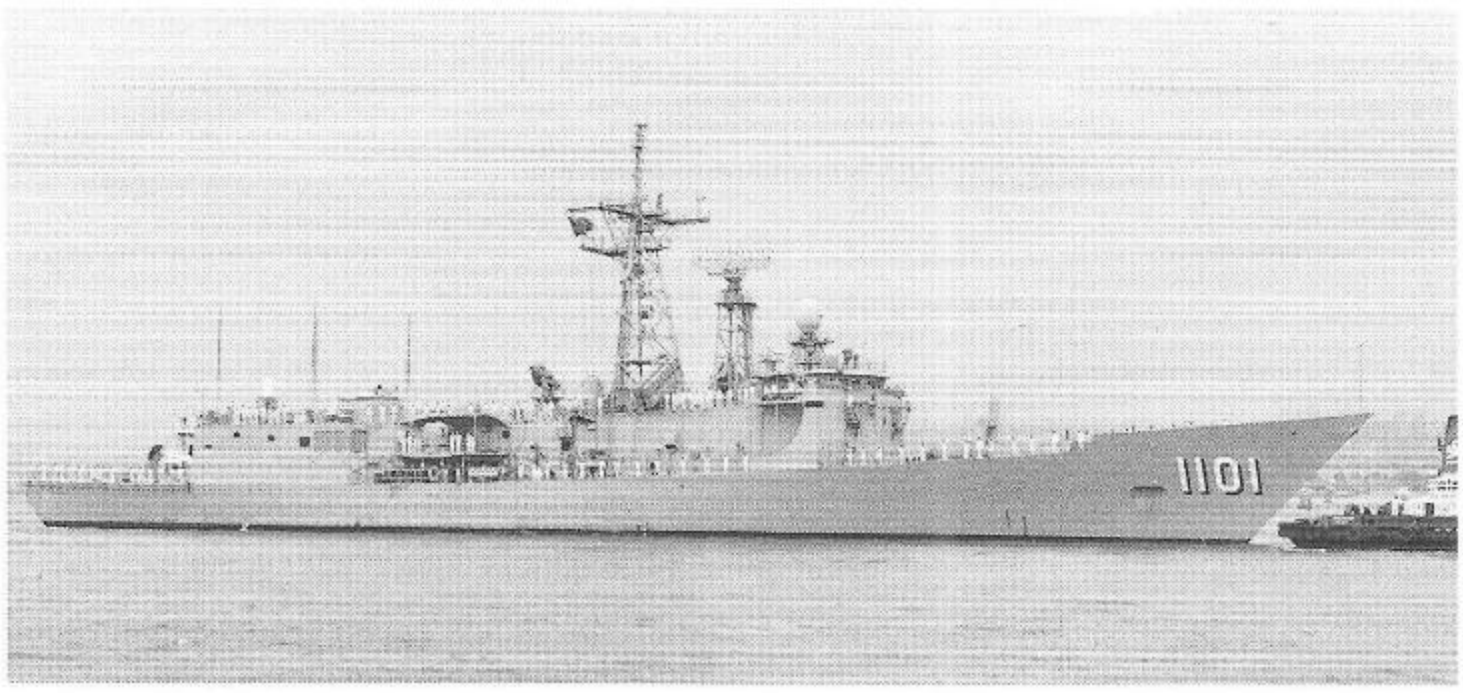
Specifications

Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,380 ft/s)
Rate of fire: 3,000 rds/min (Block 0, Block 1 Baseline 0), 4,500 rds/min (Block 1 Baseline 1)
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor

Hughes Missile Systems, Tucson, Arizona, USA (system).



Cheng Kung *(1101)* (H & L van Ginderen Collection)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Chang Feng IV (AN/SLQ-32(V)5) ESM/ ECM suite

An order was placed with the Hughes Company to deliver eight AN/SLQ-32(V)5 systems to the US Navy and one to Taiwan, an order which was eventually taken over and completed by Raytheon. AN/SLQ-35(V)5 is now produced in Taiwan as the Chang Feng IV system.

The ESM component gives radar warning on B to J-bands, while the additional Sidekick ECM element provides active onboard countermeasures, employing a high-gain, multibeam antenna system and with full ECM techniques repertoire for both ship defence and counter-targeting roles. Sidekick can counter simultaneous threats from any azimuth angle.

Manufacturer/Contractor

Raytheon Company, Electromagnetic Systems Division, Goleta, California.

Prairie Masker noise suppression systems

The ships are fitted with Prairie Masker radiated noise suppression systems in which air is passed down the propeller shaft and ejected from a groove in the leading edge of the blade, thus delaying the onset of cavitation.

DECOYS

Kung Fen 6 chaff launchers

These ships carry four Kung Fen 6, locally produced copies of the Hycor RBOC (Rapid-Blooming-Chaff system), which was used in the US Navy as the Mk 33/34, prior to the entry into service of the Mk 36 (5.1 in) SRBOC system. Each unit comprises six fixed (4.4 in) launch tubes, which are mounted in pairs at angles of 55°, 65°, and 75°. Rounds for the system include a chaff cartridge, a chaff decoy, an IR decoy, and a combined chaff/IR decoy.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

AN/SYS-2(V)2 data fusion system

AN/SYS-2(V)2 is fitted in all ships in the class. The role of the SYS-2(V)2 IADT (Integrated Automatic Detection and Tracking system) is to increase the number of air and surface targets which may be detected and tracked in all types of electronic environments. The system accepts contacts from each radar, seeks potential targets, correlates the data by comparing all the sensors' returns and then produces a single file of valid tracks, while avoiding duplication. The different radar characteristics provide an overlapping volume of coverage in a variety of clutter and ECM environments which may be monitored to obtain the best possible search coverage. The data is then fed to the ship's command and weapon control systems, and accepts inputs from fire-control radars.

Each system consists of two 16-bit Paramax AN/UYK-44 computers and two display consoles. In later systems 32-bit digital microprocessors are added to improve sensor data fusion. Supplementary processors are the Motorola 68020, the INMOS Transputer (801/5) and the Intel i860 RISC. The UYK-44 uses Ultra-16 Assembly language and Ada is planned for SYS-2. The transputer uses OCCAM software language. In most systems one computer is used to interface with the sensors and the inertial navigation system while the other supports the display consoles and interfaces with the combat direction system, and fire/weapon control systems.

In SYS-2 (V)2 one computer supports the AN/SPS-49 radar which acts as the long-range tracker while the second interfaces with the Mk 92 fire-control system and, through the preprocessor, with the AN/SPS-55 radar which acts as the medium-range tracker.

Manufacturer/Contractor

Norden Systems, Melville, New York, USA.

Ta Chen

The Ta Chen is a datalink used in targeting for the Hsiung Feng missile system. It is being installed in *Chi Kuang* onwards and is being back-fitted into the first two ships.

WEAPONS CONTROL

UniSys Mk 92 Mod 6 fire-control system

All the Taiwanese ships have the Mk 92 Mod 6 fire-control system with CORT. This is the latest version of the system, which provides earlier detection and longer tracking ranges. The system includes improved clutter and ECCM performance and the track-while-scan element has six air target channels. The prime modification is the replacement of the CAS and STIR transmitter-receivers with COherent Receiver Transmitters (CORT) which incorporate test sets. A Unisys AN/UYK-44B is added to the computer system to act as a converter control processor; it has a core memory of 256,000 words or a semiconductor memory of 4 million words, together with up to 16 input-output channels.

Manufacturer/Contractor

Unisys Corporation, Government Systems Group, USA.

Weapon Direction System Mk 13 Mod 4 target designation system

'Perry' class frigates are fitted with WDS Mk 13 Mod 2. In these ships the NTDS evaluates search radar data on the display system, tracks targets, evaluates them, and then indicates hostile targets and assigns their engagement to the WDS. The WDS then evaluates target engageability, assigns priorities and transmits this data to the missile fire-control system, while retaining responsibility for weapon assignment, loading orders and firing. Having launched the missile, the system conducts in-flight monitoring and control, and finally carries out post-firing evaluation of the engagement. The WDS monitors data flow between the NTDS computer, the fire-control and the launching systems. Depending upon the tactical situation and computer recommendations, operators can also control both the fire-control and the launching systems and then fire missiles. The Mk 13 has a two-operator position weapon control panel group and features target scheduling. This allows the computer to provide operators with a recommended or automatically scheduled target engagement order thus simplifying the fire-control and launching system assignment orders. In the Mk 13 Mod 2 system, used in the 'Oliver Hazard Perry' (FFG 7) class frigates, there are no launch system consoles. Both use a pair of Mk 152 Mod 7 computers which each support a Mk 72 signal data converter, both computers interfacing with a single Mk 95 input-output console.

Manufacturer/Contractor

Vitro Corporation, USA.

Mk 114 ASW

It is reported that these ships are fitted with the Mk 114 ASW weapon direction system, which is normally associated with the ASROC ASW missile, which is not carried. If the reports are correct, then the system will presumably be used only with the 'over-the-side' Mk 32 torpedo launch system.,

Mk 24 Target Designation Transmitter (TDT)

There are two Mk 24 TDTs. These comprise a pair of binoculars on a pedestal, which are manually trained and then pass target bearing and elevation information to the combat system.

Mk 309 Mod 1 anti-submarine fire-control system

Officially designated Control Panel Mk 309, this compact anti-submarine fire-control system was developed in the late 1960s and combines basic displays with the capabilities needed to direct anti-submarine operations involving tube-launched torpedoes. The bulkhead-mounted panel combines the functions of a target bearing and range indicator, a repeater of 'own ship' heading, a torpedo presetter and a firing panel. It also displays attack recommendations, defining the direction of the torpedo track and the firing range most suitable for a given tactical situation, as well as generating course-to-steer orders for transmission to remote indicating equipment. Where interlocks are required they are related only to basic safety requirements. The panel does not have a computer but uses a memory based upon a series of shore-developed simulations incorporating the experience of 40,000 torpedo attack exercises, which have been analysed to produce a range of attack solutions for both ship and weapons. During an attack, data is fed to the panel from the gyrocompass and the hull-mounted sonar (range and bearing) and the data is then compared with the attack solutions in the memory to find the appropriate one. The Mk 309 recommends which courses to steer for interception then launching the torpedoes. It also indicates the minimum and maximum ranges at which the torpedo should be launched, based upon the tubes being at a 45° angle, and which angle-on-bow approach should be taken. It will also indicate when the ship should turn to unmask the launchers.

Note:
* In these ships the STIR radar uses the US Navy UD 417 antenna group.

SONARS

Raytheon AN/SQS-56 hull-mounted sonar

The AN/SQS-56 hull-mounted sonar was originally developed specifically for the 'Oliver Hazard Perry' (FFG 7) class frigates. Digital implementation allows packaging of the complete multifunction active and passive sonar in five medium-size electronics cabinets and one operator's console. System control uses a built-in mini-computer and an advanced display system. The sonar is an active/passive, preformed beam, digital sonar providing panoramic echo ranging and panoramic (DIMUS) passive surveillance. All signal processing, except transducer-received signal amplification and linear transducer transmit drive, is accomplished in digital hardware, most of which is implemented using US Navy SEMP (Standard Electronic Module Programme) components in compact water-cooled cabinets small enough to allow installation through standard-size hatches.

The basic system includes the transducer array, transducer junction box, five electronics cabinets (array interface, transmitter(s), receiver and controller), operator console, sonar dome and control unit. Options in production include a loudspeaker/intercom, a water-cooling unit, a remote display and a performance prediction subsystem.

A single operator can search, track, classify and designate multiple targets from the active system while simultaneously maintaining anti-torpedo surveillance on the passive display. Computer-assisted system control permits the operator to concentrate on the sonar data being displayed rather than on the system control. Operating frequencies are 5.6, 7.5 and 8.4 kHz.

Manufacturer/Contractor

Raytheon Company, Submarine Signal Division, Portsmouth, Rhode Island.

ATAS active towed array sonar

BAe/Thomson ATAS is installed in the third (*Chi Kuang* (1105)) and subsequent ships, with the first two only having AN/SQR-18A(V)2. ATAS comprises a high-power, low-frequency transmitter, operating in three frequencies around the 3 kHz band, which can be deployed at up to 900 m (2,953 ft) behind the towing platform, together with an in-line receiver array towed a further 300 m (984 ft) behind the transmitter, all of which may be towed at depths suited to prevailing oceanographic conditions. The port/starboard ambiguity normally associated with a towed array is automatically and instantaneously resolved within the system without the need for ship manoeuvre. ATAS can be operated at depths of 235 m (771 ft). The transmitter has a high-power acoustic sound source consisting of a vertical stave of 10 in low-frequency flextensional transducers. Transmissions in CW or FM are omnidirectional in the horizontal plane with a vertical beamwidth of 25°. The receiver array is a 30 m (98.4 ft) long flexible tube housing a line of hydrophones and associated electronics to condition and digitise hydrophone signals. The receiver gives full azimuth cover and in the broadside direction a bearing resolution of up to 0.5°. The receiver uses 96 preformed beams with bearing stabilisation. The processing equipment uses current technology to provide high processing capability within a single compact unit.

Manufacturers/Contractors

BAeSEMA Marine Division, Bristol, UK.
Thomson Sintra Activités Sous-Marines, Sophia Antipolis Cedex, France.

Armament: 2 Mk 46 torpedoes

PROPULSION

Specifications

System: Gas turbine
Main machinery: 2 General Electric LM-2500 gas turbines; 30.59 MW (41,000 hp) sustained
Shafts: 1
Propeller: cp
Auxiliary propulsion: 2 retractable propulsors; 650 hp (484 kW)

FURTHER INFORMATION

PROGRAMME

The first two were ordered on 8 May 1989. The first seven of the class are designated Flight I; for Flight II see next entry.

NAMES

The ships are named after generals, admirals and warriors of ancient China. Admiral Cheng Ho, for example, was a famous navigator and his discovery of the Spratlys is used as part of the basis for the Chinese claim to the islands.

DESIGN

These ships are generally similar to USS *Ingraham*, the last of the 'Perry' class to be built in the USA. The ships do, however, have a number of Taiwanese weapons and electronics systems.

The use of containerised anti-ship missiles has freed the missile magazine to take a full load (40) of SM-1MR SAMs, although the area between the mast had to be strengthened to take the Hsiung Feng II missiles, which may have had an adverse effect on topweight.

The two single 40 mm Bofors are unique to the Taiwanese ships, and it should be noted that the existing platform deck has had to be extended to take the port mounting, while a completely new platform deck has had to be built on the starboard side. In addition there are the three Type 75 20 mm cannon on the hangar roof. These, added to the Mk 15 Phalanx CIWS and OTOBREDA 76 mm, make these the most heavily armed 'Perry' class frigates, although they must add yet more to the topweight problem.

DEPLOYMENT

Cheng Kung joined the 124th Attack Squadron on 15 January 1994 and the remainder are following as they complete operational work ups.

Chi Kuang *(1105). Note the Bofors 40 mm on its special platform deck amidships* (H & L van Ginderen Collection)

SHIPS

TIEN TAN (1110)

Builder	China SB Corporation, Kaohsiung, Taiwan
Laid down	Nov 1996
Launched	Oct 1997
Commissioned	Jan 2001

WEAPONS SYSTEMS

MISSILE LAUNCHER

Mk 41 VLS
There will be one Mk 41 VLS in the foredeck and consideration is being given to a second unit in the space currently occupied by the starboard hangar.

SURFACE-TO-SURFACE MISSILES (SSM)

Hsiung Feng II
Two quad launchers will be mounted in the superstructure break.

SURFACE-TO-AIR MISSILES (SAM)

Standard SM-2
There will be 48 SM-2s in the forward Mk 41 VLS.

Sea Sparrow/Tien Chung II
The after Mk 41 VLS would be used to house either Sea Sparrow, Enhanced Sea Sparrow or Tien Chung II missiles.

TORPEDOES

Torpedo armament will remain as now, with two 324 mm Mk 32 triple launchers and Alliant Techsystems Mk 46 Mod 5 torpedoes.

GUNS

FMC 127 mm/54 Mk 45 Mod 2
Following the trend for larger calibre naval guns, these ships will mount a 127 mm gun in place of the earlier 76 mm weapon.

20 mm/76 6-barrelled Phalanx Mk 15 Mod 1
The current ships have just one Phalanx on the hangar roof aft. In the new ships there will be a second mount forward of the bridge screen on a new platform.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

The ADAR-2N will require a new and much more sophisticated command system, which will be provided by the Unisys CSIST.

RADARS

The most important change in the new ships will be the installation of a four-faced, phased array radar. This will not be the SPY-1 of the US Navy's Aegis system, but will be the ADAR-2N, which is being developed in co-operation with Lockheed Martin, the company that developed Aegis. Lockheed Martin also worked on FARS (Frigate Array Radar System), a D/E-band radar whose individual arrays would have an area some 25 per cent smaller than that of the SPY-1 panels. The system is being dubbed a 'mini-Aegis' and Taiwanese electronic ingenuity will doubtless ensure that its performance is as near as possible to that of the original Aegis. The system will be able to track 300 targets simultaneously and carry out 16 concurrent engagements. There will also be a second STIR.

AVIATION

AVIATION FACILITIES

If the plan to use the starboard hangar to accommodate Mk 41 VLS comes to fruition, then only one helicopter, the Sikorsky S-70C(M)1 will be accommodated.

PROPULSION

Specifications
System: Gas turbine
Main machinery: 2 GE LM 2500 gas turbines; 30.59 MW (41,000 hp) sustained (see 'Further Information' below)
Shafts: 2
Propeller: cp
Auxiliary propulsion: 2 retractable units

FURTHER INFORMATION

PROGRAMME

Flight II of the 'PFG-2' class project has been delayed by six months. The plan is to build only one of the class and then go on to Flight III with the emphasis on fleet area air defence.

DESIGN

A number of design and equipment options have not yet been finalised and the details listed could change.

Modifications to Flight I include inserting a 17 ft plug in the hull, immediately forward of the bridge. This would enable a 157 mm gun to be mounted in 'A' position, the Mk 13 launcher and the 40-round magazine to be removed and replaced by a 48-cell Mk 41 vertical launch system (VLS), and a second Phalanx (or alternative CIWS) added on a step forward of the bridge.

Another element in the plan is to replace the starboard hangar by four Mk 41 VLS, each of which would be subdivided into four, each quarter housing one Lockheed Martin Sea Sparrow quad-pack.

The superstructure will be cut down amidships and the CIC moved from the superstructure down into the hull. A back-up CIC would be located aft, well away from the main CIC, as a survivability measure.

A phased array radar system similar to the SPY-1 will be fitted. Two STIRs provide target illumination. In the break in the superstructure amidships, eight Hsiung Feng II launchers are fitted with options for either Bofors guns or ASW missiles.

The hull will be longer and the displacement greater. It is, therefore, highly probable that the opportunity will be taken to modify the propulsion system, possibly by adding two more gas turbines in a COGOG arrangement, and adding a second shaft. In such a situation there would seem to be little need for the two auxiliary 'get-you-home' propulsors.

GENERAL SPECIFICATIONS

Operator: United States of America

Class: OLIVER HAZARD PERRY (FFG)

Built: 51
Active: 45

Displacement:
light: 2,750 t
full load:
FFG 7, 8, 15, 28, 29, 32, 36-61: 4,100 t
others: 3,638 t

Dimensions
Length:
FFG 7, 8, 15, 28, 29, 32, 36-61: 138.1 m (453 ft)
others: 135.6 m (445 ft)
Beam: 13.7 m (45 ft)

Draught: 4.5 m (14.8 ft) (hull); 7.5 m (24.5 ft) (sonar)

Speed: 29 kts
Range: 4,500 n miles at 20 kts

Complement: 206 (13 officers) including 19 aircrew

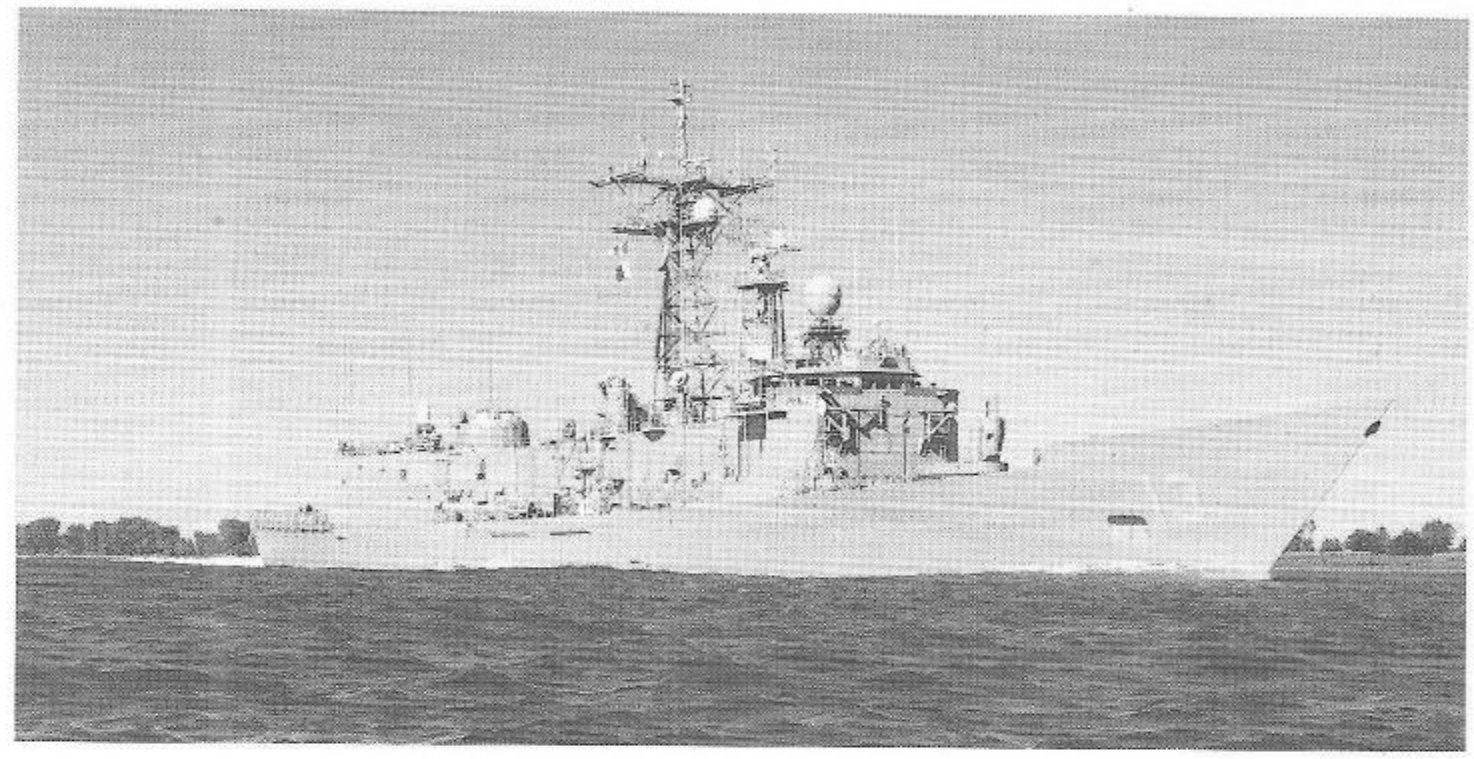
WEAPONS SYSTEMS

MISSILE LAUNCHER

Mk 13 Mod 4 launcher

There is a single Mk 13 Mod 4 launcher located on the foredeck, used to launch both Harpoon SSM and Standard SM-1MR SAMs. There are 40 missiles stored vertically in a below-decks magazine in two concentric rings. Launching rate is one missile every 10 seconds. Mod 4 introduced solid-state technology, replacing the electromechanical relays in Mods 1-3.



Samuel Eliot Morison *(FFG 13) showing the class' weapons systems. On the foredeck is the Mk 13 Mod 4 launcher, with, beneath it, a magazine holding four Harpoon SSMs and 36 Standard SM-1MR SAMs. The main gun, an OTOBREDA 76 mm Mk 75 is on the superstructure forward of the stack and on the hangar roof is the Mk 15 CIWS. One of two triple 324 mm torpedo launchers can be seen immediately below the 76 mm gun* (H & L van Ginderen Collection)

ANTI-SHIP MISSILES (ASM)

McDonnell Douglas UGM-84B Harpoon

The missile magazine contains four Harpoon Block 1C anti-ship missiles. This missile can either fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses or it can approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. It can also use selectable seeker search expansion patterns, and for the terminal phase can use either a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications

Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg (11,905 lb) thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors

McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

Standard Missile-1 Medium Range (SM-1MR)

Main air defence armament is the SM-1MR which is launched from the Mk 13 Mod 4 launcher on the foredeck. SM-1MR Block IV missiles have a Naval Weapons Center Mk 51 expanding rod warhead, while Block V missiles have a Naval Weapons Center Mk 90 blast fragmentation warhead.

Specifications

Length: 4.48 m (14.7 ft)
Diameter: 34.3 cm (13.5 in)
Wing span: 1.06 m (3.48 ft)
Weight: 642.3 kg (1,416 lb)
Speed: Mach 2
Range: 20.5 n miles (38 km)
Altitude: 19,800 m (65,000 ft)

Manufacturers/Contractors

Hughes Missile Systems, Tucson, Arizona, USA.
Raytheon, Missile Systems Division, Bedford, Maryland, USA.

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited amidships, one set on either beam.

Specifications

Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

Manufacturer/Contractor

GEC-Marconi Naval Systems, UK.

Another view of Samuel Eliot Morison *(FFG 13) showing an SH-2F LAMP I helicopter and the vertical transom. FFG 9 to 16 (both inclusive) are the only US Navy 'Perry' class ships not to be either built with or converted to the LAMPS III system*

TORPEDOES

Alliant Techsystems Mk 46 Mod 5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 76 mm (3 in)/62 Mk 75 Compact

There is one OTOBREDA 76 mm (3 in) gun sited amidships atop the superstructure.

Specifications
Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range: 8.6 n miles (16 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy

Hughes Mk 15 CIWS Phalanx

There is one Hughes Mk 15 CIWS Phalanx close in weapons system (CIWS) situated at the after end of the hangar roof. The mount consists of a 20 mm M61A1 six-barrel, Gatling-principle gun with a cylindrical magazine and feeding mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,380 ft/s)
Rate of fire: 3,000 rds/min (Block 0, Block 1 Baseline 0), 4,500 rds/min (Block 1 Baseline 1)
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor
Hughes Missile Systems, Tucson, Arizona, USA (system).

M2HB 12.7 mm (0.50 in) machine guns

Four M2HB 12.7 mm machine guns are carried and can be mounted on flexible mounts.

Specifications
Calibre: 12.7 mm (0.50 in)
Rate of fire: 450-550 rds/min
Muzzle velocity: 883 m/s (2,900 ft/s)
Max effective range:
anti-surface: 6,700 m (7,400 yd)
anti-air: 1,380 m (4,500 ft)

Mk 38 Bushmaster 25 mm cannon

Up to four Bushmasters can be mounted amidships and are usually carried by 'Perry' class ships deploying to the Gulf. The Bushmaster automatic cannon consists of the Mk 38 25 mm automatic cannon ('chain gun') on a Mk 88 mount. The Mk 38 is a single barrel, externally powered weapon, incorporating a rotating bolt mechanism driven by a chain and firing either single shots or automatic at 180 rds/min. Ammunition is supplied from a box containing 150 linked rounds, which is located on the left side of the weapon. Ammunition used in the Mk 38 is the M-792 HEI-T and M-793 TP-T 25 × 137 mm rimless, bottle-necked, Oerlikon KBA rounds, both being manufactured by Aerojet Ordnance, Alliant Techsystems Inc, and Loral Aeronutronic.

Specifications
Calibre: 25 mm
Length of barrel: 81 calibres
Muzzle velocity: 1,100 m/s (3,609 ft/s)
Traverse: 360°
Elevation: −20 to +55°
Weight: 589 kg (1,298 lb) (loaded)
Crew: 1 (often supported by a spotter)
Range: 1.33 n miles (2.47 km)
Rate of fire: 180 rds/min (max)
Ammunition: 184 g HEI-T
Barrel life: <13,000 rounds
Reliability: 22,000 rounds between stoppages

Manufacturer/Contractor
McDonnell Douglas Helicopter Company.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

AN/SLQ-32(V)2 ESM or AN/SLQ-32(V)5 ESM/ECM suites

As built, FFG7 to FFG 35 were fitted with the AN/SLQ32(V)2 ESM-only suite, which gives radar warning on B to J-bands, but has no ECM (jamming) capability. All these ships are being upgraded to SLQ-32(V)5 standard by adding the Raytheon 'Sidekick' which provides active onboard countermeasures, employing a high-gain, multibeam antenna system and has a full ECM techniques repertoire for both ship defence and counter-targeting roles. System software is a modification of that used with AN/SLQ-32(V)3. Sidekick can counter simultaneous threats from any azimuth angle.

FFG 36 to FFG 60 were fitted with AN/SLQ-32(V)5 (essentially, AN/SLQ-32 plus Sidekick) integrated ESM/ECM suite from the start.

Manufacturer/Contractor
Raytheon Company, Electromagnetic Systems Division, Goleta, California.

The officer is standing beside the AN/SLQ-32(V)2 ESM array and the back of the other array can be seen on the other side of bridge roof. The rectangular, flat dielectric plates cover the direction-finding arrays, while the semicircular plates cover semi-omni arrays

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launchers

There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)
Barrels: 6

Rounds
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

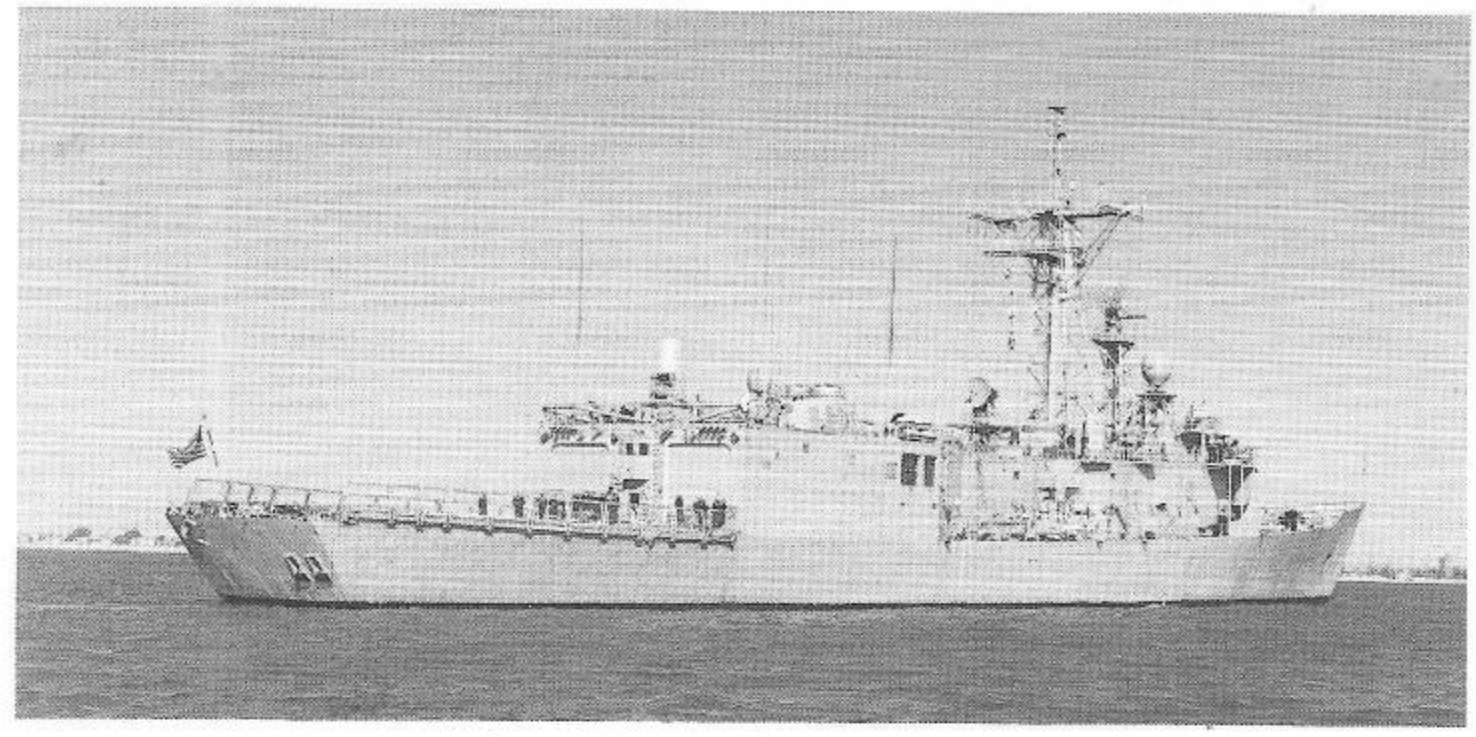
Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

AN/SLQ-25 Nixie noisemaker

One AN/SLQ-25 Nixie (Phase 1), solid-state, modular design electroacoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit which selects the appropriate cable or load and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed through the transom. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads, and the transmitter are located. Each winch can stream and recover the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed bodies, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, are 95 cm (3.10 ft) long, 15.24 cm (6 in) in

diameter and weigh 18 kg (40 lb). They receive amplifier outputs, convert them into acoustic signals and project them. Usually one towed body at a time is deployed.

Manufacturer/Contractor
Aerojet ElectroSystems, Sacramento, California, USA.



McInerney *(FFG 8). Sensors visible in this picture include: Mk 92 fire-control director (large 'egg' on bridge roof) with AN/SLQ-32(V)2 below and to the right. The tower on the bridge roof supports the AN/SPS-49(V) antenna. Abaft the mast is the Lockheed STIR fire-control director and the white 'thimble' atop the Mk 15 CIWS houses the AN/UPS-20 radar. A Satcom terminal is also situated on the hangar roof*

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEM

NTDS tactical data handling system

NTDS (Naval Tactical Data System) provides an up-to-date picture of the tactical situation around individual warships and task groups using inputs from onboard and, via datalinks, offboard sensors. The data is also used to designate targets with priorities for aircraft and for shipborne Weapons Direction Systems (WDS), which assigns them to the appropriate weapon system.

NTDS does not receive direct inputs from ESM or ASW systems, data from the latter coming via the underwater fire-control system. In the anti-ship role, NTDS has a direct output into the SWG-1A Harpoon fire-control system. NTDS consists of a data processing group, a display group and data transmission equipment. The data processing group includes computers, software and ancillary equipment. Sensor data enters the system through the central equipment group and sensor switchboard and is transferred to the computer. The data is then processed with the aid of the radar video processor and with inputs from both the beacon video processor (IFF data), Link 11 and (where fitted) Link 14. Once the data has been evaluated and correlated it is transmitted both to relevant 'own ship' systems and to offboard platforms on land, sea and air.

The sensor data is presented to the display group which consists of PPI display consoles. The display systems are associated with specific sensors and the operators may enter tactical data and decisions into the computer for incorporation on other display systems. The Link 11 data transmission equipment provides automatic, high-speed, computer-to-computer digital communications between NTDS ships as well as air and land-based tactical data handling systems. A separate switchboard is responsible for communications. Other hardware associated with NTDS includes:

Digital datalink: Harris AN/ASW-25A
Airborne communications set: Litton AN/ASW-27
Radar information display: Hazeltine AN/SPA-41
Communications central: Collins AN/SRC-16, 17
Shipboard radio: Collins AN/SRC-23A
Digital data terminal: ECI AN/SRC-31A
Data terminal: Jetronic AN/SYW-1, Collins AN/USQ-36.

The mainframe data processing group in the 'Perry' class version of NTDS consists of two UYK-7 computers, which will remain in service into the early part of the next century, when they will be replaced by AN/UYK-43 computers, which incorporate Very Large Scale Integrated Circuits (VLSIC) technology. UYK-7 has a memory of 256,000, 32-bit words and an optimum processing power of 667 Kops.

NTDS software is in the US Navy's own CMS-2 language and is being constantly updated to meet new operational requirements. It is organised into large modules for air control, surface operations and tracking operations with each module consisting of tens of thousands of lines of code. Consideration is being given to replacing this with Ada but no decisions have been made.

Manufacturers/Contractors
Unisys (computers).
Hughes Aircraft Company (displays).
Collins (communications).

WEAPONS CONTROL

AN/SWG-1A Harpoon Launch Control System (LCS)

SWG-1A is the Harpoon weapons control system, which activates the missile, selects the flight pattern and sets seeker search modes (with small-, medium- or large-acquisition windows), as well as providing target range and bearing data. Alternatively, the missile can simply be launched along the bearing of the target, with the seeker activated early to scan a 90° sector; if, after a set time, no target has been acquired the missile commences a preset search pattern. SWG-1A takes account of other ships in the general target area and generates indirect flight plans for the missile, including waypoints to optimise angles of approach which will achieve the highest possibility of success while minimising the chances of the missile being destroyed by hostile fire. It can also be used to compute flight plans in a multiple attack so that several missiles, from either the same or different ships, arrive on target simultaneously, thus swamping the defences.

Mk 92 Mod 2/6 fire-control system

Mk 92 is an Americanised version of the Signaal WM28 system, produced under licence by Unisys. Mk 92 Mod 2 was installed in all ships 'as built' except for the final ship, *Ingraham* (FFG 61), which received the improved Mk 92 Mod 6, which will be retrofitted to the earlier ships.

The Mk 92 Mod 2 system uses a combined antenna system with its distinctive egg-shaped housing, together with the STIR (Signaal Track and Illuminating Radar) and provides continuous air and surface search around a ship even in an ECCM environment. It has a fast reaction time and is capable of simultaneous engagement of up to four surface targets, or two air and two surface targets. The system can engage air, surface or shore targets with guns or missiles. It is fully compatible with NTDS and interfaces with the Mk 13 Mod 4 missile handling/launching system, the Mk 75 gun and the Mk 15 Phalanx CIWS.

The Mk 92 consists of a combined antenna system, a separate track illuminating radar, a computer system, weapon control consoles, and ancillary equipment, and has a crew of four. The Mk 53 Combined Antenna System (CAS) consists of a monopulse track radar with CW injection above and a track-while-scan radar. Their antennas share a stabilised mount with the monopulse antenna above and the TWS antenna below. The monopulse radar can detect, track and illuminate one target in the air or on the surface. The TWS radar can detect and track up to two surface or shore targets simultaneously, as well as low-altitude targets.

The Lockheed STIR (in American terminology Separate Track Illuminating Radar) is an I/K-band monopulse tracking radar with CW injection which is designed to provide an additional channel of fire for a single air or surface target. It consists of a Mk 54 director with antenna.

There are two 32-bit AN/UYK-7 computers, each with 256 k memory and an optimum operating speed of 667 Kops, the second computer having been added to improve the processing of ASW data. There are two Weapons Control Consoles in the CIC to provide an MMI for acquiring and tracking targets, engagement control, launcher assignment, missile firing and post-engagement evaluation. The Mk 106 WCC supports the CAS and the Mk 107 WCC supports the STIR, but both also receive video data from ship search radars. Between the WCCs are the CIWS and Harpoon control stations and the CIC also has five consoles from the AN/UYA-4 family.

Mk 92 Mod 6 is an improved version of the Mod 2 which provides earlier detection and longer tracking ranges. The system includes improved clutter and ECCM performance and the track-while-scan element has six air target channels. The prime modification is the replacement of the CAS and STIR transmitter-receivers with COherent Receiver Transmitters (CORT) which incorporate test sets. A Unisys AN/UYK-44B is added to the computer system to act as a converter control processor; it has a core memory of 256,000 words or a semiconductor memory of 4 million words, together with up to 16 input-output channels. An AN/SYS-2 Integrated Automatic Detection and Tracking (IADT) system interfaces with the Mod 6 and the AN/SPS-49(V)4 radar is replaced by the (V)5 model.

Manufacturer/Contractor
Unisys Corporation, Government Systems Group.

Weapon Direction System Mk 13 Mod 2 target designation system

'Perry' class frigates are fitted with WDS Mk 13 Mod 2. In these ships the NTDS evaluates search radar data on the display system, tracks targets, evaluates them, and then indicates hostile targets and assigns their engagement to the WDS. The WDS then evaluates target engageability, assigns priorities and transmits this data to the missile fire-control system, while retaining responsibility for weapon assignment, loading orders and firing. Having launched the missile, the system conducts in-flight monitoring and control, and finally carries out post-firing evaluation of the engagement. The WDS monitors data flow between the NTDS computer, the fire-control and the launching systems. Depending upon the tactical situation and computer recommendations, operators can also control both the fire-control and the launching systems and then fire missiles. The Mk 13 has a two-operator position weapon control panel group and features target scheduling. This allows the computer to provide operators with a recommended or automatically scheduled target

engagement order thus simplifying the fire-control and launching system assignment orders. In the Mk 13 Mod 2 system, used in the 'Oliver Hazard Perry' (FFG 7) class frigates, there are no launch system consoles. Both use a pair of Mk 152 Mod 7 computers which each support a Mk 72 signal data converter, both computers interfacing with a single Mk 95 input-output console.

Manufacturer/Contractor
Vitro Corporation, USA.

Mk 24 optical directors
There are two Mk 24 optical directors.

AN/SYS-2(V)2 data fusion system
AN/SYS-2(V)2 is fitted in FFG 61 and is being fitted in eleven others of the class. The role of the SYS-2(V)2 IADT (Integrated Automatic Detection and Tracking system) is to increase the number of air and surface targets which may be detected and tracked in all types of electronic environments. The system accepts contacts from each radar, seeks potential targets, correlates the data by comparing all the sensors' returns and then produces a single file of valid tracks, while avoiding duplication. The different radar characteristics provide an overlapping volume of coverage in a variety of clutter and ECM environments which may be monitored to obtain the best possible search coverage. The data is then fed to the ship's command and weapon control systems, and accepts inputs from fire-control radars.

Each system consists of two 16-bit Paramax AN/UYK-44 computers and two display consoles. In later systems 32-bit digital microprocessors are added to improve sensor data fusion. Supplementary processors are the Motorola 68020, the INMOS Transputer (801/5) and the Intel i860 RISC. The UYK-44 uses Ultra-16 Assembly language and Ada is planned for SYS-2. The transputer uses OCCAM software language. In most systems one computer is used to interface with the sensors and the inertial navigation system while the other supports the display consoles and interfaces with the combat direction system, and fire/weapon control systems.

In SYS-2 (V)2 one computer supports the AN/SPS-49 radar which acts as the long-range tracker while the second interfaces with the Mk 92 fire-control system and, through the preprocessor, with the AN/SPS-55 radar which acts as the medium-range tracker.

Manufacturer/Contractor
Norden Systems, Melville, New York, USA.

SONARS

Hughes AN/SQS-53B sonar
The prime sensor is the bow-mounted, low-frequency AN/SQS-53B (except for FFG 10, 24, 27, 31, 51, 52 and 54, which have AN/SQS-56). AN/SQS-53B is an active/passive sonar produced by Hughes Aircraft Company's Systems Group. The system has a cylindrical array 1.6 m (5.2 ft) high and 4.8 m (15.7 ft) in diameter with 576 transducers. The sonar has a power requirement of about 65 kW, a reported active transmitting frequency of about 3 kHz and a peak frequency of 192 kHz. SQS-53 operates in three active modes; surface duct, bottom bounce and convergence zone, and ranges are believed to be about 10 n miles (18.5 km) in surface duct mode and up to 34.5 n miles (64 km) in convergence zone mode. Passive detection range is reportedly greater than with earlier sets (such as SQS-26) with the ship capable of operating at higher speeds. SQS-53B has 37 cabinets of signal processing, transmitting and display equipment, the latter having digital display subsystems. SQS-53B has an AN/UYK-44 Military Reconfigurable Processor (MRP).

AN/SQR-19(V)
The AN/SQR-19(V) towed sonar array is a passive, long-range omnidirectional system for detecting and classifying submarine targets. Its OA-9056/SQR-19 towed array group consists of an array 244 m (800 ft) long and 82 mm (3.2) in diameter, which is towed on a 1 n mile (1.85 km) cable. The array can reach depths of up to 365 m (1,200 ft), but is so designed that it can achieve this without needing a 'fish' to depress it. The other two major subsystems are the Ship-based Electronic Subsystem (SES) and the OK-410/SQR-19 Handling and Stowage Group (H&SG). Early versions of AN/SQR-19 use the AN/UYK-20 Data Processing Set (DPS) but systems produced from FY87 onwards use the AN/UYK-44-based Signal Data Processing Unit (SDPU).

A few SQR-18A may still be fitted to ships assigned to the Navy Reserve Force.

AN/SQQ-28(V)9 SSPS
The AN/SQQ-28 Shipboard Sonar Processing System (SSPS) is the shipboard processor for the LAMPS III weapon system. It processes raw data from the sonobuoys laid by Sikorsky SH-60B Seahawk LAMPS IIIA SW helicopters which are relayed to the ship via the AN/SQR-4 duplex digital link and received by the AN/ARR-75 receiver. LAMPS I acoustic data, from sonobuoys laid by the Kaman SH-2F Seasprite, can also be received using the AN/SKR-4B(V) receiver. Modifications to the SKR-4 interface allow LAMPS I and LAMPS III interoperability, and shipboard sonobuoy receiver set or training acoustic inputs to the datalink port of the AN/SQQ-28 Input Signal Switching Unit (ISSU). When SQQ-28 is installed in ships with the AN/SQR-19, it shares the DPS or the SDPU. The AN/UYQ-25A(V)2 DPS and the associated SIMAS provide a computer-based capability for sonar in-situ performance prediction and mode selection to provide the most effective AN/SQQ-89 system performance in various environmental conditions.

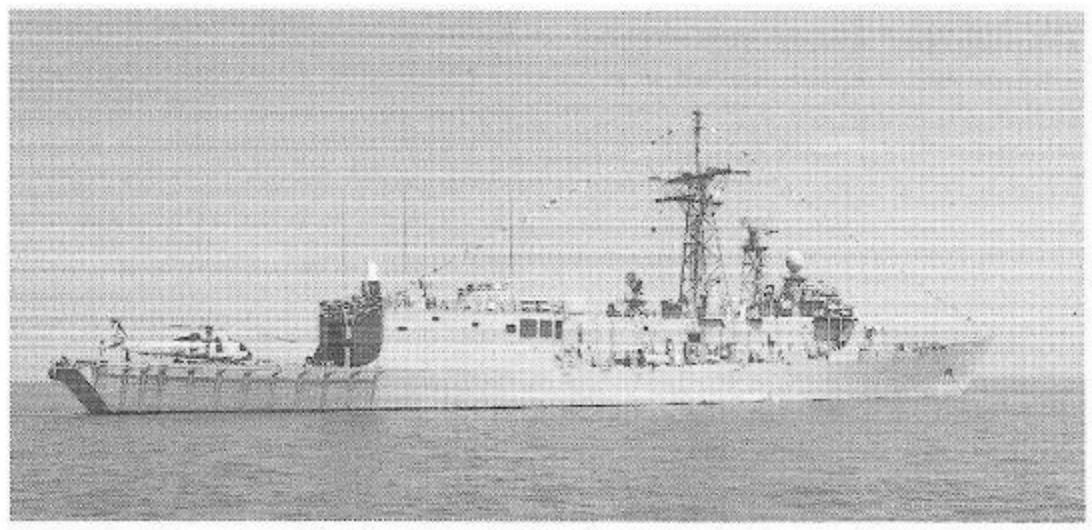
AN/SQQ-89(V)2 anti-submarine combat system
The AN/SQQ-89(V) surface ship anti-submarine warfare combat system detects, locates, tracks and engages submarine targets, and transmits and/or receives acoustic signals using a variety of sensors. Received signals are processed to provide target classification as well as performing TMA and controlling the setting of 'own ship' ASW weapons. In addition it provides multisensor track correlation, track management control and forwards track data to ship's Combat Direction System (CDS) or Command and Decision System (C&DS). The system is an integrated combat system consisting of sonar sensors which in other types of ship interface with the Mk 116 fire-control system to provide maximum operational effectiveness combined with minimum manpower requirements. Because there is no Mk 116 system in the 'Oliver Hazard Perry' class, however, the SQQ-89(V)2 system in these vessels has only two consoles and uses a Weapons Alternate Processor (WAP) in place of the Mk 116.

In the 'Perry' class, the sensors integrated in AN/SQQ-89(V)2 are the GE Electronic Systems Division AN/SQS-53B hull-mounted sonar, the GE Electronic Systems Division AN/SQR-19(V) Tactical Towed Array Sonar (TACTAS), the AN/SQQ-28 LAMPS I/III Sonar Signal Processing System (SSPS), all supported by the AN/UYQ-25 Data Processing System (DPS) and its associated Sonar In-situ Mode Assessment System (SIMAS) computer program.



From FFG 7 to FFG 35 the ships were designed to operate the LAMPS I system. These ships had a vertical transom (left) and operated the Kaman SH-2F helicopter. The LAMPS III system and the larger SH-60B helicopter required an extended flight deck with the transom angled out at 45° (right)
(Kaman (left); H & L van Ginderen Collection (right))

AVIATION

AVIATION FACILITIES

FFG 7 to FFG 35 were constructed to take the LAMPS I system, operating two Kaman SH-2 Seasprite helicopters, and thus required a smaller flight deck. When it was decided to deploy the LAMPS III system, however, a larger flight deck was required to enable the Indals helicopter landing system (RAST) to be installed. This was achieved by increasing the angle of the transom from virtually perpendicular to 45°, which increased the overall length of the ship by 2.4 m (8 ft). This extension was not, however, to enlarge the flight deck, but to provide alternative housing for the mooring facilities.

The original hangar had a single door, but this has been changed to twin doors, with an internal dividing bulkhead creating two hangars.

LAMPS III support facilities and RAST were tested in *McInerny* (FFG 8) and then fitted in all ships from FFG 36 onwards during construction and have been backfitted to all except FFG 9-14, 16-27, 30, 31 and 33-35. These latter ships can operate LAMPS III helicopters, but do not have the RAST landing facilities.

RAST

The Recovery Assistance Securing and Traversing (RAST) system enables helicopters to take off and land with the flight deck pitching up to 5° and rolling up to 28°.

An SH-60B lands aboard McInerney *(FFG 8) — note RAST tracks inset in the flight deck* (US Navy)

HELICOPTERS

Either two Kaman SH-2G Seasprite LAMPS I (NRF (short hull) ships) or two Sikorsky SH-60B Seahawk LAMPS III (long hull ships).

Sikorsky SH-60B Seahawk (LAMPS III)

Specifications

Dimensions
Main rotor diameter: 16.36 m (53.66 ft)
Tail rotor diameter: 3.35 m (11.00 ft)
Length overall (fuselage): 15.26 m (50.0 ft)
Height to top of rotor head: 3.79 m (12.43 ft)
Weights:
empty: 6,191 kg (13,648 lb)
mission gross weight: 9,182 kg (20,244 lb)
Performance:
dash speed (typical): 126 kts (234 km/h)
vertical rate of climb at S/L: 213 m (700 ft)/min
Power plant: 2 General Electric T700-GE-401C turboshafts rated at 1,417 kW (1,900 shp)
Accommodation: 3 (pilot and airborne tactical officer/back-up pilot in cockpit, sensor operator in specially equipped station in cabin)
Communications: Collins AN/ARC-159(V)2 UHF, Collins AN/ARC-174(V)2 HF, Hazeltine AN/APX-76A(V) and Bendix/King AN/APX-100(V)1 IFF transponders, TSEC/KG-45(E-1) communications security set, TSEC/KY-75 voice security set
Mission avionics: Sikorsky sonobuoy launcher, Edmac AN/ARR-75 and R-1651/ARA sonobuoy receiving sets (AN/ARR-84 receiver in Block 1 upgrade), Texas Instruments AN/ASQ-81(V)2 towed MAD, IBM AN/UYS-1(V)2 Proteus acoustic processor and CV-3252/A converter display, Control Data AN/AYK-14 (XN-1A) digital computer, Raytheon AN/ALQ-142 ESM, Sierra Research AN/ARQ-44 datalink and telemetry
Armament:
2 Mk 46 torpedoes;
2 AGM-119B Penguin 2 Mod 7 anti-shipping missiles (some helicopters only)
2 Honeywell 50 Advanced Lightweight Torpedoes; Hellfire missiles

SH-2F lands aboard an unmodified 'Perry' class frigate (Kaman)

Kaman SH-2G/LAMPS I Super Seasprite

Specifications

Main rotor diameter: 13.51 m (44.33 ft)
Tail rotor diameter: 2.46 m (8.15 ft)
Length overall (both rotors turning): 16.08 m (52.75 ft)
Fuselage length: 12.19 m (40.00 ft)
Height to top of rotor head: 4.58 m (15.00 ft)
Weights:
empty: 3,447 kg (7,600 lb)
max take-off: 6,124 kg (13,500 lb)
Max level speed at sea level: 138 kts (256 km/h)
Typical cruising speed: 120 kts (222 km/h)
Service ceiling: 7,285 m (23,900 ft)
Range with max standard fuel: 478 n miles (885 km)
Power plant: 2—1,285 kW (1,723 shp) General Electric T700-GE-401 turboshafts
Accommodation: Crew of 3 in ASW role (pilot, co-pilot/tactical co-ordinator, sensor operator)
Sensors: Canadian Marconi LN-66HP surveillance radar; AN/ALR-66(V)1 radar warning/ESM; Teledyne Systems AN/ASN-150 tactical management system; dual Collins AN/ARC-159(V) UHF radios; Texas Instruments AN/ASQ-81(V)2 MAD; Computing Devices AN/USY-503 acoustic processor; Flightline Electronics AN/ARR-84 sonobuoy receiver and AN/ARN-146 on-top position indicator. Tele-Dynamics AN/AKT-22(V)6 sonobuoy datalink; 15 DIFAR and DICASS sonobuoys. AN/ALE-39 chaff/flare dispensers; AN/ASQ-18B torpedo presetter
Weapons: 1/2 Mk 46 or Mk 50 torpedoes; 8 Mk 25 marine smoke markers. Provision for pintle-mounted 7.62 mm MG in both doorways

PROPULSION

Specifications
System: Gas turbine
Main machinery: 2 General Electric LM-2500 gas turbines; 30.59 MW (41,000 hp) sustained
Shafts: 1

Propeller: cp
Auxiliary propulsion units: 2 retractable props; 242 kW (325 hp) each
Ships services: 4—1,000 kW diesel generators

FURTHER INFORMATION

PROGRAMME

These were follow-on ships to the large number of frigates of the 'Garcia' and 'Knox' classes (formerly Destroyer Escorts DE) which were built for the US Navy in the 1960s and early 1970s. The lead ship, *Oliver Hazard Perry* (FFG 7), was authorised in FY73, laid down in 1975, launched in 1976 and commissioned in 1977.

The original US Navy plan was for approximately 75 ships, but this was later reduced to 50, although Congress subsequently added one further ship, *Ingraham* (FFG 61), which was commissioned in 1989.

It should be noted that US Navy hull numbers ran from FFG7 to FFG 61 (both inclusive), but excluded four numbers. This was because US hull numbers FFG 17, 18, 35 and 44 were provisionally allocated to the four ships built by the Todd yard in Seattle for the Royal Australian Navy.

The final ship in the class, *Ingraham* (FFG 61), was mandated by Congress against the navy's wishes and incorporated a variety of improved systems, many of which have since been retrofitted to earlier ships.

DESIGNATION

At the start of the programme these ships were designated 'patrol frigates' and *Perry* was initially allocated the pennant number 'PF 109'. This was, however, later changed to 'guided missile frigate (FFG)' and *Perry* was redesignated FFG 7 on 30 June 1975.

PROTECTION

These ships have considerable additional protection, with 19 mm Kevlar armour protection over vital spaces, steel armour (16 mm) over engine spaces and aluminium armour (19 mm) over magazines.

GROWTH MARGIN

The ships were designed with a growth margin of 39 tonnes, but this has proved to be a hopeless underestimate.

THE FUTURE

Under current plans 22 'Perry' class frigates will be retained in service, predominantly from the later production hulls. This will include FFG 36, 47, 48, 50-55, 57 and 59 which have had combat data and fire-control equipment retrofitted, and the last ship, *Ingraham* (FFG 61), but excluding the mine-damaged *Samuel B Roberts* (FFG 58).

RAM CIWS may be fitted in due course.

DISPOSALS

The first of this class transferred to the Naval Reserve Force on 31 January 1984, since when 15 more have transferred. Such ships have about 75 reservists (out of a total crew of 203) in their complement.

FFG 10 paid off in December 1994, followed by FFGs 16, 20, 21, 24, 26 in 1995/96, and with more to follow. This has made them available for sale or lease to foreign navies and it was originally proposed that they should go to: Bahrain — 1; Egypt — 2; Greece — 1; Oman — 1; Turkey — 3; and UAE — 2. Whether these transfers go ahead depends on the ships being made available and on the requirement being confirmed by the intended recipient. Bahrain and Greece have both declined the offer, while the UAE has opted for two ex-Dutch 'Kortenaer' class instead.

OPERATIONAL

Although built as ocean escorts, these ships have proved very valuable to the US Navy as general purpose warships; they have, for example, been deployed in the Gulf since the early 1980s and no less than 14 were present during the Gulf War.

Stark (FFG 31) was hit by two Exocet missiles in the Persian Gulf on 17 May 1987 and, although only one exploded, causing serious damage, a near-fatal list was caused by the lack of drainage facilities for the water pumped aboard rather than by direct enemy action. The ship was, however, saved and returned to operational status in August 1988. The incident gave rise to many improvements in firefighting, damage control doctrine, and the procedures and equipment needed to deal with residual missile propellant-induced fires.

On 14 April 1988, *Samuel B Roberts* (FFG 58), was mined in the Gulf, but was able to reach Bahrain using the auxiliary propulsion motor. The ship was repaired at Bath Iron Works, Bath, Maine, USA and returned to the fleet in November 1989.

Vandegrift (FFG 48) was the trials ship for the Canadair CL-227 Sea Sentinel MAVUS II unmanned rotary-wing air vehicle in 1993/94 but this programme has not been pursued.

Builder	Split SY, Yugoslavia (Croatia)
Laid down	11 May 1979
Launched	11 Oct 1980
Commissioned	31 Oct 1981

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Exocet MM 38 medium-range anti-ship missile

There are four MM 38 Exocet launcher-containers mounted aft, facing across the ship, one pair pointing to starboard the other to port. Targets are acquired by the ship's search radar and the operator then aligns the axial gyros in the target's direction and begins the initiation sequence. This involves turning on the thermal battery, releasing the mechanical safety locks, igniting the booster and, finally, breaking the umbilical cord; the total process takes some 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change of course during its flight.

The attack consists of three phases:

Cruise phase. The cruise phase starts as the missile clears the container and the missile, powered by the sustainer motor, flies towards the general location of the target at a height of about 100 m (328 ft) which is low enough to reduce the chance of detection but adequate for target acquisition. This phase can be as long as 22 km and ends when the seeker acquires the target. This seeker is a Dassault Electronique ADAC (Auto Directeur Anti-Clutter) active monopulse radar, working in the I-band (8-10 GHz), which has a typical range of 13 n miles (24 km) against FACs.

Approach phase. On detecting the target the missile descends to 9-15 m (30-50 ft) in the approach phase.

Terminal phase. During this final phase the missile descends to 8 m (26 ft) (2-5 m (6.5-16 ft) in a calm sea) for a sea-skimming run in to the target.

A salvo may be fired in 12-20 seconds.

Specifications

MM 38
Length: 5.21 m (17 ft)
Diameter: 35 cm (14 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,621 ft)
Speed: Mach 0.9
Range: 2-22.5 n miles (4-42 km)
Guidance: Inertial and active radar
Sustainer motor: SNPE Eole alloy-cased CDB; weight 151 kg (333 lb); max burn time 93 s
Booster: 100 kg SNPE Epervier boost motor, weight 100 kg, burn time of 2.4 s
Warhead: Luchaire 165 kg fragmentation warhead
Fuzes: Delayed impact fuze and autopilot-controlled proximity fuze

Manufacturer/Contractor

Aerospatiale Missiles.

TUBES

There are two 533 mm (21 in) torpedo tubes on the quarterdeck, pointing aft.

TORPEDOES

SUT anti-surface vessel/anti-submarine torpedo

SUT (Surface and Underwater Target) is a dual-purpose, electrically propelled, variable speed, wire-guided torpedo for engaging both surface and submarine targets. The wire guidance gives immunity to interference with a two-way datalink between vessel and torpedo, while the acoustic homing head has long acquisition ranges and a wide search sector for active and passive operation. On termination of wire guidance, SUT continues in operation, but now as a highly intelligent homing torpedo, with internal guidance programmes for target search, target loss and so on. The large payload with combined fuze systems ensures the optimum effect of explosive power. The SUT operates at great depths as well as in very shallow waters.

Specifications

Length: 6.15 m (20.17 ft)
Diameter: 533 mm (21 in)
Weight: 1,420 kg (3,130 lb)
Warhead: 260 kg (573 lb)
Speed: Selectable, max 35 kts
Range: >16 n miles (30 km)
Fuze: Magnetic proximity and impact

Manufacturer/Contractor

STN Atlas Elektronik, Bremen, Germany.

GUNS

Bofors SAK 57 L/70 Mk 1

The SAK 57 Mk 1 is a less sophisticated version of the more widely used Mk 2 and comprises a Bofors L/70 gun in a plastic turret. Two types of fixed 6.1 kg (20 lb) ammunition are available: one is a proximity-fuzed pre-fragmented shell for use against aerial targets; the other is a special surface target shell which penetrates the target and is detonated after a short delay.

Specifications

Calibre: 57 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,025 m/s (3,363 ft/s)
Traverse: 360° at 55°/s
Elevation: −10 to +75° at 40°/s
Crew: 5
Range: 9 n miles (17 km)
Rate of fire: 200 rds/min

Ki Hajar Dewantara *(364) was designed and built in (the then) Yugoslavia and fitted out in the Netherlands. There is a flight deck but no hangar, although the after deckhouse contains spares and safety equipment for the helicopter. Note the two 533 mm (21 in) torpedo tubes sited on the quarterdeck, which launch their torpedoes into the ship's wake* (92 Wing RAAF)

Manufacturer/Contractor
Bofors Ordnance, Sweden.

Rheinmetall Rh-202 20 mm cannon

One of the lessons of Gulf deployments is the need for a light, short-range gun. Therefore, the Type 123 ships mount two Rheinmetall Rh-202 20 mm cannon, which were taken from decommissioned Klasse 520 landing craft. These are mounted in the bridge wings, abaft the target designation sights.

Specifications
Calibre: 20 mm
Length of barrel: 85 calibres
Muzzle velocity: 1,050-1,250 m/s (3,297-4,101 ft/s)
Traverse: 360°
Elevation: −10 to +55°
Crew: 1-2
Range: 1 n mile (2,000 m)
Rate of fire: 800-1,000 rds/min

Manufacturer/Contractor
Rheinmetall, Germany.

DEPTH CHARGES

There is one projector/mortar.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Susie-1 radar intercept

Susie is a Thorn EMI ESM system covering the frequency range 2-18 GHz and Susie-1 is a version specifically designed for small warships. The system intercepts radar transmissions, analyses them and then displays relevant parameters including: bearing; frequency; pulse repetition frequency (PRF); pulsewidth; and signal strength.

Manufacturer/Contractor
Thorn EMI, UK.

DECOYS

There are two 128 mm twin-tubed flare launchers.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEM

SEWACO-RI action data automation/ Daisy data processing

SEWACO-RI (RI = Republik Indonesia) was specifically assembled for Indonesian use and is based on an expansion of the WM28 weapons control system.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

WEAPONS CONTROL

Signaal WM28/61

This ship is fitted with the Signaal WM28/61 fire-control system. Like other members of the WM20 family, WM28 radar has two antennas sharing a common, stabilised mounting and housed in a distinctive, egg-shaped radome — the famous 'Signaal egg' — which is located on top of the prominent, open-work mast. The stabilisation system permits operation at roll angles of ±30° and pitch angles of ±10°. The upper antenna, which is of the cassegrain type, is used for searching as well as for automatic tracking of surface targets for weapon control. The lower antenna is of the paraboloid segment type with horn feed and is used for tracking air targets and for controlling air defence weapons. The antennas are fed from a common I/J-band transmitter but during surveillance all the transmitter output is channelled to the search antenna.

Peak pulse power is 180 kW and output power is shared by waveguide switching. The search radar has a range of between 30 and 32 km against surface targets and 7,600 m (24,936 ft) against air targets, while the tracker has a range of about 29 km. With the larger search antenna the search radar is increased to about 46 km. The tracker is capable of monitoring the movement of aircraft with a 1 m² cross-section at velocities up to 900 m/s (2,953 ft/s) and similar size objects moving at or near the surface at maximum velocities of between 34 and 55 m/s (111 and 180 ft/s).

The computer, controls and displays are in a two- or three-man console which includes firing pedals. The consoles feature a small PPI display, an A-scope to present data on the tracking radar and shell splashes and a B-scope for presenting search radar video and the predicted hitting point. The PPI display has range scales of 10, 30 and 60 km. The console also has an alphanumeric display capable of presenting 16 lines, each of 32 characters.

WM28/61 (the suffix '61' denotes that it uses the SMR-MU computer) is a weapon control system for ships up to destroyer size to control light- or medium-calibre guns and an ASV missile using semi-active guidance. It can engage either an air or a surface target with the gun and a surface target with the missile system.

The radar can automatically track one air and one surface target simultaneously. For use with the missile the air target tracking antenna is slaved to the surface target tracking programme and linked with a CW transmitter in order to illuminate the target. It can control a second light- or medium-calibre gun for engaging an air and/or surface target.

The system can track automatically an air and/or two surface targets.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

RADARS

Set	WM 28	AC 1229*
Company	Signaal	Racal-Decca
Role	Fire control (SSM/127 mm gun)	Navigation
Band	I/J	I/J
Beam	1.5 × 4/7° (search) 2.4° (track)	1.3 × 30°
Peak power	200 kW	25 kW
Gain	33.5 dB	30 dB
Pulsewidth	0.22/4.5 µs	0.05/0.25/1.0 µs
PRF	3,600/1,800 pps	1,300/650 pps
Scan rate	60 rpm	25 rpm
Range	25 n miles (46 km)	—

Notes
* AC = Anti-Collision

SONAR

Signaal PHS-32 hull-mounted search and attack sonar system

PHS-32 is a medium-range, high-performance search and attack sonar which includes signal processing facilities for fast Fourier transformation processing of all preformed beam receiving channels. All data are presented on a single TV-type display, while operation has been much simplified by the use of light pen control. The system can track up to four targets automatically. A circular transducer permits all-round coverage in various modes of transmission such as: Omni, TRDT, MCC (wide vertical beam), LISTEN (passive with time/bearing recorder presentation). An audio beam is also available.

Specifications

Frequencies: 3
Pulse lengths: 12.5, 25, 50, 100 ms and 400 ms long pulse (CW or FM)
Detection range: >10,000 yd
Vertical beamwidth: 12 or 20°
Bearing accuracy: 1° RMS
Range accuracy: ±0.5-2%
Notch filtering: Selectable rejection bandwidth
Own Doppler correction: On all 60 channels
Roll and pitch performance: Automatic co-ordination of transmitting pulse and vertical beamwidth in rough weather

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

AVIATION

AVIATION FACILITIES

Flight deck: 15.4 × 11.2 m (50 × 36 ft)
Hangar: There is no hangar, but a small deckhouse at the forward end of the flight deck would appear to offer maintenance facilities

HELICOPTERS

The helicopter normally carried is the Nurtanio-built version of the Eurocopter BO-105.

Specifications

Dimensions
main rotor diameter: 9.84 m (32.28 ft)
tail rotor diameter: 1.90 m (6.23 ft)
length including rotors: 11.86 m (38.91 ft)
height to top of main rotor head: 3.02 m (9.91 ft)
Weights
empty, basic: 1,301 kg (2,868 lb)
max take-off: 2,500 kg (5,511 lb)
Performance (at max T-O weight):
never-exceed speed (VNE) (sea level): 131 kts (242 km/h)
max cruising speed (sea level): 129 kts (240 km/h)
best range speed (sea level): 110 kts (204 km/h)
max rate of climb: 444 m (1,457 ft)/min
range (sea level): 300 n miles (555 km)
endurance (standard fuel/max payload): 3 h 24 min
Power plant: 2–313 kW (420 shp) Allison 250-C20B turboshafts, each with a max continuous rating of 298 kW (400 shp)
Accommodation: 5 (pilot, co-pilot/passenger, three passengers)

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 1 Rolls-Royce Olympus TM3B gas turbine; 18.3 MW (24,525 hp) sustained; 2 MTU 16V 956 TB92 diesels, 8.14 MW (11070 hp(m)) sustained
Shafts: 2
Propellers: cp

FURTHER INFORMATION

PROGRAMME

This ship was built as a training ship and can carry 14 instructors and 100 cadets. It does, however, have a potential combat role in a local conflict.

The ship was ordered on 14 March 1978 from Split shipyard in the former Yugoslavia, where the hull was built and engines fitted. The armament and electronics were subsequently fitted in the Netherlands and Indonesia.

The design is closely related to that of the Iraqi ship *Ibn Majid,* which was built at the same yard. There were reports in the early 1980s that a second unit had been ordered in 1983, but no such ship has been built.

DESIGN

There is a general purpose classroom together with specialised training rooms for navigation and radio training, and an additional wheelhouse.

Armament includes four MM 38 Exocet, one 57 mm Bofors gun, two 20 mm cannon, two 533 mm torpedo tubes and a helicopter, which give the ship a useful combat capability.

DEPLOYMENT

Aside from its primary use as a training ship, *Hajar Dewantara* is also used in peacetime as a troop transport, a valuable role in the Indonesian archipelago. War roles include convoy escort, anti-submarine warfare and troop transport.

Ki Hajar Dewantara *(364). The shipyard at Split in Croatia, which built this ship has achieved a number of export sales over the past 20 years* (Vic Jeffrey RAN)

CORVETTES

DJEBEL CHINOISE

WEAPONS SYSTEMS

GUNS

OTOBREDA 76 mm (3 in)/62 Compact (fitted for but not with)

It is intended to mount an OTOBREDA 76 mm/62 Compact gun on the foredeck. The fittings for both the gun and an optronic director are already built in, but the guns are not yet installed.

Specifications
Elevation: −15 to +85° at 45°/s
Traverse: 360° at 70°/s
Weight (unloaded): 7.5 t
Muzzle velocity: 925 m/s (3,034 ft/s)
Rate of fire: 10-85 rds/min
Range: 8.6 n miles (16 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

OTOBREDA 40 mm/70

It is also intended to mount a single twin OTOBREDA Fast Forty mounting on the quarterdeck, but this too, has yet to be installed.

The Fast Forty is designed for use against manned aircraft and small ships but possesses an anti-missile capability and is marketed as a Close In Weapon System (CIWS).

Specifications
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,025 m/s (3,362 ft/s) (PFHE), 1,350 m/s (4,429 ft/s) (APFSDS)
Traverse: Unlimited at 90°/s
Elevation: −13 to +85° at 60°/s (Twin)
Range: 6.75 n miles (12.5 km) surface/surface, 8,700 m (AA) (28,500 ft)
Rate of fire: 900 rds/min
Ammunition: 2.4 kg (5.3 lb) (PFHE), 2.5 kg (5.5 lb) (APFSDS)
Power requirements: 400 V, 60 Hz, three phase; 115 V, 400 Hz, one phase
Power consumption: 13 kW (peak)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

23 mm ZU-23-2 (2 twin)

There are two twin ZU-23-2 mounts side-by-side on the after superstructure.
Note: These are the only weapons currently installed.

Specifications
Calibre: 23 mm
Length of barrel: 87 calibres
Traverse: 360°
Elevation: −10 to +90°
Rate of fire: 200 rds/min/barrel
Range:
anti-surface: 1.1 n mile (2 km)
anti-air: 1,500 m (4,920 ft)

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Electro-optic director

There is space for an electro-optic director for the 76 mm gun on the bridge roof, but this is not currently fitted.

RADARS

Racal-Decca 1226

I-band surface search radar.

PROPULSION

Specifications
System: Diesel
Main machinery: 3 MTU 20V538 TB92, 9.4 MW (12,800 hp)
Shafts: 3

FURTHER INFORMATION

PROGRAMME

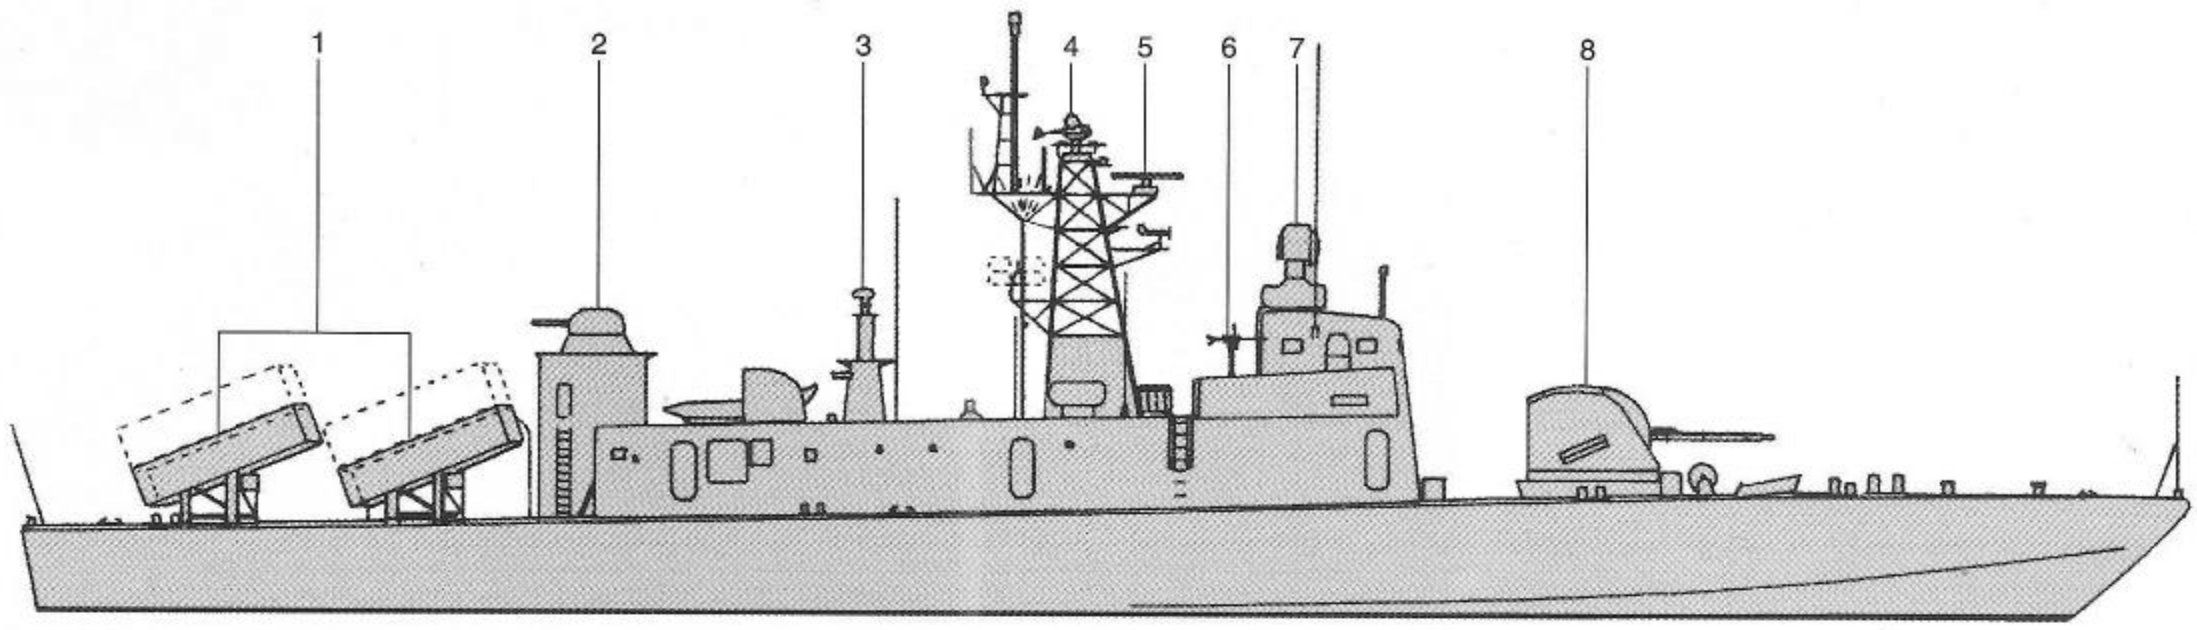
Project 802 is a class of corvette being built with assistance and advice from Bulgarian experts. The first warships ever to be constructed in Algeria, the programme has been affected by a combination of shipbuilding inexperience and shortage of funds. The three ships were ordered in July 1983 and the first of class was launched in 1985 and commissioned in 1988. The second was launched in 1990, but fitting-out work was suspended in 1992 due to shipyard debt problems, although the ship has subsequently been completed. The third of class is currently being held up by shipyard funding problems. The main armament was due to be fitted to the first two ships in 1996.

DESIGN

There are suggestions that the design may have been prepared by Bulgarian shipyards.

El Chihab *(352), the second of these Algerian-built ships. The armament is being slowly completed: the stern-mounted OTOBREDA 40 mm has recently been installed, but the planned 76 mm gun has yet to be acquired* (Diego Quevedo)

KRALJ (TYPE 400)



Kralj (Ian Sturton)
1 *CelsiusTech RBS 15 anti-ship missiles (four/eight)* **2** *AK-630 six-barrel 30 mm CIWS* **3** *CelsiusTech 9LV 249 Mk 2 director* **4** *Racal BT 502 surface search radar* **5** *Racal 1290A navigation radar* **6** *Oerlikon 20 mm or 12.7 mm machine guns* **7** *CelsiusTech 9LV 249 Mk 2 director* **8** *Bofors single 57 mm SAK 57*

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Saab RBS-15M

The 'Kralj' class carries either four or eight Saab RBS-15M anti-ship missiles, but where eight are mounted, the mine rails must be removed. The RBS-15M missile system features inertial guidance and active radar homing to 37.8 n miles (70 km) at Mach 0.8. In the missile's nose is the CelsiusTech 9GR400 monopulse J-band (12-18 GHz) seeker. The broad band, frequency-agile radar with its digital processing is claimed to provide a high-Electronic Counter-Counter-Measures (ECCM) performance. The seeker has two modes which may be selected by the operator; active or active-passive lock on.

The ship system is operated by one man and consists of control and display panels, a computer, launcher switching units and power supply.

The system receives data from ship sensors, ship fire-control system or from external sensors on land, sea or air. The fire-control panel and the computer are in the ship's combat information centre.

There are three modes of operation; test, simulation and combat. The combat mode has preparation and firing submodes with the former offering automatic and/or manual selection of target data, missile readiness, tactical parameters and salvo numbers. The tactical parameters' data include seeker search pattern, target selection logic and trajectory. There is a separate selection of the distance the missile will travel in the high-level cruise phase. Using this and other data the system calculates missile heading, seeker parameters, tactical boundaries and the time to the point when the missile will enter the low-level cruise phase.

The firing sub-mode is initiated manually but the selected missiles are automatically activated and their container doors are automatically opened. The system compensates for ship motion and ignites the boost motors which burn for approximately three seconds before being jettisoned. As the missile reaches its maximum altitude the turbojet is activated and the missile turns towards the target, the maximum offset being about 90°. It then enters a predetermined high-level cruise phase, which allows it to overfly islands, then descends to the low-level cruise phase.

At an appropriate distance from the target the seeker is activated and the predetermined search pattern is adopted. Once the seeker has locked on to the target the missile can then enter its terminal sea-skimming phase.

Specifications

Length: 4.33 m (14.2 ft)
Diameter: 50 cm (19.7 in)
Wing span: 1.4 m (4.6 ft) (unfolded)
Weight (without boosters): 626 kg (1,380 lb)
Speed: In excess of Mach 0.8
Range: In excess of 38 n miles (70 km)
Warhead: 200 kg (441 lb) HE (blast fragmentation)

Manufacturer/Contractor

Saab Dynamics AB, Sweden.

GUNS

Bofors SAK 57 L/70 Mk 1

There is a single Bofors SAK 57 L/70 Mk 1 in 'A' position. This is intended to engage air and surface targets and to provide gunfire in support of troops ashore. It is housed inside a GRP shield.

Specifications

Calibre: 57 mm
Length of barrel: 70 calibres
Traverse: 360° at 55°/s
Elevation: −10 to +77° at 40°/s
Crew: 3
Range: 9 n miles (17 km)
Rate of fire: 220 rds/min
Projectile weight: 2.4 kg (5.3 lb)

Manufacturer/Contractor

Bofors Ordnance, Sweden.

AK-630 30 mm CIWS

One AK-630 30 mm six-barrel CIWS is mounted on a small tower at the aft end of the superstructure.

Specifications

Calibre: 30 mm
Length of barrel: 65 calibres
Muzzle velocity: 890 m/s (2,920 ft/s)
Traverse: 360° (depending on location of turret) at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range:
radar fire control: 4,000 m (4,400 yd
electro-optic fire control: 5,000 m (5,470 yd)
Rate of fire: 4,000-5,000 rds/min
Ammunition:
round: 1,224 kg (2.7 lb)
projectile weight: `UOF-84 384 g (13.68 oz); UOR-84; 388 g (13.69 oz)

Oerlikon 20 mm or 2-12.7 mm MGs

These ships are reported to mount either two Oerlikon 20 mm guns or two M2HB 12.7 mm (0.50 in) machine guns (although there seems no reason why they should not mount both types of weapon).

Specifications

	Oerlikon 20 mm	M2HB
Calibre	20 mm	12.7 mm
Length of barrel	70 calibres	—
Muzzle velocity	835 m/s (2,739 ft/s)	883 m/s (2,900 ft/s)
Range		
anti-surface	1,500 m (1,640 yd)	6,700 m (7,400 yd)
anti-air	1,150 m (3,800 ft)	1,380 m (4,500 ft)
Rate of fire	450 rds/min	450-550 rds/min
Elevation	−15 to + 55°	depends on mount

MINES

AIM-70 mine

Up to four AIM-70 (Acoustic-Induction Mine) can be carried. This bottom mine is effective against warships of up to 5,000 tonne displacement and merchant ships up to 20,000 tonnes and contains 700 kg (1,543 lb) of explosive.

SAG-1 mine

Alternatively, up to six SAG-1 mines can be carried. This is believed to be a Yugoslav-produced contact mine, which can be laid at depths of up to 106 m (350 ft).

Kralj Petar Kresimir IV *(RT 11)* (L Poggiali)

ELECTRONIC WARFARE SYSTEMS

DECOYS

ML Aviation Barricade countermeasures system

Barricade launchers are mounted in these ships to provide them with the means of deploying chaff and infra-red (IR) decoys to counter missile attacks, using a layered defence against the various types of anti-ship missile. The system uses a 102 mm rocket and a launcher with four sets of triple-cell launchers. The ammunition lockers each contain 24 rockets. There are four decoy modes:

- confusion, in which long-range (Stockade) rockets are fired to confuse enemy search radar and make target selection difficult
- distraction, in which medium-range chaff and/or infra-red rockets are fired in a pattern of six around the ship to present alternative targets to missiles during their search phase, affording defence against multiple missiles coming from different directions
- dump is used where a missile has locked on to the ship. The ship uses a jammer to remove the missile's range gate and then fires a single rocket to produce a chaff cloud on which the gate may be 'dumped', thus allowing the jammer to be redeployed.
- centroid, is a close-range, final defence mode, used against single missiles. If the incoming missile is locked on to the ship, a pattern of short-range chaff and/or IR rockets is fired to create a large alternative target close to the ship, which manoeuvres away, leaving the missile to home on to the decoy.

Manufacturer/Contractor

ML Wallop Defence Systems, Andover, Hampshire, UK.

COMMAND AND CONTROL SYSTEMS

CelsiusTech 9LV 249 Mk2

The basic 9LV 200 system is an air defence (LV = *Luftvarn* (anti-aircraft)) fire-control system for small warships controlling dual-purpose guns from 40 mm to 120 mm calibre, but has been extended to the surface engagement role using anti-ship missiles or wire-guided torpedoes. The system can direct one or more guns against one or more targets simultaneously. The 9LV 200 family has a mainframe architecture, using the Philips P800 series of minicomputers. A typical 9LV 200 installation features a tactical display, two gun control consoles (with primary air defence and surface engagement roles respectively), two optical target designators and a wind sensor.

Manufacturer/Contractor

CelsiusTech, Sweden.

RADARS

Racal BT-502

The BT-502 is an E/F-band surface search radar.

Racal 1290A

The 1290A is an I-band navigation radar.

SONARS

RIZ PP10M

This is either a Russian or Yugoslav hull-mounted, active search, high-frequency sonar.

PROPULSION

Specifications

System: Diesel

Main machinery: 3 M504B-2 diesels, 9.2 MW (12,500 hp)

Shafts: 3

FURTHER INFORMATION

PROGRAMME

The building of this class (formerly called the 'Kobra' class) was officially announced as 'suspended' in 1989 but was restarted in 1991 and the first of class was commissioned in 1992. Progress on the second of class is equally slow. Projected numbers are uncertain after the first two. Designated as a *Raketna Topovnajaca* (Missile Gunboat).

DESIGN

This design has been derived from that of the 'Koncar' class fast attack craft, six of which were built at the same yard in the 1970s. The 'Koncar' class was designed by the Naval Shipping Institute at Zagreb and was based on the Swedish 'Spica' design. The Kralj design has a stretched hull (it is actually 8.6 m (28.2 ft) longer) with a greater spacing between the ribs. There is also a new superstructure. The principle weapons are the anti-ship Saab RBS-15 missiles, which were originally acquired for use by Yugoslav coastal defence batteries.

The original 'Koncar' class carried two SS-N-2B Styx missiles on the stern and the Kralj, as currently configured, carries four Saab RBS-15 launchers, plus two mine rails. It is intended, however, to mount eight missiles, in which case, the mine rails will be removed.

OPERATIONAL

Kralj Petar Kresimir IV was reported to be damaged as a result of a missile explosion during ammunition loading in July 1993. This had, however, been repaired by October 1994 when the ship carried out a live SSM firing. It is of interest that the missile that blew up was reported to be an SA-N-5, a type not normally listed as part of the ship's weapons fit.

Kralj Petar Kresimir IV is normally based at Sibenik.

STANDARD FLEX 300

OVERVIEW

The Royal Danish Navy's (RDanN) Standard Flex 300 represents a unique response to modern naval requirements. The situation in which the RDanN found itself in 1982 was that 22 old ships would have to be replaced at the end of the decade: eight US 'Bluebird' class coastal minesweepers, six 'Soloven' class light torpedo boats and eight 'Daphne' class patrol boats. One-for-one replacement would have been prohibitively expensive and so a novel concept was evolved in which a basic ship platform would be designed, with exchangeable weapon and electronic modules to enable it to be configured to meet a variety of missions. The outcome was a set of principles:

- A common basic ship platform.
- Closely defined roles to enable the containers to be designed.
- A series of containerised modules, requiring the shortest possible role-changing time.
- The ship command team to be assembled in one room.
- A distributed command and control system (a prerequisite for the quick exhange of modules).
- An operator's standard workstation.
- Reduced crew.
- Reduced onboard maintenance.
- Reduced life-cycle costs.

The standard console of the Standard Flex C³I system. The number of positions varies between three and six depending on the role. The system is based on an Ethernet (IEEE 802.3) duplicated databus, with intelligent modes serving as subsystem gateways. All software is written in Ada and there are now some 1.5 million source lines of codes (RDanN)

Ship platform

The ship platform has a full load displacement of 450 tonnes and is constructed using the Glass Fibre-Reinforced Plastic Sandwich (GRP-sandwich) method, in which PVC cellular core plates are laminated on both sides with several layers of glass fibre mats wetted with polyester resin. In combination with decks and bulkheads, this produces a very rigid shell, with good thermal insulation, and which is 20 per cent lighter than a traditional steel ship of the same size.

The platform includes all the services common to all roles, such as propulsion, machinery control, surveillance radar and gunfire-control system. There are also four container positions for the special-role modules: one on the foredeck and three aft.

Containers

The containers, which are constructed of Non-Magnetic Stainless Steel, are 3.5 × 3.0 × 2.5 m (11.5 × 9.8 × 8.2 ft) in size and have two sets of standard interfaces for the supply of power, video, LAN, intercom, fire warning, Halon supply, degaussing, and fresh- and seawater supplies. There are two types of container. The gun is fitted to an open-sided container, while most other modules are fitted into a closed container. There is also a simple deck plate to cover the hole if no container is fitted. The containers all have standard lifting attachments and have a precision-machined flange to ensure accurate alignment when bolted to the corresponding deck flange.

Additional items

In addition to the containers, there are a number of other items which are part of the overall system:

- Mine rails for use in the minelaying role.
- Surface Auxiliary Vessel (SAV) for use in the MCMV role.
- Mine destruction vehicle, also for use in the MCMV role.
- Rigid inflatable boat (RIB).

Role changing

It takes less than 12 hours to change roles, using a dockside mobile or stationary crane. This time includes: exchanging the necessary containers; off-loading unwanted supplies, ammunition and missiles

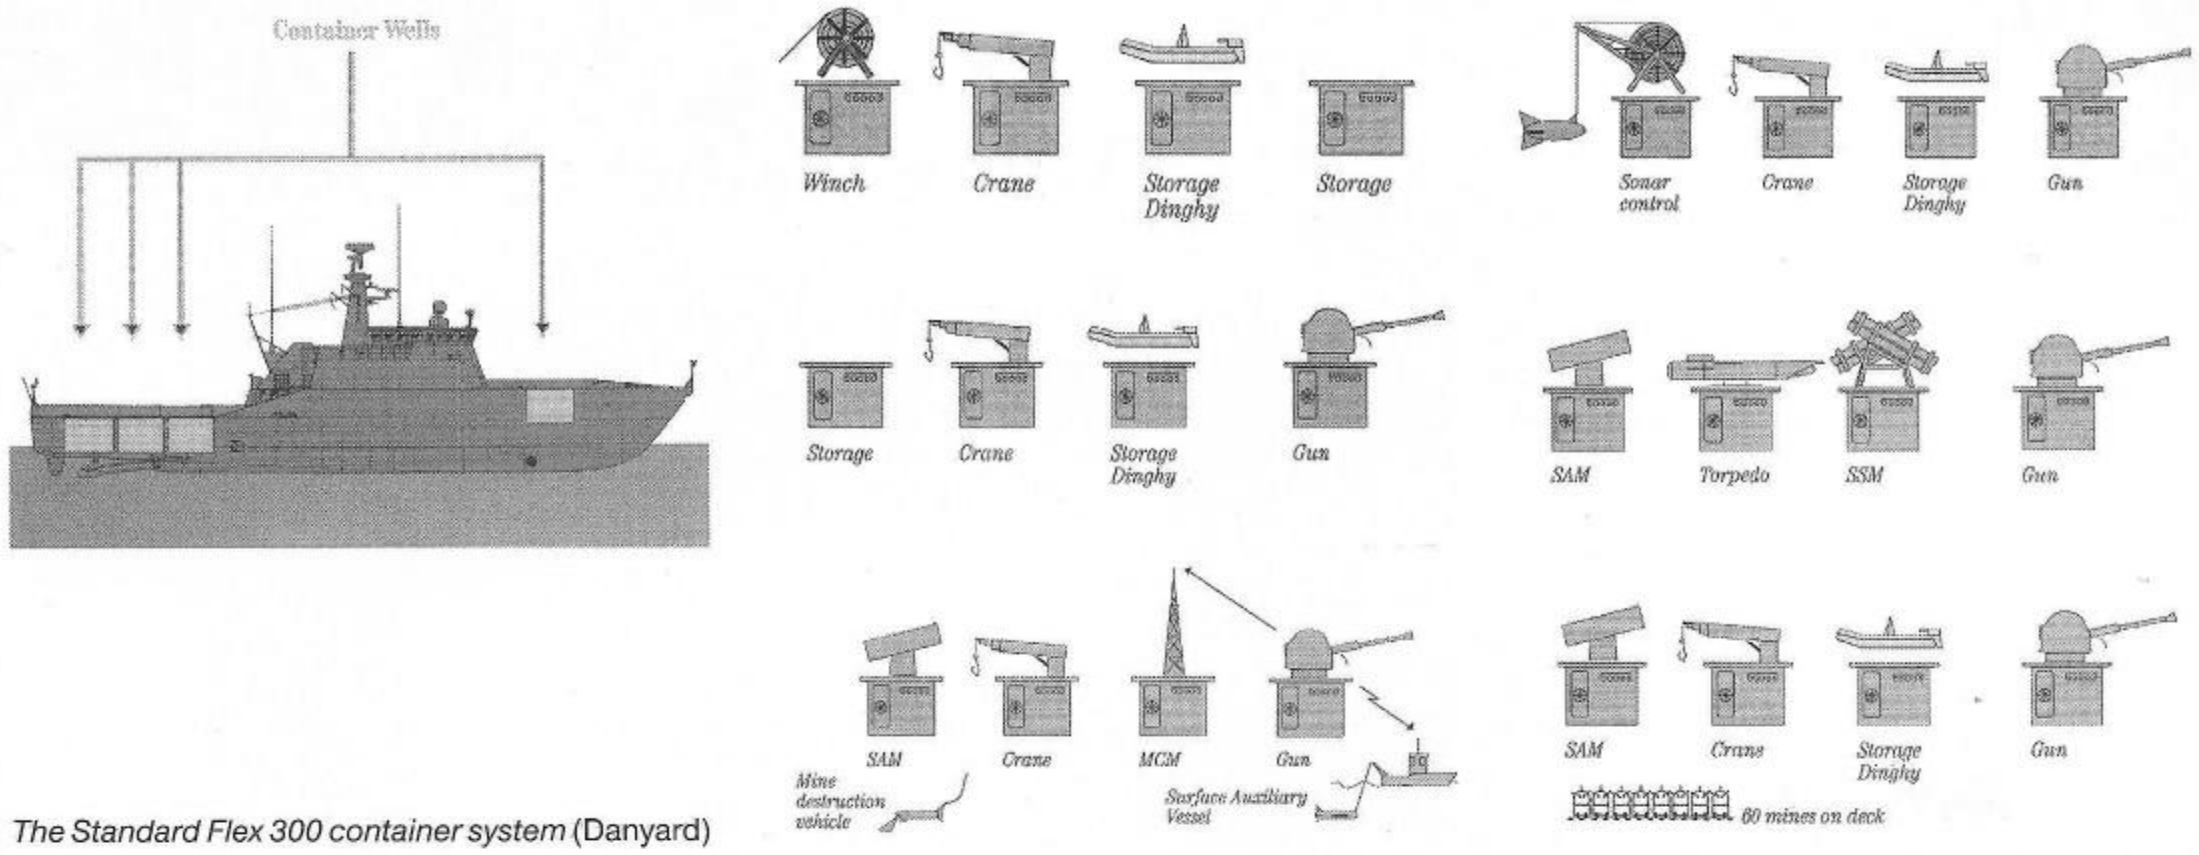
D

The variety of roles which can be fulfilled by the STANFLEX 300 system: **A** Makrelen *(P 544), fitted as a hydrographic survey vessel with 76 mm gun, crane module and an ISO-containerised survey/communications unit* **B** Flyvefisken *(P 550) as a patrol ship with a gun, crane module and RIB* **C** Hajen *(P 551) in the surface warfare role, with 76 mm gun, a full outfit of eight Harpoon anti-ship missiles and a crane. The intended Sea Sparrow SAM modules have yet to be procured* **D** Støren *(P 555) in the ASW role with gun, crane and VDS* (All pictures RDanN via Hans Harboe-Hansen)



The Standard Flex 300 container system (Danyard)

and restocking with those necessary for the new role; inputting the necessary new system software; and pre-sailing checks.

Roles

The current ships and containers are designed to fulfil seven major roles:

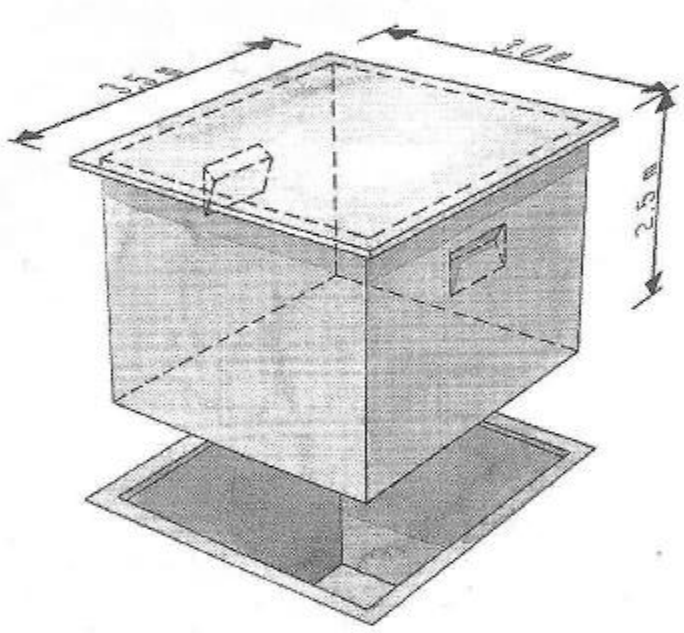
- Anti-surface warfare.
- Minelaying.
- Mine countermeasures.
- Surveillance (for example, EEZ patrols).
- Mine countermeasures (MCM).
- Anti-submarine warfare.
- Anti-pollution.

Coverage

The combat unit and ASW unit are described below, while the MCMV and minelaying versions are described in the relevant sections elsewhere in this volume.

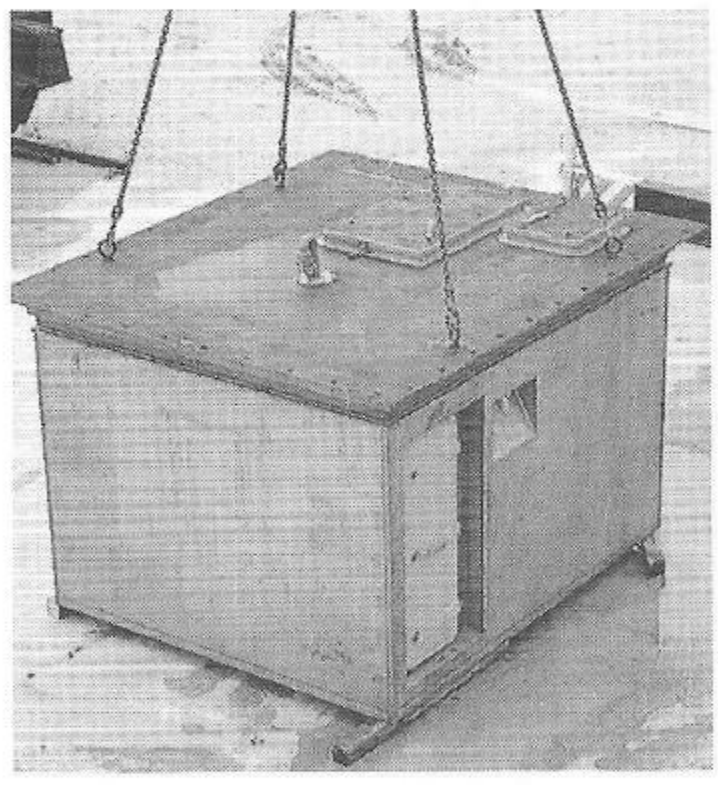
Current position

With the commissioning of the fourteenth ship in May 1996, platform procurement came to an end but module procurement continues. DKr276 million (US$47 million) have recently been released for MCM systems numbers four and five, while other equipments such as Vertical Launch Sea Sparrow Harpoon and ASW systems remain in the plan.



A

B

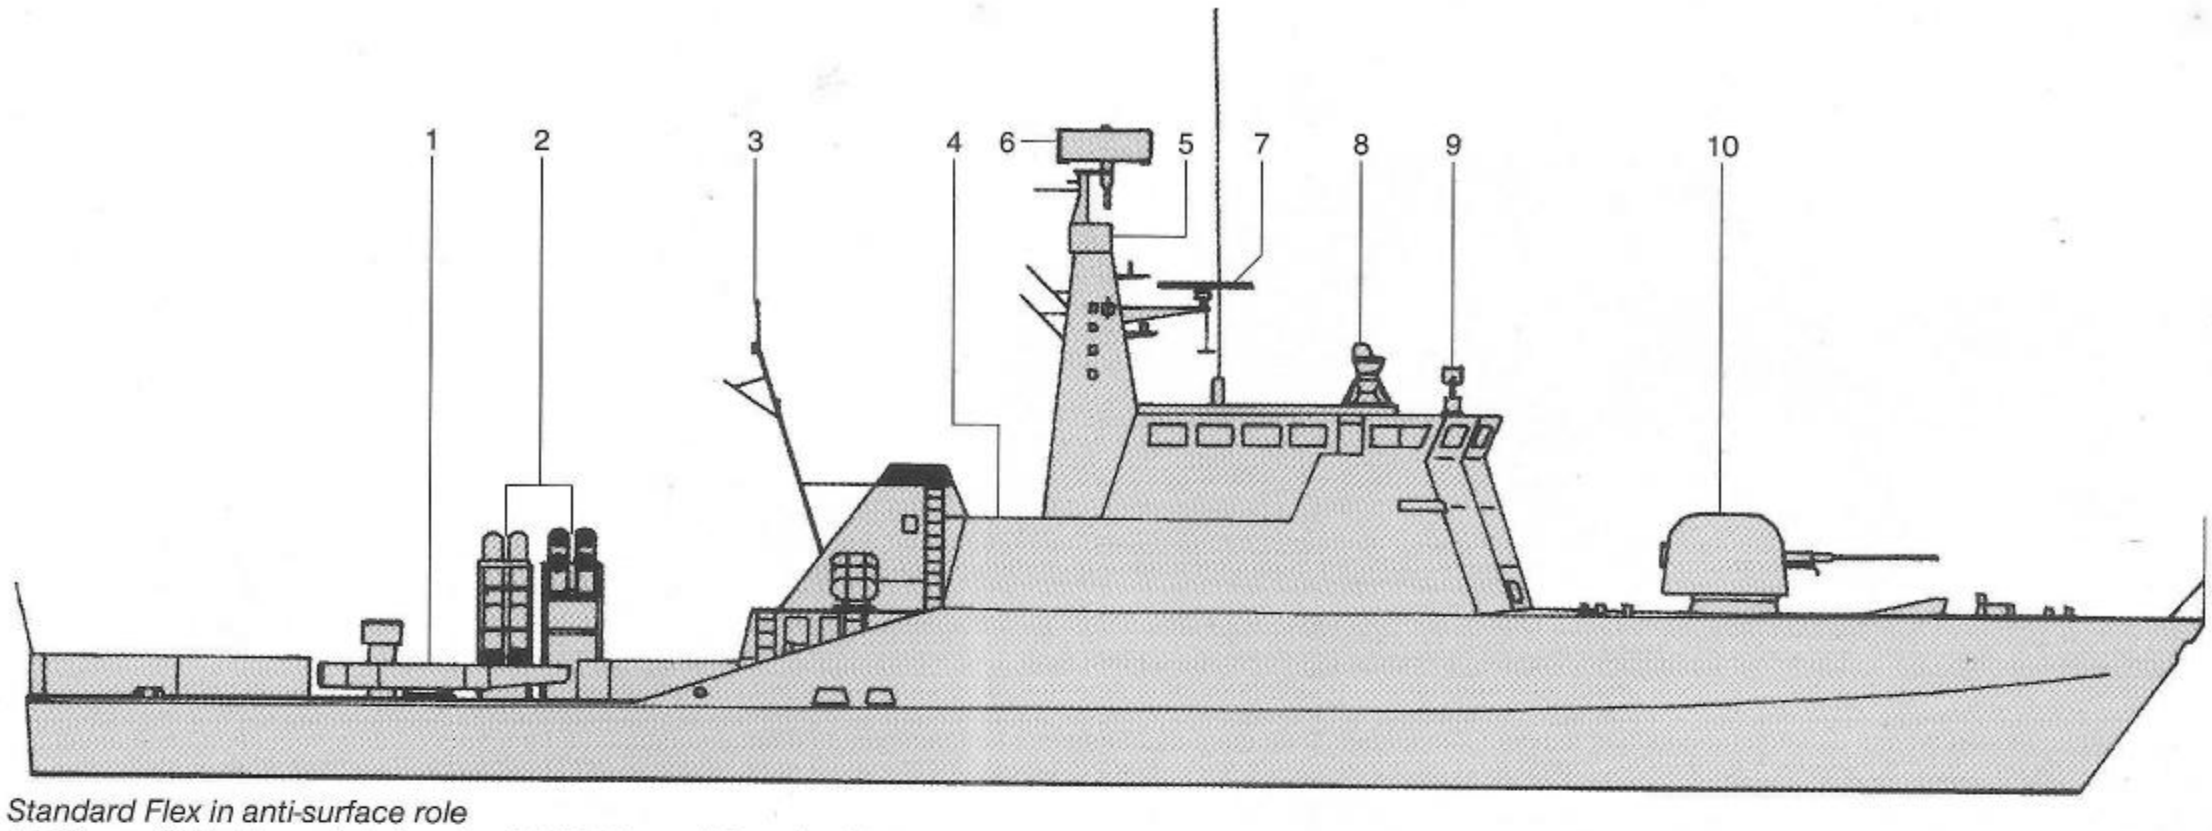


C

D

Containers **A** *have standard measurements and are either open-sided* **B** *or closed* **C** *. There is also a simple deckplate if no containers are being used. Containers are changed using mobile cranes* **D** *and static cranes; it takes under an hour to change each container and the entire platform can be reroled and tested in less than 12 hours* (Danyard)

FLYVEFISKEN (STANFLEX 300)



Standard Flex in anti-surface role
1 *533 mm (21 in) torpedo tubes (two)* **2** *McDonnell Douglas Harpoon anti-ship missiles (eight)* **3** *Radio antennas* **4** *Thorn EMI Sea Gnat decoy launcher* **5** *Racal Sabre ESM* **6** *AEG-Telefunken TRS-3D air/surface search* **7** *Terma Pilot navigation radar* **8** *Electro-optic fire director* **9** *Searchlight* **10** *OTOBREDA 76 mm (3 in)/62 Super Rapid automatic gun*

GENERAL SPECIFICATIONS

Operator: Denmark
Type: Stanflex 300

Class: FLYVEFISKEN

Built: 14
Active: 14
Building: 0

Displacement:
light: 320 t
full load: 450 t

Dimensions
Length: 54 m (177.2 ft)
Beam: 9 m (29.5 ft)
Draught: 2.5 m (8.2 ft)

Speed: 30 kts (20 on diesels, 10 on hydraulic propulsion)
Range: 2,400 n miles at 18 kts

Complement: 19 to 29, depending on role (4 officers)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas Harpoon

A total of eight Harpoon active radar homing anti-ship missiles is fitted on the 'Flyvefisken' class when in attack mode. Internally, the Harpoon is divided into guidance, warhead, propulsion and control sections and an integral booster. The guidance compartment has the Texas Instruments PR-53/DSQ-28 J-band active radar seeker with flat, phased-array antenna which may be rotated 90°. Behind it is the mid-course guidance unit which includes a Lear Siegler three-axis attitude reference platform and an IBM 4PiSP-OA 16-bit digital computer which acts as the autopilot. The Honeywell or Kollsman AN/APN-194 radar altimeter has a transmitter antenna in this compartment and a receiver antenna in the warhead compartment. The Block 1B system, introduced in 1982, featured improved ECCM performance while in the Block 1C, introduced in 1985, there were a number of improvements to the range, fuze and seeker. The sea-skimming performance was improved, the missile was capable of an indirect approach to the target by means of way points and the seeker had enhanced ECCM performance.

The Mk 141 launcher, fitted to the 'Flyvefisken' class, features shock resistant and thick wall assemblies which are usually used in larger vessels. Each has a support structure while the front ends of the launcher tubes are held by a clamp frame assembly. The central and rear ends are held by stacking frames with the thick wall assemblies providing armour protection for the missiles against fragments.

After the missile is launched and the booster carries it to an altitude of 430 m (1,410 ft), the turbojet is activated and the booster is jettisoned. The missile may be launched to engage targets at 180° to the platform's course.

In the Block 1A and Block 1B the missile then descends to its cruising altitude and, at a point preset by the launch platform, activates its seeker to acquire and designate the target. The Harpoon can fly one of

Glenten *(P 557) in the anti-surface role. Note that only four Harpoons are fitted and the Sea Sparrow module is not fitted at all* (Sovuernets Materielkommands via Hans Harboe-Hansen)

three fixed patterns (large, medium and small) or one variable search pattern. In the terminal phase the Block 1A missiles would then climb suddenly at a distance of about 0.9 n miles (1.8 km) from the target to make a 30° dive attack upon the target. The seeker is believed to optimise the horizontal radar cross-section but is adjustable. In both systems this terminal phase is an option and sea-skimming is the other option. The Block 1C has a similar performance to the Block 1B but has a number of additional options. It can fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses and it can approach the target indirectly by means of a preselected waypoint (the missile being capable of three waypoint course changes with turns greater than 15°). Approaching the target, it can use selectable seeker search expansion patterns and for the terminal phase it has the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
(Block 1A-C)
Length:
with booster: 4.63 m (15.2 ft)
without booster: 3.84 m (12.6 ft)
Diameter: 34 cm (13.3 in)
Wing span: 83 cm (32.6 in)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 50 n miles (92 km) (1A/B); 67 n miles (124 km) (1C)
Warhead: 221.6 kg (488.5 lb)
Guidance: Inertial and active radar

Manufacturer/Contractor
McDonnell Douglas, USA.

SURFACE-TO-AIR MISSILES (SAM)

Mk 48 Mod 3 launcher for Sea Sparrow
The Mk 48 system is designed to provide hemispheric coverage, a higher rate of sustained fire power and increased reliability in a flexible, modular system which requires lower manning levels. However, there is no provision for underway replenishment.

The system consists of a number of Mk 164 vertical launcher groups with launcher canisters, a Mk 220 missile launch controller and a Mk 63 Shipboard Mounting Interface-Electrical (SMI-E). The system prime contractor is Raytheon with the SMI-E provided by Denmark's NEA-Lindberg. The Shipboard Mounting Interface-Mechanical (SMI-M) is provided by Canada's EBCO, the Mk 20 canister by Belgium's Bronswerk and the Mk 220 missile launch controller by the Netherland's MBLE.

The Mk 164 launcher group consists of pairs of aluminium honeycomb launcher canisters, each 3.97 m (13 ft) long, attached to an aluminium framework. Each container has its own efflux system. The Mod 3 system consists of an in-decks module of six canisters with the six efflux pipes in a line between them.

There is one Mk 220 launch-controller for every 16 missiles. This deck-mounted system weighs 374 kg (824.5 lb) and is 61 × 101.6 × 132 cm (2 × 3.3 × 4.3 ft) (width × depth × height). There is one bulkhead-mounted Mk 62 SMI-E for every four missiles. It weighs 109 kg (240 lb) and is 68.5 × 45.72 × 91.44 cm (2.2 × 1.5 × 3 ft) (width × depth × height).

Specifications
Mod 3 launcher
Length: 4.95 m (16.2 ft)
Width: 3.76 m (12.3 ft)
Depth: 2.84 m (9.3 ft)
Weight:
above deck: 7.956 t
below deck: 340 kg (749.5 lb)

Manufacturer/Contractor
Raytheon Company, Equipment Division, US (prime).

Sea Sparrow missile
The following description is of the latest production version of the missile, RIM-7P, which is typical of all production Sea Sparrows. The missile has a slim cylindrical body with pointed nose, and clipped delta planform wings midway along the body in a cruciform configuration. The wings, made by Titech Inc, have hinge fairings halfway along their length to allow them to fold. Four smaller clipped delta planform fins are at the end of the body.

In the front of the body is the guidance and control section which includes a Raytheon inverse monopulse semi-active radar seeker with a digital computer. Elements of the seeker are made by Trak, Microsonics and M/A Com while the computer is reprogrammable to enable the missile to operate in changing ECM conditions. The computer provides the missile with both a proportional navigation capability as well as a substantial improvement in seeker performance allowing sea-skimming targets to be detected in conditions of heavy clutter.

Behind the control and guidance section is the warhead which ends at the wing's leading edge. The 38.6 kg (85 lb) WAU-17/B blast fragmentation warhead is manufactured by the Naval Weapons Center, Crane, and uses a dual-purpose proximity impact fuze. Behind the warhead is the hydraulic actuation system with Eagle Picher battery and Moog valves. In the rear of the missile is the Hercules/Aerojet Mk 58 Mod 4 solid propellant booster-sustainer with remote safety and arming.

For vertical launch applications a Jet Vane Control (JVC) unit weighing 15.8 kg (34.8 lb) is attached to the rear of the missile. The JVC consists of a strapdown inertial reference system, a digital microprocessor with supporting analogue package and an autonomous actuation system. The system operates four jet vanes and it is powered by a thermal battery.

The RIM-7M incorporated the solid-state onboard computer with larger rocket motor and the 39 kg (89 lb) warhead. Two versions exist; RIM-7M (F1-build) and RIM-7M (H-build), these differ only in the software used in their hardware processors.

The RIM-7P, which succeeded the RIM-7M on the production lines in 1991, has a Missile-Borne Computer (MBC) to control overall missile performance and to link the major missile subsystems. It features Electrically Erasable Programmable Read Only Memory (EEPROM) chips to assist easy reprogramming as well as advanced guidance algorithms and double the processing speed. The missile has an improved low-altitude guidance mode and enhanced sub-clutter performance against very low-altitude targets. Other features include a 38.6 kg (85 lb) warhead with new fuze for low-altitude use, a command uplink, sample data homing and multiple target designation. On the 'Flyvefisken' class it is used with the 9LV Mk 3 command and weapon control system.

Specifications
Length: 3.66 m (12 ft)
Diameter: 20.3 cm (8 in)
Wing span: 1.02 m (3.3 ft)
Weight: 231.5 kg (510 lb)
Speed: Mach 1
Range: 8 n miles (14.8 km)
Guidance: Semi-active radar

TUBES

21 in (533 mm) tubes for Type 617 torpedoes
2 tubes for Bofors Underwater Systems Type 617 heavyweight wire-guided torpedoes fitted in attack mode. The Type 617 is based on the Tp61 and retains the same thermal propulsion system with hydrogen peroxide/acohol/water as the propellants.

Specifications
Length: 6.98 m (22.9 ft)
Diameter: 533 mm (1.7 ft)
Weight: 1,860 kg (4,100 lb)
Warhead: 250 kg (551 lb)
Speed: 25 kts
Range: 20,000 m (65,617 ft)
Propulsion: High Test Peroxide (HTP)

Manufacturer/Contractor
Bofors Underwater Systems, Sweden.

GUNS

OTOBREDA 3 in (76 mm)/62 Super Rapid
Single dual-purpose main gun usually fitted forward.

The 62 calibre barrel is of two-part construction consisting of the tube and a liner with rifling consisting of one turn in 30 calibres. It is 4.7 m (15.4 ft) long and weighs 765 kg (1686.5 lb) of which the liner is 324 kg (714.3 lb). The whole gun is 5.28 m (17.3 ft) long and features a vertically sliding breech, a small multihole muzzle brake, a fume extractor and an automatic salt water spray cooling system based upon a 7 kg/cm² spray with 2-4 kg/cm² fresh water flushing. The MMI mounting is protected by a watertight, splinter-proof shaped shield with the gun's director on the left-hand side at the front. Ammunition is fed from a magazine containing 15 rounds, each of which is moved by a feeding system which can be from 2.5 to 11 m (8.2 to 36 ft) long to the loading tray where it is automatically rammed into the breech. The mounting is normally under local electrical and hydraulic control but may be controlled remotely if required. The mounting weighs 12 tonnes. The 76/62 Compact can fire 80 rounds without reloading and the rate of fire is adjustable from 10 to 85 rds/min.

The Super Rapid mounting is similar in design, dimensions and weight to the Compact. It features upgraded hydraulic motors for the feed and hoist systems, rocker arms made from titanium, a redesigned feeder device and loading tray which move shorter distances for faster action. There is also a new digital console with plasma display for gun control.

Specifications
Elevation: −15 to +85° at 35°/s
Training speed: 60°/s
Weight (unloaded): 8 t
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 120 rds/min
Range: 8.5 n miles/15.75 km

Manufacturer/Contractor
OTOBREDA, Italy.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Sabre ESM System

SABRE is a modular, high-performance naval radar intercept (ESM) system covering the 0.5 to 18 GHz frequency range. It is configured to address a wide range of surface ship electronic warfare requirements, including threat warning, surveillance, identification, intelligence gathering and targeting. It uses the Racal Sadie processor and advanced antenna techniques to achieve a high specification and operational flexibility. The system is fully modular in design with options available to extend its performance to satisfy future operational requirements. The system has a bearing accuracy of 2°, which is one of the reasons for its selection by the Royal Danish Navy, which required a great degree of precision in the cluttered waters in which these ships operate. The system is fully integrated with the ship's AIO and ECM systems, interfacing with the ship's multifunction consoles through standard bus interfaces.

An advanced ESM processor design using the latest VLSI integrated circuit technology provides fast signal processing and identification in high-density signal environments. The processor tracks 200 radars automatically and provides a continuous update on status to the ESN operator and the command team. Scan analysis is measured on all intercepted transmitters. The ESM library holds 3,000 radar emitter modes and is loaded from a disk unit. An auxiliary library of 250 emitter modes is provided to hold operator-loaded data. The operator's console features twin high-resolution colour displays, a normal keyboard, special function keys and a rollerball. The displays present both graphical information, in either polar or cartesian format, and tabular information of the emitter parameters. Full digital data recording onto magnetic disk is available.

Specifications

Frequency range: 0.5-18 GHz (option to 40 GHz)
Accuracy: 2° RMS
Sensitivity: −60 dBmi
Dynamic range: 60 dB
Pulse density capability: 500,000 pps
Radar store capability: 3,000 modes
Processing time: <1 s

Manufacturer/Contractor

Racal Radar Defence Systems Ltd, Chessington, UK.

Ravnen *(P 560) in the surveillance role. Note the RIB on the afterdeck and at the masthead the TRS-3D radar and, below it, the Racal Sabre ESM array* (Jane's/H M Steele)

ELECTRONIC COUNTERMEASURES (ECM)

Racal-Decca Cygnus ECM system

Cygnus is an I/J-band jammer, which uses both responsive noise and deception jamming to provide an effective jamming capability against all types of radar including early warning, target acquisition and missile guidance. Cygnus has a narrow beamwidth giving very high effective radiated power (300 kW) and is kept on target by built-in, interferometer-type, passive tracking system in both azimuth and elevation. The tracking system is also used to relay accurate position data to systems of other ships. RF received by the tracking antennas is also used as the basis of transmitted RF and modulation, and power management is under the control of a processor which also controls the tracking procedure. Types of modulation sequence available include range gate pull off and false target generation.

Manufacturer/Contractor

Racal Radar Defence Systems Ltd, Chessington, UK.

DECOYS

Sea Gnat DL-6T

Two 6-barrelled launchers for chaff and InfraRed (IR) flares.

The Sea Gnat system uses a new control unit, new launcher with 130 mm tubes and new munitions.

The control unit provides for the launching of the most effective combination of rounds for distraction and centroid/seduction giving the type, speed and direction of the threat, the ship's speed and heading as well as wind direction and speed.

The munitions involved are the Mk 214 RF seduction and Mk 216 RF distraction rounds, which are provided by Chemring Ltd. A Mk 218 IR seduction round was expected to enter service in 1995.

Manufacturers/Contractors

Thorn EMI, UK.
AB Precision, UK.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

CelsiusTech 9LV Mk 3

The 9LV 200 Mk 3/9SCS Mk 3 or 9LV Mk 3 command systems are based upon Bassystem 2000 (or BS 2000 with FS2000 as the naval version) with hardware and software modules used to create flexibility with real-time processing in both the short and long term. The systems have a distributed architecture and are based upon a 32-bit computer using Motorola 68020 and 68040 microprocessors and Ada-language software, workstations and Ethernet IEEE 802.3 standard local area networks. Memory consists of 4 MByte RAM and 256 k of Erasable Programmable Read Only Memory (EPROM). The hardware is used to create nodes which may be workstations, processing or interface nodes with a network interface, one or more processing units, power supply, local PROM, and appropriate interfaces. Memory management is by means of the Motorola 68851 while the floating-point processor is the Motorola 68881. All the software programs run independently but communicate through an Inter-Program Communication 2000 (IPC2000) mechanism. The software is in Ada and the basic system has about 500,000 lines of code but this is usually more than doubled to meet added requirements.

Each system consists of a dual-redundant local area network which interfaces with all sensors, weapon systems and workstations. The system is supported by two processor units (one redundant) which provide command, communications and control as well as a database. The systems are capable of acting as a data handling system compiling the tactical situation,

conducting threat evaluation and target designation as well as providing navigation and offboard sensor data (the latter via a datalink) while recording and providing a simulation capability. The fire-control radar is Celsius-Tech's Sea Viking director, which acts as a stand-alone system with servo-controlled pedestal, tracking and ballistic computer. This can control not only guns but also surface-to-air missiles. It can control different weapons in sequence and has an automated air defence function for use against multiple targets. It takes sensor data, evaluates the threat and automatically deploys the most effective hard or soft kill countermeasure to neutralise each target.

The Sea Viking tracker can weigh up to 700 kg (1,543 lb). The prime sensor is a tracking Ku/J-band radar with stabilised cassegrain monopulse antenna and travelling-wave tube transmitter which operates in the 15.9-17.1 GHz frequency range and permits the combination of pulse Doppler-MTI operation with batch-to-batch frequency agility. Pulse-to-pulse frequency agility is retained for use when return suppression is not required. The radar may be supplemented by a range of electro-optical sensors including a Si-Vidicon CCIR-compatible TV camera with 300 mm lens and 42 × 31 mrad field of view, an 8-12 µ infra-red camera using Cadmium Mercury Telluride detectors with closed-cycle Sterling cooling and fields of view of 52 × 35 mrad and 157 × 105 mrad. There may also be a 1.06 µ Nd:YAG laser rangefinder with a peak power of 4MW and a PRF of 10 Hz.

Also available is an independent G/H or C-band and I/J or X-band search radar with parabolic, horn-fed stabilised 2.4 × 1.0 m antenna. This also has a travelling-wave tube transmitter and operates in the 5.4-5.9 GHz and 8.5-9.6 GHz frequencies. An optional I/J-band magnetron transmitter is also available.

The Mk 3 system retains the horizontal tactical situation compilation display used in the Mk 1 systems although with improved electronics and its own secondary database. On the 'Flyvefisken' class, the prime HCI consists of Terma Standard Consoles (SCL), which use Motorola 68020 and 68040 microprocessors on a VME bus. The Type I was designed for the SF 300 C3 system and is a one-man console with two 53.34 cm (21 in) 1,024 × 1,224 pixel raster scan displays which can present radar, tactical situation, graphics and electro-optic data as well as providing space of 80 columns and 18 lines for alphanumeric data. There may also be provision for internal and external communications facilities (including a telephone). The HCI consists of an LED, a 78-key function panel and two rollerballs. They are low, wide displays designed initially for the Standard Flex ships.

Specifications
(Terma SCL Type 1)
Length: 1.23 m (4 ft)
Width: 1.20 m (3.9 ft)
Height: 1.20 m (3.9 ft)
Weight: 320 kg (705 lb)
Power requirements: 115 V, 60-400 Hz, three phase (2 kVA)
Back-up: 24 V DC (30 VA).

Manufacturer/Contractor
CelsiusTech, Sweden.

RADARS

AEG-Telefunken TRS-3D/16
Initial units were fitted with the Plessey AWS-6, but later units have the AEG-Telefunken TRS-3D/16, which is also being backfitted into the earlier ships. TRS-3D/16 has a large rectangular antenna angled at about 35°. It is a frequency agile set operating in the C-band.

Terma Scanter
I-band surface search radar.

Furuno
I-band navigation radar.

SONARS

CelsiusTech CTS-36
A hull-mounted, high-frequency active search sonar.

Thomson Sintra TSM 2640 Salmon
Variable Depth Sonar (VDS) medium frequency for ASW. The Salmon is a compact sonar designed for shallow water ASW. The basic version consists of an acoustic array of 24 staves housed in a streamlined fish. Embedded facilities include passive listening, sound ray tracer, integrated onboard simulator, and acoustic propagation prediction.

Specifications
Acoustic array: 24 identical staves of 7 transducers
Weight: 260 kg (573 lb)
Frequency: 19 kHz approximately.
Transmitter: Omnidirectional transmission in CW and FM modes
Receiver: 36 preformed beams; advanced processing coherent in FM with pulse compression and spectrum analysis (FFT) in CW

Manufacturer/Contractor
Thomson Sintra ASM, France.

PROPULSION

Specifications
System: Combined diesel and gas turbine (CODAG)
Main machinery: 1 GE LM500 gas turbine on centre shaft; 2 MTU 16V 396 TB94 diesels on outer shafts; plus auxiliary propulsion by hydraulic motors on outer gearboxes (hydraulic pumps driven by 1 GM 12V-71 diesel)
Power output: 5,450 hp (4.1 MW) from gas turbine; 5,800 (4.26 MW) from diesel engines; 500 hp (375 kW) from diesel for hydraulic pumps.
Shafts: 3

FURTHER INFORMATION

PROGRAMME

Standard Flex 300 has replaced 'Daphne' class (seaward defence craft) and 'Soloven' class (fast attack craft torpedo) and will replace 'Sund' (MCM) class. The first batch of seven with an option on a further nine was contracted with Danyard on 27 July 1985 with the second. This total of 14 is two less than the 16 originally planned.

OPERATIONAL

All vessels can be fitted out as patrol craft; the planned number of outfits for the other roles are: attack role 10; MCMV six; minelayer eight. In general, outfits can be changed within a few hours. Outfits for non-military tasks such as pollution control and hydrographic survey have also been developed.

WEAPONS SYSTEMS

GUNS

Bofors TAK 120 mm (4.7 in)/46

There is a single Bofors 120 mm (4.7 in) gun in 'A' position on the foredeck, which is capable of firing 80 rds/min to a range of 10 n miles (18.5 km). The turret is also fitted with 103 mm (4 in) rails for illuminants. The water-cooled TAK 120 L/46 has two feed tables each holding six rounds, located on the sides of the automatic loader and beneath the ammunition compartments; they can be fed from either magazine, permitting the loading of two different kinds of ammunition. The gun is normally served by two loaders and an operator; during manual operation the operator acts as the layer in training, while an additional man is responsible for elevation.

Specifications
Calibre: 120 mm
Length of barrel: 46 calibres
Muzzle velocity: 800 m/s (2,625 ft/s)
Traverse: 360° at 40°/s
Elevation: −10 to +80° at 32°/s
Mounting weight: 28.8 t
Crew: 3-4
Range: 10 n miles (18.5 km)
Rate of fire: 80 rds/min/barrel

Manufacturer/Contractor
Bofors, Sweden.

Bofors SAK 40L/70-350

Two single Bofors 40 mm anti-air guns are mounted. The SAK 40L/70-350 mounting is equipped with electrohydraulic laying machinery and is remotely controlled from a central fire-control system or an optical director. It features gyrostabilised local control with hand-cranks for emergency use. Junction boxes for power, remote control and communications are built into the mounting.

Specifications
Mounting
Weight (unloaded): 2.89 t
Traverse: Nominal 360°
Elevation: −9° to +85°
Training speed: 85°/s
Elevation speed: 45°/s
Crew: 4
Power requirements: 440 V, 3 phase, 60 Hz

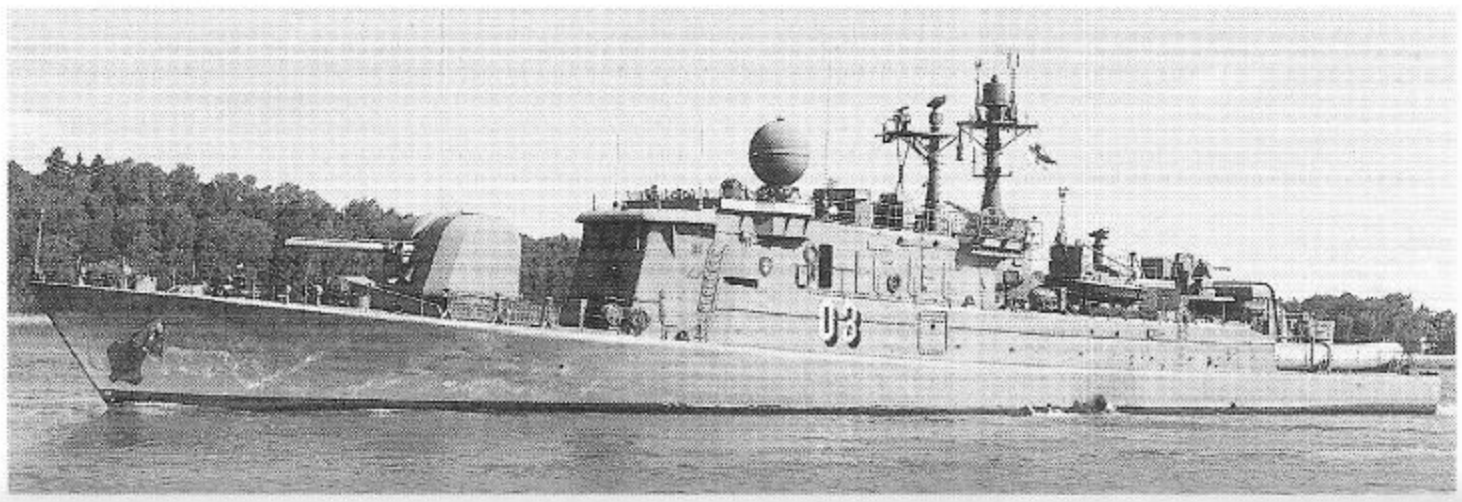
Specifications
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000-1,025 m/s (3,280-3,362 ft/s)
Range:
anti-surface: 6.75 n miles (12.5 km)
anti-air (nominal): 6,900 m (22,600 ft)
Rate of fire: 300 rds/min (practical)
Ammunition: 2.21 kg (4.87 lb)

Manufacturer/Contractor
Bofors, Sweden.

Russian 23 mm/87 (2 twin)

There are two twin ZU-23-Sako mountings in the 'Turunmaa' class consisting of two guns installed one above the other in separate cradles and on their sides so that it is fed from the side. The guns have air-cooled barrels of monobloc construction with flash suppressors at one end and an exposed spring recuperator wrapped around the barrel near the breech. The mounting, which is 1.2 m (4 ft) high, 1.6 m (5.2 ft) long (excluding the barrel) and 1.5 m (4.9 ft) wide, may be either hydraulically or manually operated. With ammunition the mounting weighs 1.735 tonnes and it has two on-mount operators and five loader-carriers.

Specifications
Calibre: 23 mm
Length of barrel: 87 calibres
Traverse: 360° at 80°/s
Elevation: −15 to +80° at 50°/s
Rates of fire: 200 rds/min/barrel
Projectile: 0.19 kg (0.4 lb)
Range:
anti-surface: 1.1 n miles (2 km)
anti-air: 1,500 m (4,920 ft)



Turunmaa *(03). The square door some 2 m (7 ft) aft of the pennant number houses the RBU-1200 ASW rocket launcher* (Pär-Henrik Sjöström)

ANTI-SUBMARINE MORTARS

RBU 1200

Two Russian RBU 1200 launchers are in fixed mountings inside the main deck superstructure (they are immediately abaft the pennant number). RBU 1200 is believed to have a range not exceeding 1,200 m (3,936 ft).

Specifications
Length: 1.4 m (4.59 ft)
Range: 1,200 m (3,936 ft)
Warhead: 34 kg (75 lb)

DEPTH CHARGES

There are two depth-charge racks.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

ARGOSystems

There is an ARGOSystems radar intercept equipment.

DECOYS

ML Aviation Barricade countermeasures system

Superbarricade launchers are being fitted in these ships. Superbarricade is an improved version of the widely used Barricade system and provides ships with means of deploying chaff and infra-red (IR) decoys to counter missile attacks, using a layered defence against the various types of anti-ship missile. The system uses a 102 mm rocket and a redesigned launcher with four sets of triple-cell launchers. The system has a similar control unit to Barricade Mk III and the same tactical computer. The ammunition lockers each contain 24 rockets. There are four decoy modes:

- confusion, in which long-range (Stockade) rockets are fired to confuse enemy search radar and make target selection difficult
- distraction, in which medium-range chaff and/or infra-red rockets are fired in a pattern of six around the ship to present alternative targets to missiles during their search phase, affording defence against multiple missiles coming from different directions
- dump is used where a missile has locked on to the ship. The ship uses a jammer to remove the missile's range gate and then fires a single rocket to produce a chaff cloud on which the gate may be 'dumped' thus allowing the jammer to be redeployed.
- centroid, is a close-range, final defence mode, used against single missiles. If the incoming missile is locked on to the ship, a pattern of short-range chaff and/or IR rockets is fired to create a large alternative target close to the ship, which manoeuvres away, leaving the missile to home on to the decoy.

Manufacturer/Contractor
ML Wallop Defence Systems, Andover, Hampshire, UK.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Signaal WM22

These ships are fitted with the Signaal WM22 fire-control system, which has two antennas sharing a common, stabilised mounting and housed in a distinctive, egg-shaped radome — the well-known 'Signaal egg' — which is located on the bridge roof. The stabilisation system permits operation at roll angles of ±30° and pitch angles of ±10°. The upper antenna, which is of the cassegrain type, is used for searching as well as for automatic tracking of surface targets for weapon control. The lower antenna is of the paraboloid segment type with horn feed and is used for tracking air targets and for controlling air defence weapons. The antennas are fed from a common I/J-band transmitter but during surveillance all the transmitter output is channelled to the search antenna.

Peak pulse power is 180 kW and output power is shared by waveguide switching. The search radar has a range of between 30 and 32 km (16.2 and 17.3 n miles) against surface targets and 7,600 m (25,000 ft) against air targets, while the tracker has a range of about 15.6 n miles (29 km). With the larger search antenna the search radar is increased to about 25 n miles (46 km). The tracker is capable of monitoring the movement of aircraft with a 1 m² cross-section at velocities up to 900 m/s (2,952 ft/s) and similar size objects moving at or near the surface at maximum velocities of between 34 and 55 m/s (111.5 and 180 ft/s).

The radar can automatically track one air and one surface target simultaneously. For use with the missile, the air target tracking antenna is slaved to the surface target tracking programme and linked with a CW transmitter in order to illuminate the target. It can control a second light- or medium-calibre gun for engaging an air and/or surface target.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

CelsiusTech EOS-400

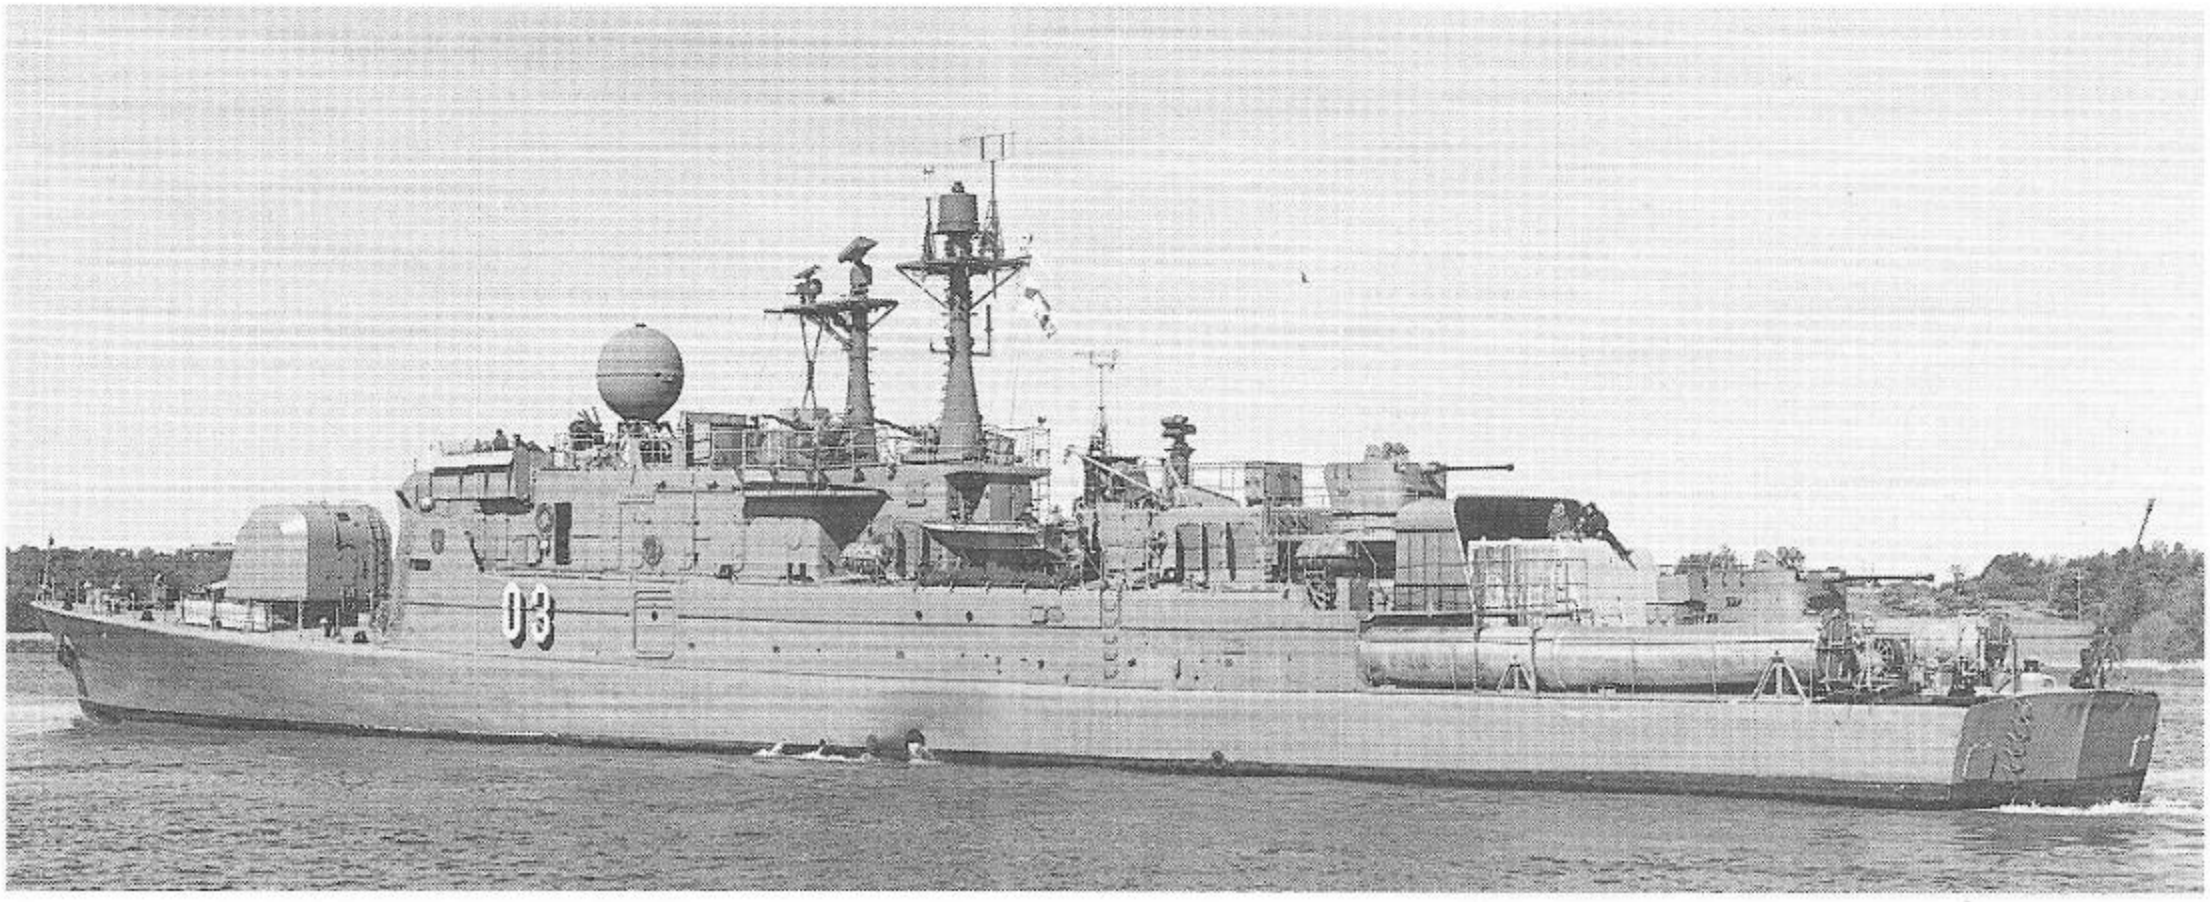
EOS-400 is a TV tracker and laser rangefinder fire director system. Accurate target position is obtained using the Saab television tracker for automatic tracking in conjunction with a laser rangefinder, both units being mounted on a common training and elevating stabilised platform. Below deck, the control/display unit is located in the operations room. The control/display unit contains a TV monitor and a joystick for sensor platform operation, a mode selector, and target data displays. The video output is connected to the platform and the video input to the control/display unit.

The system is capable of tracking one target among several in close formation, tracking when radar tracking is not possible, and either surface or air targets may be tracked. Inputs from other systems include those from the ship's surveillance radar and reference data from the ship's compass. The system calculates ballistics for several guns and gives gun-laying data.

Specifications
Tracking parameters
Training: Unlimited
Elevation: −30° to +85°

Platform
Angular speeds, azimuth and elevation: 150°/s
Angular accelerations: Azimuth 2 rad/s²; elevation 3 rad/s²
Angular transducers: Multispeed synchros
Stabilisation: Rate gyros in 2 axes
Tracking: Digital correlation
Contrast selection: Automatic black/white
Lock on area: Whole field

Daylight camera
Scanning standard: 625 lines
Camera tube: Si-vidicon
Night camera: IR camera optional



Turunmaa *(03). Sensors include the Signaal 'egg' on the bridge roof and on the foremast the Raytheon ARPA navigation radar and Terma 20T 48 surface search radar. At the main masthead are a cylindrical dome housing the ARGOSystems EW antennas, with, behind it, a small log periodic array (with a similar array atop a pole at the forward end of the after deckhouse.) Note also the large, silver exhausts for the gas turbine which can be used to propel the ship on jet propulsion alone.* (Pär-Henrik Sjöström)

Laser rangefinder
Wavelength: 1.06 µm
Repetition rate: 10 Hz
Beamwidth: 1.5 mrad

Director with basic sensors
Height: 1.5 m (4.9 ft)
Width: 1 m (3.28 ft)
Length: 0.8 m (2.6 ft)
Weight: 220 kg (485 lb)

Console
Height: 0.9 m (2.9 ft)
Width: 0.6 m (1.9 ft)
Length: 0.8 m (2.6 ft)
Weight: 75 kg (165 lb)

Optional thermal imager
Cooling: Joule-Thompson minicooler
Field of view: 52 × 35 mrad

Manufacturer/Contractor
CelsiusTech, Sweden.

RADARS

Terma 20T 48 Super
E/F-band surface search radar.

Signaal WM22
I/J-band fire-control radar.

Raytheon ARPA
I-band navigation radar.

SONARS

Simrad hull-mounted sonar
There is a high-frequency active search and attack sonar, which is optimised for operations in archipelagic waters.

PROPULSION

Specifications
System: Combined diesel or gas turbine (CODOG)
Main machinery: 1 Rolls-Royce Olympus TM1A gas turbine, 11.2 MW (15,000 hp); 3 MTU MB diesels 2.2 MW (3,000 hp)
Shafts: 3

FURTHER INFORMATION

PROGRAMME

These ships were ordered on 18 February 1965 and commissioned in 1968.

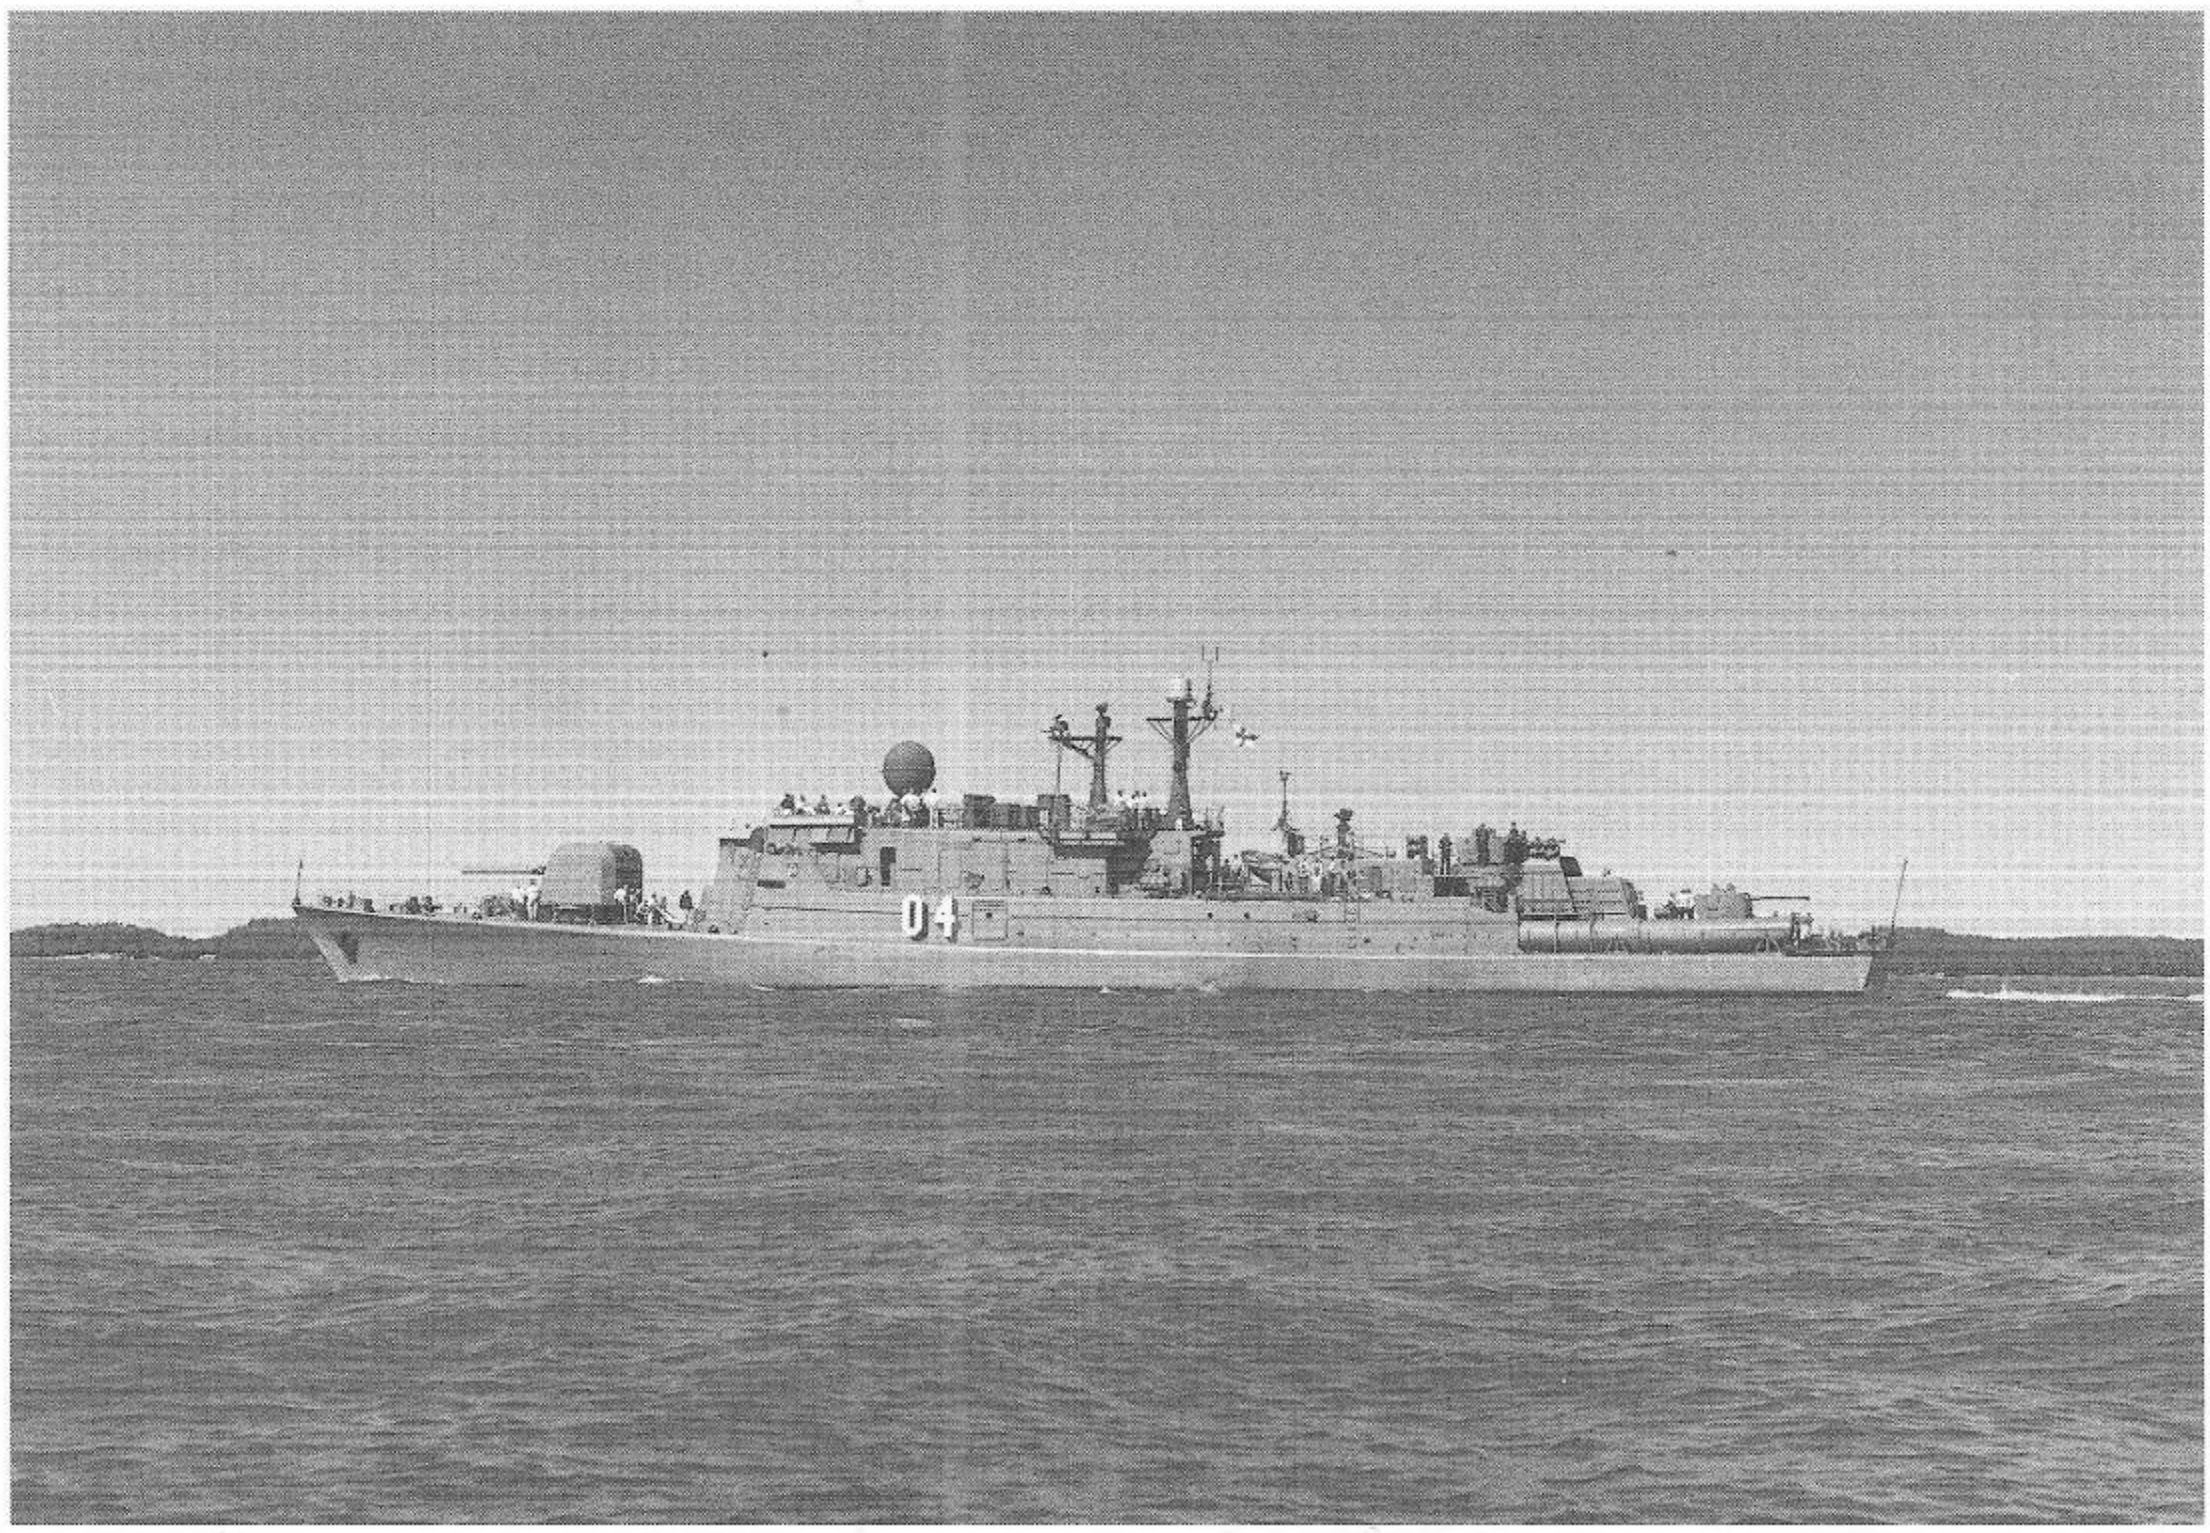
DESIGN

These flush-decked ships were designed and built in Finland. They are fitted with Vosper-Thornycroft roll-damping equipment.

One of the unusual features of these ships is that the large, tubular gas-turbine exhaust trunks are led over the quarterdeck, discharging over the stern, with their plumes coalescing some 15 m (49 ft) abaft the stern. This arrangement enables the ships to be driven at up to 12 knots without the use of propellers.

MODERNISATION

Both were completely refitted at the Wärtsilä Shipyard, Turku in 1986, when they were fitted with new equipment, including radars, EW equipment and sonar.



Karjala *(04), one of two corvettes built for the Finnish Navy in 1967-68* (Pär-Henrik Sjöström)

WEAPONS SYSTEMS

TUBES

The ships still mount the original four single 533 mm (21 in) torpedo tubes, but these use liners to enable them to launch standard Mk 46 324 mm torpedoes. There are no reloads.

TORPEDOES

Alliant Techsystems Mk 46 Mod 1/5 324 mm torpedoes

Specifications
Length: 2.59 m (8.50 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507.0 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)

GUNS

OTOBREDA 40 mm L/70 twin mounting

The ships can carry either one or two twin 40 mm mounts. The after mount is permanent, but the foredeck mounting can be used for either a second 40 mm/L 70 gun or a Bofors 375 mm anti-submarine rocket launcher.

Specifications
Traverse: 360° (nominal) at 90°/s
Elevation: −13 to +85° at 60°/s
Rate of fire: 600 rds/min/mount
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 6 km (3.25 n miles)
anti-air: 4,000 m (13,120 ft)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Ready rounds: 736
Crew: 2

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy

M2HB 12.7 mm (0.50 in) machine guns

Two M2HB 12.7 mm machine guns are carried and can be mounted on flexible mounts.

Specifications
Calibre: 12.7 mm (0.50 in)
Rate of fire: 450-550 rds/min
Muzzle velocity: 883 m/s (2,900 ft/s)
Max effective range:
anti-surface: 6,700 m (7,300 yd)
anti-air: 1,380 m (4,500 ft)

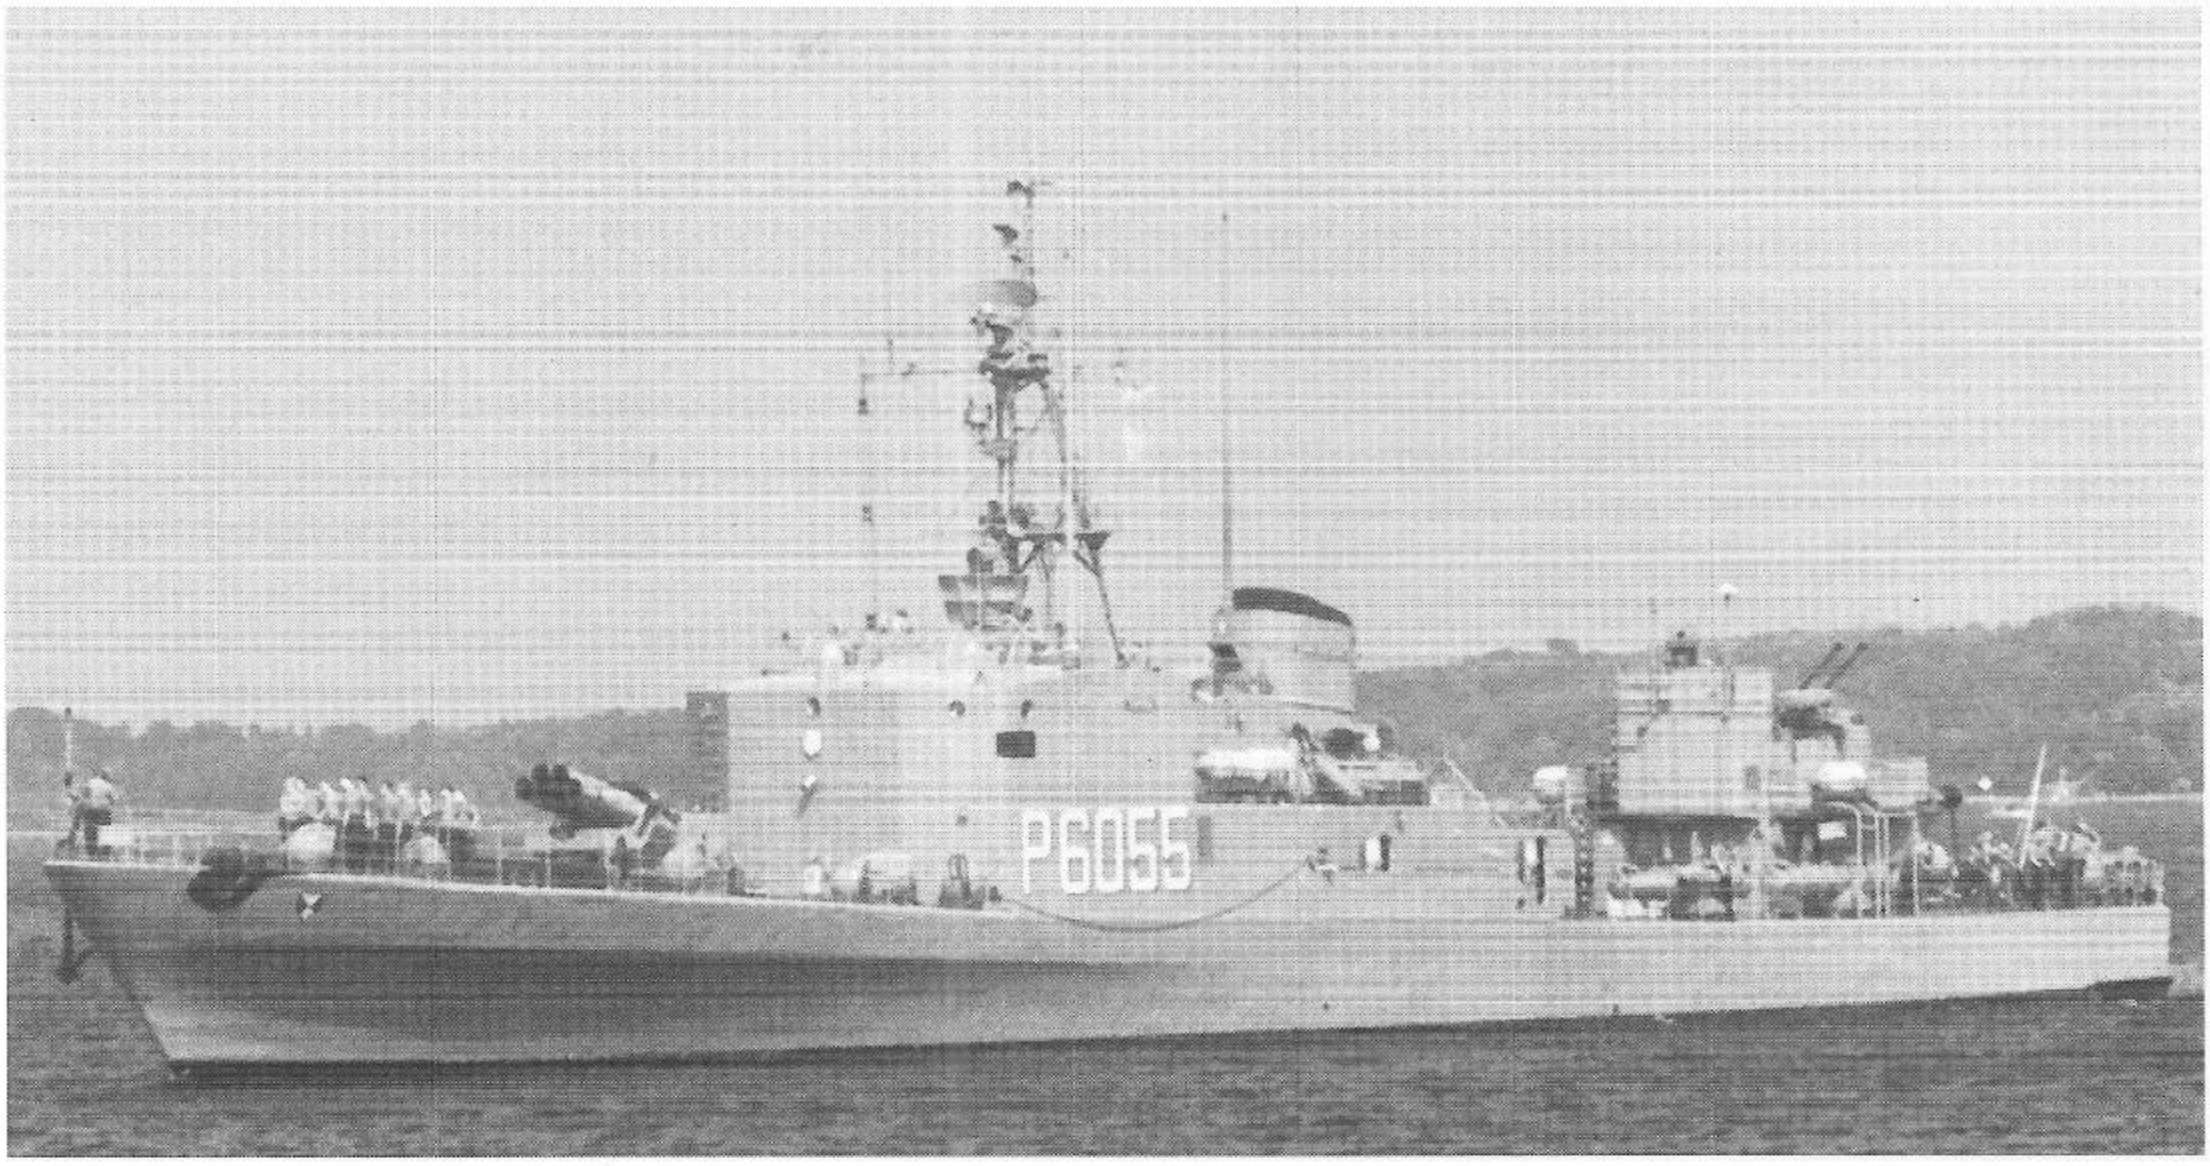
ANTI-SUBMARINE MORTARS

Bofors 375 mm ASW rocket system

There is a single, four-tube, 375 mm ASW rocket launcher located on the foredeck. The system consists of a rocket launcher, a handling system, the ship sonar and a fire-control system. The two launch tubes are mounted on trunnions with an automatic contact device to connect the rockets with the fire-control system. The hydraulic laying machinery is in the front of the mounting and a flame deflector in the rear; there is also an automatic electro-hydraulic handling system. The rounds are stored vertically beneath the mounting and selected by an operator. The rate of fire is one round a second and rockets may be fired singly or in a salvo. There are two types of rocket, both with Hexotonal filling. The Type E (Erika) rocket has Stidar time and impact fuzes, while the Type N (Nelli) uses the Zambo proximity and impact fuzes. A total of 20 rounds is carried.

The mortar can be removed and replaced by a second Bofors 40 mm/L 70.

Specifications
Launcher
Tubes: 4
Traverse: 260° at 18°/s
Elevation: −15 to +90° at 18°/s
Crew: 4



Eleftheria *(P 64) when still in the German Navy as* Triton *(P 6055). These ships were designed as heavy torpedo recovery vessels, for which they proved unsuitable and were then used as ASW training ships. They are now employed as corvettes* (Horst Dehnst)

Specifications
2-tube launcher
Weight (excluding rockets): 3.8 t
Traversing speed: 30°/s
Elevating speed: 27°/s
Traverse limits: Unlimited

Manufacturer/Contractor
Bofors Weapon Systems.

DEPTH CHARGES

There are two depth-charge rails.

COMMAND AND CONTROL SYSTEMS

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MAN V84V 5 MW (6,800 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These five ships were originally built as heavy torpedo recovery vessels, but were unable to perform this role satisfactorily and were given additional ASW armament and a sonar so that they could be used as training ships. They were eventually transferred to Greece, where they are employed as corvettes.

DESIGN

Doxa (ex-*Najade*) has a large deckhouse before the bridge which is now used as a sick bay.

Doxa *(P 63)* (Hellenic Navy)

HDW TYPE FS 1500 CORVETTE

OVERVIEW

Kasturi *(25) of the Royal Malaysian Navy is one of six HDW 1500 corvettes built for two navies* (Jane's)

The late 1970s was a lean period for European shipyards and German shipbuilder Howaldts Deutsche Werft (HDW) entered what was, for the company, a new market with a design for a 1,500 tonne corvette. It quickly won two orders, although intense international competition ensured that the profit margin was minimal. The first order was for four ships for the Colombian Navy (May 1980) and the second for two ships for the Royal Malaysian Navy (RMN) (July 1981).

DESIGN

Design work was carried out by Hamburg-based MarineTechnik-GmbH (MTG) and the design incorporated a number of features which were intended to keep costs to a minimum, including construction to Lloyds' rather than warship standards in most areas (although full warship standards were applied where it was important for combat capability). In addition, the number of plate thicknesses were reduced to a minimum to simplify fabrication, although there was a small penalty in freeboard and maximum speed. The crew requirement was also kept down to 83, although accommodation was available for 128. Two basic versions were available, one with full helicopter facilities and one without a hangar.

The basic design is the same for both Colombian ships and Malaysian ships, but with some differences. The RMN required that the ships should be able to remain afloat and continue to manoeuvre with two adjacent watertight compartments flooded. This resulted in an additional compartment between the two engine rooms and an increase in hull length of exactly 2 m ((6.56 ft) from 95.3 m (312.7 ft) to 97.3 m (319.1 ft). The Malaysian ships also have an NBC citadel, with airlocks and filters, which is not required by the Colombians.

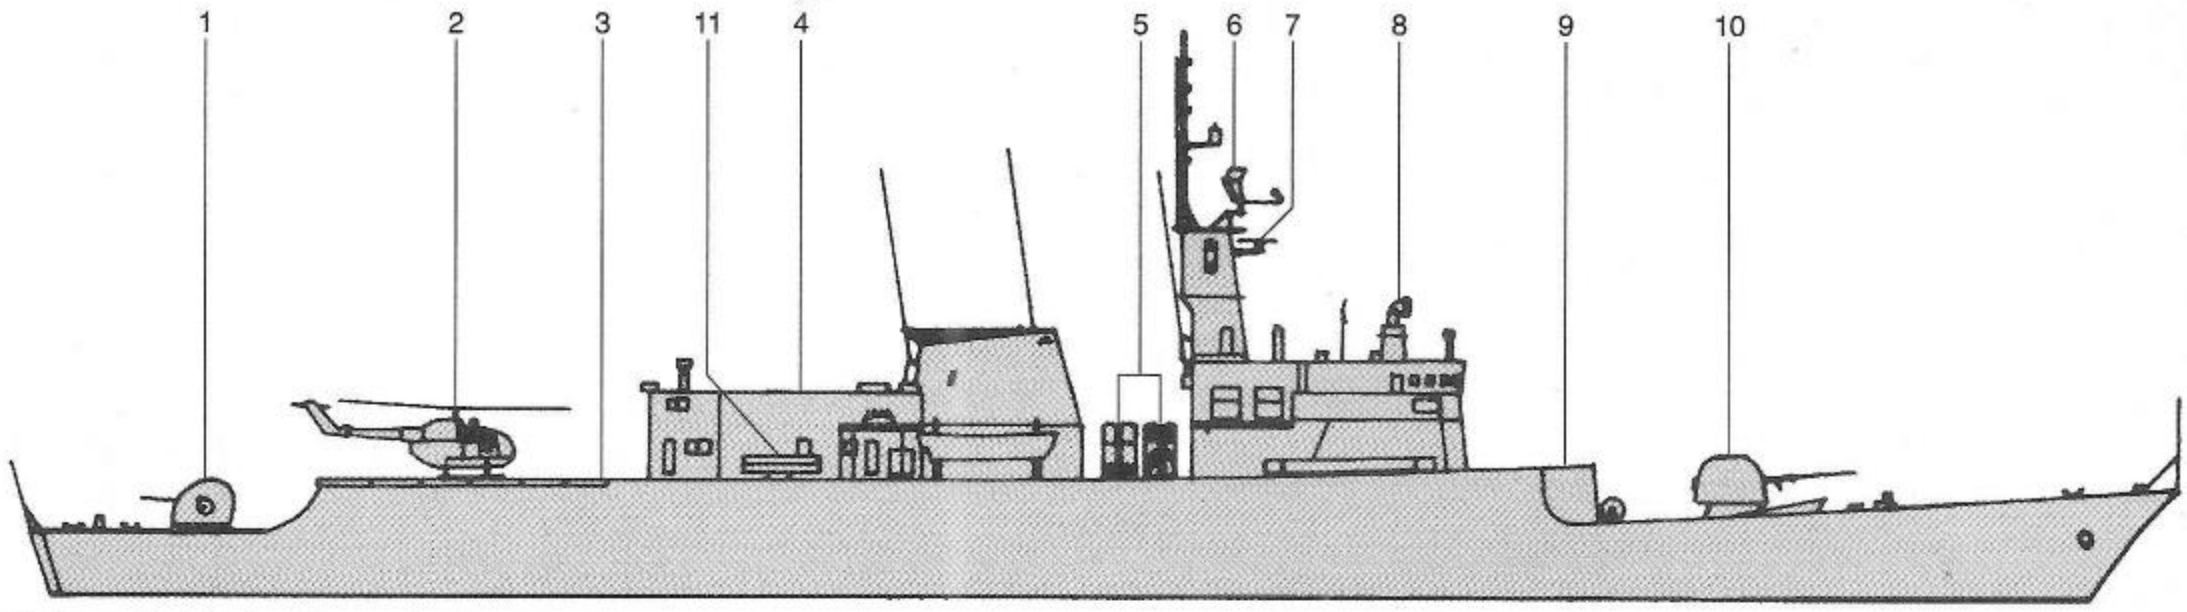
The bow has a pronounced rake, but this is not to protect a sonar dome, but for improved water deflection. A bow sonar dome was considered but rejected on the grounds that with such a shallow draft ship there would be a risk of damage due to slamming.

The Colombian ship has full helicopter facilities, including an HDW-developed traversing device to move the BO-105 (which has skids) between the flight deck and the hangar. The Malaysian ship has a flight deck, together with rearming and refuelling facilities, but no hangar. Combat system integration was subcontracted by HDW to Thomson-CSF for the Colombian ships and to Signaal for the Malaysian ships.

FURTHER ORDERS

Despite the success of the FS 1500 with these two navies and the addition of an even more capable 1,900 tonne design, no further orders have been forthcoming.

ALMIRANTE PADILLA (TYPE FS 1500)



Almirante Padilla (Ian Sturton)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Aerospatiale MM 40 Exocet medium-range anti-ship missile

Eight MM 40 Exocet launchers in two groups of four, are mounted immediately ahead of the stack, firing across the ship.

Specifications
MM 40 Block 2
Length: 5.80 m (19 ft)
Diameter: 35 cm (13.7 in)
Wing span: 1.13 m (3.7 ft)
Weight: 870 kg (1,918 lb)
Speed: Mach 0.9
Range: 2-40.5 n miles (4-75 km)
Warhead: 155 kg (341.7 lb) HE frag
Fuze: Impact/proximity
Guidance: Inertial and active radar

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

SURFACE-TO-AIR MISSILES (SAM)

There is an intention to fit SAM launchers forward of the bridge when funds become available. The type and number has yet to be decided (see 'Further Information').

TUBES

Two triple 324 mm US Mk 32 torpedo tubes are sited on the upper deck, either side of the hangar.

TORPEDOES

It is not known what types of torpedo are carried. These are the only ships in the Colombian Navy to carry 324 mm torpedo tubes.

GUNS

OTOBREDA 76 mm (3 in)/62 Compact

One OTOBREDA 76 mm/62 Compact is fitted forward in 'A' position. The 76/62 Compact can fire 80 rounds without reloading and the rate of fire is adjustable from 10 to 85 rds/min. The system is remotely controlled from the combat information centre and a reaction time of 2.8 seconds is quoted.

Specifications
Elevation: −15 to +85° at 40°/s
Training speed: 70°/s
Weight (unloaded): 7.5 t
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 10-85 rds/min
Range: 8.5 n miles (16 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

OTOBREDA 40 mm/70 (twin) Compact

One twin 40 mm/70 Compact is mounted on the quarterdeck. This mounting is designed for use against high-performance combat aircraft, against anti-ship missiles and for surface engagements. The mounting consists of two 40 mm guns located 300 mm apart, a feeding system with magazine, a local control panel, a power supply rack, a converter and an air-water panel.

Specifications
Mounting
Weight (unloaded): 5.6/5.4 t
Traverse: Nominal 360° at 90°/s
Elevation: −13 to +85° at 60°/s
Crew: 2

Specifications
Gun
Calibre: 40 mm
Length of barrel: 72 calibres
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Range:
Max: 6.75 n miles (12.5 km)
Effective:
anti-surface: 3.25 n miles (6 km)
anti-air: 4,000 m (13,000 ft)
Rate of fire: 600 rds/min
Ammunition: 2.4 kg (5.3 lb) (HCHE, PFHE), 2.5 kg (5.5 lb) (HE-T)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

ARGOSystems Phoenix II (AC-672)

Phoenix II (AC-672) is a radar warning receiver, covering the frequencies 1 to 18 GHz in five bands. The system uses automatic signal processing and target identification.

Manufacturer/Contractor

ARGOSystems, Sunnyvale, California, USA.

ELECTRONIC COUNTERMEASURES (ECM)

Scimitar ECM system

Scimitar was supplied to HDW for installation in these ships by Signaal. (Scimitar was originally developed by the British company, MEL; related systems are Signaal's Reprogrammable Advanced Multimode Shipborne ECM System (RAMSES) and the Canadian SLQ-503.) Scimitar is a modular naval electronic countermeasures system designed to provide protection against radar threats. It is an integrated responsive jammer capable of long-range jamming of search radars and the deception of missiles once launched. In these ships Scimitar operates in conjunction with Phoenix II, but in the back-up mode, it can be manually controlled (target designation and jamming) from the remote-control panel located near the EW operator. Scimitar operates in the I/J-band and is capable of high pulse and CW Effective Radiated Power (ERP). Multimode jamming is possible with multitarget handling capability.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

DECOYS

CSEE DAGAIE Mk 2 countermeasures system

There is one CSEE DAGAIE Mk 2 ten-barrelled, trainable launcher, which can be loaded with either infra-red (IR) or chaff rockets. The firing sequence runs automatically, once triggered by a missile alarm from a variety of sources, such as radar, ESM systems, or optical sights, thus providing a very short reaction time. The firing direction is optimised in accordance with the threat bearing, wind speed and direction, ship heading and speed data.

The launching of radar and IR decoys is so arranged that advanced mixed-guidance missile systems cannot discriminate them and thus collocation of both decoys is achieved. The installation is a double mounting and comprises two trainable mountings carrying 10 replaceable containers (suitcases), each of which is loaded with either IR or I/J-band chaff projectiles.

A wide range of ammunition is provided by Etienne Lacroix Défense providing seduction, distraction and seduction/dissimulation modes. The electromagnetic decoys are normally based upon aluminised fibreglass chaff with rapid bloom time and they cover the I and J frequency bands. The infra-red decoys cover both the 3-5 and the 8-14 µm bands.

Specifications

Traverse: 330° at 21°/s
Average reaction time: Within 4 s
REM rocket dimensions: 850 × 127 mm (33.5 × 5 in)
Rocket weight: 13 kg (28.66 lb)
Container dimensions: 900 × 130 mm (35.4 × 5.1 in)
Container weight: 20 kg (44.1 lb)
LIR/LEM container dimensions: 780 × 630 × 134 mm (30 × 24.8 × 5.3 in)

Manufacturer/Contractor

CSEE Défense, Paris, France.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Thomson-CSF TAVITAC

TAVITAC is an action data automation system, using a federated architecture (although the manufacturer refers to this as a 'star' system). It is designed to create a picture of the tactical situation around the ship using onboard sensors and to designate the targets for weapon systems. The system, which can carry up to 800 tracks, possesses a limited advisory capability in evaluating the tactical situation.

TAVITAC features the CIMSA Sintra 15M125 computer which is complemented for dedicated tasks by the CIMSA Sintra 15M05. The 15M05 is a 16-bit computer with 64 k memory while the more common 15M125 32-bit computer has a modular memory of 64-512 k words and an operating speed of 1 Mips. The software is written in LTR 2 language and the system elements are believed to be linked by a Gina databus network. There are two 15M125 computers which are used both to maintain the tactical picture and to operate groups of consoles.

Manufacturer/Contractor

Thomson-CSF, Paris Cedex, France.

WEAPONS CONTROL

Thomson-CSF Vega II gun fire control system

Vega II is a target designation and fire-control system of mainframe architecture, originally designed for fast attack craft and corvettes equipped with gun, missile or torpedo weapon systems. The system uses separate search and fire-control radars to provide versatility and resistance to enemy ECM through the use of different frequency bands. Vega II in the 'Almirante Padilla' class is similar to Vega I but is based upon the Thomson-CSF CDE digital processor and features some radar improvements; it is used to control the 76 mm gun against one air and two surface targets simultaneously.

The radar associated with Vega II in these vessels is Sea Tiger (TRS 3001) which is designed to detect air, surface or missile targets and to designate them for weapon systems. Visibility in clutter is achieved by complementary techniques including circular polarisation, pulse compression Doppler filtering and an anti-clutter reception chain. The transmitter features frequency agility and pulse compression over a wide frequency range. It has an average power of 1 kW and a peak power of 66 kW. There is a receiver with multiple reception chains including MTI. The Colombian Navy's Type FS 1500 corvettes use the Canopus A television director with Vega II.

Manufacturer/Contractor

Thomson-CSF, Division Systèmes Défense et Controle, France.

RADARS

Thomson-CSF TSR 3004 Sea Tiger surveillance radar

Sea Tiger is an E/F-band radar, whose main purposes are to detect and track missiles, including sea-skimmers in a very severe clutter and jamming environment. Its functions include, air surveillance, surface surveillance, anti-missile surveillance, and target designation for weapon systems (guns, missiles), with visibility in clutter being achieved through the use of circular polarisation, pulse compression, Doppler filtering and an anti-clutter reception chain. There is a roll-stabilised antenna with integrated IFF.

Antioquia *(CM 53) one of the four corvettes built in Germany for the Colombian Navy* (Harmut Ehlers)

Specifications
Detection range: 60 n miles (111 km) on 2 m² (fluctuation) target with Pd <= 50 per cent
Altitude detection: 15,240 m (50,000 ft)
Elevation pattern: Cosec² up to 50°
Sub-clutter visibility: >40 dB

Antenna
Gain: 30 dB
Polarisation: Circular/linear, switchable
Rotation speed: 15/30 rpm
Stabilisation: Better than ±15°
Transmitter: Frequency agile, pulse compression
Receiver: Noise figure better than 5.5 dB

Manufacturer/Contractor
Thomson-CSF, Systèmes Navals de Combat, Bagneux, France.

Navigation radar
There is a navigation radar antenna on the mast; type unknown.

Thomson-CSF CASTOR 2B
CASTOR 2B is the gun fire-control radar. This is an I/J-band, Doppler-filtering, tracking radar, which is able to acquire and track targets in conditions of active jamming, chaff and heavy clutter. The system uses fully coherent transmission, frequency agility, analysis of received jamming signals within all the useful bandwidths, auto-adaptive Doppler filtering and central management by computer to match the radar to the environmental conditions at all times.

Operationally, CASTOR 2B provides fully automatic acquisition to achieve very short reaction times, short burst operation (1.5 ms) with simultaneous frequency agility and Doppler processing and pulse-to-pulse operation giving true frequency agility. Other facilities include TV tracking or combined TV/radar tracking; passive tracking of a jammer with range information sent from a tracking device linked to a surveillance radar; display of the angular error between the shells and the target; display of the angular tracking error on a jammer; and autonomous surveillance, either continuous or by sector.

Specifications
Frequency: I/J-band
Peak power: More than 30 kW
Range: 0.27-14.6 n miles (0.5-27 km)
Acquisition mode: Fully automatic

Manufacturer/Contractor
Thomson-CSF Systèmes Navals de Combat, Bagneux, France.

IFF
Mk 10.

SONAR

STN Atlas Elektronik ASO 4-2
ASO 4-2 is a hull-mounted, medium-frequency, active attack sonar.

AVIATION

HELICOPTERS

Specifications
Flight deck: 17.3 × 11.3 m (57 × 37 ft)
Hangar: The hangar can house a BO-105 helicopter
Helicopter: Eurocopter MBB BO-105CB. All four ships can embark one BO-105 helicopter, which can be armed with machine guns or rocket pods, if necessary.

Specifications
Dimensions
Main rotor diameter: 9.84 m (32.28 ft)
Tail rotor diameter: 1.90 m (6.23 ft)
Length (including main and tail rotors): 11 m (36.08 ft)
Height (top of rotor head): 3.02 m (9.91 ft)
Weights:
empty, basic: 1,301 kg (2,868 lb)
max take-off: 2,500 kg (5,511 lb)
Performance (max T-O weight)
never-exceed speed (VNE) at sea level: 131 kts (242 km/h)
max cruising speed at sea level: 129 kts (240 km/h)
best range speed at sea level: 110 kts (204 km/h)
max rate of climb (sea level): 444 m (1,457 ft)/min
max operating altitude (2,500 kg): 3,050 m (10,000 ft)
max range:
at sea level: 300 n miles (555 km)
at 1,525 m (5,000 ft): 321 n miles (593 km)
endurance: 3 h 24 min
Power plant: 2–313 kW (420 shp) Allison 250-C20B turboshafts, each with a max continuous rating of 298 kW (400 shp)
Accommodation: 5 (pilot and co-pilot/passenger in front and 3 persons at rear)
Avionics: A wide variety of avionics is available including weather radar, Doppler and GPS navigation, 360° search radar, FLIR, TV broadcast and microwave datalink

PROPULSION

Specifications
System: Diesel
Main machinery: 4 MTU 20V 1163 TB92, 17.2 MW (23,400 hp)
Shafts: 2
Propellers: 2, five-bladed, controllable pitch

FURTHER INFORMATION

PROGRAMME

The order for four Type FS 1500 was placed in late 1980 and *Almirante Padilla* started trials in July 1982.

SYSTEM INTEGRATION

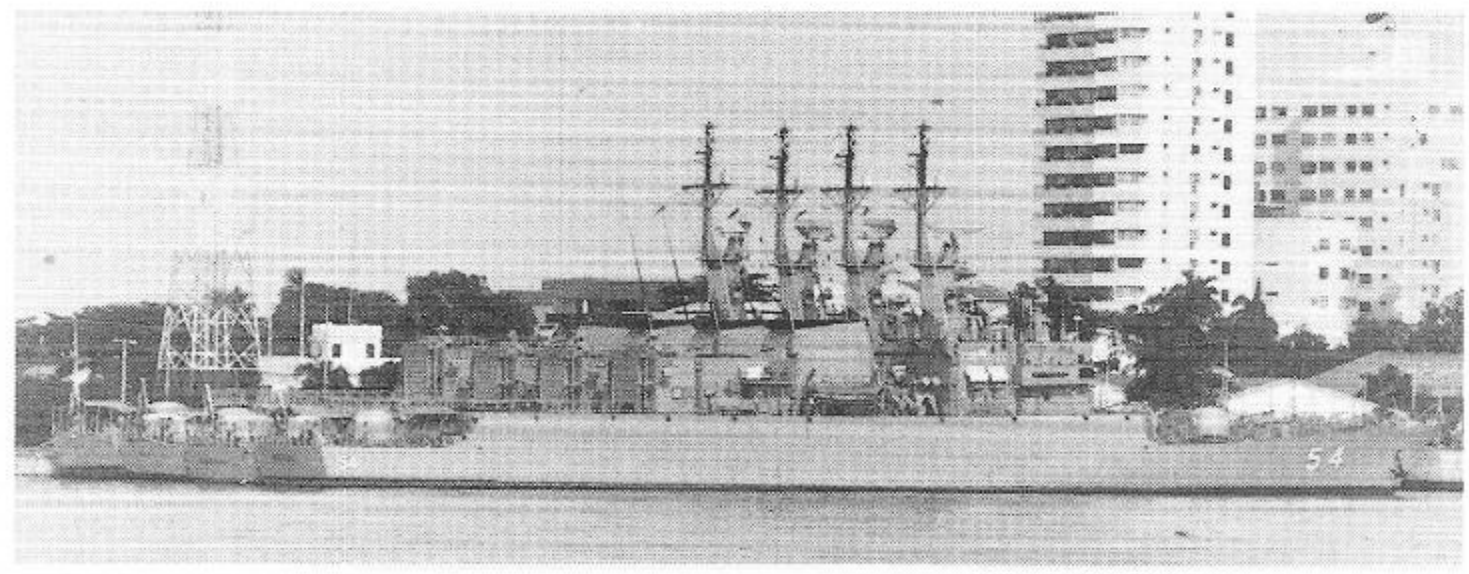
When delivered, the electronic warfare system came from a variety of sources. The ESM suite was the ARGOSystems Phoenix, ECM was the Signaal Scimitar, and the chaff launchers the CSEE Défense Dagaie. This caused integration problems, which were exacerbated by the fact that the Sea Tiger main radar was not only from a fourth manufacturer, but also had several new features, which took a little time to resolve. Much work was needed, particularly on the software, to integrate these systems, which led to some delay in the programme. The problems have long since been resolved but were an early illustration of the difficulties of integrating equipment from different sources.

PROPULSION

There are four MTU diesels, two on each shaft, with one in the forward engine room and the other in the after engine room. These drive through a Renk reduction gearbox located at the forward end of the after engine room.

A CODAG system of one gas turbine and two diesels was considered at the design stage but rejected principally because of the space required for the turbine air downtake and the exhaust uptake.

The machinery control centre is combined with the damage control centre and is located at the stern of the ship, and extends across the full width. Control consoles are provided by Siemens.



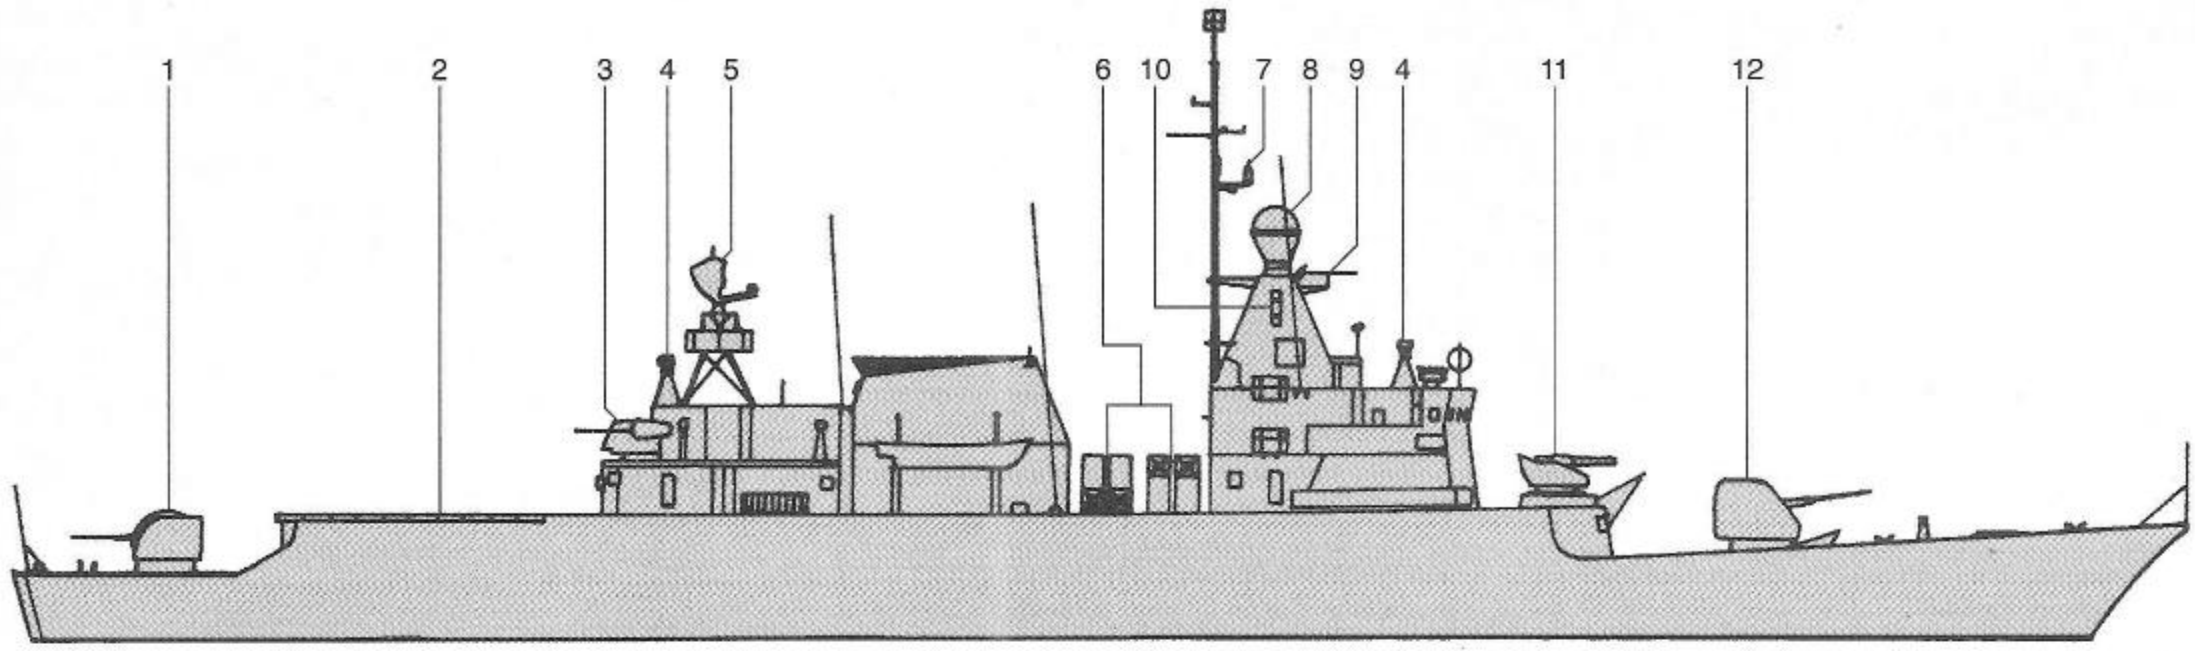
All four ships of the 'Almirante Padilla' class together (H & L van Ginderen Collection)

MODERNISATION

Since the ships were delivered in 1983-84 there has been talk of fitting a SAM system in the space allocated for it on the platform before the bridge. Systems such as Barak, Albatros/Aspide, Crotale and Sea Sparrow have all been mentioned, but no decision has yet been made.

A modernisation programme remains the top priority and plans to replace the engines were reported in 1994, but so far no funds have been earmarked.

KASTURI (FS 1500)



Kasturi (Ian Sturton)
1 *Bofors 57 mm/70 automatic gun* **2** *Flight deck (no hangar)* **3** *ESCO twin 30 mm cannon (two)* **4** *Signaal LIOD electro-optic director (guns)* **5** *Signaal DA08 air/surface search radar* **6** *Aerospatiale Exocet MM 38 anti-ship missiles (four)* **7** *MEL Rapids jammer* **8** *Signaal WM22 fire-control radar* **9** *Racal-Decca TM1226C navigation radar* **10** *MEL Scimitar radar* **11** *Bofors 375 mm twin tube ASW rocket launcher* **12** *Creusot-Loire 100 mm (3.9 in)/55 Mk 2 Compact automatic gun*

GENERAL SPECIFICATIONS

Country of origin: Germany
Operator: Malaysia
Type: HDW FS 1500

Class: KASTURI

Built: 2
Active: 2

Displacement:
standard: 1,500 t
full load: 1,850 t

Dimensions
Length: 97.3 m (319.1 ft)
Beam: 11.3 m (37.1 ft)
Draught: 3.5 m (11.5 ft)

Speed: 28 kts; 18 kts on two diesels
Range: 3,000 n miles at 18 kts; 5,000 n miles at 14 kts

Complement: 124 (13 officers)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Aerospatiale MM 38 Exocet medium-range anti-ship missile

There are two pairs of launchers for MM 38 Exocet immediately before the stack, pointing across the ship at an angle of 90°. The missile system includes a control console and a co-ordinate converter to interface the missile with the ship's sensors. Targets are acquired by the ship's search radar and the operator then aligns the axial gyros in the target's direction and begins the initiation sequence. This involves turning on the thermal battery, releasing the mechanical safety locks, igniting the booster, and finally, breaking the umbilical cord; the total process takes some 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change of course during its flight.

The attack consists of three phases:

Cruise phase. The cruise phase starts as the missile clears the container and the missile, powered by the sustainer motor, flies towards the general location of the target at a height of about 100 m (328 ft), which is low enough to reduce the chance of detection but adequate for target acquisition. This phase can be as long as 11.9 n miles (22 km) and ends when the seeker acquires the target. The seeker is a Dassault Electronique ADAC *(Auto Directeur Anti-Clutter)* active monopulse radar, working in the I-band (8-10 GHz), with a typical range of 13 n miles (24 km) against FACs.

Approach phase. On detecting the target, the missile descends to 9 to 15 m (30 to 50 ft).

Terminal phase. During this final phase the missile descends to 8 m (26 ft) (2 to 5 m (7 to 16 ft) in a calm sea) for a sea-skimming run in to the target.

A salvo may be fired in 12 to 20 seconds.

Kasturi *(25). Foredeck weapons are a Creusot-Loire 100 mm (3.9 in)/55 Mk 2 Compact and a Bofors twin-tube 375 mm ASW rocket launcher* (H & L van Ginderen Collection)

Specifications

MM 38
Length: 5.21 m (17 ft)
Diameter: 35 cm (13.8 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 2-22.5 n miles (4-42 km)
Guidance: Inertial and active radar
Sustainer motor: SNPE Eole alloy-cased CDB; weight 151 kg (333 lb); max burn time 93 s
Booster: 100 kg (220 lb) SNPE Epervier boost motor; burn time of 2.4 s
Warhead: Luchaire 165 kg (364 lb) fragmentation warhead
Fuzes: Delayed impact fuze and autopilot-controlled proximity fuze

Manufacturer/Contractor

Aerospatiale Missiles, Paris, France.

GUNS

Creusot-Loire 100 mm (3.9 in)/55 Mk 2 Compact

The Malaysian ships are fitted with a single Creusot-Loire 100 mm (3.9 in)/55 Mk 2 Compact in 'A' position (the ships were, in fact, the first to be fitted with these weapons). The weapon is controlled from the Combat Information Centre (CIC) using a control box and can be fired in single rounds or with two-, three- or six-round salvos.

The Malaysian guns were due to be upgraded to Compact Mk 2 standard from 1994. This introduces software-controlled microprocessors into the control equipment. There is a new control box for the combat information centre which displays the location of every shell in the mounting. In addition a maintenance console is now attached to the ammunition management control cabinet. This provides a built-in test equipment capability and allows faults to be overcome with the aid of a user-friendly menu.

Specifications

Calibre: 100 mm
Length of barrel: 55 calibres
Muzzle velocity: 870 m/s (2,854 ft/s)
Traverse: 360° at 50°/s
Elevation: −15 to +80° at 35°/s
Crew: 2 (loaders)
Range:
anti-surface: 9.15 n miles (17 km)
anti-air: 6,000 m (19,700 ft)
Rate of fire: 10, 40 or 90 rds/min
Ammunition: 13.5 kg (29.8 lb) (projectile)

Manufacturer/Contractor

Giat, France.

Bofors SAK 57 mm/70

One Bofors SAK 57 mm/70 Mk 1 is mounted on the quarterdeck and is housed in a glass-reinforced plastic shield. This weapon is intended to engage air and surface targets and to provide gunfire in support of troops ashore. There are attachments on the side of the shield to enable illuminants to be launched.

Specifications

Calibre: 57 mm
Length of barrel: 70 calibres
Traverse: 360° at 55°/s
Elevation: −10 to +77° at 40°/s
Crew: 3
Range: 9 n miles (17 km)
Rate of fire: 220 rds/min
Projectile weight: 2.4 kg (5.31 lb)

Manufacturer/Contractor

Bofors Weapon Systems, Sweden.

ESCO 30 twin 30 mm mounting

There are two twin ESCO (formerly Emerson) 30 mm cannon, which are located at the two corners at the after end of the superstructure. The ESCO 30 is a twin 30 mm, 70 calibre weapon designed for air defence, surface engagement and anti-missile operations, using either local or remote control. The ESCO 30 employs two Oerlikon KCB positively locked, gas-operated cannon with the gunner's cabin between them and forward of the elevating mass. Behind the cabin and in a sealed compartment, are the elevating and training drives together with flexible chutes to channel ammunition from the magazine.

The gunner's cabin is equipped with a daylight reflex, or an image-intensifier, sight, together with gyro-assisted line of sight stabilisation. Ready use ammunition is stored in an integral, below-deck, drum magazine with a capacity of 985 rounds for each barrel in a continuous, disintegrating-link belt. These are transferred to the guns through separate chutes by means of electrically operated drives which automatically respond to the individual demand for ammunition supply. Normally, the mount uses ship's power supplies, but this is backed up by an on-mount battery, providing sufficient power to fire a full complement of ammunition, and finally, there is the traditional hand-crank mechanism operated by the gunner.

Specifications

Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Traverse: 360° at 80°/s
Elevation: −15 to +80° at 80°/s
Crew: 1
Range: anti-ship (max): 3.25 n miles (6 km)
Rate of fire: 600 rds/min/barrel (nominal) or 140 rds/min/barrel (sustained)
Ammunition: 870 g (31 oz) (HEI/HEI-T, SAPHEI, TP/TP-T)

Manufacturer/Contractor

Electronics & Space Corporation (ESCO), St Louis, Missouri, USA.

ANTI-SUBMARINE MORTARS

Bofors Type 375

One twin-barrelled trainable launcher is mounted on the platform deck immediately before the bridge. This weapon has a range of 3,600 m (3,940 yd) and is provided with elevation and bearing data by the ship's sonar via the command system. The fuze is set with the rocket in the tube. The rockets have two different types of motors, designed to provide different ranges. The rocket has a flat, low trajectory, in order to reduce the reaction time available to the target.

Specifications

Weight of launcher (excluding rockets): 3.8 t
Traverse: 360° at 30°/s
Elevating speed: 27°/s

Manufacturer/Contractor

Bofors Underwater Systems, Sweden.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

MEL RAPIDS

The ESM system is RAPIDS (RAdar Passive IDentification System), which covers the frequencies 2-18 GHz in four bands. It is claimed to be capable of tracking ten signals, locking on to any three and locating the emitter bearing with an accuracy of 3°. There is a library of 64 platforms and 256 emitters.

ELECTRONIC COUNTERMEASURES (ECM)

MEL Scimitar ECM system

Scimitar was supplied to HDW for installation in these ships by Signaal. (Scimitar was originally developed by the British company, MEL; related systems are Signaal's Reprogrammable Advanced Multimode Shipborne ECM System (RAMSES) and the Canadian SLQ-503.) Scimitar is a modular naval electronic countermeasures system designed to provide protection against radar threats. It is an integrated responsive jammer capable of long-range jamming of search radars and the deception of missiles once launched.

Scimitar is capable of high pulse and CW Effective Radiated Power (ERP). Multimode jamming operation is possible with multitarget handling capability. There are two antennas in small 'egg-shaped' radomes on each side of the ship, at the end of the yard-arms.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

Lekir *(26). Unlike the Colombian ships the Malaysian corvettes do not have a helicopter hangar. Large radar is Signaal DA08 with Signaal 'egg' housing a WM22 fire-control radar forward of the mast. To the left of the 'egg' is the antenna for the Racal-Decca TM1226C navigation radar* (H & L van Ginderen Collection)

DECOYS

CSEE DAGAIE Mk 2 countermeasures system

There is one CSEE DAGAIE Mk 2 ten-barrelled, trainable launcher which can be loaded with either IR or chaff rockets. The firing sequence runs automatically, once triggered by a missile alarm from a variety of sources, such as radar, ESM systems, or optical sights, thus providing a very short reaction time. The firing direction is optimised in accordance with the threat bearing, wind speed and direction, ship heading and speed data.

The launching of radar and IR decoys is so arranged that advanced mixed-guidance missile systems cannot discriminate them and thus collocation of both decoys is achieved. The installation is a double mounting and comprises two trainable mountings carrying 10 replaceable containers (suitcases), each of which is loaded with either 3 to 5 and 8 to 14 μm IR or I/J-band chaff projectiles.

A wide range of ammunition is provided by Etienne Lacroix Défense providing seduction, distraction and seduction/dissimulation modes. The electromagnetic decoys are normally based upon aluminised fibreglass chaff with rapid bloom time and they cover the I and J frequency bands. The infra-red decoys cover both the 3-5 and the 8-14 μm bands.

Specifications

Traverse: 330° at 21°/s
Average reaction time: Within 4 s
REM rocket dimensions: 850 × 127 mm (33.5 × 5 in)
Rocket weight: 13 kg (28.66 lb)
Container dimensions: 900 × 130 mm (35.4 × 5.1 in)
Container weight: 20 kg (44.1 lb)
LIR/LEM container dimensions: 780 × 630 × 134 mm (30 × 24.8 × 5.3 in)

Manufacturer/Contractor

CSEE Défense, Paris, France.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Sensor Weapon Control and Command System (SEWACO)

SEWACO is an integrated sensor, weapon and command system built around a common command and control (C^2) system. At its heart is the DAISY-MA C^2 system which is designed to present raw and/or processed sensor data from search and fire-control radars together with IFF, sonar, electronic warfare and electro-optic systems to create a picture of the tactical situation. The data may also be used to designate targets to weapon systems and to assist in operations with auxiliary functions such as ASW helicopter direction and tactical navigation.

DAISY-based SEWACO systems, such as the one installed in the Malaysian FS 1500s use the earlier generation of Signaal mainframe architecture SMR computers. The Malaysian ships also use the CIDIS (Combat Information Display System), which features software-driven Vertical Display Consoles (VDC) and Horizontal Display Consoles (HDC).

In Malaysia's FS 1500s, the SEWACO works in conjunction with LIOD electro-optic directors, DA08 search radar and the WM22 fire-control radar.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

Link YM

The RMN purchased Link YM, which was developed in the UK by Ferranti as a digital link suitable for sale to non-NATO countries for naval and aircraft use. Different users have versions tailored to their own needs; Link YM, for example, is exclusive to the RMN. Link Y, generally, uses a standard message format of two 24-bit words and a transmission speed of 300 to 1,200 bits/s.

IFF

US Mk 10.

WEAPONS CONTROL

Signaal WM22

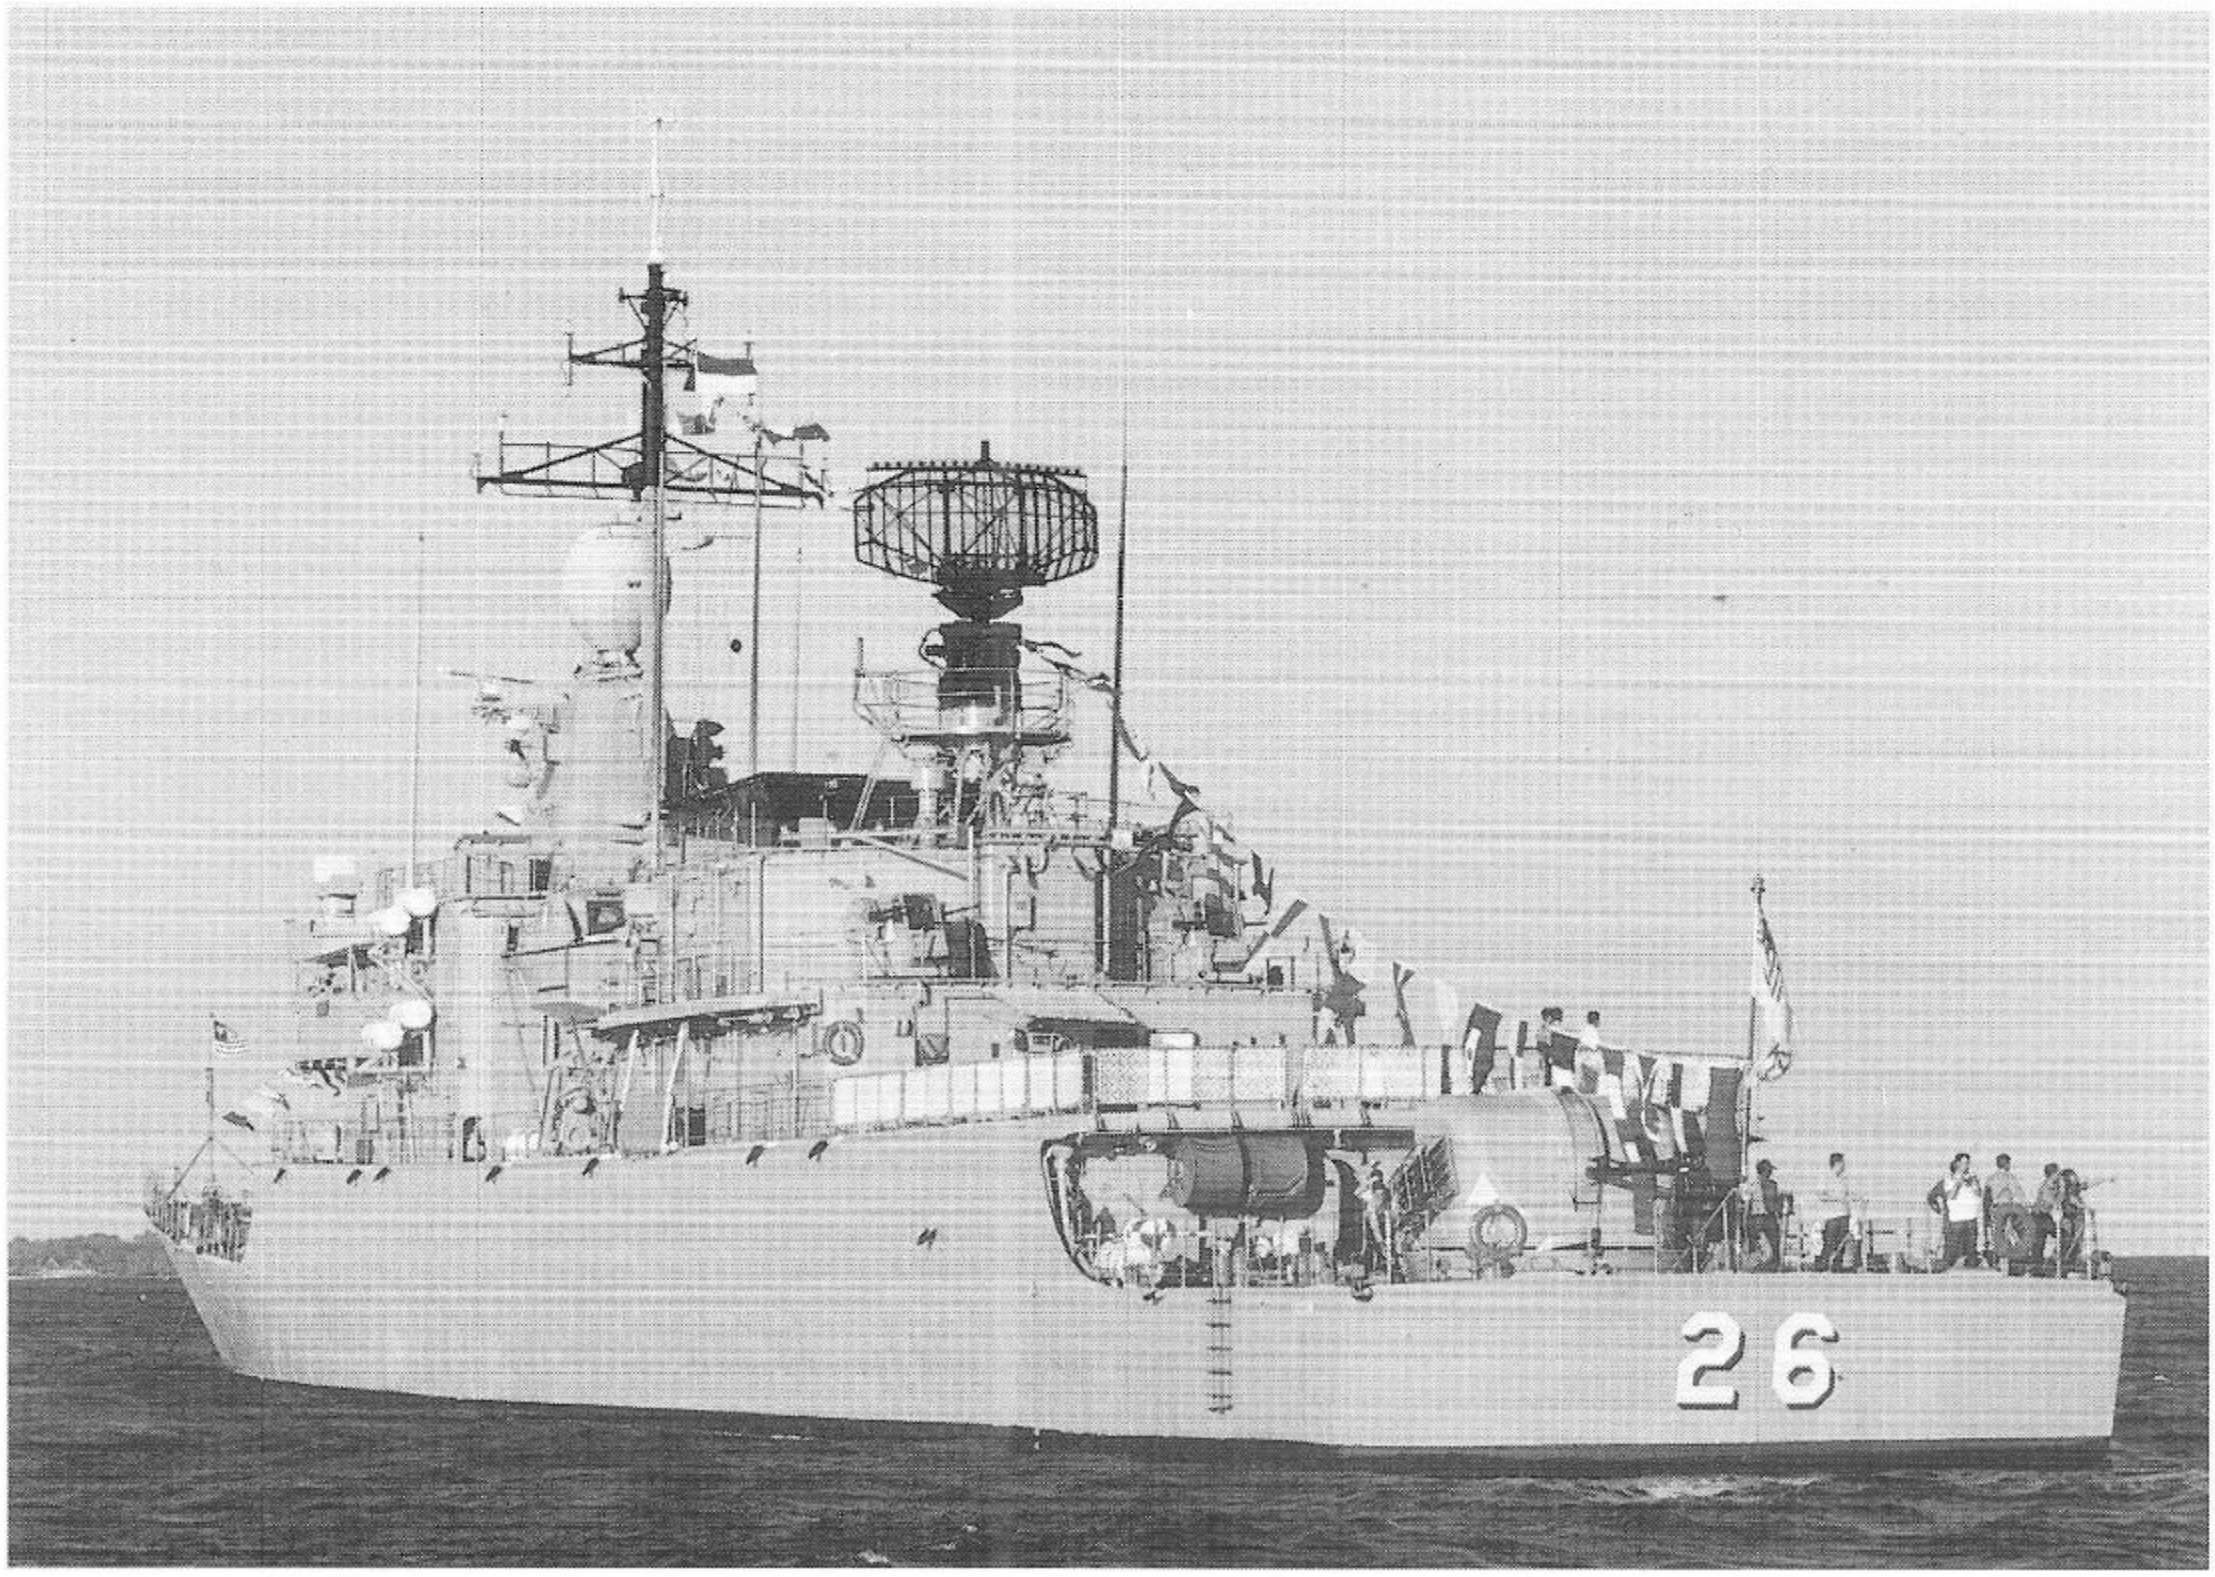
WM22 I/J-band fire-control radar is one of Signaal's family of M20/WM20 multichannel fire-control systems designed for gun and other weapon systems and using a combined radar antenna system. It is designed to provide continuous air and surface warning, navigation aid, combat information, target designation and weapon control. The WM22 features a mainframe architecture with reprogrammable computers. It is capable of simultaneously controlling two medium and/or two light calibre guns. The search radar may include digital MTI while the tracking radar may have a pulse Doppler facility. The radar is capable of automatically tracking an air target and/or two surface targets simultaneously.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

Signaal LIOD electro-optic director

There are two LIOD (Lightweight Optronic Director) directors, a weapon control system designed to



Lekir *(26) second in a class of two corvettes built for the Royal Malaysian Navy by HDW in Germany in 1983-84. The ships are German-designed and -built, have French and Swedish weapons, and British and Dutch electronics* (Jane's)

conduct automatic or manual rate-aided tracking of an air and surface target while controlling two or more dual-purpose guns of different types. The system tracks targets moving at up to 800 m/s (2,600 ft/s) and can track large warships at 11 n miles (20 km) and fighter-size aircraft at 5.4 n miles (10 km). It consists of an electro-optical director, one or two TDS directors and a control console. The main director has a TV camera with a field of view of 2 to 20°, an 8 to 12 µm IR camera with a field of view of 1.2/7.5° and an Nd:YAG laser rangefinder. The two cameras operate to the CCIR standard. The console, which also houses the SMR-MU general purpose computer, receives data not only from the electro-optic systems but also from the ship's reference systems. Tracking is by the optical contrast technique whereby the target is tracked against its background as viewed by a TV or infra-red camera. The TV camera has automatic filters to adjust for light conditions. Alternatively a correlation tracker can be implemented which is capable of automatic target acquisition. Range information is provided by a laser rangefinder. Alternatively a laser-tracker can be fitted. Both the camera and rangefinder are co-mounted on the director head unit, which is provided with appropriate servos and anti-vibration mountings. The daylight version is fitted with a TV camera and laser, while the high-performance model has a TV camera, infra-red camera and laser rangefinder.

Specifications

Director
Traverse: 360° at 130°/s
Elevation: −30 to +115° at 130°/s

Laser rangefinder
Beam divergency: 1.2-1.5 µrad
Pulse length: 20 ns
Max repetition frequency: 10 Hz
Fields of view: 3-30° (TV camera); 3° (IR camera)

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

SONARS

STN Atlas DSQS-21CZ

DSQS-21CZ is a hull-mounted, medium-frequency, active search and attack sonar. It employs computer-aided detection, classification and tracking, with information presented on colour CRT displays to permit Doppler coding and discrimination of data on the integrated displays.

Specifications

Diameter of transducer arrays: 1 m (3.28 ft)
Number of pre-formed beams: 32

Manufacturer/Contractor

STN Atlas Elektronik, Bremen, Germany.

AVIATION

HELICOPTERS

Specifications

Flight deck: 17.3 × 11.3 m (57 × 37 ft)
Hangar: There is no hangar (see 'Modernisation') but the ship has refuelling and rearming facilities
Helicopter: The RMN operates a small number of Westland Wasp helicopters, which can use the flight deck

Westland Wasp HAS Mk 1

Specifications

Dimensions:
main rotor diameter: 9.83 m (32.25 ft)
tail rotor diameter: 2.29 m (7.5 ft)
fuselage length: 9.24 m (30.33 ft)
height to top of rotor hub: 2.72 m (8.92 ft)
Weights:
empty: 1,566 kg (3,452 lb)
max take-off: 2,495 kg (5,500 lb)
Performance:
max level speed (sea level): 104 kts (193 km/h)
economic cruising speed: 96 kts (177 km/h)
max range: 263 n miles (487 km)
Power plant: 1—710 ehp (derated) Rolls-Royce/Bristol Nimbus 503 turboshaft
Avionics: PTR 170 and PV 141 VHF and UHF homing radio with standby UHF
Weapons: 1 Mk 46 or 2 Mk 44 torpedoes or 2 AS.12 anti-ship missiles

PROPULSION

Specifications

System: Diesel
Main machinery: 4 MTU 20V 1163 TB92, 17.2 MW (23,400 hp)
Shafts: 2
Propellers: 2 five-bladed, controllable pitch

FURTHER INFORMATION

PROGRAMME

The order for these two ships was placed in February 1981 and fabrication began early 1982. They were both launched on the same day (14 May 1983) and commissioned on the same day (15 August 1984). There was some discussion of an order for a second pair but this was shelved.

They are rated as corvettes by the RMN even though they are actually larger ships than *Rahmat* (24), which is rated as a frigate.

DESIGN

The basic design is the same as that of the Colombian ships, but with some important differences. The RMN required that the ships should be able to remain afloat and continue to manoeuvre with two adjacent watertight compartments flooded. This resulted in an additional compartment between the two engine rooms and an increase in hull length of some 2 m (6.5 ft). The Malaysian ships also have an NBC citadel, with airlocks and filters, which are not required by the Colombians.

SYSTEM INTEGRATION

Systems integration in the Malaysian corvettes was subcontracted to Signaal. The work went rather more smoothly than on the Colombian ships, possibly because the lessons from that experience were fed across.

MODERNISATION

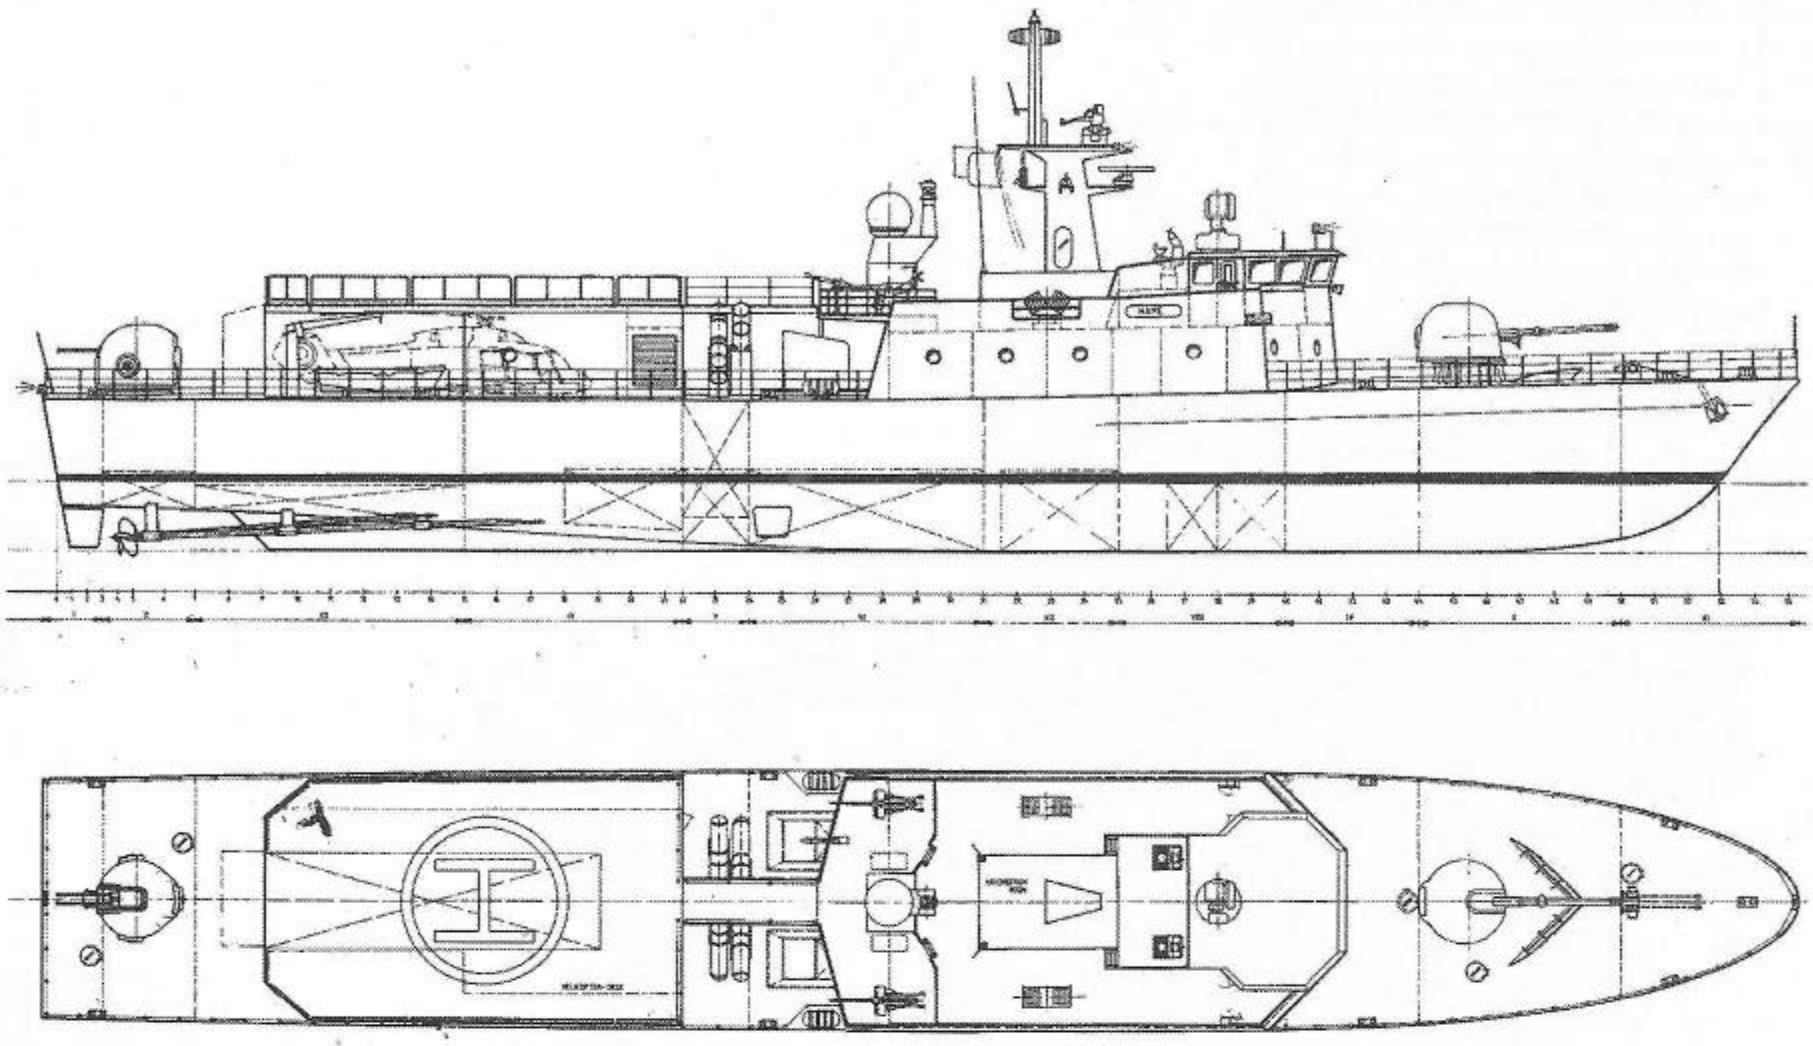
These two ships may be fitted with telescopic hangars in due course.

GUNS

The RMN was the first naval customer for the Creusot-Loire 100 mm Compact gun, taking delivery of four: two for the two FS 1500 corvettes delivered and two for either the possible order for a further two FS 1500s, or alternatively for mid-life refits of *Rahmat* and *Hang Tuah.* In the event, none of these has happened and the 100 mm turrets were installed in the 'Musytari' class patrol ships, instead.

LÜRSSEN 62 m CORVETTE

OVERVIEW



Two views of Lürssen's 62 m design. Note, in particular, the space occupied by the helicopter in the hangar (Fr Lürssen)

The 62 m design is one of a series of warship designs from the German company, Fr. Lürssen of Bremen-Vegesack. The three versions currently in service are generally similar, being virtually the same length: Bahrain — 62.95 m (206.52 ft); Singapore — 62.4 m (204.7 ft); UAE — 63 m (206.7 ft). They also have very similar armament and sensor fits. All have a steel hull and aluminium superstructure.

The major difference is that two of the classes — the Bahreini 'Al Manama' and the UAE 'Muray Jib' — have a flight deck and hangar, making them among the smallest ships to have such a capability. The flight deck is approximately 14.9 m (49 ft) long and 9.3 m (30 ft) wide and is on the roof of the hangar, the helicopter being moved between the two by an elevator.

Pilot's view of the flight deck with the sliding sections open to reveal the hangar below. Note also the twin 40 mm gun on the flight deck
(Fr Lürssen)

AL MANAMA (LÜRSSEN 62)

GENERAL SPECIFICATIONS

Country of origin: Germany
Operator: Bahrain
Type: Lürssen 62

Class: AL MANAMA

Purchased: 2
Active: 2

Displacement:
at ½ provisions: 536 t
full load: 632 t

Dimensions
Length: 62.95 m (206.52 ft)
Beam: 9.30 m (30.51 ft)
Draught: 2.90 m (9.51 ft) (at propeller)

Speed:
at 536 t: 34.70 kts
at 632 t: 32 kts
Range: 4,000 n miles at 16 kts

Complement: 43 (7 officers)

SHIPS

AL MANAMA (50)
Builder Lürssen Werft, Bremen-Vegesack, Germany
Commissioned 14 Dec 1987

AL MUHARRAQ (51)
Builder Lürssen Werft, Bremen-Vegesack, Germany
Commissioned 3 Feb 1988

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Aerospatiale MM 40 Exocet

Four launcher-containers for Aerospatiale MM 40 Exocet are located in the waist, immediately forward of the hangar. As is usual with such missiles, they are pointed to the opposite side of the ship, at an angle of 12° to the horizontal, with the motor exhaust being ejected over the side. Targets are acquired by the ship's sensors and the operator then aligns the axial gyros in the target's direction and begins the initiation sequence in which the thermal battery is turned on, the mechanical safety locks are released, the booster is ignited and the umbilical cord is broken, the total process taking 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change in the course of its flight. Once the missile has cleared the launcher-container, the sustainer carries it into the cruise phase, during which it travels towards the general location of the target at a height of about 100 m (328 ft), which is low enough to reduce the chance of detection but adequate for target acquisition. Once the target is detected the missile descends to 9 to 15 m (29.5 to 49 ft) in the approach phase before descending to 8 m (26 ft) (2 to 5 m (6.56 to 16 ft) in a calm sea) for a sea-skimming terminal phase. A salvo may be fired in 12 to 20 seconds.

Specifications
MM40 Block 1
Length: 5.78 m (19 ft)
Diameter: 35 cm (13.7 in)
Wing span: 1.13 m (3.7 ft)
Weight: 855 kg (1,885 lb)
Speed: Mach 0.9
Range: 2-38 n miles (4-70 km)
Guidance: Inertial and active radar

GUNS

OTOBREDA 76 mm (3 in)/62 Compact

One OTOBREDA 76 mm/62 Compact is mounted in 'A' position on the foredeck for use in either air defence or anti-surface roles. If the weapon is designated to the air-defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission.

Specifications
Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres
Traverse: 360° at 70°/sec
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

OTOBREDA 40 mm L/70 Compact (Type 70) twin mounting

One OTOBREDA 40 mm L/70 Compact (Type 70) twin mounting is mounted on the quarterdeck. The Compact twin 40 mm mounting is designed for use against high-performance combat aircraft, against anti-ship missiles and for surface engagements.

Specifications
Traverse: 360° (nominal) at 90°/s
Elevation: −13 to +85° at 60°/s
Rate of fire: 600 rds/min/mount
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 4,000 m (2.2 n miles)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Oerlikon GAM-BO1 20 mm/93 cannon

There are fittings to mount two single, manually operated Oerlikon GAM-BO1 20 mm/93 cannon on the small platforms on the upper deck either side of the helicopter control cabin. There is, however, no photographic evidence that these have ever been installed.

Specifications
Calibre: 20 mm
Length of barrel: 93 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 1.5 km (4,920 ft)
anti-air: 1,150 m (3,800 ft)
Rate of fire: 1,000 rds/min
Round weight: 241 g (0.5 lb)
Projectile: 122 g (0.26 lb)
Elevation: −15 to +90°

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Cutlass E ESM system

Cutlass E is designed for operation in very dense signal environments, receiving signals in the 1 to 18 GHz frequency range, measuring their parameters, comparing these with those in the radar library which contains the parameters of 2,000 radars, and displaying the information, all within one second. The EW operator is presented with a tabular display for threat identity and threat evaluation and a tactical display giving a pictorial representation of the RF environment. Selected digital outputs can be sent to other local systems and hard copy printout of the intercepted radar is also available. The tabular display can indicate 150 intercepts, in the order of priority. Cutlass is wide open in both bearing and frequency; that is, it does not employ sweep techniques, giving a very high intercept probability (nearly 100 per cent). Cutlass B1 uses the Cutlass processor and an Instantaneous Frequency Measurement (IFM) receiver. It has a 32-element array antenna to provide bearing measurement by phase analysis techniques. This antenna also provides RF for the IFM. In both systems the processor is provided with fast and accurate information on incoming pulses.

Specifications

Frequency coverage: 2-18 GHz
Accuracy: 2° RMS in bearing
Coverage: 360° azimuth; +40 to −10° elevation
Pulse density capability: 500,000/s
Radar store capability: 2,000 modes

Manufacturer/Contractor

Racal Radar Defence Systems, Chessington, Surrey, UK.

ELECTRONIC COUNTERMEASURES (ECM)

Racal Cygnus B1 jammer

The Cygnus radar jammer operates in the I or J-bands and was designed for integration with Cutlass ESM equipment. Cygnus uses both responsive noise and deception jamming to provide an effective jamming capability against all types of radar including early warning, target acquisition and missile guidance. It has a narrow beamwidth giving high effective radiated power (300 kW) and is kept on target by a built-in, interferometer-type, passive tracking system in both azimuth and elevation. The tracking system may also be used to relay accurate position data to systems of other ships. RF received by the tracking antennas is also used as the basis of transmitted RF and modulation and power management is under the control of a processor which also controls the tracking procedure. Types of modulation sequence available include range gate pull off and false target generation.

Manufacturer/Contractor

Racal Radar Defence Systems, Chessington, Surrey, UK.

DECOYS

CSEE DAGAIE Mk 2 countermeasures system

There are two CSEE DAGAIE Mk 2 ten-barrelled, trainable launchers mounted on the upper deck either side of the mast. These can be loaded with either infra-red (IR) or chaff rockets. The firing sequence runs automatically, once triggered by a missile alarm from a variety of sources, such as radar, ESM systems, or optical sights, thus providing a very short reaction time. The firing direction is optimised in accordance with the threat bearing, windspeed and direction, ship heading and speed data.

The launching of radar and IR decoys is so arranged that advanced mixed-guidance missile systems cannot discriminate them and thus collocation of both decoys is achieved. The installation is a double mounting and comprises two trainable mountings carrying 10 replaceable containers (suitcases), each of which is loaded with either 3-5 and 8-14 µm IR or I/J-band chaff projectiles.

A wide range of ammunition is provided by Etienne Lacroix Défense, providing seduction, distraction and seduction/dissimulation modes. The electromagnetic decoys are normally based upon aluminised glass fibre chaff with rapid bloom time and they cover the I and J frequency bands. The infra-red decoys cover both the 3-5 and the 8-14 µm bands.

Specifications

Traverse: 330° at 21°/s
Average reaction time: Within 4 s
REM rocket dimensions: 850 × 127 mm (33.5 × 5 in)
Rocket weight: 13 kg (28.66 lb)
Container dimensions: 900 × 130 mm (35.4 × 5.1 in)
Container weight: 20 kg (44.1 lb)
LIR/LEM container dimensions: 780 × 630 × 134 mm (30 × 24.8 × 5.3 in)

Manufacturer/Contractor

CSEE Defénse, Paris, France.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

CSEE Panda Mk 2

There are two Panda Mk 2 directors. This is an autonomous deck-mounted device for use in air defence operations as the primary system and can rotate through a nominal 360° on a mounting bracket with electrical connectors. This element consists of a binocular optical unit with auxiliary sight, gyrometric units, bearing and elevation electrical units, servo controls, a ballistics computer on the right of the mounting and control and communications units. The optical sensor offers × 8 and × 2.5 magnification with fields-of-view of 19° and 6° respectively.

It operates in two modes: surveillance/target tracking and fire control. In the former the target may be designated by the ship's radar and the director slews to face it. The target is acquired visually and identified, then tracked by the operator who moves the director with a joystick. In the fire-control mode the operator selects air or surface engagement and inserts target range data. The relevant guns are then slaved to the director whose operator then conducts the engagement.

In Panda Mk 2 the optical sensor is supplemented by a Philips low-light TV/IR electro-optic director.

Specifications

Height: 1.35 m (4.4 ft)
Width: 1.5 m (4.9 ft)
Weight: 480 kg (1,058 lb)
Traverse: 360° at 60°/s
Elevation: −25 to +65° at 60°/s

Manufacturer/Contractor

CSEE Défense, France.

RADARS

Ericsson Sea Giraffe 50 HC

The Sea Giraffe is used for air and surface search, with the antenna sited at the masthead.

Specifications

Operating frequency: G/H-band
Output power: 60 kW; average power 1,200 W
Antenna rotation rate: 60/30 rpm
Instrumented range: 25, 50, 100 and 150 km
Tracking capacity: More than 30 automatically initiated air targets; more than 50 manually initiated surface targets
Antenna sidelobe levels: −45 dB
Beamwidth, bearing: 1.8°
Elevation coverage: 0-70°
Accuracy: 20 m range; 0.3° azimuth

Manufacturer/Contractor

Ericsson Radar Electronics AB, Ground Systems Division, Molndal, Sweden.

Racal-Decca 1226

Specifications

Role: Navigation
Band: I
Beam: 1.2°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25/1.0 µs
Scan rate: 28 rpm
Typical range: 48 n miles (88.8 km)

Manufacturer/Contractor

Racal-Decca, UK.

CelsiusTech 9LV 331

9LV 331 (LV = *lucht varn*) consists of one 9LV100 electro-optic director and one 9LV200 radar/TV/laser/IR fire-control director. It is capable of simultaneous engagement of several targets, including one air target. It controls 40 and 76 mm guns and Exocet.

Manufacturer/Contractor

CelsiusTech, Sweden.

AVIATION

HELICOPTERS

Specifications

Flight deck: 14.9 × 9.3 m (49 × 30 ft)
Hangar: The hangar accommodates one helicopter; see 'Further Information'
Helicopters: 1 Eurocopter BO-105

One Eurocopter BO-105

Dimensions
main rotor diameter: 9.84 m (32.28 ft)
tail rotor diameter: 1.90 m (6.23 ft)
length (including main and tail rotors): 11 m (36 ft)
height (top of rotor head): 3.02 m (9.91 ft)
Weights
empty, basic: 1,301 kg (2,868 lb)
max take-off: 2,500 kg (5,511 lb)
Performance (max T-O weight)
never-exceed speed (VNE) at sea level: 131 kts (242 km/h)
max cruising speed at sea level: 129 kts (240 km/h)
best range speed at sea level: 110 kts (204 km/h)
max rate of climb (sea level): 444 m/min (1,457 ft)/min
max operating altitude (2,500 kg): 3,050 m (10,000 ft)
max range:
at sea level: 300 n miles (555 km)
at 1,525 m (5,000 ft): 321 n miles (594 km)
endurance: 3 h 24 min
Power plant: 2 313 kW (420 shp) Allison 250-C20B turboshafts, each with a max continuous rating of 298 kW (400 shp)
Accommodation: 5 (pilot and co-pilot/passenger in front; three persons at rear)
Avionics: A wide variety of avionics is available including weather radar, Doppler and GPS navigation, 360° search radar, FLIR, TV broadcast and microwave datalink

One of the Bahreini Navy Lürssen 62 corvettes. The flight deck measures 14.9 × 9.3 m (49 × 30 ft) and is one of the smallest on any ship. The hangar is beneath the flight deck (Fr Lürssen)

PROPULSION

Specifications

System: Diesel
Main machinery: 4 MTU 20V 538 TB92, 9.42 MW (12,820 hp)
Shafts: 4
Ship's services: 3–170 kVA

FURTHER INFORMATION

PROGRAMME

Two ships were ordered in February 1984 and entered service in February 1988. It was originally planned to purchase SA 365F helicopters and AST-15 SSMs for use with these ships, but this did not occur and BO-105 helicopters are used instead.

MODERNISATION

It is planned to upgrade these ships in 1999, which will include a SAM self-defence system.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84D-1A Block 1C Harpoon

Eight Harpoon anti-ship missile canisters are mounted immediately aft of the superstructure; there are two groups of four launchers each, with one group pointing across the ship to the opposite beam. The missiles are the Block 1C version, which has additional options compared to previous blocks, one of which is to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 lb)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n mile (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg (11,905 lb) thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors
McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

TUBES

B-515 (ILAS-3) 324 mm anti-submarine torpedo launching system

There are two B-515 (also known as ILAS-3) triple mounts on the main deck level with the Satcom dome. The tubes are manually loaded and trained but remotely operated from the combat information centre, although emergency local operation is possible.

Specifications
Length: 3.4 m (11.15 ft)
Height: 1.2 m (3.94 ft)
Width: 1.285 m (4.2 ft)
Weight: 1,050 kg (2,315 lb) (unloaded)

Manufacturer/Contractor
Whitehead, Division of Gilardini SpA.

TORPEDOES

A 244/S
Six A 244/S lightweight anti-submarine torpedoes are carried (no reloads). The seeker in this weapon is the Alenia CIACIO-S which is capable of active, passive or mixed modes for closing on to its target and it can discriminate between decoys and real targets, as well as between target noise and reverberations. It also has a series of preset programmable search patterns and tactical manoeuvres (including re-attack procedures). The computerised homing system also provides for presettable combinations of signal processing, spatial filtering and tactical torpedo manoeuvring. The software may be reprogrammed by the user to meet new tactical conditions. Upon launching, the A 244/S initially steers a straight course and, if the target is not detected, it then begins a search pattern which may be either a spiral between preselected depths or a helix pattern.

Specifications
Length: 2.7 m (8.86 ft)
Diameter: 324 mm
Weight: 215 kg (474 lb) (warshot version)
Warhead: 34 kg (75 lb) shaped charge HBX-3 HE
Propulsion: Electric; silver/zinc batteries
Range: 3.5 n miles (6.5 km)
Speed: 30 kts
Guidance: Active/passive sonar, self-adaptive programmed patterns

Manufacturer/Contractor
Whitehead SpA, Salviano, Italy.

GUNS

OTOBREDA 76 mm (3 in)/62 Super Rapid
There is one OTOBREDA 76 mm (3 in)/62 calibre Super Rapid gun in a single turret immediately forward of the bridge.

Specifications
Elevation: −15 to +85°
Training speed: 60°/s
Elevation speed: 35°/s
Muzzle velocity: 925 m/s (3,034 ft/s)
Rate of fire: 120 rds/min
Weight of shell: 6 kg (13.23 lb)
Range: 8.5 n miles (15.75 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

CIS 50 12.7 mm machine gun**
Four machine guns are carried.
(* CIS = Chartered Industries of Singapore)

Victory *(P-88), nameship of a class of six ships. On the transom is the Thomson-CSF TSM 2064 VDS. Further forward are a triple B515 324 mm torpedo launcher and four Harpoon canisters. The tower mast and the pole topmast carry numerous EW arrays* (H & L van Ginderen Collection)

ELECTRONIC WARFARE SYSTEMS

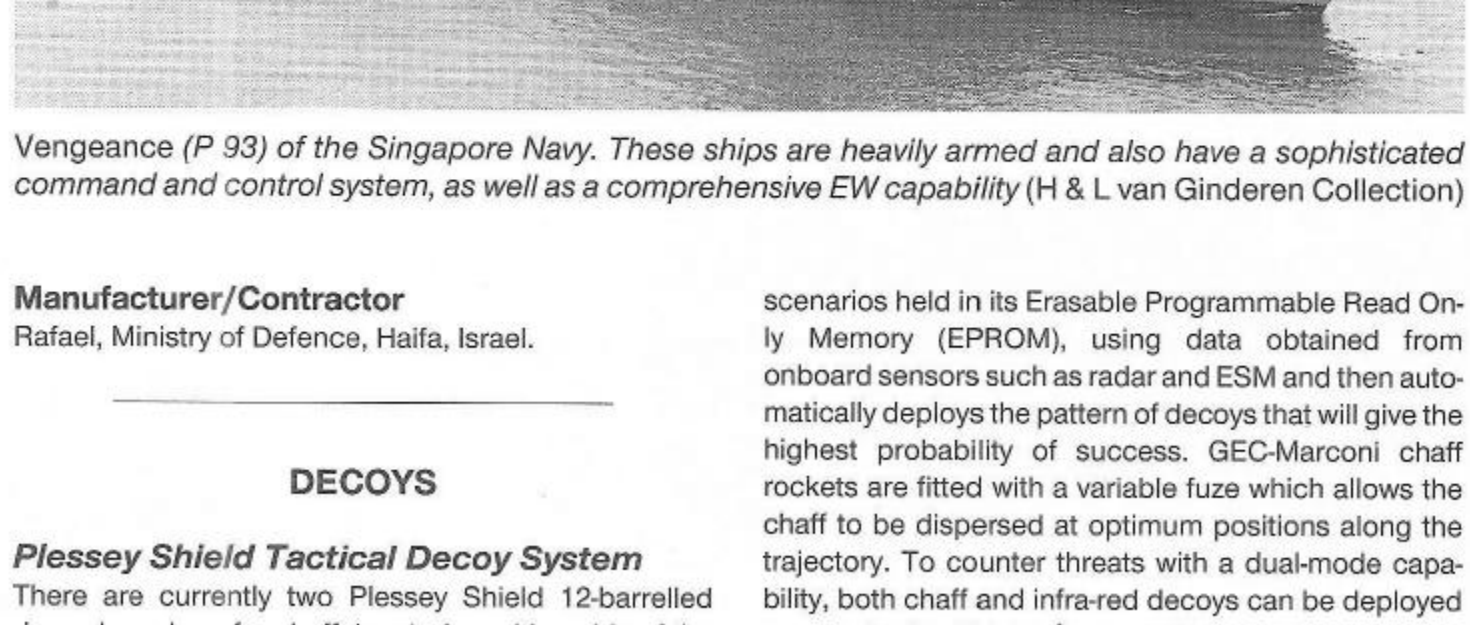
ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Rafael SEWS/RAN-1110 electronic warfare suite
SEWS/RAN-1110 (SEWS = Shiphoused Electronic Warfare System) is a fully integrated, modular and computerised shipborne electronic warfare suite, in which the SEWS elements provide the ESM techniques for the detection, analysis and identification of threat emissions, while the RAN-1110 provides the ECM measures to decoy and/or jam. The ESM subsystem is based on the C-Pearl system with high sensitivity, wide dynamic range and accurate IFM and IDF receivers covering the frequency band of 1 to 18 GHz, and a real-time processing system that analyses the information and identifies the threats by comparing the parameters to a stored emitter library. The receiver data includes frequency, bearings, amplitude, time of arrival, pulsewidth, CW, scan rate and pulse coding. Analysed threat data is displayed superimposed on a map of the area covered, together with true and relative bearing.

Following identification, the ECM subsystem responds automatically according to the threat or as commanded by the operator. It is based on the Shark/ RAN-1101 and consists of two advanced MultiBeam Array Transmitters (MBATs), each covering 180° in azimuth. These transmitters enable immediate positioning of a transmitting beam and are capable of coincidence jamming in the direction of the received threat. Both stabilised and unstabilised MBATs are available.

Specifications
SEWS (ESM)
Spatial coverage: 360° azimuth; 30° elevation
Frequency coverage: 1-18 GHz
Sensitivity: −60 dBm
Dynamic range: 60 dB
Frequency accuracy: 1.5° RMS
Direction accuracy: 2° RMS (high band); 5° RMS (low band)

RAN-1110 (ECM)
Spatial coverage: 360° azimuth; 25° elevation
Frequency coverage: 7.5-18 GHz
ERP: 78 dBm typical
Simultaneous transmission: 16 directions
Beam switching time: 100 ns



Vengeance *(P 93) of the Singapore Navy. These ships are heavily armed and also have a sophisticated command and control system, as well as a comprehensive EW capability* (H & L van Ginderen Collection)

Manufacturer/Contractor
Rafael, Ministry of Defence, Haifa, Israel.

DECOYS

Plessey Shield Tactical Decoy System
There are currently two Plessey Shield 12-barrelled decoy launchers for chaff, located on either side of the superstructure amidships (see 'Modernisation').

Shield is a microprocessor-controlled, fully automatic missile decoy system, which is designed to provide effective protection for various sizes of ship, including fast attack craft, corvettes, frigates and destroyers. On detecting a threat, Shield selects the most appropriate response from up to six million scenarios held in its Erasable Programmable Read Only Memory (EPROM), using data obtained from onboard sensors such as radar and ESM and then automatically deploys the pattern of decoys that will give the highest probability of success. GEC-Marconi chaff rockets are fitted with a variable fuze which allows the chaff to be dispersed at optimum positions along the trajectory. To counter threats with a dual-mode capability, both chaff and infra-red decoys can be deployed automatically. Shield offers four protection modes — confusion; distraction; seduction/breaklock; and seduction dump — and uses two types of decoy — chaff and infra-red — which may be used on their own, or in combination with each other.

Manufacturer/Contractor
Plessey, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Elbit AIO command system

The Elbit Action Information Organisation (AIO) system is based on Elbit's Naval Tactical Command & Control System (NTCCS), which first entered service on Israel's Sa'ar 4.5 FACs. That system was designed to accelerate the decision making process by providing data on potential targets, friendly forces and weapon system status by using inputs from shipborne sensors and those of friendly forces. System highlights include extracting and updating target data, track-while-scan operation, the ability to process two radars simultaneously and real-time handling of up to 50 air and surface targets. It also processes and displays navigation data, exchanges messages with shore-based headquarters and records tactical data for future debriefing.

Manufacturer/Contractor

Elbit Ltd, Haifa, Israel.

Satcom

There is a Satcom terminal.

RADARS

Ericsson Sea Giraffe 150 HC

The Sea Giraffe is used for air and surface search, with the antenna sited at the masthead.

Specifications

Operating frequency: G/H-band
Output power: 60 kW; average power 1,200 W
Antenna rotation rate: 60/30 rpm
Instrumented range: 25, 50, 100 and 150 km
Tracking capacity: More than 30 automatically initiated air targets; more than 50 manually initiated surface targets
Antenna sidelobe levels: −45 dB
Beamwidth, bearing: 1.8°
Elevation coverage: 0-70°
Accuracy: 20 m (65.6 ft) range; 0.3° azimuth

Manufacturer/Contractor

Ericsson Radar Electronics AB, Ground Systems Division, Molndal, Sweden.

Kelvin Hughes 1007

Specifications

Role: Navigation
Band: I/J
Beam: 1.0 × 18°
Peak power: 25 kW
Gain: 31 dB
Pulsewidth: 0.08/0.3/0.8 μs
PRF: 1,600/800/400 pps
Scan rate: 26 rpm

Manufacturer/Contractor

Kelvin Hughes, UK.

Elta EL/M-2221(X)

The fire-control system is based upon the Elta EL/M-2221GM I/J (8-20 GHz) and K-band (20-40 GHz), monopulse, coherent tracking and illumination radar which is supplemented, on the right-hand side of the mounting, by a Rafael thermal imager. The system features a dish antenna with front feed on four 'legs', the 700 kg (2,296 lb) antenna having an elevation of −25 to +85°. Search, acquisition and tracking may be conducted in either I/J or K-bands and the system can track the target or targets. The system controls the guns with the assistance of a separate ballistic computer. The radar's below-deck units consist of a servo-control and transceiver cabinets and data is fed into the main processing and control unit with overall control conducted through an IAI MBT Systems and Space Technology Fire-Control Console (FCC).

Manufacturer/Contractor

Elta. Israel.

SONAR

Thomson Sintra TSM 2643 Salmon

TSM2643 Salmon is a compact, active, Variable-Depth Sonar (VDS), based on an acoustic array of 24 staves in a streamlined fish, with a towing winch, transmitter and receiver unit and operator console with colour display. Embedded facilities include passive listening, sound ray tracer, integrated on-board simulator, and acoustic propagation prediction.

Specifications

Acoustic array: 24 identical staves of 7 transducers, weight 260 kg (573 lb)
Frequency: 19 kHz approximately
Transmitter: Omnidirectional transmission in CW and FM modes
Receiver: 36 preformed beams; advanced processing coherent in FM with pulse compression and spectrum analysis (FFT) in CW

Manufacturer/Contractor

Thomson Sintra ASM, France.

PROPULSION

Specifications

System: Diesel
Main machinery: 4 MTU 16V 538 TB93, 11 MW (15,020 hp)
Shafts: 4

FURTHER INFORMATION

PROGRAMME

Ordered in June 1986 to a Lürssen MGB 62 design, similar to the ships for Bahrain and UAE but without the helicopter facilities.

DESIGN

The design is essentially that of the Lürssen 62, as supplied to Bahrain and the UAE, but with the helicopter facilities removed. Despite the removal of the hangar, flight deck and elevator, however, the ships have demonstrated poor roll characteristics, almost certainly due to the large and heavy mast, which only exists in the Singaporean vessels.

MODERNISATION

The first priority appears to be to reduce the rolling, which has been a problem since the ships were commissioned. A roll-damping system was fitted in one ship in 1992 and is still under trial. It is possible that the mast may have to be rebuilt and reduced in size, possibly being replaced by two lighter, lattice masts.

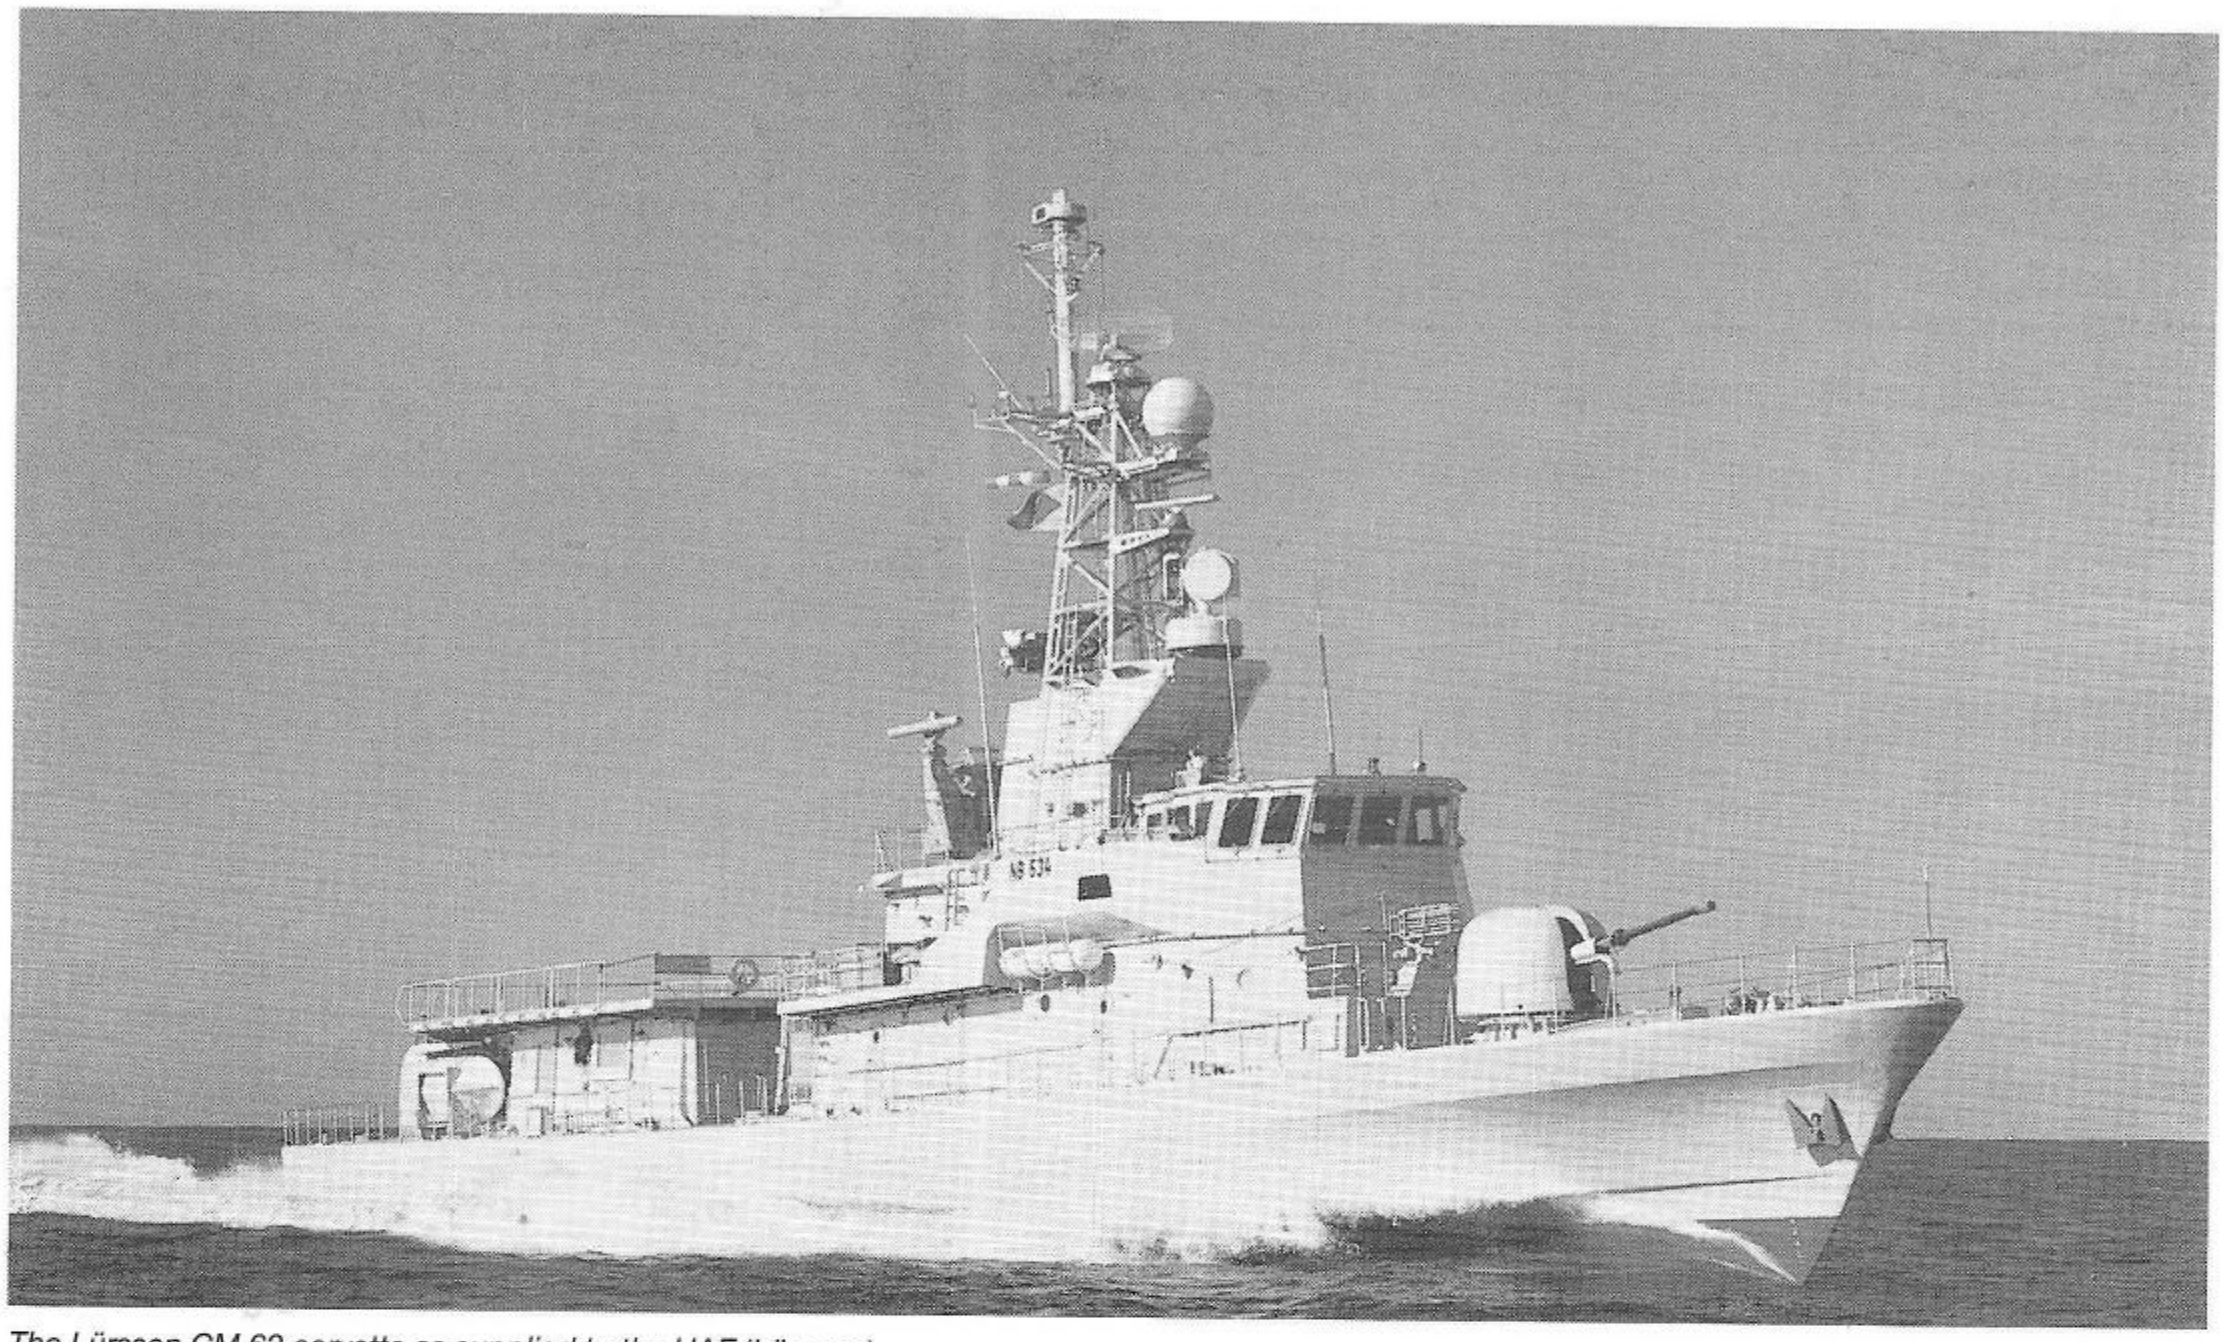
It is also intended to install a close-range missile defence system, probably either Barak I or Matra Simbad CIWS, which would include a second fire-control radar on the platform aft of the mast. It is also planned to replace the Plessey Shield by two twin Rafael long-range chaff launchers, which would be positioned below the bridge wings.

The Elbit EL/M-2221(X) fire-control system is currently used to control the guns, but it was originally designed to be part of the Barak SAM system. It will, therefore, be fully integrated into the system, when Barak is installed. It is also intended that a second set will be fitted aft of the mast to provide a second channel of fire.

DEPLOYMENT

These six corvettes form 188 Squadron, which is part of Coastal Command, whose primary peacetime mission is anti-piracy patrols, a particularly pressing task in these waters.

MURAY JIB (LÜRSSEN 62)



The Lürssen CM 62 corvette as supplied to the UAE (Lürssen)

GENERAL SPECIFICATIONS

Country of origin: Germany
Operator: UAE
Type: Lürssen 62

Class: MURAY JIB

Purchased: 2
Active: 2

Displacement:
full load: 708.5 t

Dimensions
Length: 64.50 m (212 ft)
Beam: 9.80 m (32 ft)
Draught: 3.10 m (10.2 ft)

Speed: 34 kts
Range: 3,930 n miles at 15 kts

Complement: 43 (7 officers)

SHIPS

MURAY JIB (CM 01)
Builder Lürssen, Bremen-Vegesack, Germany
Commissioned Nov 1990

DAS (CM 02)
Builder Lurssen, Bremen-Vegesack, Germany
Commissioned Jan 1991

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Aerospatiale MM 40 Exocet

The 'Muray Jib' class is equipped with 8 MM 40 sea skimming anti-ship missiles in two groups of two, firing across the ship.

Specifications
MM 40 Block 2
Length: 5.80 m (19 ft)
Diameter: 35 cm (13.7 in)
Wing span: 1.13 m (3.7 ft)
Weight: 870 kg (1,918 lb)
Speed: Mach 0.9
Range: 2-40.5 n miles (4-75 km)
Warhead: 155 kg (341.7 lb) HE frag
Fuze: Impact/proximity
Guidance: Inertial and active radar

Manufacturer/Contractor
Aerospatiale, France.

SURFACE-TO-AIR MISSILES (SAM)

Thomson-CSF Crotale Navale Modulaire

The eight-cell launcher for the Crotale Navale Modulaire system is located on the quarterdeck, immediately aft of the helicopter platform. The missile (designated R440N) can manoeuvre at up to 25 *g* in each axis and can reach Mach 2.3 in 2.5 seconds. Modular Crotale Naval uses the same missile as the original system but the launcher and the director are separated and the electronics are dispersed around the ship. The launcher, which is 3.87 m (12.7 ft) high, has eight containers, together with the infra-red localiser, and weighs 4.2 tonnes, while the below-decks electronics, including the launch control unit, weigh 850 kg (1,874 lb). The director weighs 800 kg (1,764 lb) and has the radar antenna on the right-hand side. The electro-optic trackers are on the left-hand side together with the missile guidance antenna. The control console is in the CIC. There is an eight-round reload system for Crotale Navale Modulaire, but does not appear to be installed in these UAE ships.

Specifications
Missile
Length: 2.9 m (9.5 ft)
Diameter: 16 cm (6.3 in)
Wing span: 54 cm (21 in)
Weight: 84 kg (185 lb)
Speed: Mach 2.4
Range: 700 m to 13 km (0.3 to 7 n miles)
Altitude: 4,000 m (13,120 ft)

Manufacturer/Contractor
Thomson-CSF, France.

GUNS

OTOBREDA 3 in (76 mm)/62 Mod 6 Super Rapid

There is one OTOBREDA 76 mm (3 in)/62 calibre Super Rapid gun in a single turret immediately forward of the bridge.

Specifications
Elevation: −15 to +85°
Training speed: 60°/s
Elevation speed: 35°/s
Muzzle velocity: 925 m/s (3,034 ft/s)
Rate of fire: 120 rds/min
Weight of shell: 6 kg (13.23 lb)
Range: 8.5 n miles (15.75 km)
Ammunition carried: 400 rds

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Signaal/General Electric SGE-30 30 mm Goalkeeper close in weapons system
One Signaal/General Electric 30 mm 7-barrelled Gatling Goalkeeper close in weapons system is mounted at the after end of the main superstructure. Goalkeeper is an autonomous, fully automatic system, consisting of a General Electric Sea Vulcan 30 gun, I-band search radar, I/K-band tracking radar, TV camera and ancillaries. The Sea Vulcan 30 is based upon the electrohydraulically powered GAU-8/A 30 mm seven-barrel, Gatling gun, with each barrel firing once during each revolution of the barrel cluster. The gun is very reliable, with 33,000 mean rounds between stoppages. The mounting has an ammunition capacity of 1,190 rounds carried in a linkless system using a feed and storage drum, which is claimed to be sufficient for several target engagements before reloading is necessary. The warhead kill capability of Goalkeeper against anti-ship missiles is achieved by use of APDS (Armour-Piercing Discarding Sabot) rounds which have high-density, tungsten-alloy penetrators. For 'soft' targets, HEI and TP types of ammunition can be used.

The I-band search radar uses a 2,050 × 280 mm linear array antenna with an integrated sidelobe suppression antenna. The antenna rotates at 60 rpm and has a horizontal beamwidth of 1.7° and a vertical beam width of 60°. The radar is powered by a water-cooled, synthesiser-driven, TWT transmitter with high output power for greater frequency and PRF flexibility in the face of ECM threats.

Specifications
Calibre: 30 mm
Muzzle velocity: 1,020 m/s (3,345 ft/s) (TP, HEI); 1,150 m/s (3,772 ft/s) (APDS)
Traverse: 360°
Elevation: −25 to +85°
Mounting weight: 6,800 kg (14,991 lb)
Crew: 0
Range: 200 m to 3 km (1.61 n miles)
Rate of fire: 4,200 rds/min
Ammunition: 369 g (813 lb) (TP, HEI, HEISD, API, MPDS)
Ammunition carried: 3,600 rds

Manufacturers/Contractors
Hollandse Signaalapparaten BV, Hengelo, Netherlands (system/radar).
General Electric Company, Armament Systems Department (gun).

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Racal-EMI Cutlass E ESM system
Cutlass E is designed for operation in very dense signal environments, receiving signals in the 1 to 18 GHz frequency range, measuring their parameters, comparing them with those in the radar library which contains the parameters of 2,000 radars, and displaying the information — all within one second. The EW operator is presented with a tabular display for threat identity and threat evaluation and a tactical display giving a pictorial representation of the RF environment. Selected digital outputs can be sent to other local systems and hard copy printout of the intercepted radar is also available. The tabular display can indicate 150 intercepts, in the order of priority. Cutlass is wide open in both bearing and frequency: that is, it does not employ sweep techniques, giving a very high intercept probability (nearly 100 per cent). Cutlass B1 uses the Cutlass processor and an Instantaneous Frequency Measurement (IFM) receiver. It has a 32-element array antenna to provide bearing measurement by phase analysis techniques. This antenna also provides RF for the IFM. In both systems the processor is provided with fast and accurate information on incoming pulses.

Specifications
Frequency coverage: 2-18 GHz
Accuracy: 2° RMS in bearing
Coverage: 360° azimuth; +40 to −10° elevation
Pulse density capability: 500,000/s
Radar store capability: 2,000 modes

Manufacturer/Contractor
Racal Radar Defence Systems, Chessington, Surrey, UK.

ELECTRONIC COUNTERMEASURES (ECM)

Racal-EMI Cygnus B1 jammer
The Cygnus radar jammer operates in the I or J-bands and was designed for integration with Cutlass ESM equipment. Cygnus uses both responsive noise and deception jamming to provide an effective jamming capability against all types of radar including early warning, target acquisition and missile guidance. It has a narrow beamwidth giving high effective radiated power (300 kW) and is kept on target by a built-in, interferometer type, passive tracking system in both azimuth and elevation. The tracking system may also be used to relay accurate position data to systems of other ships. RF received by the tracking antennas is also used as the basis of transmitted RF and modulation and power management is under the control of a processor which also controls the tracking procedure. Types of modulation sequence available include range gate pull off and false target generation. A total of 59 charges is carried.

Manufacturer/Contractor
Racal Radar Defence Systems, Chessington, Surrey, UK.

DECOYS

CSEE DAGAIE Mk 2 countermeasures system
There are two CSEE DAGAIE Mk 2 ten-barrelled, trainable launchers, which can be loaded with either infrared (IR) or chaff rockets. The firing sequence runs automatically, once triggered by a missile alarm from a variety of sources, such as radar, ESM systems or optical sights, thus providing a very short reaction time. The firing direction is optimised in accordance with the threat bearing, wind speed and direction, ship heading and speed data.

The launching of radar and IR decoys is so arranged that advanced mixed-guidance missile systems cannot discriminate them and thus collocation of both decoys is achieved. The installation is a double mounting and comprises two trainable mountings carrying 10 replaceable containers (suitcases), each of which is loaded with either IR or I/J-band chaff projectiles.

A wide range of ammunition is provided by Etienne Lacroix Défense providing seduction, distraction and seduction/dissimulation modes. The electromagnetic decoys are normally based upon aluminised glass fibre chaff with rapid bloom time and they cover the I and J frequency bands. The infra-red decoys cover both the 3-5 and the 8-14 µm bands.

Specifications
Traverse: 330° at 21°/s
Average reaction time: Within 4 s
REM rocket dimensions: 850 × 127 mm (33.5 × 5 in)
Rocket weight: 13 kg (28.66 lb)
Container dimensions: 900 × 130 mm (35.4 × 5.1 in)
Container weight: 20 kg (44.1 lb)
LIR/LEM container dimensions: 780 × 630 × 134 mm (30 × 24.8 × 5.3 in)

Manufacturer/Contractor
CSEE Défense, Paris, France.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

CSEE Najir
Najir (designated DMAc by the French Navy) is an autonomous, deck-mounted director for use in air defence operations to complement the radar fire-control system. It has similar functions to Panda/Naja but the manned element supplements the Ericsson Nd:YAG laser rangefinder with an SAT Murene thermal imager operating in the 8-11 µm range. The latest production Najir features Radamec television cameras and consideration is being given to an eye-safe laser rangefinder. The manned element has, in addition to three sensors, a servo cabinet, a ballistic unit based upon two Motorola 68000 microprocessors and a power supply box.

Specifications
Najir
Height: 1.35 m (4.4 ft)
Width: 1.5 m (4.9 ft)
Weight: 560 kg (1,235 lb)
Max velocity
(traverse): 90°/s
(elevation): 60°/s

Manufacturer/Contractor
CSEE Défense, France.

RADARS

Ericsson Sea Giraffe 50 HC
The Sea Giraffe is used for air and surface search, with the antenna sited at the masthead.

Specifications
Operating frequency: G/H-band
Output power: 60 kW; average power 1,200 W
Antenna rotation rate: 60/30 rpm
Instrumented range: 25, 50, 100 and 150 km
Tracking capacity: More than 30 automatically initiated air targets; more than 50 manually initiated surface targets
Antenna sidelobe levels: −45 dB
Beamwidth, bearing: 1.8°
Elevation coverage: 0-70°
Accuracy: 20 m range; 0.3° azimuth

Manufacturer/Contractor
Ericsson, Sweden.

Racal-Decca 1226

Specifications
Role: Navigation
Band: I
Beam: 1.2°
Peak power: 25 kW
Gain: 30 dB

Pulsewidth: 0.05/0.25/1.0 µs
Scan rate: 28 rpm
Typical range: 48 n miles (89 km)

Manufacturer/Contractor
Racal-Decca, UK.

CelsiusTech 9LV 223
9LV 223 (LV = *lucht varn*) consists of one 9LV100 optronic director and one 9LV200 radar/TV/laser/IR fire control director. It is capable of simultaneous engagement of several targets, including one air target and controls Exocet, 76 mm and 40 mm guns.

Manufacturer/Contractor
CelsiusTech, Sweden.

AVIATION

AVIATION FACILITIES

Specifications
Flight deck: 14.9 × 9.3 m (49 × 30 ft)
Hangar: The hangar accommodates one helicopter; see 'Further Information'

HELICOPTER

Aerospatiale Alouette SA 316 Alouette

Specifications
Dimensions:
main rotor diameter: 11.02 m (36.15 ft)
length overall (rotor turning): 12.84 m (42.15 ft)
fuselage length: 10.17 m (33.3 ft)
height to rotor head: 3.00 m (9.84 ft)
Weights
empty: 1,143 kg (2,520 lb)
max take-off: 2,200 kg (4,850 lb)
Performance
max speed (never exceed): 113 kts (210 km/h)
max cruising speed: 100 kts (185 km/h)
service ceiling: 3,200 m (10,500 ft)
range (max fuel): 267 n miles (495 km)
Engines: 1–694 kW (870 shp) Turbomeca Artouste IIIB turboshaft derated to 425 kW (570 shp)
Accommodation: 7 (pilot plus 6)
Weapons: In the ASW role the Alouette III would carry 2 lightweight torpedoes

Das *(02), preparing to land a helicopter* (Lürssen)

PROPULSION

Specifications
System: Diesel
Main machinery: 4 MTU 16V 538 TB92, 10 MW (13,640 hp)
Shafts: 4
Ships's services: 4—152 kVA diesel-generator sets

FURTHER INFORMATION

PROGRAMME

These ships were ordered in late 1986 and are very similar to those purchased by Bahrain. They were delivered in October 1991.

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

SA-N-5 'GRAIL' (Strela-2M)

There is one, four-missile launcher for the SA-N-5 short-range SAM system. SA-N-5 is the NATO designation for the Russian Strela-2M (Strela = arrow), which is the naval version of the very widely used Strela-2 (NATO = SA-7 Grail) land-based, shoulder-launched short-range missile system. In the naval version, four missiles are mounted on a metal framework, with the operator standing inside the framework, leaning back into a lumbar pad, with the missiles at shoulder level, as in the land-based system.

When the target is acquired the operator selects a missile and then activates the thermal battery. When the seeker acquires the target the operator receives an audio signal and partially pulls the trigger to activate the missile gyros, which take some four to six seconds to warm up. The operator uses stadia reference marks in the optical sight to compute the lead angle to the target then fully engages the trigger to launch the missile. The booster burns for 0.05 seconds, ejecting the missile from the launch tube at a speed of 28 m/s (92 ft/s) and spinning it up. Then, at a distance of 6 m (20 ft), the sustainer ignites and the trailing fins pop out.

The missile has four small fins of cruciform configuration and two pop-out trailing fins behind the exhaust. The missile homes on the 'hottest' part of the target and probably has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead. In Strela-2M (SA-7B 'Grail' Mod 1) the seeker has a filter for improved performance and the warhead has better fragmentation uniformity.

A Polish report describes this system as 'FAM-14' and the missile as Strzala-2M.

Specifications

(Strela 2)
Length: 1.45 m (4.76 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (21.98 lb)
Speed: Mach 1.7
Range: 5.5 km (2.9 n miles)
Altitude: 18 - 4,500 m (60 - 15,000 ft)
Guidance: IR homing

Manufacturer/Contractor

Fakel

GUNS

AK-176M 76 mm (3 in)/60

There is one single 76 mm (3 in) gun on the foredeck which is intended for air defence, surface engagement and shore bombardment roles. The AK-176 is a four-man mounting which may be either operated from the weapon control centre or from a local control station. The AK-176 is part of a weapon control system based upon the H-band fire-control radar with the NATO designation 'Bass Tilt'. This radar is also associated with the AK-630 and the two may form an integrated weapon system. The radar director is mounted on a pedestal and has an antenna with drum-shaped radome inclined at an angle of approximately 45°. Local control is achieved semi-automatically using the Kondensor sight which is installed as a backup in the event of the failure of 'Bass Tilt'. It is a day-night sight which may be used to engage both surface and air targets. In the event of a power failure the crew may use the WD-221 optical sight. 254 rounds are carried.

Specifications

Calibre: 76 mm
Length of barrel: 59 calibres
Muzzle velocity: n/k
Traverse: 360° at 35°/s
Elevation: −3 to +85° at 30°/s
Ammunition (total): 16 kg (35.3 lb)
Rate of fire: 120-130 rds/min
Range:
anti-surface: 3.75 n miles (7 km)
anti-air: 10,000 m (32,800 ft)

30 mm/65 AK-630M close in weapons system

The single 30 mm AK-630 six-barrel anti-aircraft gun is mounted on the roof of the after superstructure. This weapon has five roles, engaging anti-ship missiles, aircraft, small surface vessels, drifting mines and unprotected targets ashore. The AK-630 weapon is a water-cooled, Gatling-principle weapon with fixed breech block and revolving barrels. The weapon is believed to operate in a similar manner to that of the

Phalanx, firing bursts of up to 400 rounds, but unlike the US weapon AK-630 features a separate radar director, Bass Tilt.

Specifications

Calibre: 30 mm
Length of barrel: 65 calibres
Number of barrels: 6
Muzzle velocity: 890 m/s (2,919 ft/s)
Cooling: Water
Traverse: 360° at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range:
radar fire control: 4,000 m (13,000 ft)
electro-optic fire control: 5,000 m (16,500 ft)
Rate of fire: 4,000-5,000 rds/min
Magazine: 2,000 rounds
Weight of complete round: 1.224 kg (2.7 lb)
Ammunition types:
Weight:
UOF-84 HE-I: 384 g (13.5 oz)
UOR-84 HE-T: 388 g (13.68 oz)
Fuze: MG-32 point impact (both rounds)

ELECTRONIC WARFARE SYSTEMS

DECOYS

Decoy/chaff launchers

There are two decoy launchers for chaff and IR decoys, designated Derkacz-2 and ORA-1. These appear to be related to the Russian PK-10.

COMMAND AND CONTROL SYSTEMS

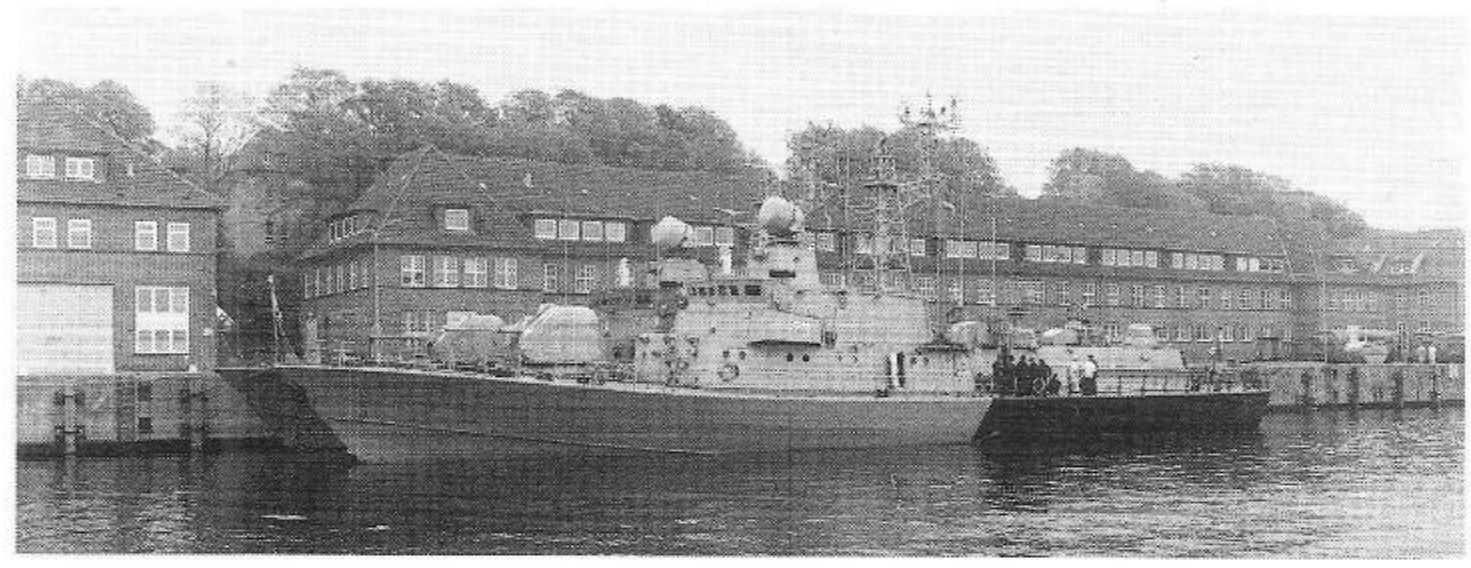
RADARS

NUR-27XA

Polish-designed and -produced I-band surface search radar.

Bass Tilt MR-123

Bass Tilt is an H/I-band fire-control radar which entered service in the mid-1970s and is part of the fire-control system for the AK-176M and AK-630M CIWS. The weapon system and director are mounted on a pedestal, with the drum-shaped antenna radome, 1.2 m (4 ft) in diameter, inclined at an angle of approximately 45°. The radar is probably linked to a ballistic computer and each director controls one or two gun mountings. A Polish report describes this system as Wympiel-AME.



Grom *(423) of the Polish 'Orkan' class. Six of these ships were ordered from Peenewerft, Germany, but only three were completed* (H M Steele)

SRN 443XTA

I-band navigation radar.

IFF

Square Head; Salt Pot.

PROPULSION

Specifications

System: Diesel
Main machinery: 3 Type M 520 diesels 10.80 MW (14,685 hp)
Shafts: 3
Auxiliary power: 3 Wola 104ZPM-135R6TC, each 180 kW

FURTHER INFORMATION

PROGRAMME

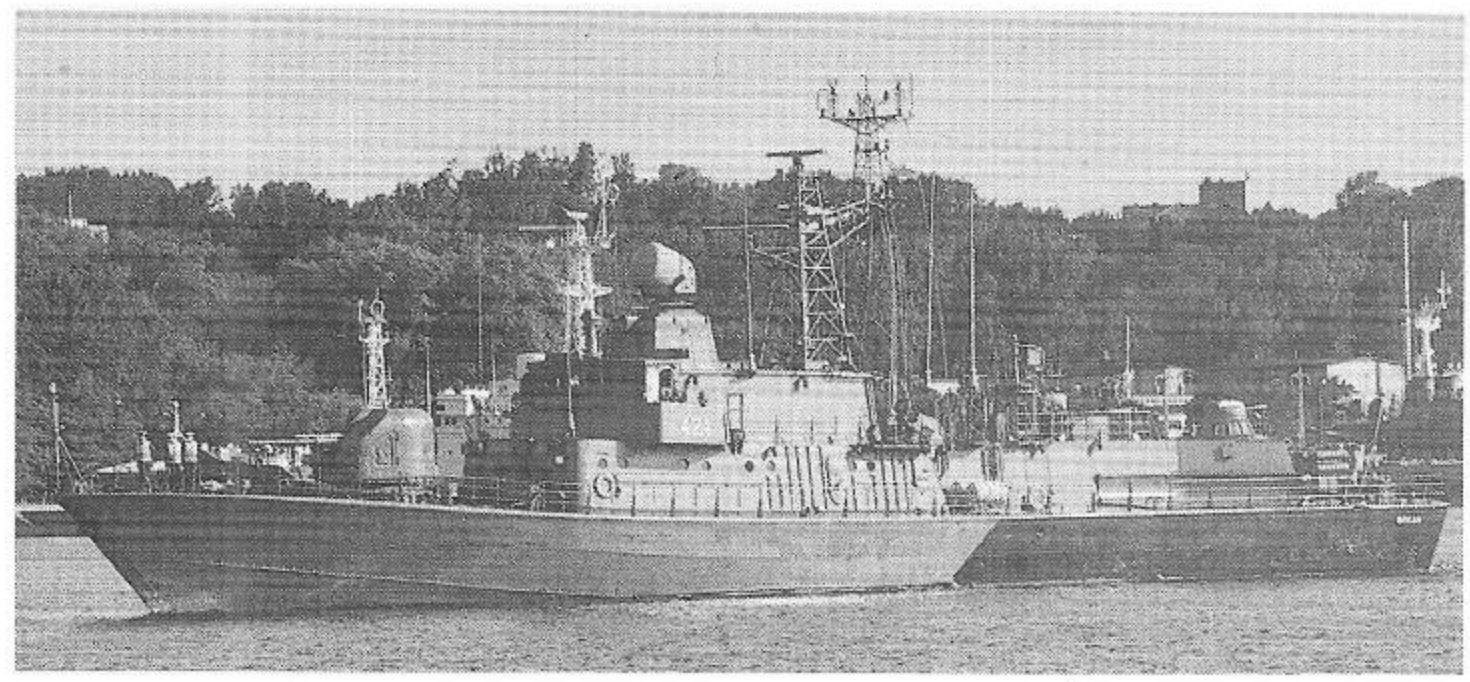
The original design was produced in the (then) DDR for a common corvette for the Warsaw Pact and was designated 'Balcom 10' by NATO (Balcom = Baltic Combatant). The original plan to produce up to 50, of which six would have been for Poland, but this was overtaken by the collapse of the Warsaw Pact and the re-unification of Germany. The Polish Navy, however, managed to obtain three partially-completed hulls which were taken to Gdansk and fitted out.

Three other ships were also completed in Germany and now serve in the Küstenwache (border guard). These are armed with just one Bofors 40 mm cannon, have two MTU diesels in place of the original Russian type, and have Racal radars.

DESIGN

The prototype vessel was armed with two quadruple launchers for the Russian SS-N-25 'Exocet-type' missile, but these were not available to the Poles when they completed the ships. It is, however, planned to fit eight SSMs of an undisclosed type in due course. Plank Shave radar has been replaced by a Polish set.

Unlike the German coastguard vessels of the same class, these ships retained the three Russian engines.



Orkan *(421)* (J Cislak)

OPERATIONAL

In peacetime these three corvettes form the 1st Division of the 3rd Flotilla of the Polish Navy and are based in Gdynia.

PARCHIM

OVERVIEW

During the Cold War, the German Democratic Republic (East Germany — DDR) possessed a fairly busy shipyard at Wolgast, known as Peenewerft. This yard produced a number of designs, the largest of which was the 1,950 tonne 'Frosch' class landing ship, and several types were selected by the (then) Soviet Union for use elsewhere within the Warsaw Pact. One of these designs was the Parchim.

The Parchim design originated in a requirement from the DDR Navy (Volksmarine) for a replacement for the 'Hai' class light anti-submarine patrol boats. 16 were built for the *Volksmarine* between 1977 and 1985 and all served in the Baltic. They were not particularly well-armed, having one twin 57 mm mount and two SA-N-5s for close in air defence, while their ASW armament comprised two RBU-6000s, four 400 mm torpedo tubes and a depth-charge projector. They were, however, able to carry 60 mines, rather more than many other ships. Their primary ASW sensor was the Russian dipping sonar which required the ship to stop to operate, using the so-called 'dip-and-dash' technique. They were not fitted with roll dampers and were reputed to be poor sea-boats.

The (then) Soviet Navy ordered twelve of an improved design, designated 'Parchim II' by NATO. This had a more effective air search radar, a 76 mm gun in place of the twin 57 mm, a 30 mm Gatling and four 533 mm torpedo tubes in place of the four 400 mm tubes. The ASW sensors remained the same however.

On the end of the Cold War and the reunification of Germany, the *Volksmarine* ceased to exist and the Peenewerft was absorbed into a German industrial combine. The *Bundesmarine* absorbed five of the former-GDR Parchim Is for a brief period, leaving the other eleven in reserve, but then placed all 16 on the export market and sold them to Indonesia.

The Russian Navy has retained all twelve of its Parchim IIs in service and all were refitted at Rostock in 1994-95.

WEAPONS SYSTEMS

TUBES

400 mm tubes

There are four 400 mm torpedo tubes located either side of the after deckhouse.

GUNS

57 mm/80 ZIF-72

There is one twin ZIF-72 'Y' position on the quarterdeck. This weapon is an evolutionary development of the twin-barrel ZIF-31B, but it has clearly been designed for prolonged air defence engagements and for this reason has a slightly longer (4.57 m), water-cooled barrel. It may also be used against surface and coastal targets.

The mounting is operated by two men from the fire-control station associated with the 'Muff Cob' radar system. 'Muff Cob' has its antenna in a 1 m (3.28 ft) wide, weather-proof mounting suspended from a trunnion-yoke carried on a traversing mounting. The radar is supplemented by an electro-optic sensor. The height of the mounting is about 3 m (9.8 ft) and the H-band radar can probably tilt from −10 to +50° as with the gun mounting. It is likely that control of the mounting is conducted from the compartment which houses the radar display system.

Specifications

Length of barrel: 80 calibres
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Traverse: ±200°
Elevation: −10 to +85°
Range:
- **anti-surface:** 3.25 n miles (6 km)
- **anti-air:** 6,000 m (20,000 ft)

Rate of fire: 120 rds/min/barrel
Projectile weight: 6.61 kg (14.6 lb)

30 mm 65 AK-230 twin mounting

A single AK-230 twin 30 mm mount is located at the forward end of the superstructure. AK-230 is a remotely operated, twin barrel, automatic anti-aircraft gun designed to engage air targets at heights of up to 4,000 m (13,120 ft). It is also capable of engaging surface targets at ranges up to 2.2 n miles (4 km). The electrically powered mounting consists of two 64.2 calibre, water-cooled, NN30 guns, each with a liner and a rotating breech with four chambers. The elevating mechanism is on the carriage together with a compressed air tank and associated equipment for the loading system. Russian ammunition for this weapon consists of two rounds; BR-83 and OF-83D (see Specifications). The fire control radar is the I/J-band Muff Cob fire-control radar, whose maximum acquisition range is approximately 22 n miles (40 km), with each radar director controlling two gun mountings.

Tjiptadi *(381). The purchase of these ships boosted the number of patrol ships in the Indonesian Navy* (H & L van Ginderen Collection)

Specifications

NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,450 ft/s)
Range:
- **anti-surface:** 2.2 n miles (4 km)
- **anti-air:** 4,000 m (13,120 ft)

Rate of fire: 1,000 rds/min/ gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s
Crew: 2 (off mount)

Ammunition
BR-83:
- **type:** Armour-piercing tracer
- **weight (complete round):** 1.47 kg (3.24 lb)
- **weight (projectile):** 0.35 kg (0.77 lb)

OF-83D:
- **type:** High explosive
- **weight (complete round):** 1.40 kg (3.09 lb)
- **projectile:** 0.27 kg (0.60 lb)

ANTI-SUBMARINE MORTARS

RBU 6000

Two automatic, 300 mm calibre, 12-barrelled trainable launchers with a range of 6,000 m (19,680 ft) are fitted aft of the 30 mm gun. The launch tubes are arranged in a circular fashion and are reloaded automatically by bringing them into the vertical and then indexing one by one while depth bombs are loaded from below.

Specifications

Length: 1.8 m (5.9 ft)
Range: 6,000 m (19,680 ft)
Warhead: 31 kg (68 lb)

DEPTH CHARGES

There are two depth charge racks.

MINES

There are two mine rails, which can discharge up to 60 mines over ramps in the transom.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Watch Dog

There are two Watch Dog arrays. Watch Dog is an intercept and radar warning system which has been in service for over 30 years. It is a wide-open system with an array consisting of four tiers of eight microwave horns, covering frequencies from D to H-band and normally has two arrays, one on each side of the ship.

DECOYS

PK-16

There are two PK-16 launchers. PK-16 is a Russian naval decoy system about which details were first revealed in 1993. The system consists of KT-216

launchers, a control console and three munitions. The launcher has ten 120 mm barrels fixed at an angle of about 45°. The launcher appears to be turnable. The control console appears to be a relatively simple design capable of controlling up to four launchers. The munitions are all for seduction purposes. The SR-50 is a chaff round with a payload of 11 kg (24 lb). The SOM-50 is a heat-seeker/laser-guided missile seduction round with 7.3 kg (16 lb) payload while the SK-50 is a combined round with 9.1 kg (20 lb of payload.

COMMAND AND CONTROL SYSTEMS

RADARS

Strut Curve search radar

The air search radar is the Russian MR-302 (NATO = Strut Curve) a medium-range, general purpose, F-band, air search radar. The elliptical lattice reflector is mounted at the masthead. Range performance against a 2 m² aircraft target at medium altitude is about 60 n miles (110 km) with a likely maximum range of 150 n miles (280 km).

TSR 333

TSR-333 is an I-band navigation radar.

Muff Cob

Muff Cob is the director for the 57 mm fire-control system and is the large cylindrical radome atop the small tower overlooking the quarterdeck. The radome is supported by a trunnion yoke in a traversing mounting and is thus capable of both elevation and traverse. There is a device to the left of the radome (from the front), with a remotely-controlled cover, which may be a TV camera. The F/G-band radar is named Muff Cob by NATO and Bars (Wildcat) by the Russian Navy.

IFF

High Pole B.

SONAR

MGK-332T sonar suite

According to recent information, these ships are fitted with a sonar suite named MGK-332T. There are two principle elements:

- a hull-mounted active search and attack, medium-frequency sonar, believed to operate in the 20-30 kHz range.
- a Variable Depth Sonar (VDS) known as Elk Tail, which is a high-frequency, helicopter-type VDS, and is lowered into the water from the forward of two doors in the starboard side of the ship.

PROPULSION

Specifications

System: Diesel

Main machinery: 3 Type M 504 diesels, 7.95 MW (10,812 hp)

Shafts: 3

FURTHER INFORMATION

PROGRAMME

These ships were all built for the DDR *Volksmarine,* being commissioned between 1983 and 1984. On unification in 1991 four were temporarily commissioned into the Federal German Navy, while the remainder was paid off. All 16 ships were then purchased by Indonesia, being formally transferred on 4 January 1993 and commissioned into the Indonesian Navy on 25 August 1993. The first three arrived in Indonesia in November 1993.

MODERNISATION

All were refitted prior to sailing for Indonesia. The work included turning some of the voids into additional fuel tanks to increase the range, and adding air conditioning to make them more habitable in the tropics.

OPERATIONAL

These 16 ships represented a sudden and massive increase in the front-line strength of the Indonesian Navy and created some turbulence concerning manning and maintenance. Some reports suggest that the ships are being poorly maintained, although this is probably due to a lack of crews trained to maintain these specific ships.

Launched	1985-89
Commissioned	1986-89

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

SA-N-5 Grail

There are two quad launchers per ship. The Strela 2 (9M32M) missiles in the SA-N-5 missile system are housed in glass fibre launcher-containers. When the operator acquires the target he/she activates the thermal battery and when the seeker has acquired the target an audio signal is received. The operator then takes the first pressure on the trigger to activate the missile gyros which are warmed up in four to six seconds. The operator uses stadia reference marks in the optical sight to compute the lead angle to the target then takes the full pressure on the trigger to launch the missile. The booster burns for 0.05 seconds to eject the missile from the launch tube at a speed of 28 m/s (92 ft/s) and to spin it; then, at a distance of 6 m (20 ft), the sustainer ignites and the trailing fins pop out. The missile homes on the 'hottest' part of the target and probably has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead.

Specifications

Length: 1.45 m (4.76 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (21.98 lb)
Speed: Mach 1.7
Range: 2.9 n miles (5.5 km)
Altitude: 18-4,500 m (60-15,000 ft)

Manufacturer/Contractor

Fakel, Russia.

TUBES

533 mm (21 in) torpedo tubes

There are four 533 mm (21 in) torpedo tubes mounted in two groups of two either side of the after deckhouse.

TORPEDOES

The normal types of Russian 533 mm (21 in) torpedoes are carried.

GUNS

AK 176M 76 mm (3 in)/60

There is one AK-176M 76 mm gun mounted on the quarterdeck. The AK-176M is designed for air defence, surface engagement and shore bombardment roles and is a four-man mounting which may be operated from the weapon control centre or from a local control station. The barrel is cooled externally by taking seawater from the ship's fire main through a jacket which lies around the liner.

The AK-176M is part of a weapon control system based upon the H-band fire-control radar with the NATO designation 'Bass Tilt'. This radar is also associated with the AK-630M and the two form an integrated weapon system. The radar director is mounted on a pedestal and has an antenna with drum-shaped radome inclined at an angle of approximately 45°. Local control is achieved semi-automatically using the *Kondensor* sight which is installed as a backup in the event of the failure of 'Bass Tilt'. It is a day/night sight which may be used to engage both surface and air targets. In the event of a power failure the crew may use the WD-221 optical sight. Some vessels appear to have the mounting in a stand-alone configuration supported by other fire-control radars.

Specifications

Calibre: 76 mm
Length of barrel: 59 calibres
Muzzle velocity: 980 m/s (3,214 ft/s)
Traverse: 360° at 35°/s
Elevation: −7 to +85° at 30°/s
Ammunition (total): 16 kg (35.2 lb)
Rate of fire: 120 rds/min

30 mm/65 AK-630

There is a single, six-barrelled AK-630 CIWS at the forward end of the superstructure. This weapon has five roles, engaging anti-ship missiles, aircraft, small surface vessels, drifting mines and unprotected targets ashore. The AK-630 gun is a water-cooled, Gatling-principle weapon with fixed breech block and revolving barrels. The weapon is believed to operate in a similar manner to that of the Phalanx, firing bursts of up to 400 rounds, but, unlike the US weapon, AK-630 features a separate radar director.

Specifications

Calibre: 30 mm
Length of barrel: 65 calibres

MPK-223, a Parchim II class corvette of the Russian Navy (H & L van Ginderen Collection)

Number of barrels: 6
Muzzle velocity: 890 m/s (2,920 ft/s)
Cooling: Water
Traverse: 360° at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range:
radar fire control: 4,000 m (4,374 yd)
electro-optic fire control: 5,000 m (5,468 yd)
Rate of fire: 4,000-5,000 rds/min
Magazine: 2,000 rounds
Weight of complete round: 1.224 kg (2.7 lb)
Ammunition types:
UOF-84 HE-I: weight: 384 g (13.5 oz)
UOR-84 HE-T: weight: 388 g (13.68 oz)
Fuze: MG-32 point impact (both rounds)

ANTI-SUBMARINE MORTARS

RBU 6000

Two 12-tubed trainable launchers per ship with a range of 6,000 m (19,680 ft) are mounted immediately in front of the bridge screen. There are 12 300 mm calibre launch tubes arranged in a circular fashion, which are reloaded automatically by bringing them into the vertical and then indexing one by one while depth bombs are loaded from below.

Specifications
Length: 1.8 m (5.9 ft)
Range: 6,000 m (19,680 ft)
Warhead: 31 kg (68 lb)

DEPTH CHARGES

There are two depth-charge racks.

MINES

Mine rails are fitted; 60 mines can be carried.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Watch Dog

There are two Watch Dog arrays. Watch Dog is an intercept and radar warning system which has been in service for over 30 years. It is a wide-open system with an array consisting of four tiers of eight microwave horns, covering frequencies from D to H-band and normally has two arrays, one on each side of the ship.

DECOYS

PK-16

There are two PK-16 launchers. PK-16 is a Russian naval decoy system about which details were first revealed in 1993. The system consists of KT-216 launchers, a control console and three munitions. The launcher has ten 120 mm barrels fixed at an angle of about 45°. The launcher appears to be turnable. The control console appears to be a relatively simple design capable of controlling up to four launchers. The munitions are all for seduction purposes. The SR-50 is a chaff round with a payload of 11 kg (24 lb). The SOM-50 is a heat-seeker/laser-guided missile seduction round with 7.3 kg (16 lb) payload while the SK-50 is a combined round with 9.1 kg (20 lb) of payload.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Hood Wink and Odd Box

These are two electro-optic systems; no details are known.

RADARS

Cross Dome/Positive E

Cross Dome is an E/F-band air and surface search radar, which is under the large radome at the masthead. The same radar is to be found in the Gepard export frigate and in the Indian Navy Khukri and Abhay ('Nanuchka II') class corvettes.

Parchim II. Note the Cross Dome radar and the Bass Tilt on a substantial square section tower, which distinguish this version from Parchim I

TSR 333 or Nayala or Kivach III
I-band navigation radars.

Bass Tilt fire-control radar
Bass Tilt is an H/I-band fire-control radar which entered service in the mid-1970s and is part of the fire-control system for the ADG-630 CIWS. The weapon system and director are mounted on a pedestal, with the drum-shaped antenna radome, 1.2 m (4 ft) in diameter, inclined at an angle of approximately 45°. The director is 2 m (6.56 ft) high and 1.45 m (4.8 ft) long. The radar is probably linked to a ballistic computer and each director controls one or two gun mountings.

IFF
High Pole A

SONARS

MGK-335 Platina sonar suite
According to recent information, these ships are fitted with a sonar suite named MGK-335 Platina. There are two principle elements:

- a hull-mounted sonar (NATO = Bull Horn), which is an active search and attack, medium-frequency sonar, believed to operate in the 20-30 kHz range.
- a variable depth sonar known as Lamb Tail, which is a high-frequency, helicopter type, Variable Depth Sonar (VDS).

PROPULSION

Specifications
System: Diesel
Main machinery: 3 Type M 504A diesels; 7.95 MW (10,812 hp)
Shafts: 3

FURTHER INFORMATION

PROGRAMME

These were built in the DDR at Peenewerft, Wolgast for the (then) Soviet Navy. The first was commissioned on 19 December 1986 and the last on 6 April 1990.

STRUCTURE

Similar design to the ex-DDR 'Parchim I' class but with some armament differences.

MODERNISATION

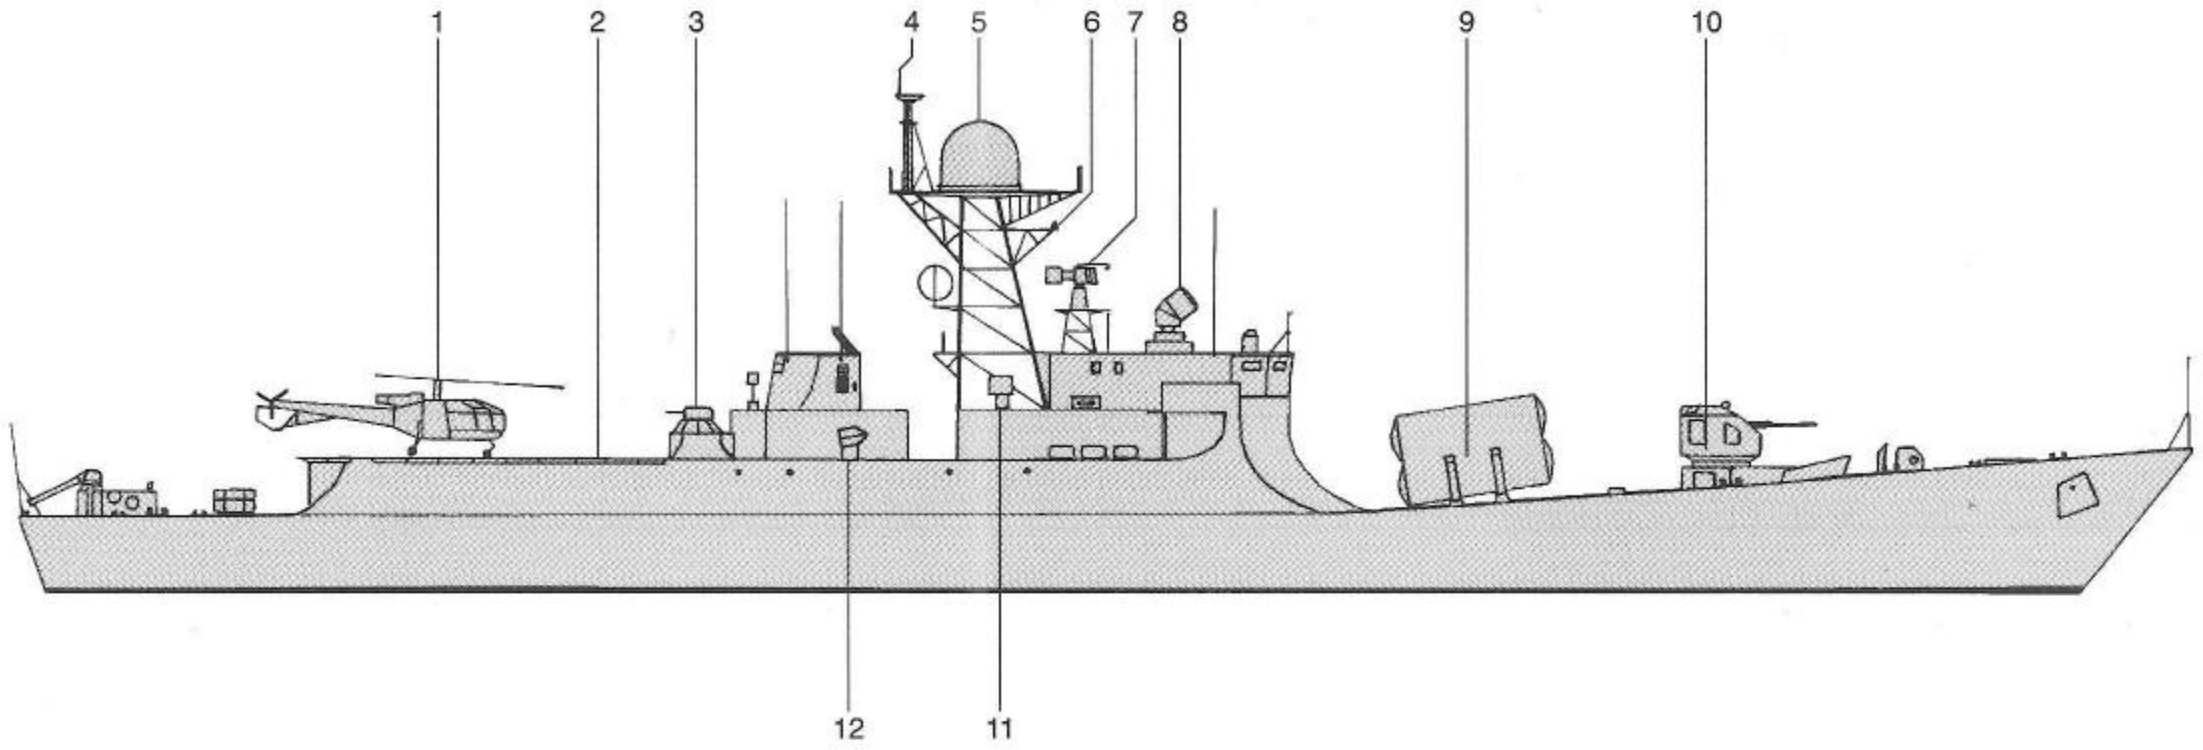
All ships in the class were refitted at Rostock in 1994/95.

OPERATIONAL

All operate in the Baltic.

Parchim II of the Russian Navy. Curiously the base for the Cross Dome radar is fitted, but there is no radar array or radome (US Navy)

KHUKRI (PROJECTS 25 and 25 A)



Khukri (Ian Sturton)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

SS-N-2d (Rubezh P-22) ('Styx') medium-range anti-ship missile

The 'Khukri' class is armed with four SS-N-2d 'Styx' missiles with two pairs of missile launch tubes on the foredeck, in a mounting similar to that in the 'Veer' ('Tarantul') class, also operated by the Indian Navy. The outer part of the bridge screen acts as a blast-deflector. There are no reloads.

The SS-N-2d was introduced into Soviet service in 1967 and is essentially an SS-N-2a with an added infra-red seeker. This relatively large anti-ship missile is powered by a liquid-fuelled rocket motor, with a solid fuel booster attached. Once the target is detected the ship must close, with the aim of being within the optimum engagement distance, some 15 to 20 n miles (28 to 37 km). Once ready to launch, the ship must face the target, maintain a speed of 15 kts or less, and hold its course for 20 to 30 seconds before launching the first salvo of two missiles. These may be followed, a minute later, by the second pair. Upon launch, the missile climbs at an angle of 45° to one of five preset altitudes (100, 150, 200, 250 or 350 m (328, 492, 656, 820 or 1,148 ft)), where the onboard radar searches for a target and the receiver is switched on for very short periods to receive signals from a designated range, the range gate being 1 km (0.54 n miles) on either side of the target. The radar locks only after eight returns have been received, at distances of 3.5 to 12 n miles (6.5 to 22 km), whereupon the seeker guidance system switches off the autopilot. A throw-off gyroscope takes the missile on target a few seconds before impact as it becomes too close for radar-generated homing signals. Russian Navy tacticians calculate that seven to eight missiles are required to destroy a cruiser-size target and four for a destroyer, making salvo firing a major feature of any tactical engagement scenario with SS-N-2d missiles to ensure destruction of the target.

Specifications

(SS-N-2d)
Length: 6.55 m (21.5 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.87 ft)
Speed: Mach 0.9
Weight (without booster): 2,600 kg (5,732 lb)
Warhead: 454 kg (1,000 lb) hollow-charge
Fuzes: Impact, proximity
Range: 3-54 n miles (5.5-100 km)
Guidance: Autopilot with active radar (supplemented in some with IR)

MS-2 seeker
Frequency: I-band (8-12 GHz) (four presets)
PRF: 300-500 pps (adjustable)
Altitude control: Barometric pressure device

Manufacturer/Contractor

Raduga, Moscow, Russia.

SURFACE-TO-AIR MISSILES (SAM)

SA-N-5 'Grail' (Strela-2M)

There are two, four-missile launchers for the SA-N-5 short-range SAM system. SA-N-5 is the NATO designation for the Russian *Strela*-2M (*Strela* = arrow), which is the naval version of the very widely used Strela-2

(NATO = SA-7 Grail) land-based, shoulder-launched short-range missile system. In the naval version, four missiles are mounted on a metal framework, with the operator standing inside the framework, leaning back into a lumbar pad, with the missiles at shoulder level, as in the land-based system.

When the target is acquired, the operator selects a missile and then activates the thermal battery. When the seeker acquires the target the operator receives an audio signal and partially pulls the trigger to activate the missile gyros, which take some four to six seconds to warm up. The operator uses stadia reference marks in the optical sight to compute the lead angle to the target then fully engages the trigger to launch the missile. The booster burns for 0.05 seconds, ejecting the missile from the launch tube at a speed of 28 m/s (92 ft/s) and spinning it up. Then, at a distance of 6 m (20 ft), the sustainer ignites and the trailing fins pop out.

The missile has four small fins of cruciform configuration and two pop-out trailing fins behind the exhaust. The missile homes on the 'hottest' part of the aircraft and probably has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead. In Strela 2M (SA-7B 'Grail' Mod 1) the seeker has a filter for improved performance and the warhead has better fragmentation uniformity.

Specifications
(Strela 2)
Length: 1.45 m (4.76 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg 21.98 lb)
Speed: Mach 1.7
Range: 5.5 km (2.9 n miles)
Altitude: 18 - 4,500 m (60 - 15,000 ft)
Guidance: IR homing

Manufacturer/Contractor
Fakel, Russia.

GUNS

AK-176 76 mm (3 in)/60
There is one single 76 mm (3 in) gun on the foredeck which is intended for air defence, surface engagement and shore bombardment roles. The AK-176 is a four-man mounting which may be either operated from the weapon control centre or from a local control station.

Khukri *(P 49). Note the AK 176 76 mm gun and four SS-N-2d anti-ship missile launchers on the foredeck. The flight deck will accept a Chetak (Alouette) helicopter, and the ship has refuelling and rearming facilities, but no hangar* (H & L van Ginderen Collection)

The AK-176 is part of a weapon control system based upon the H-band fire-control radar with the NATO designation 'Bass Tilt'. This radar is also associated with the AK-630 and the two may form an integrated weapon system. The radar director is mounted on a pedestal and has an antenna with drum-shaped radome inclined at an angle of approximately 45°. Local control is achieved semi-automatically using the *Kondensor* sight which is installed as a backup in the event of the failure of 'Bass Tilt'. It is a day-night sight which may be used to engage both surface and air targets. In the event of a power failure the crew may use the WD-221 optical sight.

Specifications
Calibre: 76 mm
Length of barrel: 59 calibres
Muzzle velocity: n/k
Traverse: 360° at 35°/s
Elevation: −3 to +85° at 30°/s
Ammunition (total): 16 kg (35.3 lb)
Rate of fire: 120-130 rds/min
Range:
anti-surface: 3.75 n miles (7 km)
anti-air: 10,000 m (32,800 ft)

30 mm/65 AK-630 close in weapons system
There are two 30 mm Gatling-type AK-630s mounted on platforms at the forward end of the flight deck. These have five roles, engaging anti-ship missiles, aircraft, small surface vessels, drifting mines and unprotected targets ashore. The AK-630 weapon is a water-cooled, six-barrelled, Gatling-principle weapon with fixed breech block and revolving barrels. The weapon is believed to operate in a similar manner to that of the Phalanx, firing bursts of up to 400 rounds, but unlike the US weapon, AK-630 features a separate radar director, Bass Tilt.

Specifications
Calibre: 30 mm
Length of barrel: 65 calibres
Number of barrels: 6
Muzzle velocity: 890 m/s (2,919 ft/s)
Cooling: Water
Traverse: 360° at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range:
radar fire control: 4,000 m (13,000 ft)
electro-optic fire control: 5,000 m (16,400 ft)
Rate of fire: 4,000-5,000 rds/min
Magazine: 2,000 rounds
Weight of complete round: 1.224 kg (2.7 lb)
Ammunition types:
UOF-84 HE-I: 384 g (13.5 oz)
UOR-84 HE-T: 388 g (13.68 oz)
Fuze: MG-32 point impact (both rounds)

ELECTRONIC WARFARE

ELECTRONIC SUPPORT MEASURES (ESM)

Bharat Ajanta P intercept
The Bharat Ajanta P ESM suite is a 1-18 GHz radar warning system, with a 1,500 emitter library, developed from the Elettronica RQN-3. The array is at the top of the mast.

Manufacturer/Contractor
Bharat Electronics, Bangalore, India.

DECOYS

PK-16
There are two Russian PK-16 chaff launchers, mounted on the main deck, on either side of the superstructure.

Bharat Toted towed torpedo decoy
There is a towed torpedo decoy, which is almost certainly the 'Toted' which was developed by the Naval Physical and Oceanic Laboratory (NPOL) at Cochin and is produced by Bharat Electronics. This consists of a towed 'fish' containing a piezoelectric transducer, a 400 m (1,300 ft) electromechanical cable and a high-gain, wideband amplifier. The system includes elements to prevent 'blue-on-blue' interference with sonars aboard the towing ships or other friendly ships in the area.

Manufacturer/Contractor
Bharat Electronics, Bangalore, India.

COMBAT AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Bharat Vympal command and weapon control system
India is developing its own naval fire control and command/weapon control systems, using licence-produced Western electronics (primarily Italian, but with some Dutch radars). The first such system is the Bharat Vympal which entered service when the second 'Khukri' class corvette, *Kuthar*, was commissioned in June 1990. The system has a distributed architecture and is based upon purpose-built workstations which use Barco 48.26 cm (19 in) raster scan displays with an HCI based upon QWERTY keyboard, numeric pad and probably rollerball. A corvette will have two to three

Khanjar *(P 47). The radome at the masthead is part of the Bharat Ajanta ESM system, while the large radome below it houses the Russian-designed Cross Dome (Positive E) radar* (Jane's/H M Steele)

such workstations, probably supplemented by a data processing unit linked by an FMC (now United Defence) Unicom-type local area network capable of 10-20 Mb/s. (First of class *Khukri* has a Selenia (now Alenia) system).

Manufacturer/Contractor

Bharat Electronics, Bangalore, India.

RADARS

Positive E/Cross Dome

There is a large radome on the platform at the top of the mast, which has been named 'Positive E' in Indian reports. This is a translation of the Russian name of the equipment ('*Pozitiv*') and the suffix 'E' on Russian equipment normally indicates an export version. It is also very similar to the Cross Dome radar installed at the masthead in the 'Gepard' class export frigate. The set appears to have an air/surface search function and has a range of some 70 n miles (130 km)

Plank Shave

The 'Khukri' class ships are fitted with Plank Shave atop a small tower on the bridge roof. This is an I-band set used for surface search and targeting the SS-N-2d missiles.

Bass Tilt

Bass Tilt is an H/I-band fire-control radar which entered service in the mid-1970s and is part of the fire-control system for the AK-630 CIWS. The weapon system and director are mounted on a pedestal, with the drum-shaped antenna radome, 1.2 m (3.9 ft) in diameter, inclined at an angle of approximately 45°. The radar is probably linked to a ballistic computer and each director controls one or two gun mountings.

Bharat 1245

The Bharat 1245 is an Indian-developed I-band navigation radar.

SONAR

These ships do not carry any sonar equipment, but are fitted with an STN Atlas echo-sounder.

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 15 × 10.5 m (50 × 34 ft)
Hangar: There is no hangar, but there are full refuelling and rearming facilities.

HELICOPTER

SA 316/SA 319B Chetak (Alouette III)

The ships currently operate the Chetak (licence-produced Alouette III), but it is intended that in the future they will operate the Hindustan Aeronautics Ltd (HAL) ALH (Advanced Light Helicopter). The ALH will operate either in the anti-ship role, carrying Sea Eagle, or in the anti-submarine role carrying a dunking sonar, torpedoes and depth charges.

Specifications

Dimensions:
main rotor diameter: 11.02 m (36.15 ft)
length overall (rotor turning): 12.84 m (42.15 ft)
fuselage length: 10.17 m (33.7 ft)
height to rotor head: 3.00 m (9.84 ft)
Weights
empty: 1,143 kg (2,520 lb)
max take-off: 2,200 kg (4,850 lb)
Performance
max speed (never exceed): 113 kts (210 km/h)
max cruising speed: 100 kts (185 km/h)
service ceiling: 3,200 m (10,500 ft)
max range: 267 n miles (495 km)
Engines: 1–694 kW (870 shp) Turbomeca Artouste IIIB turboshaft derated to 425 kW (570 shp).
Accommodation: 7 (pilot plus six).
Weapons: In the ASW role the helicopter would carry two lightweight torpedoes.

PROPULSION

Specifications

System: Diesel
Main machinery: 2 SEMT-Pielstick/Kirloskar 18 PA6 V 280 diesels, 10.58 MW (14,000 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

The 'Khukri' class were the first major warships to be completely designed and built in India, being designed by the Indian Navy Design Office (INDO) and built by Mazagon (two ships) and Garden Reach (the remainder).

The first two of these corvettes were ordered in December 1983, followed by orders for another two in 1985, and two more in April 1990. The class is intended to replace the Russian-built Petyas, which have been in service since the early 1970s. *Kora* (fifth of class) and following ships are to an upgraded design, but work has been slowed down due to delays in the supply of Russian equipment.

It was reported in October 1994 that a further two would be ordered, but no date was given and it now appears possible that the programme may end with the sixth ship, *Kirch*.

The indigenous content of the whole ship is about 65 per cent, with much of the electronics being either of Bharat design or produced by them under licence, while the diesels are assembled in India under licence by Kirloskar.

'Khukri' class corvette displays its nuclear fallout washdown capabilities. This picture shows clearly the blast deflection plates built into the bridge screen (Indian Navy)

DESIGN

The 'Khukri' class is designed for open ocean patrols and protecting the approaches to sensitive harbours and coastal installations, releasing larger warships, previously committed to such tasks to operate further into the Indian Ocean.

The hull and superstructure are to an original Indian design and are constructed of steel, although some components, such as the lattice masts, are of aluminium. Propulsion is diesel, with the first four sets of SEMT-Pielstick 18 PA6 V-280 being imported, but from the fifth hull onwards the engines are assembled in India by Kirloskar Oil Engines, of Puna.

All ships are fitted with roll-damping fins and have full air conditioning.

OPERATIONAL

Two ships are currently based in Bombay and two at Vishakapatnam.

MINERVA

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Teseo Otomat

All ships are fitted for but not with six Teseo launchers between the masts.

Manufacturers/Contractors

OTOBREDA, La Spezia, Italy.
Matra, France.

SURFACE-TO-AIR MISSILES (SAM)

The Albatros system comprises two elements:

Riva-Calzoni launcher
Aspide missile

Riva-Calzoni Albatros launcher

The single, eight-cell Albatros launcher is located aft in 'X' position. Produced by Riva-Calzoni, it has eight launch cells, four on each side of the mounting, each with a frangible front and rear cover. Each cell contains a loading guide to which the launching rail of the missile is electrically and mechanically connected. There is currently no reload facility, although the space and weight for a magazine exists in the deckhouse beneath the launcher.

Specifications

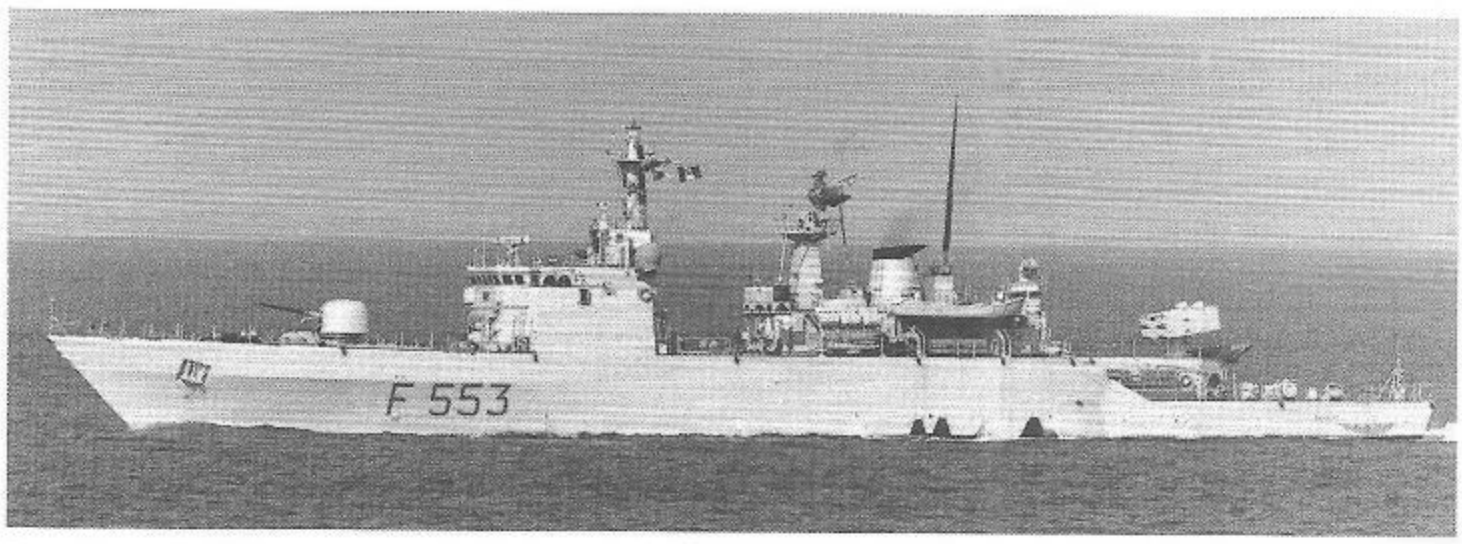
Albatros launcher
Height: 2.98 m (9.8 ft)
Width: 3.82 m (12.5 ft)
Length: 3.82 m (12.5 ft)
Weight (loaded): 8.5 t
Traverse: 360° at 45°/s
Elevation: −5 to +80° at 25°/s.

Alenia Aspide missile

The system uses the Alenia Aspide SAM, a missile developed by Selenia from the US Sparrow. Targets are detected by the ship's primary search radar and then allocated to the Signaal WM25 fire-control system. The target is acquired by the fire-control system radar and the CW transmitter group injects signals into the fire-control system tracker as the launcher slews in the target's direction. The missile control system selects the missile or missiles which the power supply units then prepare for launch. Total system reaction time is 8 seconds. When the decision is made to engage the target with missiles the reversible pre-launch commands are issued. The firing command itself can be issued automatically or manually, the operator also having the options of a single shot or salvo mode. In the latter, two missiles are launched sequentially against the same target, the maximum firing rate of the system being one missile every 2.5 seconds. Upon launch the missile is gathered into the tracker-illuminator's beam through a direct signal to the rear receiver and homes on the reflected energy from the target. Up to three missiles at once may be controlled by the tracker, according to the manufacturer. They also claim the system can engage horizontal targets at up to 8.1 n miles (15 km), vertical ones at 2.7 n miles (5 km) and lateral ones at 4.3 n miles (8 km). A short reaction time gives the system the ability to destroy anti-ship missiles even when detection is late.

Specifications

Aspide missile
Length: 3.7 m (12 ft)
Diameter: 20.3 cm (8 in)
Wing span: 80 cm (2.6 ft)
Weight: 220 kg (485 lb)



Danaide *(F 553). These ships have both weight and space reserved for up to six Teseo anti-ship missiles, an Aspide reload capability and a variable depth sonar. If funded, this would make them very formidable for their size* (H & L van Ginderen Collection)

Speed: Mach 2.5
Range: 7 n miles (13 km)
Altitude: 15-5,000 m (49-16,400 ft)
Warhead: 33 kg (72.7 lb)
Guidance: Semi-active radar

Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy (system/missile).
Riva-Calzoni, Bologna, Italy (launcher).

TORPEDOES

B515 (ILAS-3) anti-submarine torpedo launching system
There are two B515 (also known as ILAS-3) triple mounts on the main deck below the stack. The tubes are manually loaded and trained but remotely operated from the combat information centre, although emergency local operation is possible.

Specifications
Length: 3.4 m (11.1 ft)
Height: 1.2 m (4 ft)
Width: 1.285 m (4.2 ft)
Weight: 1,050 kg (2,315 lb) (unloaded)

Manufacturer/Contractor
Whitehead SpA, Italy.

Eurotorp Impact (MU-90) 324 mm torpedo
The Eurotorp Impact 324 mm ASW torpedo entered service in 1995, replacing the Mk 46 in Italian Navy service. A combined Franco-Italian project, the new torpedo uses the seeker developed for the French Murene, the warhead and guidance system developed for the Italian A 290, Murene software and battery and the A290 afterbody. The Thomson-Sintra seeker, with its Mangouste processor, uses very high capacity data processing for sophisticated signal processing and the weapon is reportedly capable of tracking up to 12 targets simultaneously. The 30-transducer planar array, two side arrays and depth finder all operate on separate frequencies to overcome reverberation and false echo problems. The Whitehead shaped charge warhead weighs some 50 kg (110 lb).

Specifications
Diameter: 324 mm
Speed: 45 kts
Propulsion: STN stepless, variable speed, electric motor driving a pump-jet propulsor
Battery: Silver oxide-aluminium battery with a potassium hydroxide electrolyte

Manufacturer/Contractor
Eurotorp, Sophia Antipolis Cedex, France.

GUNS

OTOBREDA 76 mm (3 in)/62 Compact
There is one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck for use in either air defence or anti-surface roles. If the weapon is designated to the air-defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission.

Specifications
Calibre: 76.2 mm
Length of barrel: 62 calibres
Traverse: 360° at 70°/sec
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,952 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Selenia INS-3 ESM/ECM system
INS-3 (Integrated Naval System) is a Selenia (now Alenia) ESM/ECM system. The main components are ESM equipment, a 1-18 GHz radar warning system with a 1,500 emitter library, developed from the Elettronica RQN-3. The ECM system is the Elettronica TQN-2 jammer. INS-3 is used to trigger jamming and the Barricade countermeasures system. The array characteristic of the INS-3 is mounted at the head of the short extension on the foremast.

Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy.

DECOYS

ML Aviation Barricade countermeasures system
The Barricade system provides ships with means of deploying chaff and infra-red (IR) decoys to counter missile attacks, using a layered defence against the various types of anti-ship missile. The system uses a 102 mm rocket and a redesigned launcher with four sets of triple-cell launchers. The system has a similar control unit to Barricade Mk III and the same tactical computer. The ammunition lockers each contain 24 rockets. There are four decoy modes:

- confusion, in which long-range (Stockade) rockets are fired to confuse enemy search radar and make target selection difficult
- distraction, in which medium-range chaff and/or infra-red rockets are fired in a pattern of six around the ship to present alternative targets to missiles during their search phase, affording defence against multiple missiles coming from different directions
- dump is used where a missile has locked on to the ship. The ship uses a jammer to remove the missile's range gate and then fires a single rocket to produce a chaff cloud on which the gate may be 'dumped' thus allowing the jammer to be redeployed.
- centroid, is a close-range, final defence mode, used against single missiles. If the incoming missile is locked on to the ship, a pattern of short-range chaff and/or IR rockets is fired to create a large alternative target close to the ship, which manoeuvres away, leaving the missile to home on to the decoy.

Manufacturer/Contractor
ML Wallop Defence Systems, Andover, Hampshire, UK.

AN/SLQ-25 Nixie towed torpedo decoy
One AN/SLQ-25 Nixie (Phase 1), solid-state, modular design electro-acoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit which selects the appropriate cable or load and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them, while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed through the transom or in a partially or totally enclosed location on the main deck. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads and the transmitter are located. Each winch can stream and recover the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed bodies, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, are 95 cm (3.10 ft) long , 15.24 cm (6 in) in diameter and weigh 18 kg (40 lb). They receive amplifier outputs, convert them into acoustic signals and project them. Usually one towed body is deployed at a time.

Manufacturer/Contractor
Aerojet ElectroSystems, Sacramento, California, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

IPN 10 Mini SADOC
SADOC 2/IPN 10 (SADOC = *Systema Direzione della Operazioni di Combattimento*) is a mainframe architecture system designed to acquire, process and present data acquired by sensors but can also be used for a number of other functions, including threat evaluation and weapons control, ECM management, aircraft control, conducting ASW operations, as well as datalink and data bank management.

Data are received from onboard and offboard sensors via datalinks. The system has two or three Central Processing Units (CPU) mini-computers (Alenia 32-bit CDG-3032 with a 128 k memory), one of which usually acts as the immediate backup in the event of system failure. Within the consoles are Alenia 16-bit NDC-160 processors, with 64 k memories. Both possess mass memory modules for handling programmes and large amounts of data and an interface with a 10 Mbit/s serial databus. The basic software of the latter is under the control of two TAVITAC operating systems; the disk operating system and a time-sharing executive.

Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy.

WEAPONS CONTROL

NA 30/Dardo E

NA 30/Dardo-E is a multipurpose fire-control system designed to control up to three medium and light calibre guns of two calibres as well as Albatros point defence surface-to-air missiles and even anti-ship missiles. It consists of a Data Processing Unit (DPU), a supervisory console and the Orion RTN 30X fire-control radar. The DPU is based upon the Selenia (now Alenia) ESA 24 24-bit microprocessor with a memory access time of 250 µs and up to 21 I/O channels. The single-operator console has a 19 in (48.26 cm) and 15 in (38.1 cm) raster scan display for PPI, A/R radar data presentation and a 15 in (38.1 cm) raster scan display for pictures from the electro-optic trackers. The MCI consists of a multifunction keyboard, numeric keyboard, rollerball and joystick.

The RTN 30 is an I-band (8-10 GHz) radar whose above-deck equipment consists of the stabilised director with radar antenna, an infra-red thermal camera and a daylight TV camera. The director covers −30 to +85° in elevation and has slewing speeds of 126°/s (traverse) and 86°/s (elevation). The silicon target TV camera can operate in light conditions down to 2 lux and has a field of view of 3.01°. Below-decks equipment includes the transmitter and receiver cabinets as well as the servo unit. The range against missiles is up to 13.5 n miles (25 km).

The antenna is of the monopulse horn cassegrain type with polarisation twist. The transmission chain is fully coherent and uses a high average power transmitter with a peak power of 12 kW. This can operate in two modes; long pulse with coded waveform (0.5 s compressed, 6.5 s uncompressed) and short, single pulse (0.5 s). In both the final amplification is accomplished by a TWT. A multicanceller MTI and a data processor are in the receiver to perform accurate tracking in all conditions. Accuracy is enhanced by special anti-nodding and air defence spotting devices.

The engagement process, like that of Dardo, is completely automatic following target acquisition either through the ship's search radar or through the RTN 30 director. The system is capable of engaging targets up to Mach 3 and travelling only 3 m (10 ft) above the surface.

Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy.

NA 18L Pegaso

The NA 18 is designed to control two guns of up to 76 mm calibre and can conduct ballistic calculations for two separate calibres simultaneously. It may be used as the primary fire-control system for small warships or as a complementary system for larger warships. It consists of a console which receives data from ship's radar and navigation sensors. It is supported by a transformer/power distribution unit and operates the electro-optic director through a servo unit. The console has a monochrome raster scan display and an optional raster scan PPI display, the other HCI features including dedicated buttons, a joystick and a rollerball.

The NA 18 director has 8-12 micron infra-red camera, a silicon target TV camera with focal length of 30 to 360 mm and a scene dynamic of 100 to 200,000 lux, and an Nd:YAG laser rangefinder with a peak power of 18 MW. The IR camera has fields of view of 4 × 2.6° and 2 × 1.3°. The NA 18L/Pegaso director is more compact and may be used with only the TV camera or with the full range of electro-optic sensors. These are similar to the ones in NA 18 but a 10 MW laser rangefinder is available as an option.

Specifications
Traverse: 360° at 1.8 rad/s
Elevation: −22 to +84° at 1.5 rad/s

Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy.

RADARS

SPS-774 (RAN 10S)

E/F-band air/surface search radar with range of 155 km (85 n miles).

Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy.

SMA SPN-728(V)2

I-band navigation radar.

Manufacturer/Contractor
SMA, Italy.

SONARS

Raytheon/Alenia DE 1167

This is a hull-mounted active search and attack sonar operating at 7.5-12 kHz. The DE 1167 features largely digital electronics. The inboard electronics comprises three cabinets and a single operator console. The outboard equipment comprises a transducer array and a 2.74 m (9 ft) dome for the 12 kHz (centre frequency) installation. DE 1167 is an active/passive, preformed beam, omni and directional transmission sonar which uses three non-interfering 600 Hz wide FM transmission bands centred around 12 kHz or 7.5 kHz. Passive mode may be used for torpedo detection.

Specifications
Centre frequency: 12 kHz
Source level: TRDT 227 dB (HM), omni 217 dB
Pulse type: 600, 2,000 Hz FM sweep; 100, 200, 50, 6 ms pulse lengths
Receiver type: Spatial polarity coincidence correlator between 36 pairs of half beams
Beam characteristics: 36 sets of left and right half beams
Active display: 300 range cells, 288 bearing cells; single and multiple echo history; 4 intensity levels
Passive display: Electronic bearing time recorder with medium time averaging
Track displays: Sector scan indicator and target Doppler indicator
Weight: 12 kHz

Manufacturers/Contractors
Raytheon, USA.
Alenia Elsag Sistemi Navali, Rome, Italy.

PROPULSION

Specifications
System: Diesel
Main machinery: Fincantieri GMT BM 230.20 DVM
Power output: 9.26 MW (12,600 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

The first four were ordered in November 1982, followed by a second four in January 1987. A third batch of four was planned, but was cancelled when it was decided to order the 'Artigliere' class. They are intended for a number of roles including Economic Exclusion (EEZ) patrol, fishery protection and Commanding Officers' training.

STRUCTURE

The funnels were remodelled to reduce turbulence and IR signature. There are two roll dampers.

OPERATIONAL

Omega transit is fitted. First four based at Augusta, Sicily.

Sfinge *(F 554) ready for launch and showing its hull form* (Fincantieri)

FINCANTIERI 60 m CORVETTES

OVERVIEW

Italian shipbuilders have produced a successful series of corvettes for both the Italian and foreign navies, which started with the 'Albatros' class (950 tonnes) in 1954 and was followed by the 'De Cristofaro' class (1,020 tonnes) in 1964-65. This led Fincantieri to design and market a series of closely related designs which, for the purposes of this book, will be termed the 'Fincantieri 60 m corvettes.'

The first buyer was Libya, which ordered four ships in 1974. Known as the 'Wadi M Ragh' class, these were 57.8 m (189.6 ft) long, displaced 670 tonnes, and were armed with four Otomat SSMs, one 76 mm gun, two 35 mm Oerlikon cannons and two triple 324 mm torpedo tubes. They were powered by four diesels, had a range of 4,150 n miles (7,677.5 km) at 18 knots and a top speed of 31.5 knots.

The second order was placed by Ecuador in 1978, which purchased six as the 'Esmeraldas' class. These were very similar to the Libyan ships, having the same hull, and a displacement of 685 tonnes. The weapon fit was rather heavier, comprising six MM 40 Exocet SSMs, an octuple Albatros launcher, a 76 mm gun, two 40 mm cannon and six 324 mm torpedo tubes. The engines were also much more powerful, raising top speed to 37 knots. The most significant difference was that the Ecuadorean ships had a flight deck for a helicopter, which took up the after one-third of the ship's length, but without a hangar.

Then, in February 1981, Iraq placed an order for six corvettes, with the same hull and engines as the Ecuadorean 'Esmeraldas' class.

Four of these (F 214, F 216, F 218 and F 220) did not have a flight deck and had virtually the same weapons fit as the Libyan ships, but with six Teseo SSMs in place of the Exocets. The other two ships in the order (F 210 and F 212) again had the same hull and engines as the Esmeraldas, but in addition, had not only a flight deck, but also a telescopic hangar, which reduced the number of Otomat launchers to two.

The Iraqi ships were all built on schedule and completed in 1986-87. Iraqi crews actually took over F 210 and F 212, even though at the time the ships still lacked some of the weapons systems, there was then a considerable delay due to the trade embargo imposed during the Iran-Iraq war. When that embargo was lifted, training with the ships started in 1990, but Iraq then invaded Kuwait and the United Nations imposed another embargo on military equipment for Iraq. This resulted in the Italians impounding all six ships, which were then held in La Spezia. F 210 and F 212 were held as 'enemy' ships and continued to fly the Iraqi flag and were manned by reduced Iraqi crews. The other four ships were simply not handed over and remained the property of Fincantieri. Fincantieri even carried out some work on the two helicopter corvettes, receiving payment via Cuba.

The non-delivery of these six ships for Iraq (plus four 'Lupo' class frigates and a replenishment oiler) raised considerable problems and the Italian Navy was eventually compelled to accept the four Lupos (see 'Lupo' class). Disposal of the six corvettes did not prove so easy and they were offered on the international market, with Morocco and Colombia both reported to be showing a strong interest, although neither has ever translated that interest into an actual order.

Then, it was announced in October 1995 that the Royal Malaysian Navy (RMN) had signed a contract for the purchase of two of the ships (the former Iraqi F 216 and F 218) which would be refurbished by Fincantieri with certain equipment being changed and then commissioned into the RMN in February 1997. This announcement was followed a year later by reports that the RMN is in the final stages of negotiation to buy both the helicopter carriers and one of the two remaining ships without a flight deck. The fate of the single remaining ship is not known.

Meanwhile, Fincantieri took the Iraqi Government to court in Italy over the losses the company has suffered through these contracts. The sums involved are alleged to be in the region of US$70 million, less what is received from the sale of the ships to the Italian and Malaysian navies.

Launched 27 Feb 1982
Commissioned 26 May 1984

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Aerospatiale MM 40 Exocet

This class embarks a total of 6 missiles in 2 triple launchers. The MM 40 features inertial cruise, active radar homing to 40 n miles (70 km) at Mach 0.9 and a warhead of 165 kg (364 lb). The MM 40 has folding wings, a steel-cased CMDB sustainer and a Thomson-TRT RAM 01 altimeter. Compared with the MM 38 the booster is larger while the Block 1 seeker has a wider search and acquisition angle. The Block 2 missile features a new J-band (10-20 GHz) Super ADAC seeker which has improved (Electronic Counter-CounterMeasures) performance, associated electronics and a new guidance computer although no further details are available. Company literature indicates the presence of a smaller, 155 kg warhead with both impact and proximity fuzes. The new electronics permit the missile to optimise its sea-skimming height allowing it to operate in conditions to Sea State 7 even in severe Electronic CounterMeasures (ECM) conditions. The fire-control system has also been adapted with the development of the Cat-Visac console which can operate with two types of the Exocet missile simultaneously.

The new fire-control system allows improved target selectivity, attacks upon multiple targets by diverging and converging salvos.

Targets for the surface-launched missiles are acquired by the ship's sensors. The operator then aligns the axial gyros in the target's direction and begins the initiation sequence which can take up to a minute. The thermal battery is turned on, the mechanical safety locks are released, the booster is ignited and the umbilical cord is broken, the total process taking 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change in the course of its flight. Once the missile has cleared the launcher-container, the sustainer carries it into the cruise phase during which, it travels towards the general location of the target at a height of about 100 m (328 ft) which is low enough to reduce the chance of detection but adequate for target acquisition. Once the target is detected the missile descends to between 9 and 15 m (29.5 and 49 ft) in the approach phase before descending to 8 m (26 ft) (2 to 5 m (6.5 to 16 ft) in a calm sea) for a sea-skimming terminal phase. A salvo may be fired in 12 to 20 seconds.

Specifications (MM 40 Block 1)
Length: 5.78 m (19 ft)
Diameter: 35 cm (13.7 in)
Wing span: 1.13 m (3.7 ft)
Weight: 855 kg (1,885 lb)
Speed: Mach 0.9
Range: 2-38 n miles (4-70 km)
Guidance: Inertial and active radar

Manufacturer/Contractor
Aerospatiale, France

SURFACE-TO-AIR MISSILES (SAM)

Albatros SAM system

A quad launcher for the Aspide semi-active radar homing missile is mounted just aft of the main mast. Albatros is a modular system consisting of the Aspide missile, a guidance and launching subsystem, and a missile handling subsystem and complements the gun fire-control system to produce an overlapping, layered, air defence against both anti-aircraft and anti-ship missiles. Albatros may be used with one or two directors, the launcher being automatically slaved to one director

during the operation. The MCU receives missile orders from the MSCU and missile status data from the launcher, selects the missile and initiates the launch sequence.

Targets are detected by the ship's primary search radars and allocated to the fire-control system, whose radar acquires the target and the CW transmitter group injects signals into the fire-control system tracker as the launcher slews towards the target. The missile control system selects the missile or missiles which the power supply units then prepare for launch. Total system reaction time is 8 seconds.

When the decision is made to engage the target the reversible pre-launch commands are issued. The firing command itself can be issued automatically or manually, the operator also having the options of a single shot or salvo mode, in which two missiles are launched sequentially against the same target, the maximum firing rate of the system being one missile every 2.5 seconds. Upon launch, the missile is gathered into the tracker-illuminator's beam through a direct signal to the rear receiver and homes on the reflected energy from the target. Up to three missiles at once may be controlled by one tracker, according to the manufacturer, who also claims that the system can engage horizontal targets at up to 15 km, vertical ones at 5 km and lateral ones at 8 km. A short reaction time gives the system the ability to destroy anti-ship missiles, even when detection is late.

Specifications
Length: 3.7 m (12.1 ft)
Diameter: 20.3 cm (8 in)
Wing span: 80 cm (31.5 in)
Weight: 220 kg (485 lb)
Speed: Mach 2.5
Range: 7 n miles (13 km)
Warhead: 33 kg (72.75 lb)
Guidance: Semi-active radar

Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy.

TUBES

324 mm ILAS-3 torpedo tubes
Esmereldas corvettes have two triple torpedo tubes for A244 lightweight anti-submarine torpedoes. The B515/ILAS-3 consists of three 324 mm diameter torpedo tubes with two tubes at the bottom of the installation and one on the top. The launcher weighs 1,050 kg (2,315 lb) unloaded and is designed for installation on an open deck, usually with one installation on each side of the ship. They are manually loaded and trained but remotely operated from the combat information centre. Emergency local operation is possible on each tube.

Specifications
Length: 3.4 m (11.15 ft)
Height: 1.2 m (3.94 ft)
Width: 1.28 m (4.2 ft)
Weight: 1,050 kg (2,315 lb)(unloaded)

Manufacturer/Contractor
Whitehead, SpA, Italy.

Esmeraldas *(CM 11). On a displacement of 650 tonnes these corvettes mount a 76 mm gun, a twin 40 mm gun, six Exocet anti-ship missiles, two sets of triple torpedo tubes, and a helicopter platform*

TORPEDOES

A244 Mod 1 torpedo
The A244 torpedo features self adaptive patterns to 3.8 n miles (7 km) at 33 knots and a 34 kg (74.95 lb) shaped charge warhead. The acoustic homing head has active, passive and mixed modes and has a large search volume covered by multiple preformed beams. Active acquisition range is in excess of 2,100 m (2,296 yd). The propulsion system uses a saltwater battery powering a DC counter-rotating motor providing direct drive to a two-bladed propeller shaft.

Specifications
Length: 2.75 m (9.0 ft)
Diameter: 324 mm (12.75 in)
Weight: 221 kg (487 lb)
Warhead: HBX-3 HE
Propulsion: Electric
Guidance: Active/passive sonar, self-adaptive programmed patterns

Manufacturer/Contractor
Whitehead SpA, Italy.

GUNS

OTOBREDA 76 mm (3 in)/62 Compact
The 76 mm/62 on the 'Esmereldas' class is located in the A gun position. The Compact mounting features extensive aluminium fabrication of the gun platform, the trunnion supports and the trunk. The 76/62 Compact can fire 80 rounds without reloading and the rate of fire is adjustable from 10 to 85 rds/min. The system is remotely controlled. A reaction time of 2.8 seconds is quoted.

Specifications
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 10-85 rds/min
Range: 8.6n miles (16 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Bofors 40 mm/70 (twin)
A twin Bofors 40 mm/70 mounting is located aft, which can be used against air or surface targets. The Compact twin 40 mm mounting is designed for use against high performance combat aircraft, against anti-ship missiles and for surface engagements. The mounting consists of two 40 mm guns which are 300 mm apart, a feeding system with magazine, a local control panel, a power supply rack, a converter and an air-water panel.

Specifications
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 4,000 m (13,000 ft)
Rate of fire: 600 rds/min
Ammunition: 2.4 kg (5.30 lb) (HCHE, PFHE), 2.5 kg (5.51 lb) (HE-T)
Traverse: Nominal 360° at 90°/s
Elevation: −13 to +85° at 60°/s
Crew: 2

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Elettronica Gamma ED
Gamma is an ESM/ECM suite from Elettronica, which is, in essence, a simpler version of the widely used Newton system. Frequency range is 2-18 GHz and the system incorporates receivers, processors and jammers.

Manufacturer/Contractor
Elettronica, Rome, Italy.

DECOYS

OTOBREDA SCLAR Mk 2
The OTOBREDA multipurpose naval rocket launcher system consists of two launchers for SNIA 105 mm countermeasure or assault rockets and an Alenia UCLAR control unit. Although designed as a multirole rocket launcher SCLAR is normally used to fire decoys. SCLAR Mk 2 uses an ESA 24 microprocessor. The launchers are mounted on each side of the ship and they can be trained and elevated by remote-control. The control unit is linked to the ship's radar and a control panel in the ECM compartment provides the necessary operating signals. The data needed to stabilise the two launchers against pitch and roll is provided by the ship's gyrocompass.

Specifications
Mounting
Traverse: 300° at 60°/s
Elevation: −5 to +60° at 30°/s
Rate of fire: 1 rd/s (approx)

Rockets
Length: 1.85 m (6.07 ft) (SNIA 105 LR); 1.83 m (6 ft) (SNIA 105 MR)
Diameter: 105 mm (4.1 in)
Weight: 27 kg (59.5 lb) (SNIA 105 LR); 29 kg (63.9 lb) (SNIA 105 MR)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Alenia SADOC 2/IPN 10

SADOC 2 *(Sistema Automatico Direzione delle Operazioni de Combattimento)* entered service aboard the frigate *Lupo* in September 1977. It is designed to produce an up-to-date picture of the tactical situation within the vicinity of both the ship and task group and has a mainframe architecture designed for processing and presenting data acquired by sensors. It can also be used for a number of other functions, including, threat evaluation and weapons control, ECM management, aircraft control, conducting ASW operations and datalink data bank management.

The system has two or three Central Processing Units (CPU) mini-computers, with one usually acting as an immediate backup in the event of system failure. These are Selenia (now Alenia) 32-bit CDG-3032, with a memory of 128 k. Within the consoles are Selenia (now Alenia) 16-bit NDC-160, with memory of 64 k. Both possess mass memory modules for handling programmes and large amounts of data and an interface with a 10 Mbit/s serial databus. The basic software of the latter is under the control of two TAVITAC operating systems; the disk operating system and a time-sharing executive.

Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy.

WEAPONS CONTROL

Elsag NA 10 Mod 2

The NA 10 system is designed for surface engagement, air engagements or shore bombardments and can control three guns of two calibres simultaneously. It uses an RTN-10X fire-control radar which was supplemented in earlier versions by two optical periscope sights. Electro-optical equipment which could be mounted on the director included InfraRed (IR) camera, TV camera and laser rangefinder while a CW illuminator could also be installed. The system is operated through the Main Control Unit (MCU) which is a console with ballistic computer. A TV display may be added when electro-optical units are used. The MCU is used for target acquisition, tracking and engagement either manually or automatically. Two periscope sights may also be used to provide supplementary target data input to the radar and permit a second target to be engaged.

Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy.

RADARS

Alenia RAN 10S (SPS-774)

Specifications
Role: Air/surface search
Band: E/F
Beam: 1.5 × 17°
Peak power: 140 kW
Gain: 28 dB
Pulsewidth: 0.4 µs
PRF: 900 pps
Scan rate: 15/30 rpm
Range: 85 n miles (155 km)

Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy.

SMA 3 RM 20

Specifications
Role: Navigation
Band: I
Beam: 1.2 × 25°
Peak power: 20 kW
Gain: 27 dB
Pulsewidth: 0.05/0.15/0.5/1.5 µs
PRF: 5,200/2,600/1,300/650 pps
Scan rate: 25 rpm

Manufacturer/Contractor
SMA, Florence, Italy.

Alenia RTN-10X

Specifications
Role: Fire control
Band: I/J
Peak power: 200 kW
Pulsewidth: 1.5 µs
PRF: 450-550 pps
Range (typical): 10.75 n miles (20 km) against missiles

SONAR

Thomson Sintra Diodon (TSM 2635)

A hull-mounted active search and attack sonar operating at 11, 12 or 13 kHz. Diodon is a panoramic sonar with a one-man console using a dual-screen high-resolution display. Embedded facilities include passive listening, sound ray tracer, an acoustic propagation system and a recording system that can be used for post-mission debrief.

Specifications
Acoustic array: 24 identical staves weighing 450 kg (992 lb)
Frequency: 12 kHZ approximately
Transmitter: Omnidirectional transmission in CW and FM modes.
Receiver: 36 pre-formed beams, advanced processing with replica correlator in FM, and spectrum analysis in CW.
Video processing: Simultaneous multitrack extraction (up to 64 targets)
Total weight: 1,500 kg (3,306 lb)

Manufacturer/Contractor
Thomson Sintra ASM, France.

AVIATION

Specifications
Flight deck: 11 × 9.3 m (36 × 30.5 ft)
Hangar: None.

HELICOPTERS

One Bell 706B JetRanger

Specifications
Operational speed: 115 kts (213 km/h)
Service ceiling: 13,500 ft (4,115 m)
Range: 368 n miles (680 km)
Sensors: None.
Weapons: None.
Role/weapon systems: Support helicopter for afloat reconnaissance and SAR.

PROPULSION

Specifications
System: Diesel
Main machinery: 4 MTU 20V 956 TB92, 16.27MW (22,140 hp)
Shafts: 4

FURTHER INFORMATION

PROGRAMME

These six ships were ordered in 1979 and delivered between 1982 and 1984.

DESIGN

These ships are similar to the Libyan Fincantieri corvettes ('Musa ben Nussair' class), but with a helicopter deck and larger engines, which give greater speed.

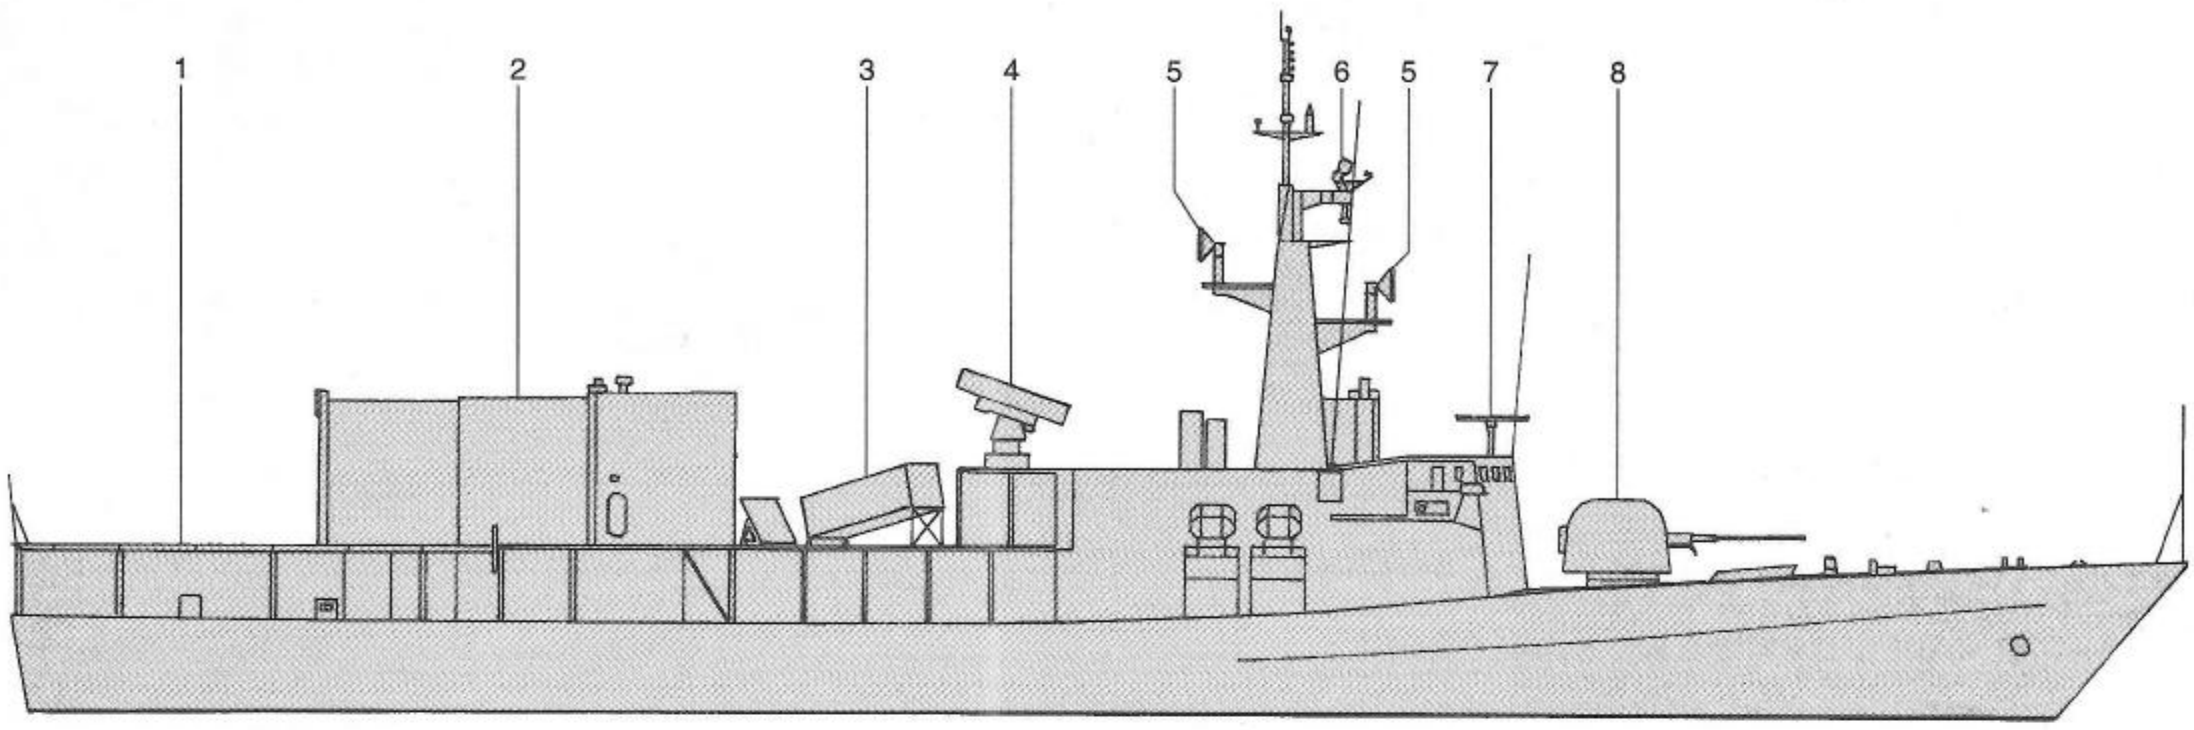
MODERNISATION

Contracts for updating command and weapons control systems were placed in 1993/94. One of the top priorities is for a datalink system compatible with the frigates.

DEPLOYMENT

El Oro (CM 14) was out of commission for two years from mid-1985 after a serious fire.

MUSSA BEN NUSSAIR (FINCANTIERI 60 m CORVETTES)



Mussad ben Nussair (Ian Sturton)
1 *Flight deck* **2** *Telescopic hangar* **3** *OTOBREDA/Matra Teseo Mk 2/Otomat launcher (two single launchers)* **4** *Alenia Albatros launcher for Aspide SAMs* **5** *Alenia Orion RTN-10X* **6** *Alenia RAN-10S air/surface search radar* **7** *SMA SPN-703 (3 RM 20) navigation radar* **8** *OTOBREDA 76 mm (3 in)/62 Super Rapid automatic gun*

GENERAL SPECIFICATIONS

Country of origin: Italy
Operator: Iraq (see 'Further Information'*)
Type: Fincantieri 60 m corvettes

Class: MUSSA BEN NUSSAIR

Built: 2
Active: 0

Displacement:
full load: 685 t

Dimensions
Length: 62.3 m (204.4 ft)
Beam: 9.3 m (30.5 ft)
Draught: 2.5 m (8 ft)

Speed: 37 kts
Range: 4,000 n miles at 18 kts

Complement: 51 (not including aircrew)

* At the time of closing for press these ships were still technically owned by Iraq, although Malaysia was showing an interest in buying them. See 'Overview'.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

OTOBREDA/Matra Teseo Mk 2

There are two single launchers for the Teseo Mk 2 system, using the Otomat missile, located immediately before the hangar. The Mk 2 version uses mid-course correction system to achieve longer ranges. All versions of the Otomat missile are housed in a launcher-container, which weighs 1.61 tonnes and is inclined at an angle of 15°, with the missile suspended from a ceiling launch rail. The target may be acquired by the ship's radar, by the radars of friendly ships or by helicopter radars. Data on the target's location are transmitted to the missile's autopilot and the turbojet is started. Once it has reached full power the boosters are ignited and the missile is launched. The missile can turn through an angle of ±200° so the warship does not have to be facing the target during the launch phase.

Once launched, the missile climbs to 150 m (492 ft) assisted by the boosters which burn for 4 seconds until it reaches cruising speed some 2.15 n miles (4 km) from the launch point when the boosters are jettisoned. The missile then descends to a cruising height of 15 to 20 m (49 to 66 ft) which is suitable for ensuring a good communications link with the mothership although still difficult for the target to observe. It continues towards the target with mid-course guidance correction until the radar seeker, which is azimuth only, is activated at a predetermined point and scans a 40° sector, then acquires the target at a range of about 6.5 n miles (12 km). For the terminal phase the Otomat drops to sea-skimming height. The Otomat system is capable of engaging two separate targets simultaneously in sea states up to Force 7.

Specifications

Length: 4.46 m (14.63 ft)
Diameter: 46 cm (18 in)
Wing span: 1.36 m (4.46 ft)
Weight:
with boosters: 770 kg (1,698 lb)
without boosters: 762 kg (1,680 lb)
Range: 86 n miles (160 km)
Guidance: Inertial and active radar homing

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy
Matra, France.

SURFACE-TO-AIR MISSILES (SAM)

Alenia Albatros SAM System

A quad launcher for the Aspide semi-active radar homing missile is mounted just aft of the main mast. Albatros is a modular system consisting of the Aspide missile, a guidance and launching subsystem and a missile handling subsystem which complements the gun fire-control system to produce an overlapping, layered, air defence against anti-aircraft and anti-ship missiles. Albatros may be used with one or two directors, the launcher being automatically slaved to one director during the operation. The MCU receives missile orders from the MSCU and missile status data from the launcher, selects the missile and initiates the launch sequence.

Targets are detected by the ship's primary search radars and allocated to the fire-control system, whose radar acquires the target and the CW transmitter group injects signals into the fire-control system tracker as the launcher slews towards the target. The missile control system selects the missile or missiles which the power supply units then prepare for launch. Total system reaction time is 8 seconds.

When the decision is made to engage the target the reversible pre-launch commands are issued. The firing command itself can be issued automatically or manually, the operator also having the options of a single shot or salvo mode, in which two missiles are launched sequentially against the same target, the maximum firing rate of the system being one missile every 2.5 seconds. Upon launch, the missile is gathered into the tracker-illuminator's beam through a direct signal to the rear receiver and homes on the reflected energy from the target. Up to three missiles at once may be controlled by one tracker, according to the manufacturer, who also claims that the system can engage horizontal targets at up to 15 km, vertical ones at 5 km and lateral ones at 8 km. A short reaction time gives the system the ability to destroy anti-ship missiles, even when detection is late.

Specifications
Length: 3.7 m (12.14 ft)
Diameter: 20.3 cm (8 in)
Wing span: 80 cm (31.5 in)
Weight: 220 kg (485 lb)
Speed: Mach 2.5
Range:
anti-surface: 7 n miles (13 km)
anti-air: 15-5,000 m (50-16,400 ft)
Warhead: 33 kg (72.7 lb)
Guidance: Semi-active radar

Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy.

GUNS

OTOBREDA 76 mm (3 in)/62 Super Rapid
There is one 76 mm (3 in)/62 in 'A' position. The Super Rapid mounting is similar in design, dimensions and weight to the earlier Compact, but features upgraded hydraulic motors for the feed and hoist systems, rocker arms made from titanium, a redesigned feeder device and loading tray which move shorter distances for faster action. There is also a new digital console with plasma display for gun control.

Specifications
Traverse: 360° at 60°/s
Elevation: −15 to +85° at 35°/s
Weight (unloaded): 8 t
Muzzle velocity: 925 m/s (3,034 ft/s)
Rate of fire: 120 rds/min
Range: 8.5 n miles (15.75 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

INS-3 ESM/ECM system
INS-3 (Integrated Naval System) is an Elettronica ESM system, a 1-18 GHz radar warning system with a 1,500 emitter library, which was developed from the Elettronica RQN-3. INS-3 is used to trigger jamming and the Breda chaff launchers. The array characteristic of the INS-3 is mounted at the head of the short extension on the foremast. The ECM system is the Elettronica TQN-2 jammer (see below).

Manufacturer/Contractor
Elettronica SpA, Rome, Italy.

Elettronica TQN-2 jammer
The TQN-2 is built from a modular suite which can be expanded from a noise/deception jammer with a single antenna and transmitter to more complex configurations to achieve the most effective methods required.

Manufacturer/Contractor
Elettronica SpA, Rome, Italy.

DECOYS

OTOBREDA 105 mm SCLAR Mk 2
The OTOBREDA multipurpose naval rocket launcher system consists of two launchers for SNIA 105 mm countermeasure or assault rockets and an Alenia UCLAR control unit. Although designed as a multirole rocket launcher SCLAR is normally used to fire decoys. SCLAR Mk 2 uses an ESA 24 microprocessor. The launchers are mounted on each side of the ship and they can be trained and elevated by remote control. The control unit is linked to the ship's radar and a control panel in the ECM compartment provides the necessary operating signals. The data needed to stabilise the two launchers against pitch and roll is provided by the ship's gyrocompass.

Specifications
Mounting
Traverse: 300° at 60°/s
Elevation: −5 to +60° at 30°/s
Rate of fire: 1 rd/s (approx)

Rockets
Length: 1.85 m (SNIA 105 LR); 1.83 m (SNIA 105 MR)
Diameter: 105 mm
Weight: 27 kg (SNIA 105 LR); 29 kg (SNIA 105 MR)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy,

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Alenia SADOC 2/IPN 10
SADOC 2 *(Sistema Automatico Direzione delle Operazioni de Combattimento)* entered service aboard the frigate *Lupo* in September 1977. It is designed to produce an up-to-date picture of the tactical situation within the vicinity of both the ship and task group and has a mainframe architecture designed for processing and presenting data acquired by sensors. It can also be used for a number of other functions, including, threat evaluation and weapons control, ECM management, aircraft control, conducting ASW operations and data-link data bank management.

The system has two or three Central Processing Units (CPU) mini-computers, with one usually acting as an immediate backup in the event of system failure. These are Selenia (now Alenia) 32-bit CDG-3032, with a memory of 128 k. Within the consoles are Selenia (now Alenia) 16-bit NDC-160, with memory of 64 k. Both possess mass memory modules for handling programmes and large amounts of data and an interface with a 10 Mbit/s serial databus. The basic software of the latter is under the control of two TAVITAC operating systems; the disk operating system and a time-sharing executive.

Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy.

RADARS

WEAPONS CONTROL

Alenia NA 21
There are two NA 21 systems in each corvette. NA 21 was developed from NA 10 which was designed for surface engagement, air engagements or shore bombardments and can control three guns of two calibres. NA 21 has a similar function and can control three guns of two different calibres, a surface-to-air missile system and can also designate targets for a surface-to-surface missile system. The console is similar to that of the NA 10 and features a data processing unit based upon Elsag ESA 24 micro-processors. The improved electronics permit the system to conduct a programmed low altitude search with the RTN 10 and, at the same time, to use the ship's search radar for surveillance, both being either panoramic or in sectors. The NA 21 is also capable of automatic target acquisition through its own radar or through the ship's command system and it can also designate targets for other weapon system directors. The RTN 10X associated with NA21 on these vessels is a conical-scan pulse radar which operates in the I-band and controls the twin 40 mm mountings in close-in weapon system mode. The director covers −23 to +83° and on the right-hand side is a CCTV camera with control unit. The maximum training speed is 110°/s while the maximum elevation speed is 90°/s. The below-decks equipment consists of a frequency changeable, highpower magnetron transmitter, a linear receiver and a servo amplifier. The RTN 10 employs different receiver signal and data processing techniques both for ECCM and for accurate tracking of targets at all altitudes. Target acquisition is initiated through the ship's tactical data handling or command system and the radar then switches to the acquisition phase with tracking beginning automatically upon detection of the target. The operational range is about 40 km against aircraft and >20 km against missiles.

Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy.

SONAR

STN Atlas Elektronik ASO 84-41

A hull-mounted active search and attack sonar from the STN Atlas Elektronik's DSQS-21 series and intended primarily for operation against submarines below the thermal layer. It uses computer-aided detection techniques for classification and tracking. Information is presented on colour CRT displays to permit Doppler coding and discrimination of data.

Manufacturer/Contractor
STN Atlas Elektronik, Germany.

AVIATION

HELICOPTER

Specifications
Flight deck: (see 'Further Information.')
Hangar: There is a telescopic hangar, which was designed to accommodate an Agusta-Bell AB-212ASW helicopter.

Until an end-user is announced it is not known what type of helicopter will be used.

PROPULSION

Specifications
System: Diesel
Main machinery: 4 MTU 20V 956 TB92 diesels, 14.8 MW (20,120 hp)
Shafts: 4

FURTHER INFORMATION

PROGRAMME

As described in detail in the 'Overview' these two ships were ordered by Iraq in February 1981, formally handed over in 1986 and started trials with Iraqi crews in mid-1990. The invasion of Kuwait stopped any prospects of delivery.

Unlike the other four ships, however, these had actually been handed over to Iraq and they have remained flying the Iraqi flag and with a small Iraqi caretaker crew. In addition, some minor work was carried out on the two ships in 1995 at Iraq's expense, with payment being made by Iraq via Cuba.

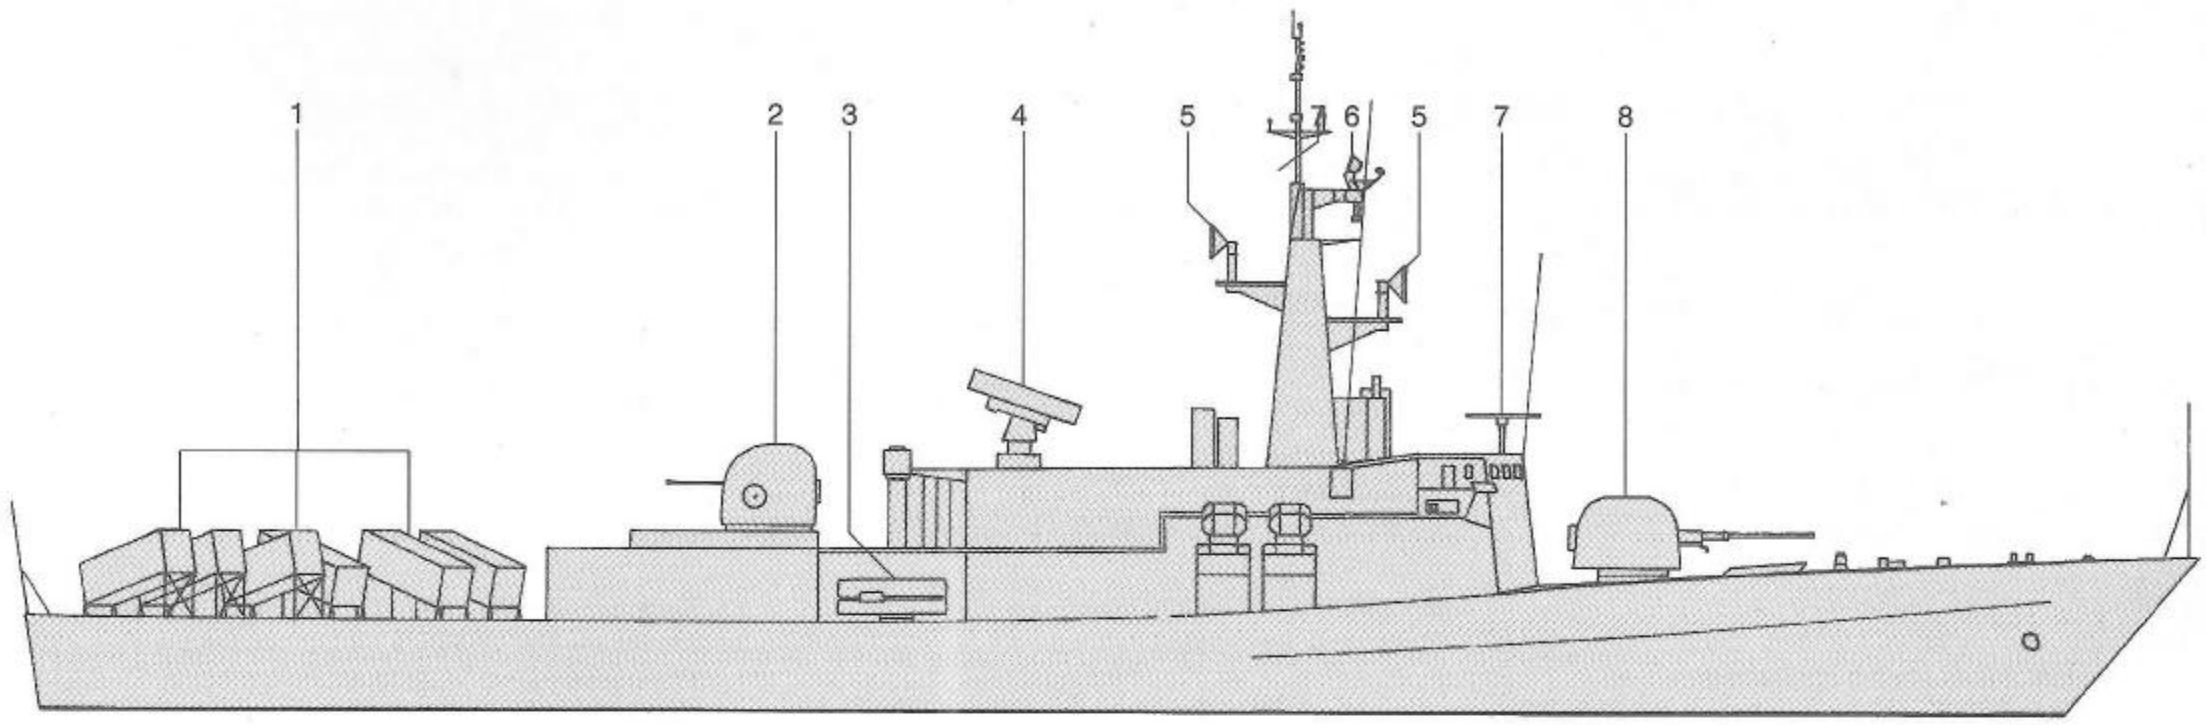
DESIGN

These ships have the same hull and propulsion system as the Ecuadorean ships. In the 'Esmeraldas' class, however, the flight deck is an isolated platform whereas in these Iraqi ships there is a continuous deck running from the superstructure to the stern. There is also a telescopic hangar, which was designed to accommodate an Agusta-Bell AB-212ASW helicopter.

FUTURE

The future of these ships is uncertain. Despite the Iraqi ownership it appears highly improbable that they will ever be delivered to that country and it was reported in late 1996 that Malaysia wishes to buy them both. If that occurs, presumably they will be given a preliminary refit similar to that for the other two corvettes.

MALAYSIAN CORVETTES (FINCANTIERI 60 m CORVETTES)



Fincantieri 60 m corvette (Malaysia) (Ian Sturton)
1 *OTOBREDA/Matra Teseo Mk 2 launcher for Otomat anti-ship missiles (three twin launchers)* **2** *OTOBREDA twin 40 mm/70 automatic gun* **3** *Triple ILAS-3 324 mm torpedo tubes* **4** *Alenia Albatros launcher for Aspide SAM* **5** *Alenia Orion RTN-10X* **6** *Alenia RAN-10S air/surface search* **7** *Navigation radar (type not known)* **8** *OTOBREDA 76 mm (3 in)/62 Super Rapid automatic gun*

Delivery	Feb 1997

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Teseo Mk 2

There are three twin launchers for the Teseo Mk 2 system, using the Otomat missile. The Mk 2 version uses mid-course correction system to achieve longer ranges. All versions of the Otomat missile are housed in a launcher-container. The container weighs 1.61 tonnes and is inclined at an angle of 15° with the missile suspended from a ceiling launch rail. The target may be acquired by the ship's radar, by the radars of friendly ships or by helicopter radars. Data on the target's location are transmitted to the missile's autopilot and the turbojet is started. Once it has reached full power the boosters are ignited and the missile is launched. The missile can turn through an angle of ±200° so the warship does not have to be facing the target during the launch phase.

Once launched, the missile climbs to 150 m (492 ft) assisted by the boosters which burn for 4 seconds until it reaches cruising speed some 2.15 n miles (4 km) from the launch point when the boosters are jettisoned. The missile then descends to a cruising height of 15 to 20 m (50 to 66 ft) which is suitable for ensuring a good communications link with the mothership although still difficult for the target to observe. It continues towards the target with mid-course guidance correction until the radar seeker, which is azimuth only, is activated at a predetermined point and scans a 40° sector, then acquires the target at a range of about 6.5 n miles (12 km). For the terminal phase the Otomat drops to sea-skimming height. The Otomat system is capable of engaging two separate targets simultaneously in sea states up to Force 7.

Specifications

Length: 4.46 m (14.63 ft)
Diameter: 46 cm (18 in)
Wing span: 1.36 m (4.46 ft)
Weight: 762 kg (1,680 lb) (without boosters); 770 kg (1,698 lb) (with boosters)
Range: 86 n miles (160 km)
Guidance: Inertial and active radar homing

Manufacturers/Contractors

OTOBREDA, La Spezia, Italy.
Matra, France.

SURFACE-TO-AIR MISSILES (SAM)

Alenia Albatros SAM system

A quad launcher for the Aspide semi-active radar homing missile is mounted just aft of the main mast. Albatros is a modular system consisting of the Aspide missile, a guidance and launching subsystem, and a missile handling subsystem and complements the gun fire-control system to produce an overlapping, layered, air defence against both anti-aircraft and anti-ship missiles. Albatros may be used with one or two directors, the launcher being automatically slaved to one director during the operation. The MCU receives missile orders from the MSCU and missile status data from the launcher, selects the missile and initiates the launch sequence.

Targets are detected by the ship's primary search radars and allocated to the fire-control system, whose radar acquires the target and the CW transmitter group injects signals into the fire-control system tracker as the launcher slews towards the target. The missile control system selects the missile or missiles which the power supply units then prepare for launch. Total system reaction time is 8 seconds.

When the decision is made to engage the target the reversible pre-launch commands are issued. The firing command itself can be issued automatically or manually, the operator also having the options of a single shot or salvo mode, in which two missiles are launched sequentially against the same target, the maximum firing rate of the system being one missile every 2.5 seconds. Upon launch, the missile is gathered into the tracker-illuminator's beam through a direct signal to the rear receiver and homes on the reflected energy from the target. Up to three missiles at once may be

controlled by one tracker. A short reaction time gives the system the ability to destroy anti-ship missiles, even when detection is late.

Specifications
Length: 3.7 m (12.14 ft)
Diameter: 20.3 cm (8 in)
Wing span: 80 cm (31.5 in)
Weight: 220 kg (485 lb)
Speed: Mach 2.5
Range:
anti-surface: 7 n miles (13 km)
anti-air: 15-5,000 m (50-16,400 ft)
Warhead: 33 kg (72.7 lb)
Guidance: Semi-active radar

Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy.

TUBES

324 mm ILAS-3 torpedo tubes
There are two triple torpedo tubes for A244 lightweight anti-submarine torpedoes. The B515/ILAS-3 consists of three 324 mm diameter torpedo tubes, two at the bottom of the installation and one on the top. The launcher is designed for installation on an open deck, usually with one installation on each side of the ship. They are manually loaded and trained but remotely operated from the combat information centre. Emergency local operation is possible on each tube.

Specifications
Length: 3.4 m (11.15 ft)
Height: 1.2 m (3.94 ft)
Width: 1.28 m (4.21 ft)
Weight: 1,050 kg (2,315 lb) (unloaded)

TORPEDOES

Whitehead A244/S lightweight torpedo
The A244/S is capable of active, passive or mixed modes for closing on its target. The head has a large search volume covered by multiple pre-formed beams following a number of self-adaptive search patterns. The seeker has an active acquisition range exceeding 2,100 m (2,296 yd) and is capable of operation in shallow water. The propulsion system uses a saltwater battery powering a DC counter-rotating motor which drives a two-bladed propeller shaft.

Specifications
Length: 2.75 m (9.0 ft)
Diameter: 324 mm (12.75 in)
Weight: 221 kg (487 lb)
Warhead: HBX-3 HE
Propulsion: Electric
Guidance: Sonar, self-adaptive programmed patterns

Manufacturer/Contractor
Whitehead, SpA, Italy.

GUNS

OTOBREDA 3 in (76 mm)/62 Super Rapid
There is one 76 mm (3 in)/62 in 'A' position. The Super Rapid mounting is similar in design, dimensions and weight to the earlier Compact, but features upgraded hydraulic motors for the feed and hoist systems, rocker arms made from titanium, a redesigned feeder device and loading tray which move shorter distances for faster action. There is also a new digital console with plasma display for gun control.

Specifications
Traverse: 360° at 60°/s
Elevation: −15 to +85° at 35°/s
Weight (unloaded): 8 t
Muzzle velocity: 925 m/s (3,034 ft/s)
Rate of fire: 120 rds/min
Range: 8.5 n miles (15.75 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

OTOBREDA 40 mm/70 (twin)
There is a single twin 40 mm mounting aft in 'Y' position. The 40 mm L/70 is an automatic cannon for air defence roles which may also be used to engage surface targets. The Compact twin 40 mm mounting is designed for use against high performance combat aircraft, against anti-ship missiles and for surface engagements. The mounting consists of two 40 mm guns which are 300 mm apart, a feeding system with magazine, a local control panel, a power supply rack, a converter and an air-water panel.

Specifications
Traverse: 360° at 90°/s
Elevation: −13 to +85° at 60°/s
Crew: 2
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 4,000 m (13,123 ft)
Rate of fire: 600 rds/min
Ammunition: 2.4 kg (5.3 lb) (HCHE, PFHE), 2.5 kg (5.51 lb) (HE-T)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

INS-3 ESM/ECM system
INS-3 (Integrated Naval System) is an Elettronica ESM system, essentially a 1-18 GHz radar warning system with a 1,500 emitter library, which was developed from the Elettronica RQN-3. INS-3 is used to trigger jamming and the OTOBREDA chaff launchers. The array characteristic of the INS-3 is mounted at the head of the short extension on the foremast. The ECM system is the Elettronica TQN-2 jammer (see below).

Manufacturer/Contractor
Elettronica SpA, Rome, Italy.

Elettronica TQN-2 jammer
The TQN-2 is built from a modular suite which can be expanded from a noise/deception jammer with a single antenna and transmitter to more complex configurations to achieve the most effective methods required.

Manufacturer/Contractor
Elettronica SpA, Rome, Italy.

DECOYS

OTOBREDA 105 mm SCLAR Mk 2
The OTOBREDA multipurpose naval rocket launcher system consists of two launchers for SNIA 105 mm countermeasure or assault rockets and an Alenia UCLAR control unit. Although designed as a multirole rocket launcher SCLAR is normally used to fire decoys. SCLAR Mk 2 uses an ESA 24 micro-processor. The launchers are mounted on each side of the ship and they can be trained and elevated by remote control. The control unit is linked to the ship's radar and a control panel in the ECM compartment to provide the necessary operating signals. The data needed to stabilise the two launchers against pitch and roll is provided by the ship's gyrocompass.

Specifications
Mounting
Traverse: 300° at 60°/s
Elevation: −5 to +60° at 30°/s
Rate of fire: 1 rd/s (approx)

Rockets
Length: 1.85 m (6.07 ft) (SNIA 105 LR); 1.83 m (6 ft) (SNIA 105 MR)
Diameter: 105 mm (4.1 in)
Weight: 27 kg (59.5 lb) (SNIA 105 LR); 29 kg (63.9 lb) (SNIA 105 MR)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Alenia SADOC 2/IPN 10
SADOC 2 *(Sistema Automatico Direzione delle Operazioni de Combattimento)* entered service aboard the frigate *Lupo* in September 1977. It is designed to produce an up-to-date picture of the tactical situation within the vicinity of both the ship and task group and has a mainframe architecture designed for processing and presenting data acquired by sensors. It can also be used for a number of other functions, including threat evaluation and weapons control, ECM management, aircraft control, conducting ASW operations and data-link data bank management.

The system has two or three Central Processing Units (CPU) mini-computers, with one usually acting as an immediate backup in the event of system failure. These are Selenia (now Alenia) 32-bit CDG-3032, with a memory of 128 k. Within the consoles are Selenia (now Alenia) 16-bit NDC-160, with memory of 64 k. Both possess mass memory modules for handling programmes and large amounts of data and an interface with a 10 Mbit/s serial databus. The basic software of the latter is under the control of two TAVITAC operating systems; the disk operating system and a time-sharing executive.

Signaal Link YM
The RMN Navy purchased the Signaal version of Link Y, which was developed in the UK by Ferranti as a digital link suitable for sale to non-NATO countries for naval and aircraft use. Different users have versions tailored to their own needs, the particular version being indicated by a single letter suffix; Link YE, for example, is exclusive to the Egyptian Navy, while Link YM is the RMN version.

Link Y generally uses a standard message format of two 24-bit words and a transmission speed of 300 to 1,200 bits/s.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

WEAPONS CONTROL

Alenia NA 21
There are two NA 21 systems in each corvette. NA 21 was developed from NA 10 which was designed for surface engagement, air engagements or shore bombardments and can control three guns of two calibres. NA 21 has a similar function and can control three guns of two different calibres, a surface-to-air missile system and can also designate targets for a surface-to-surface missile system. The console is similar to that of the NA 10 and features a data processing unit based upon Elsag ESA 24 micro-processors. The improved

electronics permit the system to conduct a programmed low-altitude search with the RTN 10 and, at the same time, to use the ship's search radar for surveillance, both being either panoramic or in sectors. The NA 21 is also capable of automatic target acquisition through its own radar or through the ship's command system and it can also designate targets for other weapon system directors. The RTN 10X associated with NA21 on these vessels is a conical-scan pulse radar which operates in the I-band and controls the twin 40 mm mountings in close-in weapon system mode. The director covers −23 to +83° and on the right-hand side is a CCTV camera with control unit. The maximum training speed is 110°/s while the maximum elevation speed is 90°/s. The below-decks equipment consists of a frequency changeable, highpower magnetron transmitter, a linear receiver and a servo amplifier. The RTN 10 employs different receiver signal and data processing techniques both for ECCM and for accurate tracking of targets at all altitudes. Target acquisition is initiated through the ship's tactical data handling or command system and the radar then switches to the acquisition phase with tracking beginning automatically upon detection of the target. The operational range is about 40 km against aircraft and >20 km against missiles.

RADARS

Manufacturer/Contractor
Alenia Elsag Sistemi Navali, Rome, Italy.

SONAR

STN Atlas Elektronik ASO 84-41
ASO 84-41 is a hull-mounted active search and attack sonar from the STN Atlas Elektronik's DSQS-21 series and is primarily intended for operation against submarines below the thermal layer. It uses computer-aided detection techniques for classification and tracking. Information is presented on colour CRT displays to permit Doppler coding and discrimination of data.

Manufacturer/Contractor
STN Atlas Elektronik, Germany.

PROPULSION

Specifications
System: Diesel
Main machinery: 4 MTU 20V 956 TB92 diesels, 14.8 MW (20,120 hp)
Shafts: 4

FURTHER INFORMATION

PROGRAMME

Originally built for the Iraqi Navy, these ships were sold to Malaysia in a contract signed on 26 October 1995. The ships are being refitted at Muggiano and the Royal Malaysian Navy crews will then undergo three months training in Italy.

MODERNISATION

During the pre-delivery refit, a Super Rapid 76 mm gun has been fitted, together with the Link YM datalink, a new navigation radar and GPS. In addition, the bridge wings are being extended to the after gun deck.

WEAPONS SYSTEMS

TUBES

324 mm Mk 32 tubes for Mk 46

Two triple tubes for Mk 46 lightweight torpedoes are mounted immediately forward of the stack, in a particularly high position.

TORPEDOES

Alliant Techsystems Mk 46 torpedo

The Mk 46 is an anti-submarine, active/passive homing torpedo with a range of 5.9 n miles (11 km) at 40 kts. It has a 44 kg warhead. The Mk 46 is a deep diving high-speed torpedo fitted with active/passive homing head and is intended mainly for use against submarines. After water entry it uses a helical search pattern and is capable of multiple re-attacks if required.

Specifications
Length: 2.59 m (8.49 ft)
Diameter: 324 mm
Weight: 231 kg (509.2 lb)
Warhead: 44 kg (97 lb) PBXN-103 HE
Speed: 40 kts
Range: 11,000 m (36,000 ft)

GUNS

OTOBREDA 76 mm (3 in)/62 Compact

The 76 mm/62 on the 'Dong Hae' class is located in the 'A' gun position. The Compact mounting features extensive aluminium fabrication of the gun platform, the trunnion supports and the trunk. The 76/62 Compact can fire 80 rounds without reloading and the rate of fire is adjustable from 10 to 85 rds/min. The system is remotely controlled. A reaction time of 2.8 seconds is quoted.

Specifications
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s
Weight (unloaded): 7.5 t
Muzzle velocity: 925 m/s (3,034 ft/s)
Rate of fire: 10-85 rds/min
Range: 8.6 n miles (16 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

ESCO 30 twin 30 mm mounting

There are two Emerlec 30 twin mounts: one is in 'B' position forward, the other right aft. The Emerlec 30 is a twin 30 mm weapon designed for air defence, surface engagement and anti-missile operations, using either local or remote-control. Ship's power supplies are used normally but there is an on-mount battery which will provide sufficient power to operate the guns and fire a full complement of ammunition in an emergency. Traditional hand-crank mechanisms provide further backup. There is an enclosed, environmentally controlled cabin for the operator and an integral below-deck magazine.

The Emerlec 30 employs the Oerlikon KCB positively locked, gas-operated cannon and the gunner sits in a cabin for local control operation using a daylight reflex, or an image-intensifier, sight, together with gyro-assisted line of sight stabilisation. The cabin is located between the barrels and forward of the elevating mass. Behind it, in a sealed compartment are the elevating and training drives together with flexible chutes to channel ammunition to the feeding mechanisms.

Ready ammunition is stored in an integral, below-deck, drum magazine with a capacity of 985 rounds for each barrel in a continuous disintegrating-link belt. These are transferred to the guns through separate chutes by means of electrically operated drives which automatically respond to the individual demand for ammunition supply.

Specifications
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,542 ft/s)
Traverse: 360° at 80°/s
Elevation: −15 to +80° at 80°/s
Crew: 1
Range: anti-ship (max): 3.25 n miles (6 km)
Rate of fire: 600 rds/min/barrel (nominal) or 140 rds/min/barrel (sustained)
Ammunition: 870 g (HEI/HEI-T, SAPHEI, TP/TP-T)

Manufacturer/Contractor
Electronics & Space Corporation (ESCO), St Louis, Missouri, USA.

Bofors 40 mm/70 (twin)

There is one twin Bofors 40 mm/70 mounting located aft, which can be used against air or surface targets. The Compact twin 40 mm mounting is designed for use against high-performance combat aircraft, against anti-ship missiles and for surface engagements. The

mounting consists of two 40 mm guns which are 300 mm apart, a feeding system with magazine, a local control panel, a power supply rack, a converter and an air-water panel.

Specifications

Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 4,000 m (13,120 ft)
Rate of fire: 600 rds/min
Ammunition: 2.4 kg (5.29 lb) (HCHE, PFHE), 2.5 kg (5.51 lb) (HE-T)
Traverse: Nominal 360° at 90°/s
Elevation: −13 to +85° at 60°/s
Crew: 2

DEPTH CHARGES

Total of 12.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

ESM/ECM

There is an intercept and jammer suite, believed to be of either Thorn EMI or NobelTech design.

DECOYS

MEL 9EW300 Protean

There are four MEL Protean chaff launchers, which consist of four magazines similar to those used in Dagaie with Lacroix munitions. Usually the magazines contain chaff munitions but one may be replaced by an infra-red (IR) munitions magazine. The Protean system uses Chemring munitions. Each chaff magazine has 36 — 40 mm grenades which each weigh 0.35 kg (0.77 lb) and have a 0.175 kg (0.38 lb) payload. They fire at an interval of 0.1 second per group and within 1 second begin to create a cloud with a 1,000 m² radar cross-section which is complete within up to 5 seconds at a height of 40 to 60 m (131 to 197 ft).

The control unit selects which groups of munitions will be launched and what combination of chaff/IR should be used. It is then used to fire the selected munitions and indicates what munitions are left in the launchers. In addition there is a course-to-steer indicator which recommends which is the most efficient evasive course the ship should take when factors such as wind strength and direction, threat bearing, ship speed and course are taken into consideration.

Manufacturers/Contractors

CelsiusTech, Sweden.
Thorn EMI, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Signaal Sensor Weapon Control and Command System (SEWACO) ZK

These ships are fitted with a specially designed version of the Signaal SEWACO system, designated SEWACO ZK (K = Korea). This system integrates the sensor, weapon and command subsystems around a common command and control (C^2) system, which presents raw and/or processed sensor data from search and fire-control radars together with IFF, sonar, electronic warfare and electro-optic systems to create a picture of the tactical situation. The data may also be used to designate targets to weapon systems and to assist in operations with auxiliary functions such as ASW helicopter direction and tactical navigation.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

WEAPONS CONTROL

Signaal Lightweight Radar Optronic Director (LIROD)

LIROD is a fire-control system based upon a K-band tracking radar and a TV camera. It is designed to control simultaneously two dual-purpose guns while tracking one air and one surface target. It may be used either as a stand-alone unit or to complement the WM28 fire-control system. The system reaction time from detection to the beginning of the engagement is about 4.5 seconds.

The radar can track fighter-size targets at ranges up to 9.7 n miles (18 km) and is capable of tracking targets with a maximum speed of 1,000 m/s (3,280 ft/s). In addition to the radar there is a militarised TV camera with CCIR standard video format. This can detect fighter-size targets at about 5.4 n miles (10 km) and large surface ships at about 10.8 n miles (20 km).

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

RADAR

Raytheon AN/SPS-64

One Raytheon AN/SPS-64 is carried for use as a surface search and navigation radar.

Specifications

Band: I/J
Max range: 64 n miles (118.5 km)
Beam: 1.25 × 20°
Peak power: 10/25/50 kW
Pulsewidth: 0.06/0.5/ 1 µs
PRF: 3,600/1,800/900 pps

Manufacturer/Contractor

Raytheon, USA.

Signaal WM28/61

The WM28/61 (the suffix '61' denotes that it uses the SMR-MU computer) is a weapon control system for light or medium-calibre guns and anti-ship missiles using semi-active guidance. It can engage either an air or a surface target with the gun and a surface target with the missile system. The radar can automatically track one air and one surface target simultaneously. For use with the missile, the air target tracking antenna is slaved to the surface target tracking programme and linked with a CW transmitter in order to illuminate the target. It can control a second light to medium-calibre gun for engaging an air and/or surface target. WM28/61 operates in the I/J-band and has a range of 25 n miles (46 km).

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

SONAR

Signaal PHS-32

PHS-32 is a hull-mounted, medium-frequency active search and attack sonar. Signal processing facilities include fast Fourier transformation of all preformed beam receiving channels. The system features automatic tracking of up to four targets and all data are presented on a single display.

Specifications

Frequencies: 3
Pulse lengths: 12.5, 25, 50,100 ms and 400 ms (CW or FM)
Detection range: Exceeding 10,000 yd (9.1 km)
Vertical beamwidth: 12 or 20°
Bearing accuracy: 1° RMS
Range accuracy: ±0.5-2%
Notch filtering: Selectable rejection bandwidth
Own Doppler correction: On all 60 channels

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 1 General Electric LM 2500 gas turbine, 20 MW (26,220 hp); 2 MTU 12V 956 TB92 diesels, 4.6 MW (6,260 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

This was the South Korean Navy's first version of the corvette series, with four being ordered in 1980, one each from the four major warship building yards. They were commissioned in 1982-83, but production then switched to the larger and more capable 'Po Hang' class.

DESIGN

The design appears to have been based on that of the 'PC-1001' class of Coast Guard cutters. However, as frequently happens with such small hulls, too many weapons and sensors were crammed into the space available and production was discontinued in favour of the 'Po Hang' class.

PO HANG

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

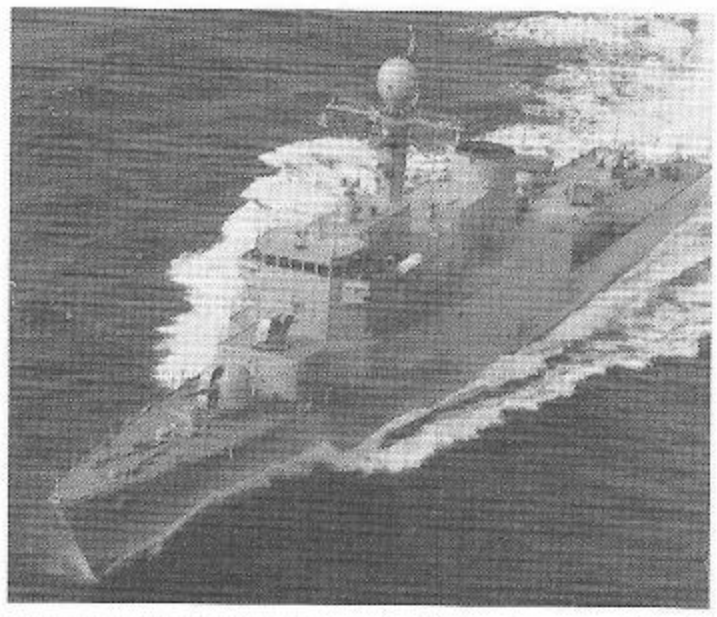
Aerospatiale Exocet MM 38 medium-range anti-ship missile

Po Hang (756) to *Mok Po* (759) only. The first four ships only mount two MM 38 Exocet in forward-facing, single launchers on the after superstructure, pointing outwards at an angle of about 30°. Targets are acquired by the ship's search radar and the operator then aligns the axial gyros in the target's direction and begins the initiation sequence. This involves turning on the thermal battery, releasing the mechanical safety locks, igniting the booster, and finally, breaking the umbilical cord; the total process takes some 60 seconds. Exocet has a 105° off-axis engagement envelope and can perform one 15° change of course during its flight.

The attack consists of three phases:

Cruise phase. The cruise phase starts as the missile clears the container and the missile, powered by the sustainer motor, flies towards the general location of the target at a height of about 100 m (328 ft) which is low enough to reduce the chance of detection but adequate for target acquisition. This phase can be as long as 22 km and ends when the seeker acquires the target. The seeker is a Dassault Electronique ADAC (*Auto Directeur Anti-Clutter*) active monopulse radar, working in the I-band (8-10 GHz), which has a typical range of 13 n miles (24 km) against FACs.

Approach phase. On detecting the target the missile



Kun San *(757), the second ship to be completed. These early ships in the class have the ESCO 30 mm twin ('B' and 'Y' positions) Exocet MM 38 launchers aft, and the Signaal WM 28 at the masthead* (Korea Tacoma)

descends to 9 to 15 m (30 to 50 ft).
Terminal phase. During this final phase the missile descends to 8 m (26 ft) (2 to 5 m (7 to 16 ft) in a calm sea) for a sea-skimming run in to the target.
A salvo may be fired in 12 to 20 seconds.

Specifications
(MM 38)
Length: 5.21 m (17 ft)
Diameter: 35 cm (13.8 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 2-22.5 nm (4-42 km)
Guidance: Inertial and active radar
Sustainer motor: SNPE Eole alloy-cased CDB; weight 151 kg (333 lb); max burn time 93 s.
Booster: 100 kg (220 lbs) SNPE Epervier boost motor; burn time of 2.4 s.
Warhead: Luchaire 165 kg (364 lb) fragmentation warhead
Fuzes: Delayed impact fuze and autopilot-controlled proximity fuze.

Manufacturer/Contractor
Aerospatiale Missiles, Paris, France.

TORPEDOES

324 mm Mk 32 torpedo launchers
Kim Chon (761) to *Sin Hung* (783). Two triple tubes for Mk 46 lightweight torpedoes are mounted immediately aft of the stack, in a particularly high position.

Alliant Techsystems Mk 46 torpedo
The Mk 46 is an anti-submarine, active/passive homing torpedo with a range of 5.9 n miles (11 km) at 40 kts. It has a 44 kg (97 lb) warhead. The Mk 46 is a deep diving high-speed torpedo fitted with active/passive homing head and is intended mainly for use against submarines. After water entry it uses a helical search pattern and is capable of multiple re-attacks if required.

Specifications
Length: 2.59 m (8.5 ft)
Diameter: 32 cm (12.75 in)
Weight: 231 kg (509 lb)
Warhead: 44 kg (97 lb) PBXN-103 HE
Speed: 40 kts
Range: 11,000 m (36,000 ft)

GUNS

OTOBREDA 76 mm (3 in)/62 Compact
Po Hang (756) to *Mok Po* (759) — one 76 mm (3 in) mounting.
Kim Chon (761) to *Sin Hung* (783) — two 76 mm (3 in) mounting.
The 76 mm/62 in the 'Po Hang' class is located either in the 'A' gun position (756 to 759) or in 'A' and 'Y' positions (761 to 783). The Compact mounting features extensive aluminium fabrication of the gun platform, the trunnion supports and the trunk. The 76/62 Compact can fire 80 rounds without reloading and the rate of fire is adjustable from 10 to 85 rds/min. The system is remotely controlled. A reaction time of 2.8 seconds is quoted.

Specifications
Elevation: −15 to +85° at 40°/s
Training speed: 70°/s
Weight (unloaded): 7.5 t
Muzzle velocity: 925 m/s (3,034 ft/s)
Rate of fire: 10-85 rds/min
Range: 8.6 n miles (16 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

ESCO 30 twin 30 mm mounting
Po Hang (756) to *Mok Po* (759) only. The first four ships have two twin ESCO (formerly Emerlec) 30 twin mounts: one in 'B' position forward, the other right aft. The ESCO 30 is a twin 30 mm weapon designed for air defence, surface engagement and anti-missile operations, using either local or remote-control. The ESCO 30 employs the Oerlikon KCB positively locked, gas-operated cannon and the gunner sits in a cabin for local control operation using a daylight reflex, or an image-intensifier, sight, together with gyro-assisted line of sight stabilisation. The cabin is located between the barrels and forward of the elevating mass. Behind it, in a sealed compartment are the elevating and training drives together with flexible chutes to channel ammunition to the feeding mechanisms. Ready ammunition is stored in an integral, below-deck, drum magazine with a capacity of 985 rounds for each barrel in a continuous disintegrating-link belt. These are transferred to the guns through separate chutes by means of electrically operated drives which automatically respond to the individual demand for ammunition supply.

Specifications
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,542 ft/s)
Traverse: 360° at 80°/s
Elevation: −15 to +80° at 80°/s
Crew: 1
Range (max): 3.25 n miles (6 km) (anti-ship)
Rate of fire: 600 rds/min/barrel
Ammunition: 870 g (19.2 lb) (HEI/HEI-T, SAPHEI, TP/TP-T)

Manufacturer/Contractor
Electronics & Space Corporation (ESCO), St Louis, Missouri, USA.

OTOBREDA 40 mm/70
Kim Chon (761) to *Sin Hung* (783). The fifth ship onwards have two twin OTOBREDA 40 mm L/70 enclosed mounts. The Compact twin 40 mm mounting is designed for use against high-performance combat aircraft, against anti-ship missiles and for surface engagements. The mounting consists of two 40 mm guns which are 300 mm apart, a feeding system with magazine, a local control panel, a power supply rack, a converter and an air-water panel.

Specifications
Calibre: 40 mm
Length of barrel: 2.8 m (9.2 ft)
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range: 3.25 n miles (6 km) for surface targets, and 4,000 m (13,120 ft) for air targets
Rate of fire: 600 rds/min
Ammunition: 2.4 kg (5.3 lb) (HCHE, PFHE), 2.5 kg (5.5 lb) (HE-T)
Traverse: Nominal 360° at 90°/s
Elevation: −13 to +85° at 60°/s
Crew: 2

DEPTH CHARGES

Kim Chon (761) to *Sin Hung* (783).
12 depth charges are carried.

ELECTRONIC WARFARE SYSTEMS

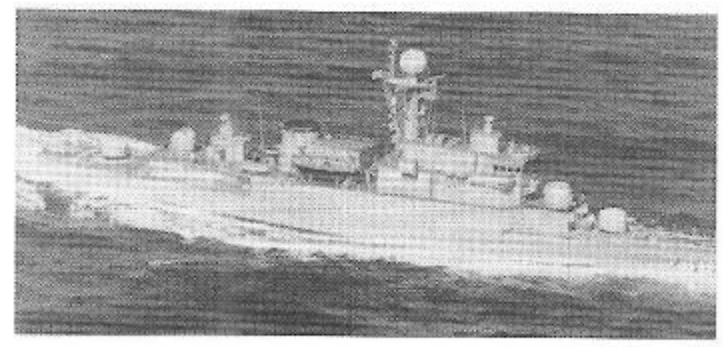
ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

There is an intercept and jammer suite, believed to be of either Thorn EMI or NobelTech design.

DECOYS

MEL 9EW300 Protean
There are four MEL Protean chaff launchers, which consist of four magazines similar to those used in Dagaie with Lacroix munitions. Usually the magazines contain chaff munitions but one may be replaced by an infra-red (IR) munitions magazine. The Protean system uses Chemring munitions.

Each chaff magazine has 36 × 40 mm grenades which each weigh 0.35 kg (0.77 lb)and have a 0.175 kg (0.38 lb) payload. They fire at an interval of 0.1 second per group and within 1 second begin to create a cloud with a 1,000 m² radar cross-section which is complete within up to 5 seconds at a height of 40 to 60 m (131 to 197 ft).



An Dong (Ships of the World)

The control unit selects which groups of munitions will be launched and what combination of chaff/IR should be used. It is then used to fire the selected munitions and indicates what munitions are left in the launchers. In addition there is a course-to-steer indicator which recommends the most efficient evasive course the ship should take when factors such as wind strength and direction, threat bearing, ship speed and course are taken into consideration.

Manufacturers/Contractors
CelsiusTech, Sweden.
Thorn EMI, UK.

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher
Some ships in the class are fitted with two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units (these are apparently in addition to, rather than in place of, the MEL Protean outfits.)

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)
Barrels: 6

Rounds
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

Manufacturers/Contractors
Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Signaal Sensor Weapon Control and Command System (SEWACO) ZK

Po Hang (756) to *Mok Po* (759). The first four ships are fitted with the same specially designed version of the Signaal SEWACO system, designated SEWACO ZK (K = Korea) as the 'Dong Hae' class. This system integrates the sensor, weapon and command subsystems around a common command and control (C^2) system, which presents raw and/or processed sensor data from search and fire-control radars together with IFF, sonar, electronic warfare and electro-optic systems to create a picture of the tactical situation. The data may also be used to designate targets to weapon systems and to assist in operations with auxiliary functions such as ASW helicopter direction and tactical navigation.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

Ferranti WSA 423

Kim Chon (761) to *Sin Hung* (783). In these ships a completely different system — the Ferranti WSA 423 — is fitted. The WSA 423 has a federated architecture to create a modular system based upon the 24-bit Ferranti FM1600E computer, which has an operating speed of 650 kops (thousand operations per second) and a memory of 1.2 million words, with one computer housed in each console. The system uses Coral 66 language software. In addition to the consoles the system consists of a tracker radar (with V.3342 or TVA2 television camera), a visual sight and an Nd:YAG laser rangefinder. The visual sight is usually the TDS to which the Ferranti Type 901 laser rangefinder may be added. Optional extras include range-only radar, surface-to-air missile direction and an ASW capability through rocket and torpedo control.

The WSA 423 command and weapon control system is based upon the WSA 422 but with added two-man command console from the CAAIS 450 system. It is designed to control two guns, (a 76 mm and 30/40 mm), and an anti-ship missile. The system may track up to 120 targets of which up to 100 may be automatic depending upon the software. It is compatible with Link Y and Link 14 as well as being capable of ECM direction and helicopter control.

Manufacturer/Contractor

GEC-Ferranti, UK.

WEAPONS CONTROL

Signaal LIROD

Po Hang (756) to *Yo Su* (765) only. These ships are fitted with the Signaal LIROD lightweight fire-control system, which is based on a K-band tracking radar and a TV camera. It is designed to simultaneously control two dual-purpose guns while tracking one air and one surface target. It may be used either as a stand-alone unit or to complement the WM28 fire-control system. The system reaction time from detection to the beginning of the engagement is about 4.5 seconds. The radar can track fighter-size targets at ranges up to 9.7 n miles (18 km) and is capable of tracking targets with a maximum speed of 1,000 m/s (3,280 ft/s). In addition to the radar there is a militarised TV camera with CCIR standard video format. This can detect fighter-size targets at about 5.4 n miles (10 km) and large surface ships at about 10.8 n miles (20 km).

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

Radamec System 2400 electro-optic director

An Dong (766) onwards. System 2400 is a remotely operated director equipped with thermal imager, daylight TV camera and laser rangefinder. It is designed for multiweapon use and includes a dedicated console which has the Ferranti GP250 digital predictor, a 14 in (35.5 cm) raster scan display.

RADARS

Samsung/Marconi S-1810/Raytheon SPS-64

Ships carry either Samsung/Marconi S-1810 or Raytheon AN/SPS-64, but some ships carry both.

Signaal WM28 or Marconi 1802

Ships carry either Signaal WM28 or Samsung/Marconi ST-1802

Type	S-1810	AN/SPS-64	ST-1802	WM28

SONARS

Signaal PHS-32 hull-mounted search and attack sonar system

Kim Chon (761) to *Sin Hung* (783). PHS-32 is a medium-range high-performance search and attack sonar with signal processing facilities for fast Fourier transformation processing of all preformed beam receiving channels. All data are presented on a single TV-type display, while operation has been much simplified by the use of light pen control. The system can track up to four targets automatically. A circular transducer permits all-round coverage in various modes of transmission such as: Omni, TRDT, MCC (wide vertical beam), LISTEN (passive with time/bearing recorder presentation). An audio beam is also available.

Specifications

Frequencies: 3
Pulse lengths: 12.5, 25, 50,100 ms and 400 ms (CW or FM)
Detection range: Exceeding 9,000 m (10,000 yd)
Vertical beamwidth: 12° or 20°
Bearing accuracy: 1°RMS
Range accuracy: ±0.5-2%
Notch filtering: Selectable rejection bandwidth
Own Doppler correction: On all 60 channels

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 1 General Electric LM-2500 gas turbine, 20 MW (26,820 hp); 2 MTU 12V 956 TB82 diesels, 4.6 MW (6,260 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

First laid down early 1983 by Korea SEC. At least one more of the class was scheduled for completion in 1995 but the status of further orders is uncertain.

PENNANT NUMBERS

The attribution of pennant number to names is uncertain but names and shipbuilders are correct. It should be noted that no pennant numbers end with the figure '0'.

DESIGN

The first group (*Po Hang* (756) to *Mok Po* (759)) has no ASW sensors or weaponry and is clearly optimised for the anti-surface warfare role. The second group (*Kim Chon* (761) to *Sin Hung* (783) has only a relatively weak anti-surface capability (there are no missiles, for example) and is optimised for the ASW mission. The second group also has a much improved combat data system with Ferranti/Radamec/Marconi fire-control systems and radars, although this may be a result of new equipment coming on stream rather than a consequence of a change of role. Although this class has been in production since the early 1980s it appears that new ships are building, which may be air defence variants.

LETYASHTI (POTI)

WEAPONS SYSTEMS

TUBES

406 mm (16 in) torpedo tubes
There are four 16 in (406 mm) torpedo tubes. These are single, fixed tubes, but relatively close together in pairs on either side of the afterdeck.

TORPEDOES

Type E40-75A torpedoes

Specifications
Diameter: 406 mm
Length: 4.5 m (14.8 ft)
Warhead: 100 kg (220 lb)
Speed: 30 kts
Range: 7 n miles (13 km)
Homing: Active/passive homing

GUNS

57 mm/75 ZIF-72/AK 725
There is one twin ZIF-72/AK-725 mounting in 'Y' position on the quarterdeck. This weapon is an evolutionary development of the twin-barrel ZIF-31B, but it has clearly been designed for prolonged air defence engagements and for this reason has a slightly longer barrel (4.57 m) which is water-cooled. It may also be used against surface and coastal targets.

The mounting is operated by two men from the fire-control station associated with the 'Muff Cob' radar system. 'Muff Cob' has its antenna in a 1 m (3.28 ft) wide, weather-proof mounting suspended from a trunnion-yoke carried on a traversing mounting. The radar is supplemented by an electro-optic sensor. The height of the mounting is about 3 m (9.8 ft) and the H-band radar can probably tilt from −10 to +50° as with the gun mounting. It is likely that control of the mounting is conducted from the compartment which houses the radar display system.

Specifications
Length of barrel: 75 calibres
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Traverse: ±200°
Elevation: −10 to +85°
Range:
anti-surface: 3.25 n miles (6 km)
anti-air: 6,000 m (20,000 ft)
Rate of fire: 120 rds/min/barrel
Projectile weight: 6.61 kg (14.6 lb)
Power requirements: 220 or 380 V, three phase

ANTI-SUBMARINE MORTARS

RBU 6000
There are two 12-tubed, RBU-6000, trainable launchers on the foredeck. These weapons have automatic loading and a range of 6,000 m (19,680 ft) with a 31 kg (68 lb) warhead. The RBU-6000 is the most modern of Soviet-origin ASW rocket launchers and has the 12 tubes arranged in a circular fashion.

Specifications
Length: 1.8 m (5.9 ft)
Range: 6,000 m (19,680 ft)
Warhead: 31 kg (68 lb)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Watch Dog
There are two Watch Dog radar-warning arrays.

COMMAND AND CONTROL SYSTEMS

RADARS

Strut Curve search radar

The air search radar is the Russian MR-302 (NATO = Strut Curve) a medium-range, general purpose, F-band, air search radar. The elliptical lattice reflector is mounted at the masthead. Range performance against a 2 m² aircraft target at medium altitude is about 60 n miles (110 km) with a likely maximum range of 150 n miles (280 km).

Don-2

Don-2 is a standard Russian Navy I-band navigation/surface search radar.

Muff Cob

Muff Cob is the director for the 57 mm fire control system and is the large cylindrical radome atop the after deckhouse. The radome is supported by a trunnion yoke in a traversing mounting and is thus capable of both elevation and traverse. There is a device to the left of the radome (from the front), with a remotely controlled cover, which may be a TV camera. The F/G-band radar is named Muff Cob by NATO and Bars (Wildcat) by the Russian Navy.

IFF

Square Head and High Pole.

SONARS

There is a hull-mounted, high-frequency active search and attack sonar; type not known.

PROPULSION

Specifications
System: Combined diesel and gas turbine (CODAG)
Main machinery: 2 gas turbines 22.4 MW (30,000 hp); 2 Type M 503 A diesels, 3.91 MW (5,350 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These four Bulgarian ships are the only survivors of the once numerous 'Poti' class, of which 69 were built between 1961 and 1968. The Bulgarian Navy received three in December 1975, one in late 1986 and the last two in 1990. Of those six, two were deleted in 1993.

Khrabri *(44). The Bulgarian Navy is the last to operate ships of the once numerous Poti class*

DESIGN

The 'Poti' class an unusually high maximum speed of 38 knots. In part, this was achieved through the use of gas turbines, the Potis being first in the (then) Soviet Navy to be powered by these new devices. The gas turbines are mounted right aft, with each driving a propeller mounted in a long thrust tube. The gas turbines also drive compressors which drive air into the tubes, thus augmenting the thrust and increasing the top speed. As this idea has only been used in one other ship class (Mirka) it would seem that it has not proved particularly effective.

NAMES

Letyashti (41) = Flying
Bditelni (42) = Vigilant
Bezstrashni (43) = Fearless
Khrabri (44) = Gallant

DEPLOYMENT

All four are based at Atiya.

NANUCHKA

OVERVIEW

A total of 40 'Nanuchka' class corvettes, divided into four sub-types, was built for four navies between 1967 and 1981.

The four versions have the same hull, propulsion and performance, the differences lying in the weapons and sensor fit. This particularly applies to the export version, Nanuchka II, which was armed with SS-N-2c anti-ship missile rather than the higher performance SS-N-9. The other major difference was that Nanuchka III and the one-off Nanuchka IV were armed with a single 76 mm gun instead of the twin 57 mm in Nanuchka I and II.

	Nanuchka I	Nanuchka II	Nanuchka III	Nanuchka IV	Totals	In service January 1997
Russia	14		16	1	31	26

WEAPONS SYSTEMS

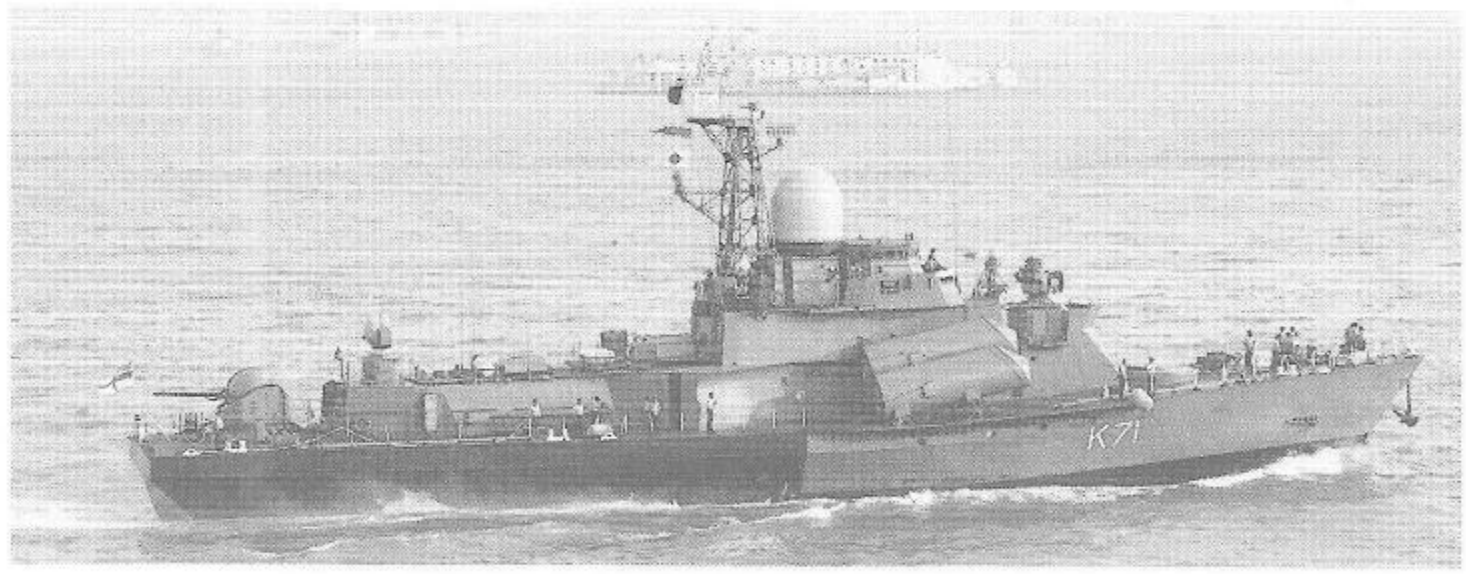
SURFACE-TO-SURFACE MISSILES (SSM)

P-21 Rubezh (SS-N-2c 'Styx') medium-range anti-ship missile

There are four P-21 (NATO = SS-N-2c 'Styx') missiles in individual, forward-facing launch bins, with two either side of the bridge structure. There are no reloads. The P-21 missile was introduced into service in 1967 and is essentially a P-15 (SS-N-2a) with an added infra-red seeker. This relatively large anti-ship missile is powered by a liquid-fuelled rocket motor, with a solid fuel booster attached.

Once the target is detected the ship must close with the aim of being within the optimum engagement distance, some 15 to 20 n miles (28 to 37 km). Then, since the missile launcher must face the target the ship must turn away and, while maintaining a speed of 15 kts or less, hold its course for 20 to 30 seconds before launching the first salvo of two missiles. These may be followed, a minute later, by another two.

Upon launch, the missile climbs at an angle of 45° to one of five preset altitudes (100, 150, 200, 250 or 350 m) (328, 492, 656, 820 or 1,148 ft), where the onboard radar searches for a target and the receiver is switched on for very short periods to receive signals from a designated range, the range gate being 1 km (0.54 n miles) on either side of the target. The radar locks only after eight returns have been received, at distances of 3.5 to 12 n miles (6.5 to 22 km), whereupon the seeker guidance system switches off the autopilot. A throw-off gyroscope takes the missile on target a few seconds before impact as it becomes too close for radar-generated homing signals. Russian Navy tacticians calculate that seven to eight missiles are required to destroy a cruiser-size target and four for a destroyer, making salvo firing a major feature of any tactical engagement scenario with SS-N-2c missiles to ensure destruction of the target.



Vijay Durg *(K 71). The Nanuchka II has four SS-N-2c anti-ship missiles but is otherwise very similar to the Russian Navy's Nanuchka I* (H & L van Ginderen Collection)

Specifications

(SS-N-2c)
Length: 6.55 m (21.5 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.87 ft)
Speed: Mach 0.9
Weight (without booster): 2,500 kg (5,732 lb)
Warhead: 454 kg (1,000 lb) hollow-charge
Fuzes: Impact, proximity
Range: 3-46 n miles (5.5-85 km)
Guidance: Autopilot with active radar (supplemented in some with IR)

MS-2 seeker
Frequency: I-band (8-12 GHz) (four presets)
PRF: 300-500 pps (adjustable)
Altitude control: Barometric pressure device

Manufacturer/Contractor

Raduga, Moscow, Russia.

SURFACE-TO-AIR MISSILES

SA-N-4 'Gecko' (OSA-M) point defence system

There is one SA-N-4 launcher aft, with 20 missiles in a below-deck magazine. This system is known to NATO as SA-N-4 (reporting name = Gecko) but is known in

Russia as the Osa-M system, while the missile itself is designated 9M33. SA-N-4 has a distinctive loading and launching system in which the twin-rail launcher lies beneath a hinged flat cover plate, emerges to launch its missiles and then retracts in order to reload. This is likely to result in a low rate of fire which must be slowed even further by the need to close the magazine cover before firing. Underneath the launcher are four revolving drums each with five missiles while the electro-mechanical and hydraulic machinery is below that. On launch, the booster burns for 2 seconds allowing the radar to gather the missile at a range of 0.75 n miles (1.4 km), following which, the sustainer burns for 15 seconds. SA-N-4 is controlled by the Pop Group system. There is a frequency-agile, monopulse radar with a parabolic rotating search antenna operating in H-band (6-8 GHz) and with a typical acquisition range of 16 n miles (30 km). There are two J-band (10-20 GHz) antennas, one of them for a pulse Doppler target-tracking element with a range of 10.75 n miles (20 km) and the smaller parabolic antenna being used to track the missile. Above the prime antennas is a smaller, circular one which emits an I-band (8-10 GHz) uplink capture beam which gathers the missile shortly after launch. The director also has a small, rectangular command uplink emitter.

Specifications
Range: 8 n miles (15 km)
Altitude: 91-3048 m (130-10,000 ft)
Speed: Mach 2.5
Warhead: 50 kg (110 lb)

GUNS

57 mm/80 (twin) ZIF-72/AK 725
The ZIF-72/AK 725 has been designed for prolonged air defence engagements and for this reason has a slightly longer barrel (4.57 m) which is water-cooled. It may also be used against surface and coastal targets. The mounting is operated by two men from the fire-control station associated with the 'Muff Cob' radar system. 'Muff Cob' has its antenna in a 1 m (3.28 ft) wide, weather-proof mounting suspended from a trunnion-yoke carried on a traversing mounting. The radar is supplemented by an electro-optic sensor. The height of the mounting is about 3 m (9.8 ft) and the H-band radar can probably tilt from −10 to +50° as with the gun mounting. It is likely that control of the mounting is conducted from the compartment which houses the radar display system.

Specifications
Length of barrel: 75 calibres
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Traverse: ±200°
Elevation: −10 to +85°
Range:
anti-surface: 3.25 n miles (6 km)
anti-air: 6,000 m (20,000 ft)
Rate of fire: 120 rds/min/barrel
Projectile weight: 6.61 kg (14. 6 lb)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Bell Tap
Bell Tap is a radar warning system.

DECOYS

PK-16
There are two PK-16 launchers on each ship. The munitions are all for seduction purposes. The SR-50 is a chaff round with a payload of 11 kg (24 lb). The SOM-50 is a heat-seeker/laser-guided missile seduction round with 7.3 kg (16 lb) payload while the SK.50 is a combined round with 9.1 kg (20 lb) of payload.

Manufacturer/Contractor
General Export for Defence, Moscow, Russia.

COMMAND AND CONTROL SYSTEMS

RADARS

Square Tie
Square Tie is an I-band air/surface search radar with a range of 40 n miles (74 km). It is mounted in the radome which is occupied by Band Stand in the Russian Navy's Nanuchka Is and IIIs.

Pop Group
Pop Group is the weapon control system for the SA-N-4 missile system, with the director sited on the roof of the forward deckhouse. The director includes an acquisition radar with a long, curved antenna on top of the cab and two target trackers. The latter two are of different size, but presumably the smaller one performs a similar function to the larger, but at higher frequencies, which would enable them to direct two different missiles against the same target. The system operates in the F/H/I-band.

Muff Cob
Muff Cob is the director for the 57 mm fire-control system and is the large cylindrical radome atop the after deckhouse. The radome is supported by a trunnion yoke in a traversing mounting and is thus capable of both elevation and traverse. There is a device to the left of the radome (from the front), with a remotely controlled cover, which may be a TV camera. The F/G-band radar is named Muff Cob by NATO and Bars (Wildcat) by the Russian Navy.

Don 2
Don 2 is a standard Russian Navy I-band navigation radar.

IFF
High Pole
Two Square Head.

PROPULSION

Specifications
System: Diesel

Main machinery: 6 M 504 diesels, 19.2 MW (26,122 hp)
Shafts: 3

FURTHER INFORMATION

PROGRAMME

These three ships were built at Leningrad (St Petersburg) and transferred from the (then) USSR in the late 1970s.

DESIGN

The ships are very similar to the Russian Navy's Nanuchka I, except that the SS-N-9 missile is replaced by the SS-N-2c. The launch bins for this older missile are considerably larger than those for the SS-N-9 so only four can be carried instead of six. Also, the radome is mounted lower than in the Russian ships due to the absence of the Fish Bowl datalink which is not required for the SS-N-2.

DEPLOYMENT

All are based at Bombay and all are currently active.

Indian Navy 'Nanuchka II' class corvette, Vijay Durg *(K 71)*

FURTHER INFORMATION

PROGRAMME

The Libyan Navy received four Nanuchka IIs from the (then) USSR, the first in October 1981, followed by the second in February 1983, the third in February 1984, and the fourth in September 1985.

DESIGN

These are virtually identical with the Nanuchka IIs supplied to India but are instantly recognisable by their camouflage paint schemes, which were applied in 1991.

DEPLOYMENT

Two of these ships were attacked by aircraft of the Sixth Fleet, during the US/Libyan confrontation in 1986, following the imposition of an embargo by President Reagan. One Libyan ship, *Ean Zaquit* (419), was sunk on 24 March 1986, and a second, *Ean Mara* (416), was severely damaged on the following day. *Ean Mara* was subsequently sent to St Petersburg for repairs and returned to Libya in early 1991 having been renamed *Tariq Ibn Ziyad.*

All are still seaworthy but it appears that the Libyan Navy only maintains one in a fully operational condition.

GENERAL SPECIFICATIONS

Operator: Russia
Type: 1234
National designation: *maly raketny korabl* (small missile ship).

Class: NANUCHKA

Built: Nanuchka I — 14; Nanuchka III — 16; Nanuchka IV — 1

Active: Nanuchka I — 10; Nanuchka III — 16; Nanuchka IV — 1

Displacement:
full load: 660 t

Length: 59.3 m (194.5 ft)
Beam: 11.8 m (38.7 ft)
Draught: 2.6 m (8.5 ft)

Speed: 33 kts
Range: 2,500 n miles at 12 kts; 900 n miles at 31 kts

Complement: 42 (7 officers)

SHIPS

Nanuchka I: SKVAL, STORM, TAIFUN, ZYKLON, METL, ZARNITSA, GROM, VOLNA, VICHR BORA
Builder: St Petersburg, Vladivostok, Russia

Nanuchka III: METEOR, TUCHA, PRILIV, URAGAN, PASSAT, PRIBOY, ZARYA, SMERCH, MIRAS, SHTYL, VETER, MOROZ, INEZ, RASSVET, RAZLIV, OTLIV AJSBERG, ZYB
Builder: St Petersburg, Vladivostok, Russia

Nanuchka IV: NAKAT
Builder: St Petersburg, Vladivostok, Russia

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Chelomey SS-N-9 Siren

Nanuchka I and Nanuchka III only. These ships have two massive triple launchers for SS-N-9 sea-skimming, anti-ship missile. The Russian 4K85 missile (NATO = SS-N-9 'Siren') is believed to be similar to the SS-N-7 'Starbright,' but longer, with a J-band (10 GHz) active radar seeker in the nose. The warheads are either 200 kT nuclear (now removed under international agreement) or 513 kg (1,131 lb) high explosive, which may be the same hollow-charge type as in the SS-N-2 'Styx' missile. The launch tubes are angled at approximately 8°, with doors at both ends which open during launching.

In the 'Nanuchka' class the fire-control system is associated with 'Band Stand,' a D/F-band (1-4 GHz) radar data link housed in a prominent radome. Little is known about this system except that it has a high data rate. The fire-control system is likely to receive offboard data through Bell Nest or Light Bulb datalinks which may also be used in providing mid-course guidance. Offboard data may be provided both by other ships and by Ka-25 Hormone C or Ka 27 Helix B helicopters which could perform over-the-horizon targeting, although Nanuchkas do not carry their own helicopters.

Specifications
Length: 8.84 m (29 ft)
Diameter: 76 cm (30 in)
Weight: 3,300 kg (7,275 lb)
Range: 60 n miles (110 km)
Speed: Mach 0.9
Guidance: Autopilot with active radar (possibly complemented by IR)

SS-CX-5

Nanuchka IV only. The sole Nanuchka IV is the trials ship for the SS-CX-5 missile. This is an improved and smaller version of SS-N-9 with a range of 162 n miles (300 km).

SURFACE-TO-AIR MISSILES (SAM)

SA-N-4 'GECKO' (OSA-M) point defence system

Nanuchka I/III/IV. There is one SA-N-4 launcher on the foredeck, with 20 missile in a below-deck magazine. This system is known to NATO as SA-N-4 (reporting name = Gecko) but is known in Russia as the Osa-M system, while the missile itself is designated 9M33.

SA-N-4 has a distinctive loading and launching system in which the twin-rail launcher normally lies beneath a hinged flat cover plate, emerges to launch its missiles, and then must retract in order to reload. This is likely to result in a low rate of fire which must be slowed even further by the need to close the magazine cover before firing. Underneath the launcher are four revolving drums each with five missiles while the electro-mechanical and hydraulic machinery is below that. On launch, the booster burns for 2 seconds allowing the radar to gather the missile at a range of 0.75 n miles (1.4 km), following which, the sustainer burns for 15 seconds. SA-N-4 is controlled by the Pop Group system. There is a frequency-agile, monopulse radar with a parabolic rotating search antenna operating in H-band (6-8 GHz) and with a typical acquisition range of 16 n miles (30 km). There are two J-band (10-20 GHz) antennas, one of them for a pulse Doppler target-tracking element with a range of 10.75 n miles (20 km) and the smaller parabolic antenna being used to track the missile. Above the prime antennas is a smaller, circular one which emits an I-band (8-10 GHz) uplink capture beam which gathers the missile shortly after launch. The director also has a small, rectangular command uplink emitter.

Specifications:
Range: 8 n miles (15 km)
Altitude: 91-3,048 m (130-10,000 ft)
Speed: Mach 2.5
Warhead: 50 kg (110 lb)

GUNS

57 mm/75 ZIF-72/AK 725

Nanuchka I only. There is one ZIF-72/AK 725 in 'Y' position on the quarterdeck. This weapon is an evolutionary development of the twin-barrel ZIF-31B, but it has clearly been designed for prolonged air defence engagements and for this reason has a slightly longer barrel (4.57 m) which is water-cooled. It may also be used against surface and coastal targets. The mounting is operated by two men from the fire-control station associated with the 'Muff Cob' radar system. 'Muff Cob' has its antenna in a 1 m (3.28 ft) wide, weatherproof mounting suspended from a trunnion-yoke carried on a traversing mounting. The radar is supplemented by an electro-optic sensor. The height of the mounting is about 3 m (9.8 ft) and the H-band radar can probably tilt from −10 to +50° as with the gun mounting. It is likely that control of the mounting is conducted from the compartment which houses the radar display system.

Specifications
Length of barrel: 75 calibres
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Traverse: ±200°
Elevation: −10 to +85°
Range:
anti-surface: 3.25 n miles (6 km)
anti-air: 6,000 m (20,000 ft)
Rate of fire: 120 rds/min/barrel
Projectile weight: 6.61 kg (14.6 lb)
Power requirements: 220 or 380 V, three phase

76 mm (3 in)/60 AK-176M

Nanuchka III and IV only. In Nanuchka III and IV there is one AK-176M 76 mm L/59 gun mounted in 'Y' position in place of the twin 57 mm mounting in the earlier ships. The AK-176M is designed for air defence, surface engagement and shore bombardment roles and is a four-man mounting which may be operated from the weapon control centre or from a local control station. The barrel is cooled externally by taking seawater from the ship's fire main through a jacket which lies around the liner.

The AK-176M is part of a weapon control system based upon the H-band fire-control radar with the NATO designation 'Bass Tilt'. This radar is also associated with the AK-630 and the two appear to form an integrated weapon system. The radar director is mounted on a pedestal and has an antenna with drum-shaped radome inclined at an angle of approximately 45°. Local control is achieved semi-automatically using the *Kondensor* sight which is installed as a backup in the event of the failure of 'Bass Tilt'. It is a day/night sight which may be used to engage both surface and air targets. In the event of a power failure the crew may use the WD-221 optical sight. Some vessels appear to have the mounting in a stand-alone configuration supported by other fire-control radars.

Specifications
Calibre: 76 mm
Length of barrel: 59 calibres
Muzzle velocity: 980 m/s (3,214 ft/s)
Traverse: 360° at 35°/s
Elevation: −7 to +85°at 30°/s
Ammunition (total): 16 kg (35.2 lb)
Rate of fire: 120 rds/min

30 mm/65 AK-630

Nanuchka III and IV only. In Nanuchka III and IV there is a single AK-630 CIWS at the after end of the superstructure. This weapon has five roles, engaging anti-ship missiles, aircraft, small surface vessels, drifting mines and unprotected targets ashore. The AO-18 weapon is a water-cooled, six-barrelled, Gatling-principle weapon with fixed breech-block and revolving barrels. The weapons is believed to operate in a similar manner to that of the Phalanx, firing bursts of up to 400 rounds, but unlike the US weapon AK-630 features a separate radar director.

Specifications
Calibre: 30 mm
Length of barrel: 65 calibres
Number of barrels: 6
Muzzle velocity: 890 m/s (2,920 ft/s)
Cooling: Water
Traverse: 360° at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range:
radar fire control: 4,000 m (4,374 yd)
electro-optic fire control: 5,000 m (5,468 yd)
Rate of fire: 4,000-5,000 rds/min
Magazine: 2,000 rounds
Weight of complete round: 1.224 kg (2.7 lb)
Ammunition types:
Weight
UOF-84 HE-I: 384 g (13.5 oz)
UOR-84 HE-T: 388 g (13.68 oz)
Fuze: MG-32 point impact (both rounds)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Nanuchka I.

Nanuchka Is are fitted with the Bell Tap ESM system.

Nanuchka III/IV

The later ships have a different fit, with Foot Ball and Half Hat A and B (IIIs). They also have four Half Cup laser warners.

DECOYS

PK-16 or PK-10

Nanuchka III and IV. Two per ship on Nanuchka III. PK-10 is a Russian naval decoy system about which details were first revealed in 1993. The system consists of KT-216 launchers, a control console and three munitions. The launcher has ten 120 mm barrels fixed at an angle of about 45°. The launcher appears to be turnable. The control console is a relatively simple design with simple controls capable of controlling up to four launchers.

The munitions are all for seduction purposes. The SR-50 is a chaff round with a payload of 11 kg (24 lb). The SOM-50 is a heat-seeker/laser-guided missile seduction round with 7.3 kg (16 lb) payload while the SK.50 is a combined round with 9.1 kg (20 lb) of payload.

Manufacturer/Contractor
General Export for Defence, Moscow, Russia.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Bell Nest/Light Bulb
Later Nanuchka IIIs only. The later Nanuchka IIIs have either two Bell Nest or Light Bulb datalink systems.

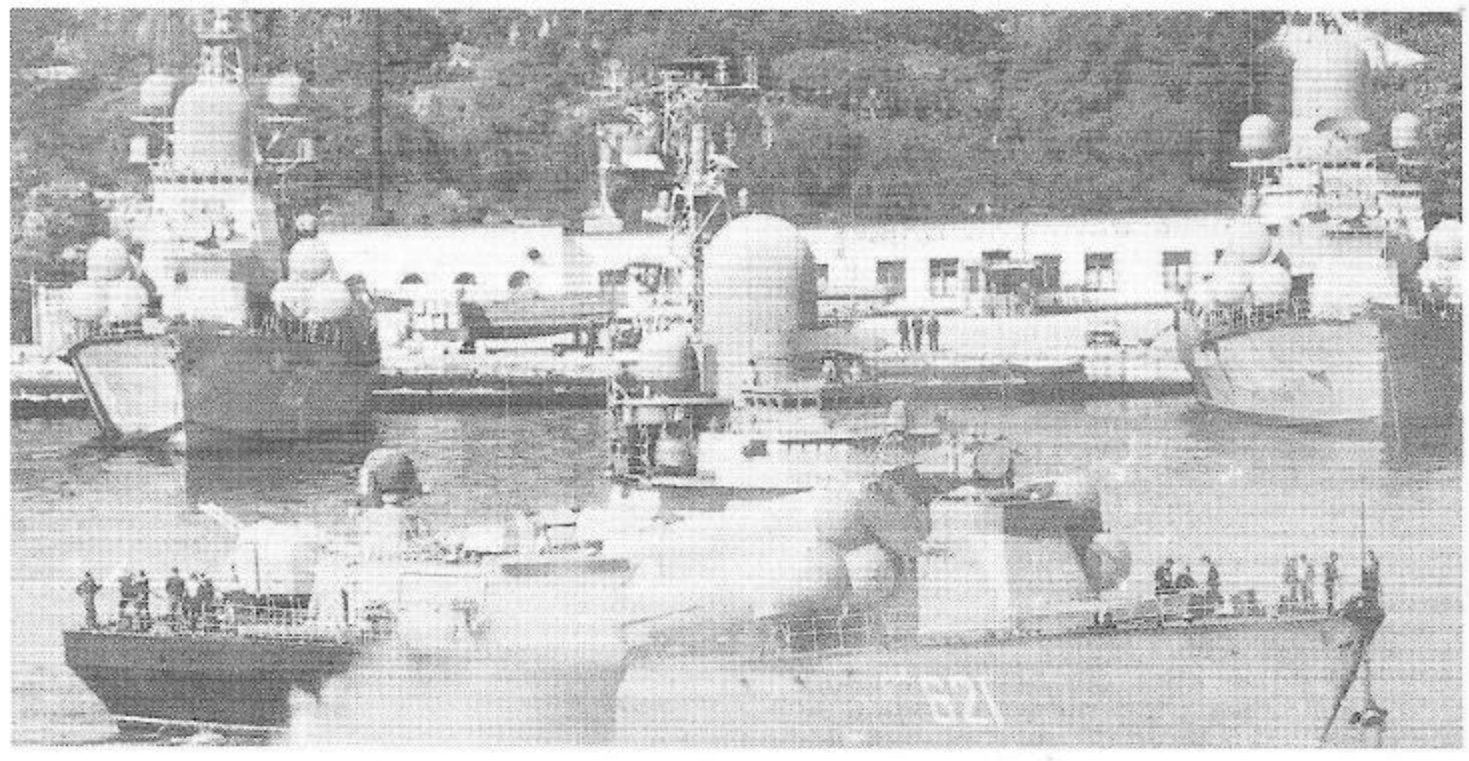
Band Stand
Band Stand is a D/E/F-band radar which is part of the fire control system for the SS-N-25 missile system, although there my be some connection with the ship's overall air surveillance, as well. The Light Bulb datalinks may well be part of the same system, providing the links between the ship and the missile.

RADARS

Peel Pair
Nanuchka I and early Nanuchka III. These ships are fitted with the Peel Pair I-band air/surface search radar. This antenna is mounted on the bridge roof and consists of two identical antennas (possibly Don-series) mounted back to back.

Plank Shave
Later Nanuchka III. The later Nanuchka IIIs are fitted with a Plank Shave antenna. This I-band set has usually been associated with targeting for the SS-N-2c missile, but it appears in this case to be used in a general air/surface search role.

Muff Cob
Nanuchka I only. Muff Cob is the director for the 57 mm fire-control system and is the large cylindrical radome atop the after deckhouse. The radome is supported by a trunnion yoke in a traversing mounting and is thus capable of both elevation and traverse. There is a device to the left of the radome (from the front), with a remotely controlled cover, which may be a TV camera. The F/G- band radar is named Muff Cob by NATO and Bars (Wildcat) by the Russian Navy.



A trio of Nanuchkas. Number 621 is a Nanuchka I, with crewmen providing the scale. The two ships still moored are a Nanuchka III (left) (note radomes on the mast) and a second Nanuchka I (right) (H & L van Ginderen Collection)

Bass Tilt
Nanuchka III only. Bass Tilt is an H/I-band fire-control radar which entered service in the mid-1970s and is part of the fire-control system for the ADG-630 CIWS. The weapon system and director are mounted on a pedestal, with the drum-shaped antenna radome, 1.2 m (4 ft) in diameter, inclined at an angle of approximately 45°. The director is 2 m (6.5 ft) high and 1.45 m (4.7 ft) long. The radar is probably linked to a ballistic computer and each director controls one or two gun mountings.

Pop Group
All versions. Pop Group is the weapon control system for the SA-N-4 missile system, with the director sited on the roof of the forward deckhouse. The director includes an acquisition radar with a long, curved antenna on top of the cab and two target trackers. The latter two are of different size, but presumably the smaller one performs a similar function to the larger, but at higher frequencies, which would enable them to direct two different missiles against the same target. The system operates in the F/H/I-band.

Nayada
All versions. Nayada is a standard Russian I-band navigation radar.

IFF
High Pole. Square Head. Spar Stump. Salt Pot A and B.

PROPULSION

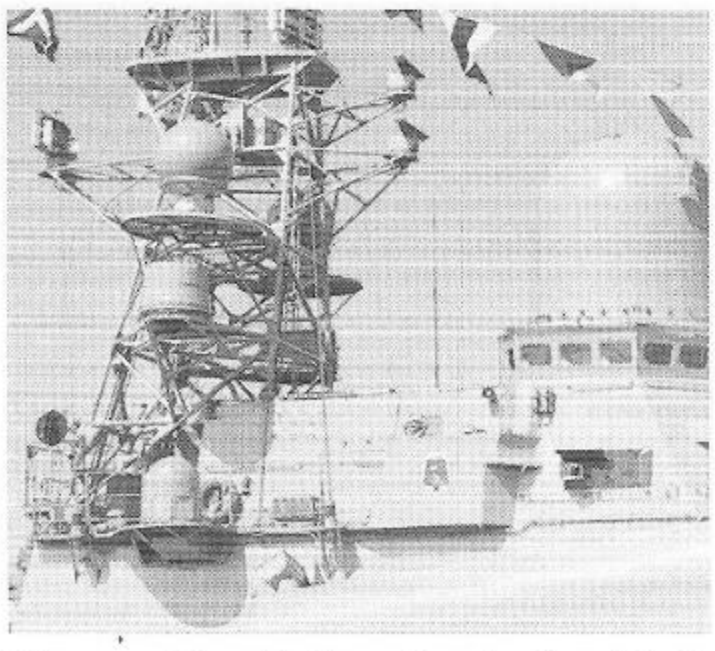
Specifications
System: Diesel

Main machinery: 6 M504 diesels, 19.2 MW (26,122 hp)
Shafts: 3

FURTHER INFORMATION

PROGRAMME

Construction of the Nanuchka Is started in 1969 at the Petrovsky yard in (then) Leningrad. Construction of the Nanuchka III, which was first observed by the West in 1978 and the one-off Nanuchka IV trial ship took place in the Pacific. Nanuchka IV was completed in 1987 as a trials ship.



Close-up of the midship section of a Nanuchka III. On the masthead platform is a Square Head IFF antenna, with a second, covering the aft sector, below and behind the platform. On the side of the mast (from top to bottom) are Light Bulb (datalink), Half Hat (radar intercept/ESM) and Wine Glass (jammer). The two rotating antennas on the front side of the mast are Nayada navigation radars. The large radome on the bridge roof is Band Stand

DEPLOYMENT

The 'Nanuchka' class is intended for deployment in coastal waters, but in the 1980s there were regular deployments to the Mediterranean, North Sea and the Pacific, where the type was seen operating in groups of two or three.

Current deployment (early 1997) is nine in the Northern Fleet, nine in the Baltic, five in the Black Sea and the remaining six in the Pacific.

FUTURE

Many of the Nanuchkas are lying alongside or at anchor and are non-operational, scrapping of Nanuchka Is has already started.

A successor class to this useful small warship is in the design stage, but whether it will enter production is another matter.

Nanuchka III. Note that the bridge house has been moved further forward and that the Band Stand radome is now on the bridge roof. Note also the unusual circular antenna at the masthead (H & L van Ginderen Collection)

PAUK

OVERVIEW

The 'Pauk' class corvettes were built between 1977 and 1982 and are essentially an anti-submarine version of the 'Tarantul' class hull. Thus, the superstructure is lighter and there are no SS-N-2c missiles, but instead there are two sonars and an ASW armament consisting of four 406 mm torpedo tubes, two RBU-1200 rocket launchers and two depth-charge racks.

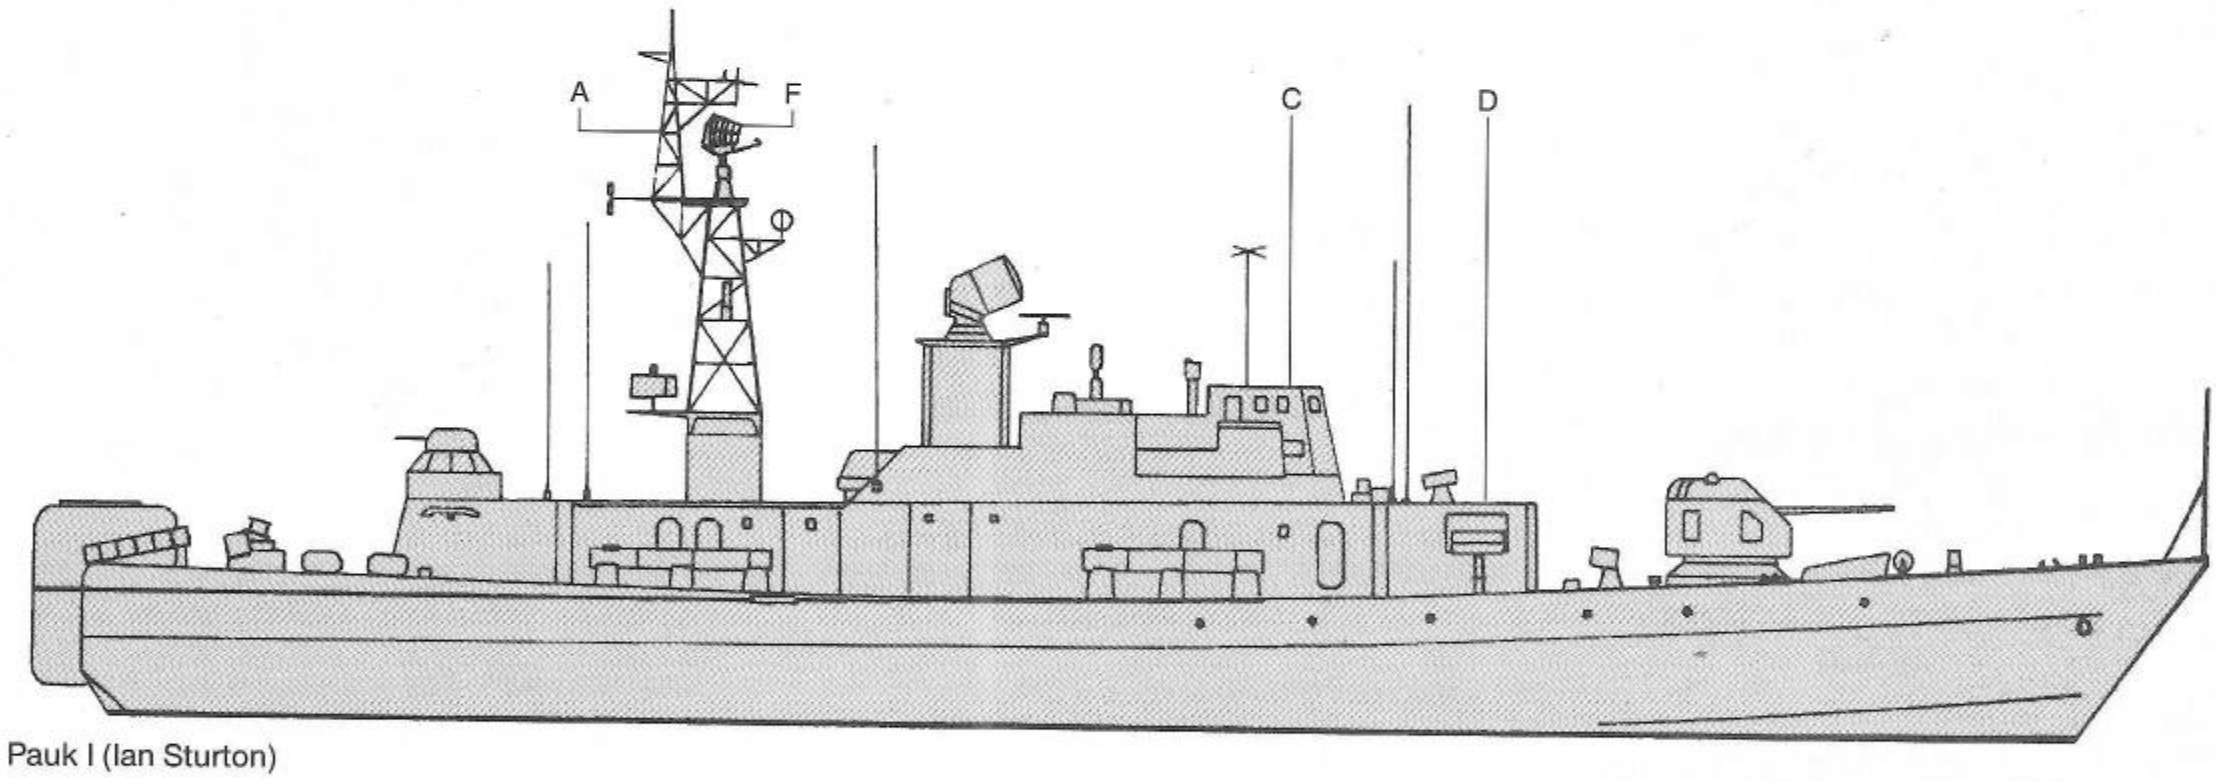
Following the usual Soviet policy of the 1970s and 1980s, there was one version (Pauk I) for Soviet forces and a second version for export (Pauk II). This made it clear that there were certain weapons (for example, 406 mm torpedoes) and items of electronic equipment (such as sonars and radars) which were not allowed out of Russian hands. In addition, and again following standard practice, one of the export versions was retained by the Soviet Navy for use in training foreign crews. A number of 'Pauk' class ships were also supplied to the KGB Maritime Border Guard.

A total of 52 'Pauk' class was delivered:

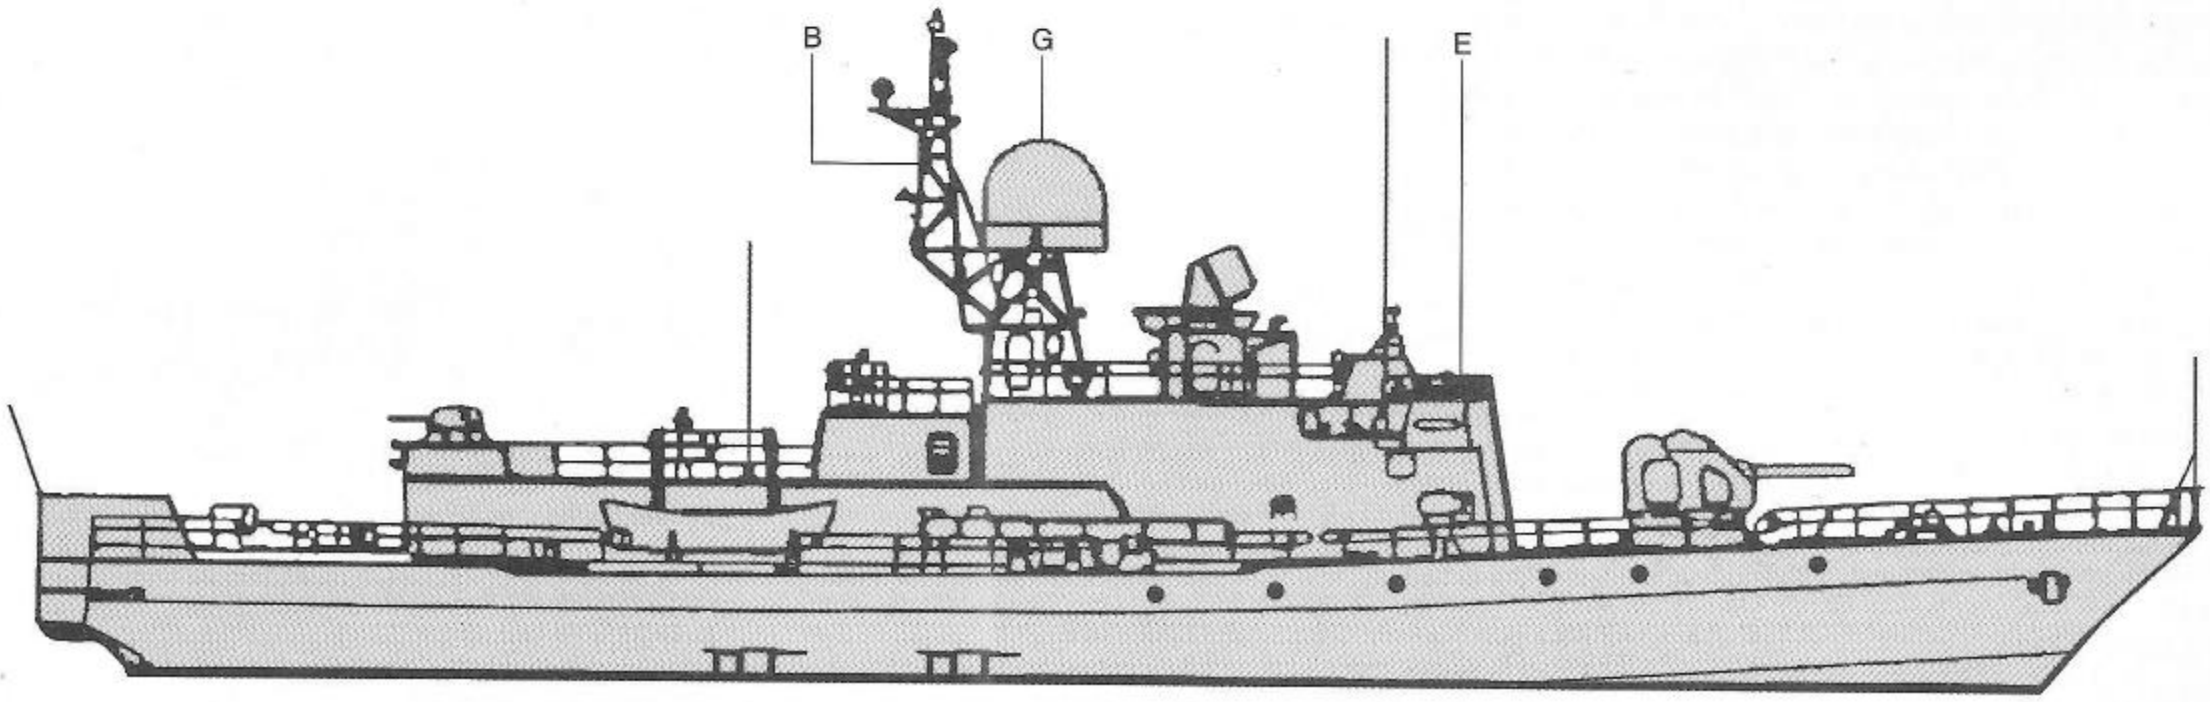
'Pauk I'
- Russian Navy: 31
- KGB Maritime Border Guard: 15
- Bulgaria: 2 (these were former Russian Navy ships)

'Pauk II'
- Cuba: 1
- India: 4
- Russia: 1

One of the three original Pauk I ASW corvettes with the low bridge. Note the large mainmast and the container for the MGK-345 sonar on the stern (MoD Bonn)



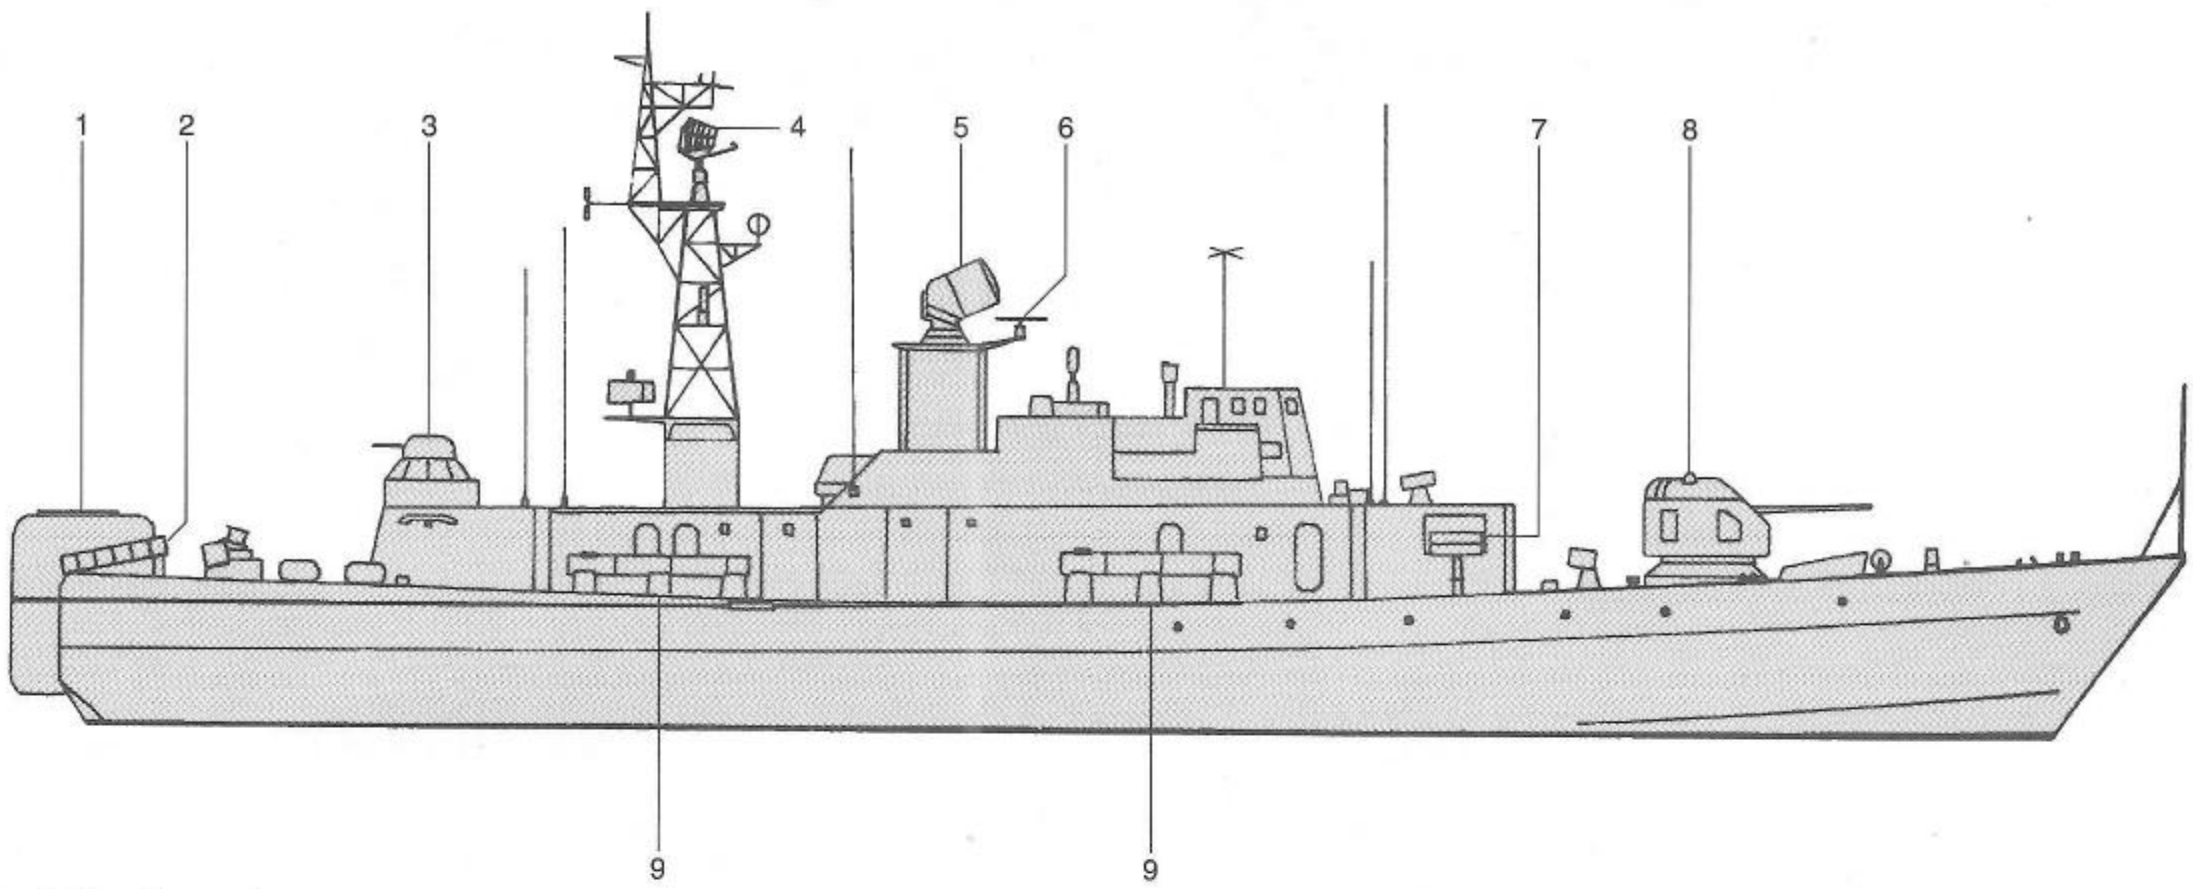
Pauk I (Ian Sturton)



Pauk II

Main differences between Pauk I (top) and Pauk II (bottom). **Mainmast:** *In Pauk I mainmast is aft (A). In Pauk II mainmast (B) is much lower and further forward occupying position taken by Bass Tilt in Pauk I.* **Bridge:** *In Pauk I bridge (C) is amidships with a flat-roofed deckhouse forward (D). In Pauk II bridge has been brought forward to front-edge of deckhouse (E).* **Sensors:** *Pauk I has Strut Curve, Pauk II has Cross Dome/Positive E (G).* **Tubes:** *Pauk I has 400 mm tubes (H); Pauk II has 533 mm tubes*

RESHITELNI (PAUK I) (TYPE 1241P)



Pauk I (Ian Sturton)
1 *MGK-345 sonar system* **2** *Depth charge rack (two racks, each six depth charges)* **3** *AK-360M six-barrelled 30 mm CIWS* **4** *Peel Cone air/surface search radar* **5** *Bass Tilt fire-control director for AK-176M/630 weapons* **6** *Navigation radar (Kivach, Pechora or SRN 207)* **7** *RBU 1200 ASW rocket launcher* **8** *AK-176M 76 mm (3 in)/60 gun* **9** *400 mm (15.75 in) torpedo tubes*

GENERAL SPECIFICATIONS

Country of origin: Russia
Operator: Bulgaria
Type: Pauk I (Type 1241P)

Class: RESHITELNI

Acquired: 2
Active: 2

Displacement:
full load: 440 t

Dimensions
Length: 59.5 m (195.2 ft)
Beam: 10.2 m (33.5 ft)
Draught: 3.3 m (10.8 ft)

Speed: 32 kts
Range: 2,200 n miles at 18 kts

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

SA-N-5 Grail

There are two quad launchers per ship. The Strela 2 (9M32M) missiles in the SA-N-5 missile system are housed in glass fibre launcher-containers. When the operator acquires the target he/she activates the thermal battery and when the seeker has acquired the target an audio signal is received. The operator then takes the first pressure on the trigger to activate the missile gyros which are warmed up in four to six seconds. The operator uses stadia reference marks in the optical sight to compute the lead angle to the target then takes the full pressure on the trigger to launch the missile. The booster burns for 0.05 seconds to eject the missile from the launch tube at a speed of 28 m/s (92 ft/s) and to spin it; then, at a distance of 6 m (20 ft), the sustainer ignites and the trailing fins pop out. The missile homes on the 'hottest' part of the aircraft and probably has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead.

Specifications
Length: 1.45 m (4.76 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (21.98 lb)
Speed: Mach 1.7
Range: 18-4,500 m (60-15,000 ft)

Manufacturer/Contractor
Fakel, Russia.

TUBES

406 mm (16 in) torpedo tubes

There are four 16 in (406 mm) torpedo tubes. These are fixed mounts, two on each side of the ship, and widely separated. (Note that the 'real' export version, the Type 1241PE has 533 mm (21 in) torpedo tubes.

TORPEDOES

Type E40-75A torpedoes.

Specifications
Diameter: 406 mm
Length: 4.5 m (14.8 ft)
Warhead: 100 kg (220 lb)
Speed: 30 kts
Range: 7 n miles (13 km)

GUNS

AK 176M 76 mm (3 in)/60

There is one AK-176M 76 mm gun mounted on the foredeck. The AK-176M is designed for air defence, surface engagement and shore bombardment roles and is a four-man mounting which may be operated from the weapon control centre or from a local control station. The barrel is cooled externally by taking sea-water from the ship's fire main through a jacket which lies around the liner.

The AK-176M is part of a weapon control system based upon the H-band fire-control radar with the NATO designation 'Bass Tilt'. This radar is also associated with the AK-630 and the two form an integrated weapon system. The radar director is mounted on a pedestal and has an antenna with drum-shaped radome inclined at an angle of approximately 45°. Local control is achieved semi-automatically using the *Kondensor* sight which is installed as a backup in the event of the failure of 'Bass Tilt'. It is a day/night sight which may be used to engage both surface and air targets. In the event of a power failure the crew may use the WD-221 optical sight.

Specifications
Calibre: 76 mm
Length of barrel: 59 calibres
Muzzle velocity: 980 m/s (3,214 ft/s)
Traverse: 360° at 35°/s
Elevation: −7 to +85° at 30°/s
Ammunition (total): 16 kg (35.2 lb)
Rate of fire: 120 rds/min

30 mm/65 AK-630

There is a single, six-barrelled AK-630 CIWS at the forward end of the superstructure. This weapon has five roles, engaging anti-ship missiles, aircraft, small surface vessels, drifting mines and unprotected targets ashore. The AO-18 gun is a water-cooled, six-barrelled, Gatling-principle weapon with fixed breech block and

Reshitelni, *a Pauk I of the Bulgarian Navy. This ship was transferred from Russian Navy stocks and is thus a standard Russian variant, with Strut Curve radar, 400 mm torpedo tubes and a prominent mainmast* (C D Yaylali)

revolving barrels. The weapon is believed to operate in a similar manner to that of the Phalanx, firing bursts of up to 400 rounds, but, unlike the US weapon, AK-630 features a separate radar director.

Specifications

Calibre: 30 mm
Length of barrel: 65 calibres
Number of barrels: 6
Muzzle velocity: 890 m/s (2,920 ft/s)
Cooling: Water
Traverse: 360° at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range:
radar fire control: 4,000 m (4,374 yd)
electro-optic fire control: 5,000 m (5,468 yd)
Rate of fire: 4,000-5,000 rds/min
Magazine: 2,000 rounds
Weight of complete round: 1.224 kg (2.7 lb)
Ammunition types:
UOF-84 HE-I: weight: 384 g (13.5 oz)
UOR-84 HE-T: weight: 388 g (13.68 oz)
Fuze: MG-32 point impact (both rounds)

ANTI-SUBMARINE MORTARS

RBU 1200

There are two RBU 1200 mountings, one on either side of the deckhouse forward of the bridge. RBU 1200 is about 1.5 m (4.9 ft) high and has a pyramid-shaped pintle with five rocket launcher tubes; a row of three along the top and one each on either side. The tubes cannot be trained and have a maximum elevation of +65°. Each tube has a diameter of 250 mm, is 1.4 m (4.6 ft) long and is reloaded manually. The 70 kg (154 lb) RGB-12 rocket has a 34 kg (75 lb) warhead and a range of about 0.8 n miles.

Specifications

Calibre: 250 mm
Length: 1.4 m (4.6 ft)
Range: 1,400 m (1,530 yd)
Warhead: 34 kg (75 lb)

DEPTH CHARGES

Two racks, each with six depth charges.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Brick Plug

There are three Brick Plug arrays.

DECOYS

PK-16

These ships have two PK-16, the Russian Navy's standard decoy system, with 16 tubes. The system consists of launchers, a control console and three types of munition. The launcher appears to be turnable, while the control console appears to be a relatively simple design with simple controls capable of controlling up to four launchers. The munitions are all for seduction purposes. The SR-50 is a chaff round with a payload of 11 kg (24 lb). The SOM-50 is a heat-seeker/laser-guided missile seduction round with 7.3 kg (16 lb) payload while the SK.50 is a combined round with 9.1 kg (20 lb) of payload.

COMMAND AND CONTROL SYSTEMS

RADARS

Peel Cone

Peel Cone is the air/surface search on the ships intended for the Russian Navy.

Spin Trough

Spin Trough is an I-band surface search and navigation radar.

Bass Tilt

Bass Tilt is an H/I-band fire-control radar which entered service in the mid-1970s and is part of the fire-control system for the ADG-630 CIWS. The weapon system and director are mounted on a pedestal, with the drum-shaped antenna radome, 1.2 m (4 ft) in diameter, inclined at an angle of approximately 45°. The director is 2 m (6.5 ft) high and 1.45 m (4.7 ft) long. The radar is probably linked to a ballistic computer and each director controls one or two gun mountings.

SONAR

MGK-345 sonar system

The sonar system, designated MGK-345 is composed of two elements. There is a keel-mounted transducer in a dome and a VDS (NATO designation Foal Tail) which can operate at depths up to 200 m (656 ft). The system has a claimed range of 6.5 n miles (12 km).

PROPULSION

Specifications

System: Diesel
Main machinery: 2 Type M521-TM5 diesels each 6,250 kW (8,600 hp)
Shafts: 2
Ship's services: 1—100 kW diesel-generator set, 2—200 kW alternators

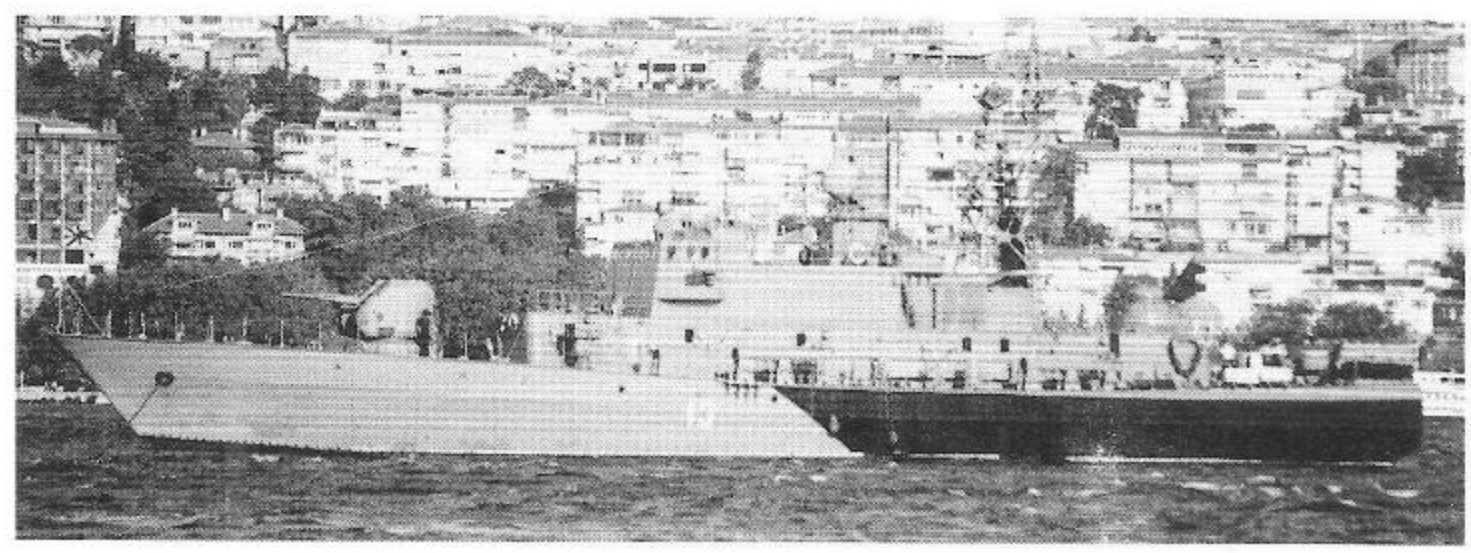
FURTHER INFORMATION

PROGRAMME

Reshitelni transferred from the Russian Navy in September 1989, followed by *Bodri* in December 1990. It should be noted that since these were transferred from Russian stocks they are the standard Russian 'Pauk I' class (Type 1241P) and not the export Pauk II (Type 1241PE) version.

DEPLOYMENT

Both ships are based at Varma. *Reshitelni* played a prominent role in the NATO Partnership for Peace (PfP) exercise in the Black Sea in 1995.



Pauk I

321 (PAUK II) (TYPE 1241PE)

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

SA-N-5 Grail

There are two quad launchers per ship. The Strela 2 (9M32M) missiles in the SA-N-5 missile system are housed in fibre glass launcher-containers. When the operator acquires the target he/she activates the thermal battery and when the seeker has acquired the target an audio signal is received. The operator then takes the first pressure on the trigger to activate the missile gyros which are warmed up in four to six seconds. The operator uses stadia reference marks in the optical sight to compute the lead angle to the target then takes the full pressure on the trigger to launch the missile. The booster burns for 0.05 seconds to eject the missile from the launch tube at a speed of 28 m/s (92 ft/s) and to spin it; then, at a distance of 6 m (20 ft), the sustainer ignites and the trailing fins pop out. The missile homes on the 'hottest' part of the target and probably has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead.

Specifications
Length: 1.45 m (4.76 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (21.98 lb)
Speed: Mach 1.7
Range: 18-4,500 m (60-15,000 ft)

Manufacturer/Contractor
Fakel, Russia.

TUBES

21 in (533 mm) tubes for SET-65E torpedo

There are four single 533 mm (21 in) torpedo tubes, two on each side of the ship. The individual tubes are widely separated from each other.

TORPEDOES

SET-65E 533 mm (21 in) torpedo

The Cuban Pauk is armed with Russian-supplied SET-65E torpedoes.

Specifications
Diameter: 533 mm (21 in)
Length: 7.8 m (25.6 ft)
Weight: n/k
Range: 10.75 n miles (20 km)
Max speed: 35 kts
Warhead: 372 kg (820 lb)

GUNS

AK 176M 76 mm (3 in)/60

There is one AK-176M 76 mm gun mounted on the foredeck. The AK-176M is designed for air defence, surface engagement and shore bombardment roles and is a four-man mounting which may be operated from the weapon control centre or from a local control station. The barrel is cooled externally by taking sea-water from the ship's fire main through a jacket which lies around the liner.

The AK-176M is part of a weapon control system based upon the H-band fire-control radar with the NATO designation 'Bass Tilt'. This radar is also associated with the AK-630 and the two form an integrated weapon system. The radar director is mounted on a pedestal and has an antenna with drum-shaped radome inclined at an angle of approximately 45°. Local control is achieved semi-automatically using the *Kondensor* sight which is installed as a backup in the event of the failure of 'Bass Tilt'. It is a day/night sight which may be used to engage both surface and air targets. In the event of a power failure the crew may use the WD-221 optical sight.

Specifications
Calibre: 76 mm
Lenght of barrel: 59 calibres
Muzzle velocity: 980 m/s (3,214 ft/s)
Traverse: 360° at 35°/s
Elevation: −7 to +85° at 30°/s
Ammunition (total): 16 kg (35.2 lb)
Rate of fire: 120 rds/min

30 mm/65 AK-630

There is a single, six-barrelled AK-630 CIWS at the forward end of the superstructure. This weapon has five roles, engaging anti-ship missiles, aircraft, small

surface vessels, drifting mines and unprotected targets ashore. The AO-18 gun is a water-cooled, Gatling-principle weapon with fixed breech-block and revolving barrels. The weapon is believed to operate in a similar manner to that of the Phalanx, firing bursts of up to 400 rounds, but, unlike the US weapon, AK-630 features a separate radar director.

Specifications

Calibre: 30 mm
Length of barrel: 65 calibres
Number of barrels: 6
Muzzle velocity: 890 m/s (2,920 ft/s)
Cooling: Water
Traverse: 360° at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range:
radar fire control: 4,000 m (4,374 yd)
electro-optic fire control: 5,000 m (5,468 yd)
Rate of fire: 4,000-5,000 rds/min
Magazine: 2,000 rounds
Weight of complete round: 1.224 kg (2.7 lb)
Ammunition types:
UOF-84 HE-I: weight: 384 g (13.5 oz)
UOR-84 HE-T: weight: 388 g (13.68 oz)
Fuze: MG-32 point impact (both rounds)

ANTI-SUBMARINE MORTARS

RBU 1200

There are two RBU 1200 mountings, one on either side of the deckhouse forward of the bridge. RBU 1200 is about 1.5 m (4.9 ft) high and has a pyramid-shaped pintle with five rocket launcher tubes; a row of three along the top and one each on either side. The tubes cannot be trained and have a maximum elevation of +65°. Each tube has a diameter of 250 mm, is 1.4 m (4.6 ft) long and is reloaded manually. The 70 kg (154 lb) RGB-12 rocket has a 34 kg (75 lb) warhead and a range of about 0.8 n miles.

Specifications

Calibre: 250 mm
Length: 1.4 m (4.6 ft)
Range: 1,400 m (1,530 yd)
Warhead: 34 kg (75 lb)

DEPTH CHARGES

Two racks, each with six depth charges.

ELECTRONIC WARFARE SYSTEMS

DECOYS

PK-16

These ships have two PK-16 chaff launchers. These are the Russian Navy's standard decoy systems, with 16 tubes. The system consists of launchers, a control console and three types of munition. The launcher appears to be turnable, while the control console appears to be a relatively simple design with simple controls capable of controlling up to four launchers. The munitions are all for seduction purposes. The SR-50 is a chaff round with a payload of 11 kg (24 lb). The SOM-50 is a heat-seeker/laser-guided missile seduction round with 7.3 kg (16 lb) payload while the SK.50 is a combined round with 9.1 kg (20 lb) of payload.

COMMAND AND CONTROL SYSTEMS

RADARS

Cross Dome/Positive E

Cross Dome/Positive E is fitted to these export ships (it is also fitted in the export versions of other ships). It is an E/F-band air/surface search radar.

Pechora

Pechora is installed in this ship as the surface search/navigation radar. It operates in the I-band.

Bass Tilt

Bass Tilt is an H/I-band fire-control radar which entered service in the mid-1970s and is part of the fire-control system for the ADG-630 CIWS. The weapon system and director are mounted on a pedestal, with the drum-shaped antenna radome, 1.2 m (4 ft) in diameter, inclined at an angle of approximately 45°. The director is 2 m (6.56 ft) high and 1.45 m (4.8 ft) long. The radar is probably linked to a ballistic computer and each director controls one or two gun mountings.

SONAR

MGK-345 sonar system

The sonar system, designated MGK-345 is composed of two elements. There is a keel-mounted transducer in a dome and a VDS (NATO designation Foal Tail) which can operate at depths up to 200 m (656 ft). The system has a claimed range of 6.5 n miles (12 km).

PROPULSION

Specifications

System: Diesel
Main machinery: 2 Type M521-TM5 diesels each 6,250 kW (8,600 hp)
Shafts: 2
Ship's services: 1—100 kW diesel generator set, 2—200 kW alternators

FURTHER INFORMATION

PROGRAMME

This is the last known warship to have been transferred from Russia to the Cuban Navy, having been delivered in May 1990. An export version of the 'Pauk' class, it was built at the Yaroslavl Shipyard and is virtually identical to the ships delivered to India.

STRUCTURE

Pauk II has a longer superstructure than the Pauk I and new electronics with an air search radome (Cross Dome/Positive E) similar to the 'Parchim II' class. It does not, however, have the large lattice mainmast, which is a major feature of Pauk I.

DEPLOYMENT

This ship was seen at sea in 1995.

FURTHER INFORMATION

PROGRAMME

This is the Type 1241PE (Pauk II), built in Russia for export. The original order was placed in late 1983 but completion of the first ship was delayed by lack of funds and the order for the remaining ships was not reinstated until 1987. A fifth of class was cancelled. The names associated with former coastal patrol craft.

DESIGN

As with the one ship supplied to Cuba, this is the export model of the Pauk. It has a longer superstructure than the Pauk I, larger torpedo tubes and new electronics.

Abhay *(P 33) name ship of a class of four Russian Pauk II (Type 1241PE) operated by the Indian Navy* (Central Design Bureau, Almaz)

The booster burns for 0.05 seconds to eject the missile from the launch tube at a speed of 28 m/s (92 ft/s) and to spin it; then, at a distance of 6 m (20 ft), the sustainer ignites and the trailing fins pop out. The missile homes on the 'hottest' part of the aircraft and probably has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead.

Specifications
Length: 1.45 m (4.76 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (21.98 lb)
Speed: Mach 1.7
Range: 2.6 n miles (4.8 km)
Altitude: 18-4,500 m (60-15,000 ft)

Manufacturer/Contractor
Fakel, Russia.

TUBES

406 mm (16 in) torpedo tubes

Pauk I only. There are four 406 mm (16 in) torpedo tubes. These are fixed mounts, two on each side of the ship, and widely separated.

533 mm (21 in) torpedo tubes

Pauk II only. There are four 533 mm (21 in) torpedo tubes. Russian system designation is TR-236-02.

GUNS

AK 176M 76 mm (3 in)/60

There is one AK-176M 76 mm gun mounted on the foredeck. The AK-176M is designed for air defence, surface engagement and shore bombardment roles and is a four-man mounting which may be operated from the weapon control centre or from a local control station. The barrel is cooled externally by taking sea-water from the ship's fire main through a jacket which lies around the liner.

The AK-176M is part of a weapon control system based upon the H-band fire-control radar with the NATO designation 'Bass Tilt'; Russian designation is Vimpel-VME. This radar is also associated with the AK-630 and the two form an integrated weapon system. The radar director is mounted on a pedestal and has an antenna with drum-shaped radome inclined at an angle of approximately 45°. Local control is achieved semi-automatically using the Kondensor sight which is installed as a backup in the event of the failure of 'Bass Tilt'. It is a day/night sight which may be used to engage both surface and air targets. In the event of a power failure the crew may use the WD-221 optical sight.

Normal ammunition load is 152 shells, with storage for a further 102, if required.

Specifications
Calibre: 76 mm
Length of barrel: 59 calibres
Muzzle velocity: 980 m/s (3,214 ft/s)
Traverse: 360° at 35°/s
Elevation: −7 to +85° at 30°/s
Ammunition (total): 16 kg (35.2 lb)
Rate of fire: 120 rds/min
Range: 8.5 n miles (15.7 km)

30 mm/65 AK-630

There is a single, six-barrelled AK-630 CIWS at the after end of the superstructure. This weapon has five roles,

Pauk I *firing an RBU 1200 ASW rocket*

engaging anti-ship missiles, aircraft, small surface vessels, drifting mines and unprotected targets ashore. The AO-18 gun is a water-cooled, Gatling-principle weapon with fixed breech block and revolving barrels. The weapon is believed to operate in a similar manner to that of the Phalanx, firing bursts of up to 400 rounds, but, unlike the US weapon, AK-630 features a separate radar director.

Specifications

Calibre: 30 mm
Length of barrel: 65 calibres
Number of barrels: 6
Muzzle velocity: 890 m/s (2,920 ft/s)
Cooling: Water
Traverse: 360° at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range:
Radar fire control: 4,000 m (4,374 yd)
Electro-optic fire control: 5,000 m (5,468 yd)
Rate of fire: 4,000-5,000 rds/min
Magazine: 2,000 rounds
Weight of complete round: 1.224 kg (2.7 lb)
Ammunition types:
UOF-84 HE-I: weight: 384 g (13.5 oz)
UOR-84 HE-T: weight: 388 g (13.68 oz)
Fuze: MG-32 point impact (both rounds)

ANTI-SUBMARINE MORTARS

RBU 1200

There are two RBU 1200 mountings, one on either side of the deckhouse forward of the bridge. RBU 1200 is about 1.5 m (4.9 ft) high and has a pyramid-shaped pintle with five rocket launcher tubes; a row of three along the top and one each on either side. The tubes cannot be trained and have a maximum elevation of +65°. Each tube has a diameter of 253.5 mm, is 1.4 m (4.6 ft) long and is reloaded manually. The 70 kg (154 lb) RGB-12 rocket has a 34 kg (75 lb) warhead and a range of about 0.8 n miles; 30 are carried.

Specifications

Calibre: 250 mm
Length: 1.4 m (4.6 ft)
Range: 1,400 m (1,530 yd)
Warhead: 34 kg (75 lb)

DEPTH CHARGES

Two racks, each with six depth charges.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Brick Plug/Half Hat

All ships have three Brick Plug and two Half Hat radar warning antennas.

DECOYS

PK-16 or PK-10

These ships have either two PK-16 or four PK-10. These are the Russian Navy's standard decoy systems, with either 10 or 16 tubes. The system consists of launchers, a control console and three types of munition. The launcher appears to be turnable, while the control console appears to be a relatively simple design with simple controls capable of controlling up to four launchers. The munitions are all for seduction purposes. The SR-50 is a chaff round with a payload of 11 kg (24 lb). The SOM-50 is a heat-seeker/laser-guided missile seduction round with 7.3 kg (16 lb) payload while the SK.50 is a combined round with 9.1 kg (20 lb) of payload.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Hood Wink

There is one Hood Wink electro-optic director.

RADARS

Peel Cone

Pauk I only. Peel Cone is the air/surface search on the ships intended for the Russian Navy.

Cross Dome/Positive E

Pauk II only. Cross Dome/Positive E is fitted to the Pauk IIs intended for export (it is also fitted in the export versions of other ships). It is an E/F-band air/surface search radar. Range against a 5 m² aircraft is 45 km and three targets can be tracked simultaneously.

Kivach/Pechora/SRN 207

One of these three models is installed in each ship as the surface search/navigation radar. All operate in the I-band.

Bass Tilt

Bass Tilt is an H/I-band fire-control radar which entered service in the mid-1970s and is part of the fire-control system for the AK-630 CIWS. The weapon system and director are mounted on a pedestal, with the drum-shaped antenna radome, 1.2 m (4 ft) in diameter, inclined at an angle of approximately 45°. The director is 2 m (6.56 ft) high and 1.45 m (4.8 ft) long. The radar is probably linked to a ballistic computer and each director controls one or two gun mountings.

SONAR

MGK-345 sonar system

The sonar system, designated MGK-345 is composed of two elements. There is a keel-mounted transducer in a dome and a VDS (NATO designation Foal Tail) which can operate at depths up to 200 m (656 ft). The system has a claimed range of 6.5 n miles (12 km).

PROPULSION

Specifications

System: Diesel
Main machinery: 2 Type M521-TM5 diesels each 6,250 kW (8,600 hp)
Shafts: 2
Ship's services: 1—100 kW diesel-generator set, 2—200 kW alternators

FURTHER INFORMATION

PROGRAMME

The first of class was laid down in 1977 and completed in 1979 and the Pauk was then in series production at Yaroslavl in the Black Sea and at Vladivostok until 1988 when the 'Svetlyak' class took over. Overall numbers of Pauk I are increased by two Pauk IIs, reported to be wearing Russian colours, perhaps while sales are still expected. An improved version was reported to be building at Kharbarovsk in 1995.

DESIGN

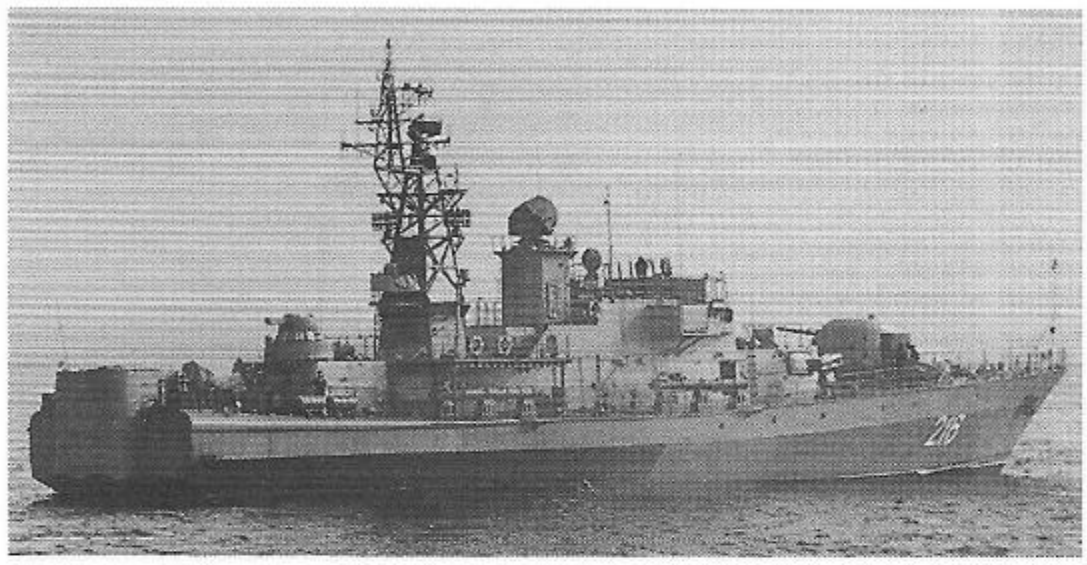
This is an ASW version of the 'Tarantul' class, having the same hull form, but with a 1.8 m (5.9 ft) extension housing for dipping sonar. The first three had a low bridge, but from the fourth hull onwards this was raised by half a deck level. A modified version (Pauk II) with a longer superstructure, two twin 533 mm torpedo tubes and a radome similar to the 'Parchim' class has been built for export with one ship retained by the Russian Navy for training foreign crews.

OPERATIONAL

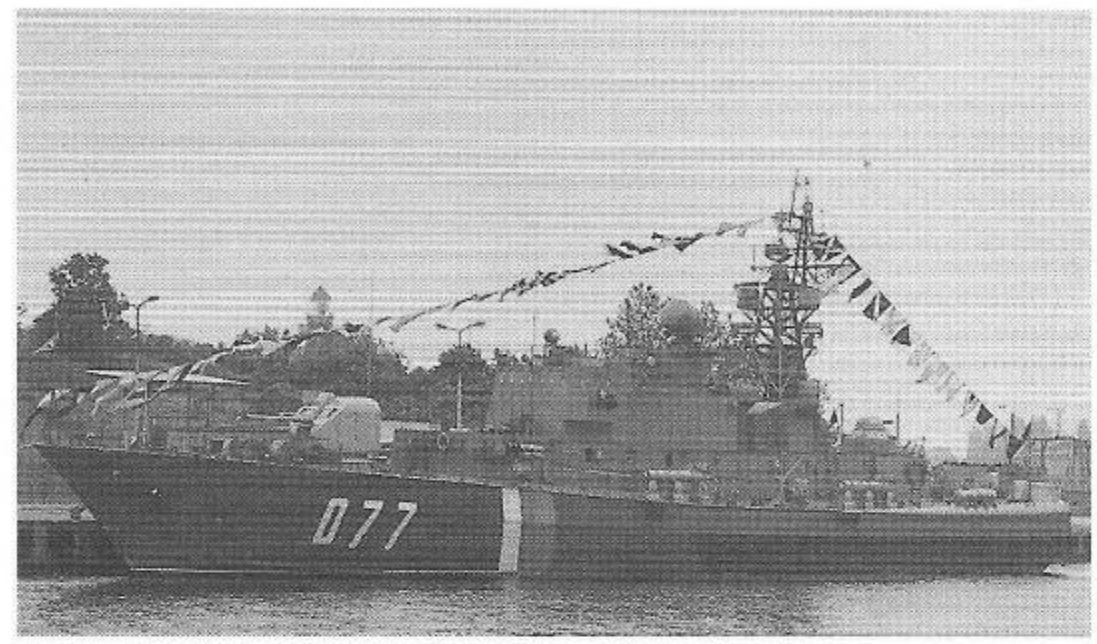
15 of these ships are operated by the Border Guard.

SALES

One Pauk I was sold to Bulgaria in September 1989 followed by a second in December 1990.



Pauk I *of the Russian Navy showing the large container at the stern for the MGK-345 sonar, which can be lowered to a depth of 200 m (656 ft)* (MoD Bonn)



Pauk I *operated by the Russian Boarder Guard* (J Cislak)

TARANTUL

OVERVIEW

The Tarantul (known in Russia as Project 1241 'Sea Lightning') has its origins in a 1970 Soviet Navy requirement for a new missile-carrying corvette *(Raketny Kater).* The ship was designed by E Yuhnin and his team at the 'Almaz' Design Bureau and emerged in 1978, armed with the SS-N-2 (NATO = Styx). It has achieved considerable success with some 76 having been constructed by the end of 1996.

The ship has a steel hull, with the deck and superstructure fabricated from an aluminium-magnesium alloy. The standard hull is 56.1 m (184.0 ft) long, with a 10.2 m (33.46 ft) beam. Displacements are: standard 385 tonnes; full load 455 tonnes. The basic weapons system in the early versions is the 'Termit' anti-ship missile (NATO = SS-N-2c 'Styx'; Russia = P-21/P-22). The role of these ships is anti-surface warfare and they do not have any sonar or anti-submarine weapons. Standard artillery weapon is the AK-176M , with a firing rate of 120-130 rounds per minute and a range of 8.1 n miles (15 km). The 'Vympel' (MR-123) system provides fire control for the AK-176M as well as for the twin AK-630 30 mm CIWS, thus ensuring that they operate in conjunction with each other.

The propulsion system in the 'Tarantul I and II' classes is COGAG, with two high-powered gas turbines for boost and two lower-powered gas turbines for cruise. One of the early Tarantul IIs was, however, used to test a CODAG system, which retained a top speed of 41 knots, but increased range to 2,400 n miles (4,440 km) and this system was then adopted for Tarantul III.

Tarantul III also switched to the SS-N-22 missile (Russia = 3M80) which has a considerably greater range than SS-N-2 and is also much faster. It is claimed that it requires 1 to 2 SS-N-22 missiles to destroy a frigate/destroyer-sized warship, and 1 to 5 for a 20,000 tonne cargo ship. This means that each Tarantul III can destroy a minimum of two targets.

Tarantul I (Type 1241RE)

Tarantul I is the export version, which, following normal Soviet Navy practice, lacks certain weapons and sensors which it was not prepared to release to foreign navies, such as the Band Stand fire-control system and the associated Light Bulb datalink. The Soviet Navy, also following normal practice, was allocated two ships for use in training foreign crews, which appear to be still operating in the Baltic. Tarantul Is for most export customers are constructed in Russia, but India has set up its own production and at one time intended to produce no less than 27. That number has, however, been drastically cut-back as a result of grave difficulties in obtaining weaponry, sensors and equipment from Russia.

Tarantul II (Type 1241M)

Tarantul II was the first production version for the Soviet Navy. This is armed with a different version of SS-N-2 with various guidance features not releasable to foreign navies. One Tarantul II was, however, sold to Bulgaria, while another has been converted to the prototype Type 1241.7.

Tarantul III (Type 12411)

This is the major production version for the Soviet/Russian Navy and is armed with four SS-N-22 missiles.

Type 1241.7

In the early 1990s the Almaz Design Bureau released brochures at various international exhibitions, advertising three new versions of the ship. The first, designated Project 1241.7 (there is no known NATO designation), has a new main radar and the CADS-N-1 'Kashtan' close in weapons system, with combined guns and missiles. One of the Russian Navy's Tarantul IIs has been converted to this standard, presumably for trials and as a sales demonstrator.

Project 1241.8

A second new version, Project 1241.8, also has a new radar, as well as four quadruple launchers for the new SS-N-25 missile.

Project 12421

Project 12421 is an export version of the Tarantul III, indicating that SS-N-22, has been released for foreign use, although the ship does not have Band Stand or Light Bulb.

Summary

Production of the 'Tarantul' class to date is:

Type 1241M (Tarantul II)

- **Russian Navy.** 18, of which one was later passed to Bulgaria and one has been converted to the prototype Type 1241.7.

Type 1241RE (Tarantul I)

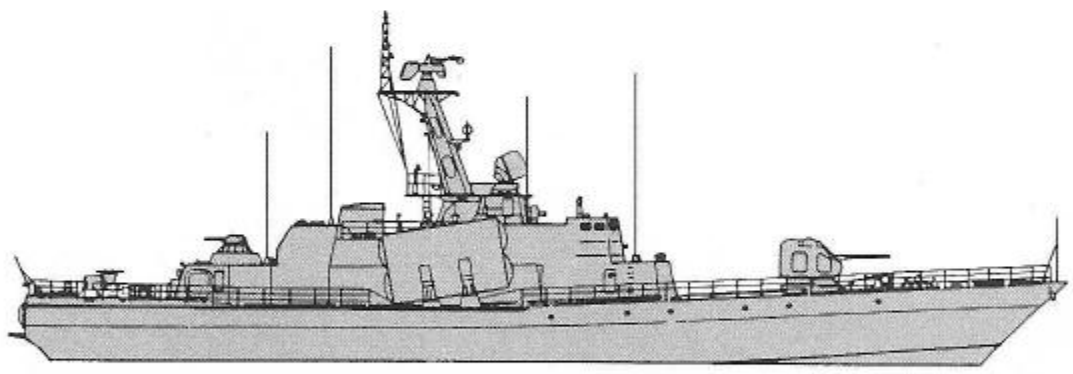
- **Germany (former DDR).** Five. Four were scrapped by Germany on reunification and one was passed to the USA for trials.
- **India.** 12. Of these, five were built in Russia and seven in India.
- **Poland.** Four.
- **Romania.** Three.
- **Vietnam.** Two.
- **Yemen.** Two.
- **Russia.** Three were allocated to the Russian Navy for training foreign crews.

Type 1241MR (Tarantul III)

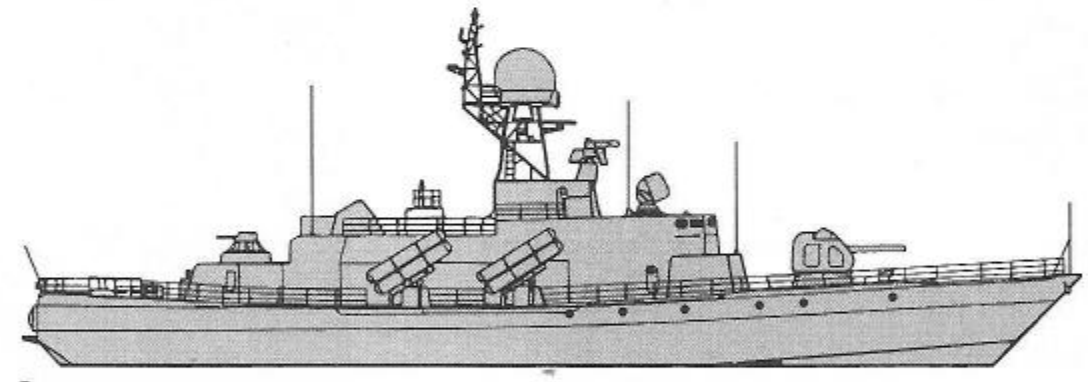
- **Russia.** 27, plus two building.

Type 1241.7 (Tarantul IV)

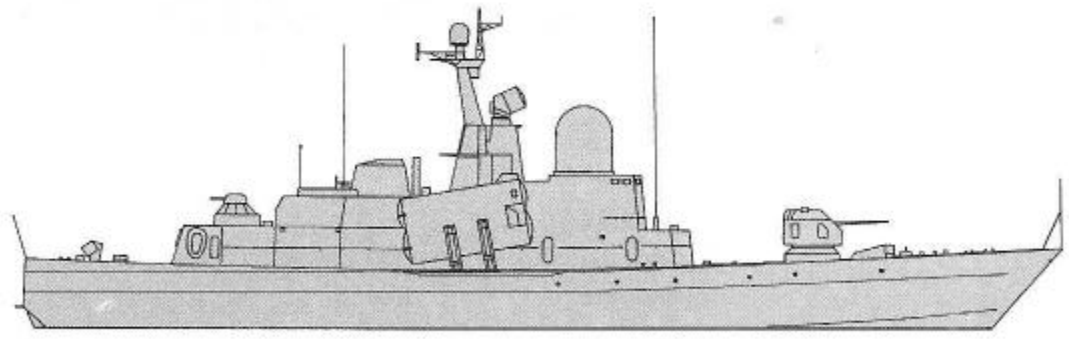
- **Russia.** One, converted from Type 1241M (Tarantul II).
- **Vietnam.** Two new Tarantuls were supplied to Vietnam in 1996. It is not yet known which model is involved.



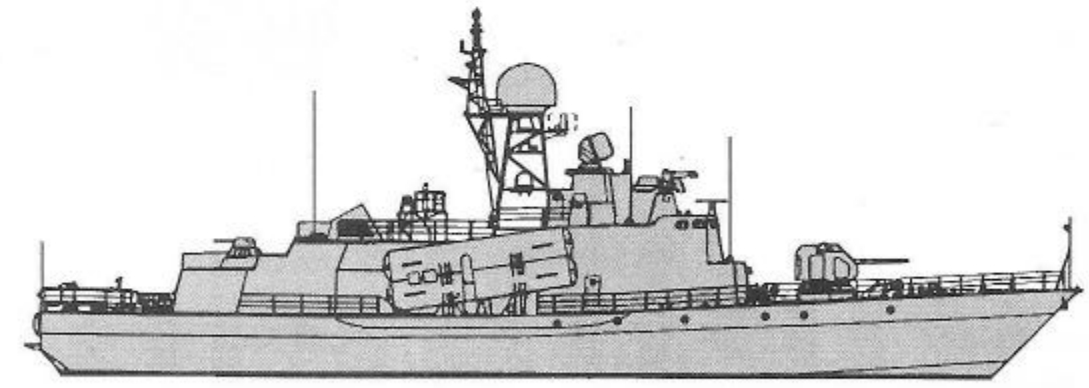
1



3



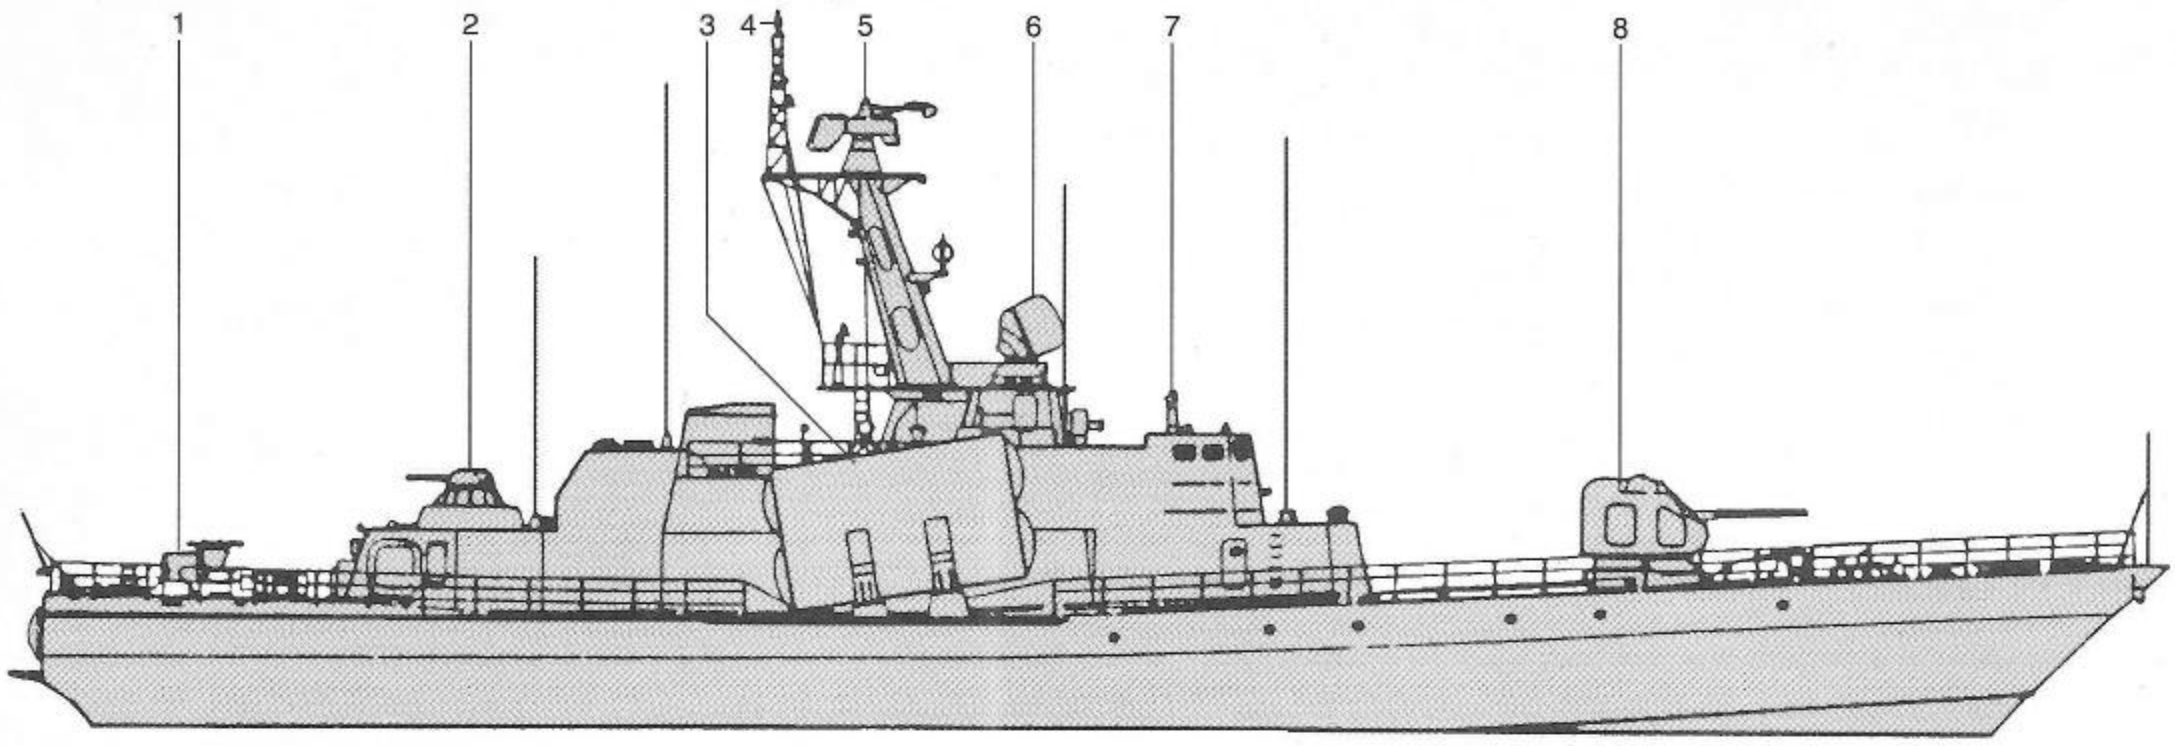
2



4

Four versions of the Tarantul. The first version **1** *was the Type 1241RE which was for export, and as with other classes, lacks the sophisticated weapons, sensors and electronics reserved for the Russian Navy. Thus, Type 1241M,* **2** *the Russian version, has Band Stand and additional ESM and ECM. Type 12418* **3** *is a development of the type 12411 (Tarantul III) (not shown), is intended for export, and has four quadruple launchers for SS-N-25 and Positive-E radar. Type 12421 is an export version of Type 12411 (Tarantul III) with SS-N-22 missiles, but without the Band Stand radar*

VEER (TARANTUL I) (TYPE 1241RE)



Veer *(Type 1241RE)* (Ian Sturton)
1 *PK-16, 16-tube decoy launcher* **2** *AK-630 30 mm, seven-barrel CIWS* **3** *SS-N-2c anti-ship missile launchers* **4** *Square Head IFF* **5** *Plank Shave (Harpun-E) surface search/targeting radar* **6** *Bass Tilt fire director* **7** *Pechora navigation radar* **8** *AK-176M 76 mm (3 in)/60 automatic gun*

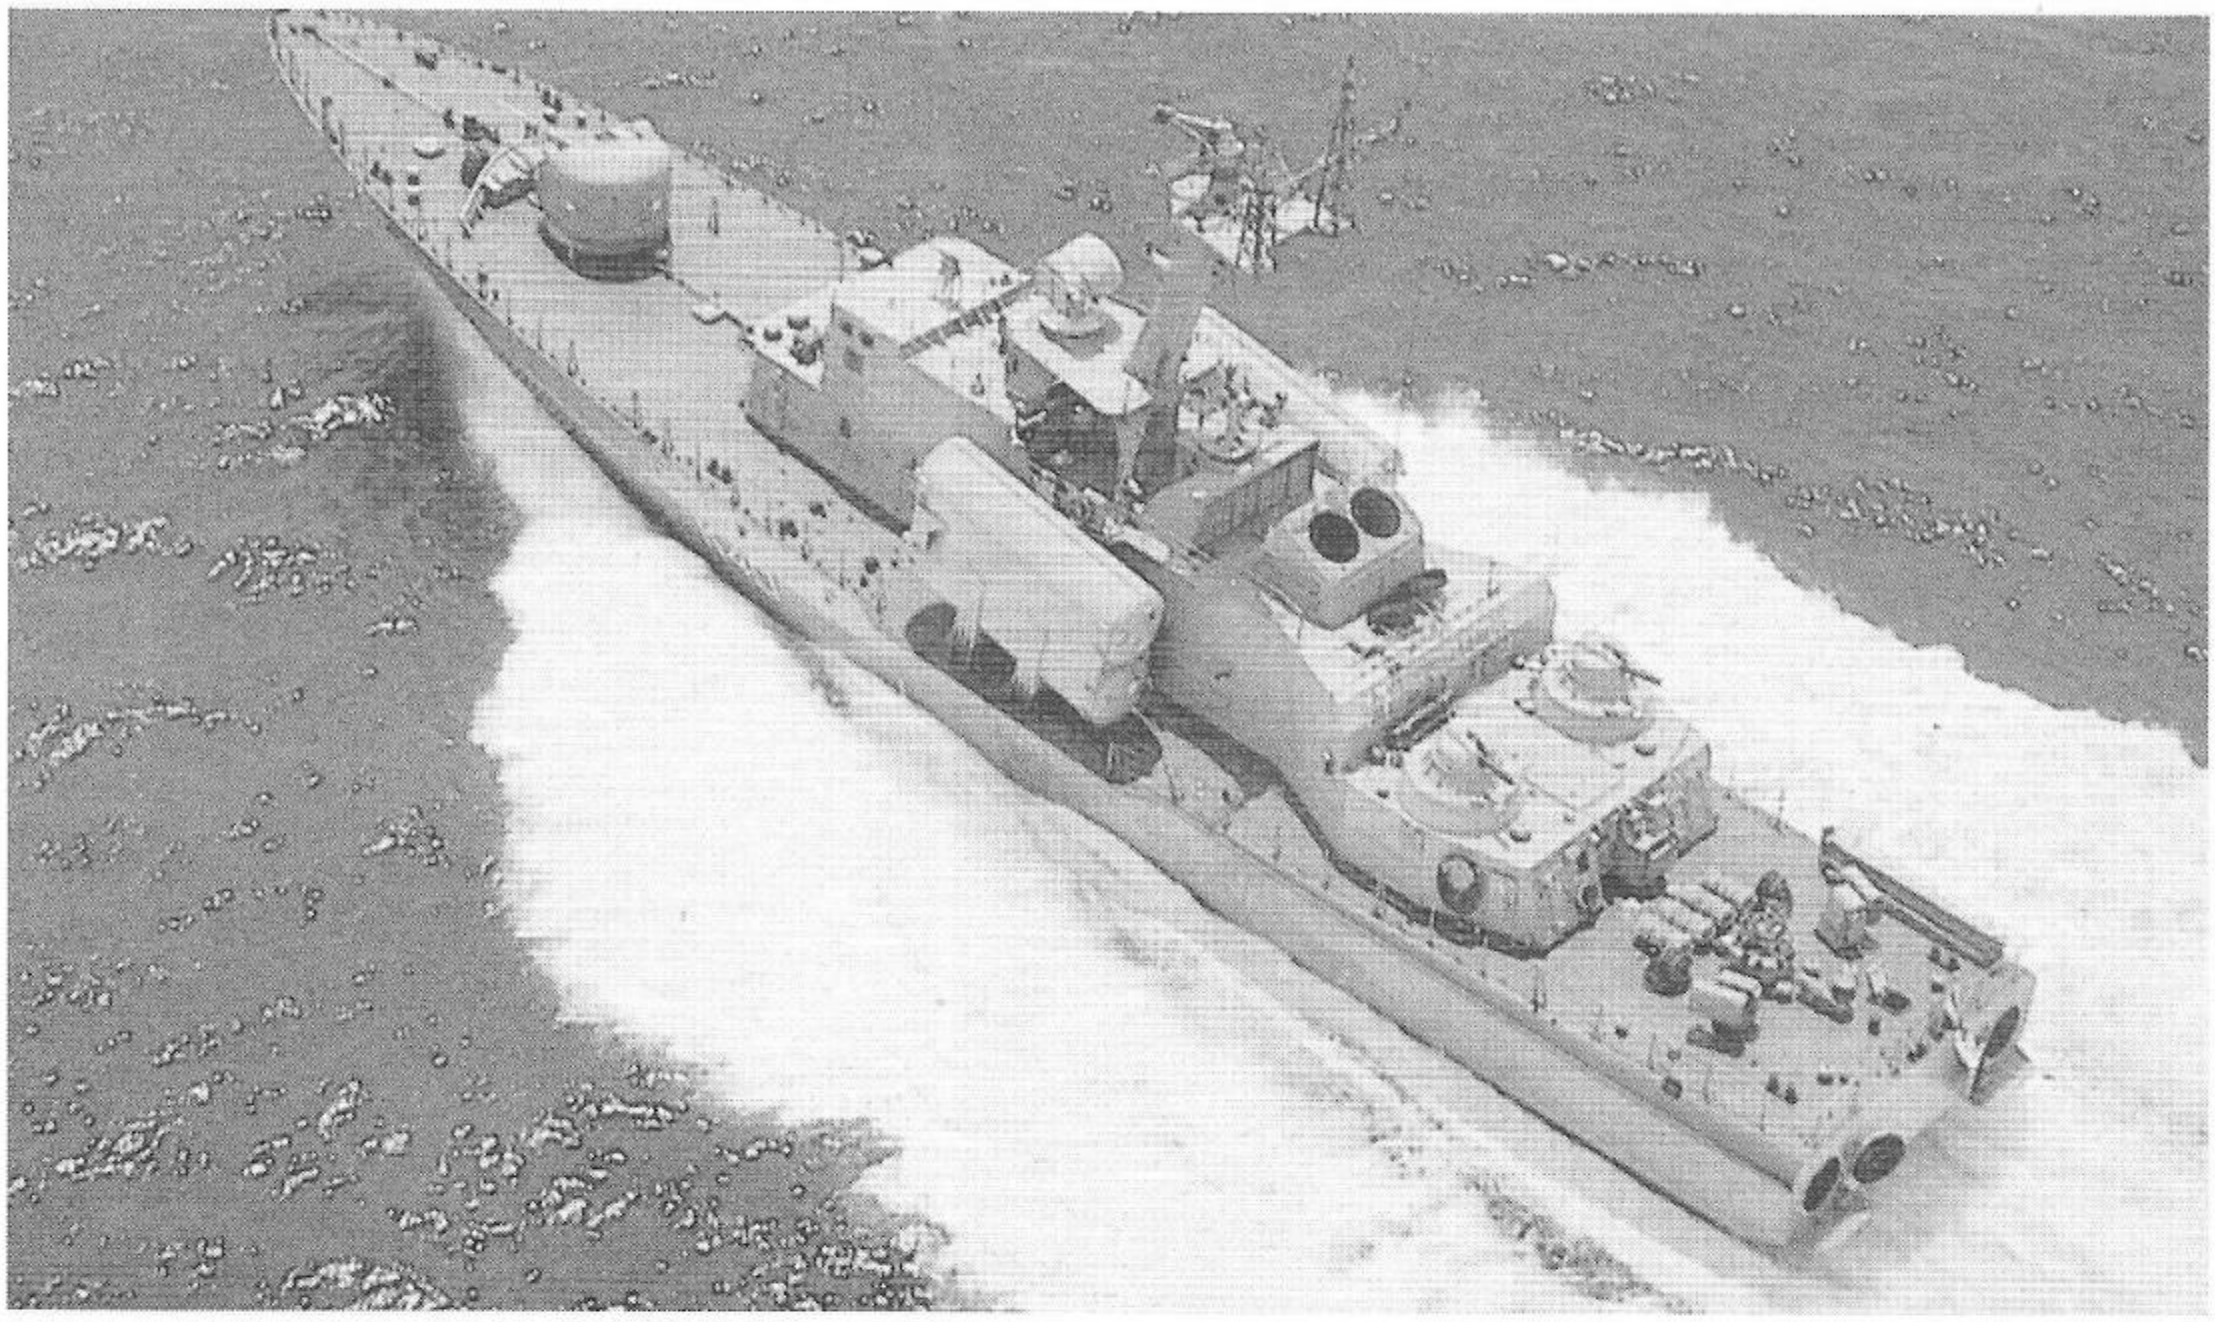
WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

P-22 Rubezh (SS-N-2c 'Styx') medium-range anti-ship missile

The 'Tarantul' class is armed with four SS-N-2c 'Styx' missiles with two vertical pairs of missile launch tubes in the waist, either side of the superstructure. There are no reloads. This relatively large anti-ship missile is powered by a liquid-fuelled rocket motor, with a solid fuel booster attached. Once the target is detected the ship must close, with the aim of being within the optimum engagement distance, some 15 to 20 n miles (28 to 37 km). Once ready to launch, the ship must face the target, maintain a speed of 15 kts or less and hold its course for 20 to 30 seconds before launching the first salvo of two missiles. These may be followed, a minute later, by the second pair. Upon launch the missile climbs at an angle of 45° to one of five preset altitudes (100, 150, 200, 250 or 350 m) (328, 492, 656, 820 or 1,148 ft), where the onboard radar searches for a target and the receiver is switched on for very short periods to receive signals from a designated range, the range gate being 0.54 n miles (1 km) on either side of the target.



Veer (K 40), lead-ship of the Indian Navy's class of Tarantul I (Type 1241RE) missile corvettes. The layout of the weapons is clearly shown: 76 mm gun forward; SS-N-2c anti-ship missile launchers in the waist and two AK-630 CIWS aft. Note also the two PK-16 decoy launchers on the quarterdeck and the open jet exhaust covers (Almaz)

The radar locks only after eight returns have been received, at distances of 3.5 to 12 n miles (6.5 to 22 km), whereupon the seeker guidance system switches off the autopilot. A throw-off gyroscope takes the missile on target a few seconds before impact as it becomes too close for radar-generated homing signals. Russian Navy tacticians calculate that seven to eight missiles are required to destroy a cruiser-size target and four for a destroyer, making salvo firing a major feature of any tactical engagement scenario with SS-N-2 missiles to ensure destruction of the target.

Specifications
(SS-N-2c)
Length: 6.55 m (21.5 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.87 ft)
Speed: Mach 0.9
Weight (without booster): 2,600 kg (5,732 lb)
Warhead: 454 kg (1,000 lb) hollow-charge
Fuzes: Impact, proximity
Range: 3-54 n miles (5.5-100 km)
Guidance: Autopilot with active radar (supplemented in some with IR)

MS-2 seeker
Frequency: I-band (8-12 GHz) (four presets)
PRF: 300-500 pps (adjustable)
Altitude control: Barometric pressure device

Manufacturer/Contractor
Raduga, Moscow, Russia.

SURFACE-TO-AIR MISSILES (SAM)

SA-N-5 'GRAIL' (Strela-2M)
There is one, four-missile launcher for the SA-N-5 short-range SAM system. SA-N-5 is the NATO designation for the Russian Strela-2M (Strela = arrow), which is the naval version of the very widely used Strela-2 (NATO = SA-7 Grail) land-based, shoulder-launched short-range missile system. In the naval version, four missiles are mounted on a metal framework, with the operator standing inside the framework, leaning back into a lumbar pad, with the missiles at shoulder level, as in the land-based system.

When the target is acquired, the operator selects a missile and then activates the thermal battery. When the seeker acquires the target the operator receives an audio signal and partially pulls the trigger to activate the missile gyros, which take some four to six seconds to warm up. The operator uses stadia reference marks in the optical sight to compute the lead angle to the target then fully engages the trigger to launch the missile. The booster burns for 0.05 seconds, ejecting the missile from the launch tube at a speed of 28 m/s (92 ft/s) and spinning it up. Then, at a distance of 6 m (20 ft), the sustainer ignites and the trailing fins pop out.

The missile has four small fins of cruciform configuration and two pop-out trailing fins behind the exhaust. The missile homes on the 'hottest' part of the aircraft and probably has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead. In Strela 2M (SA-7B 'Grail' Mod 1) the seeker has a filter for improved performance and the warhead has better fragmentation uniformity.

Specifications
(Strela 2)
Length: 1.45 m (4.76 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (21.98 lb)
Speed: Mach 1.7
Range: 18-4,500 m (60-15,000 ft)
Guidance: IR homing

Manufacturer/Contractor
Fakel, Russia.

GUNS

AK-176M 76 mm (3 in)/60
There is one single 76 mm (3 in) gun on the foredeck which is intended for air defence, surface engagement and shore bombardment roles. The AK-176M is a four-man mounting which may be operated from the weapon control centre or from a local control station. The AK-176M is part of a weapon control system based upon the H-band fire-control radar with the NATO designation 'Bass Tilt'. This radar is also associated with the AK-630 and the two may form an integrated weapon system. The radar director is mounted on a pedestal and has an antenna with drum-shaped radome inclined at an angle of approximately 45°. Local control is achieved semi-automatically using the *Kondensor* sight which is installed as a backup in the event of the failure of 'Bass Tilt'. It is a day/night sight which may be used to engage both surface and air targets. In the event of a power failure the WD-221 optical sight can be used.

Specifications
Calibre: 76 mm
Length of barrel: 59 calibres
Traverse: 360° at 35°/s
Elevation: −3 to +85° at 30°/s
Range:
anti-surface: 3.75 n miles (7 km)
anti-air: 10,000 m (32,800 ft)
Ammunition weight (total): 16 kg (35.3 lb)
Ammunition carried: 252 rounds (ready use); 150 rounds (magazine)
Rate of fire: 120-130 rds/min

30 mm/65 AK-630 close in weapons system
There are two 30 mm Gatling-type AK-630s mounted side by side on the roof of the after deckhouse. These have five roles, engaging anti-ship missiles, aircraft, small surface vessels, drifting mines and unprotected targets ashore. The AO-18 weapon is a water-cooled, six-barrelled, Gatling-principle weapon with fixed breech block and revolving barrels. The weapon is believed to operate in a similar manner to that of the Phalanx, firing bursts of up to 400 rounds, but unlike the US weapon AK-630 features a separate radar director, Bass Tilt.

Specifications
Calibre: 30 mm
Length of barrel: 65 calibres
Number of barrels: 6
Muzzle velocity: 890 m/s (2,919 ft/s)
Cooling: Water
Traverse: 360° at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range:
radar fire control: 4,000 m (13,000 ft)
electro-optic fire control: 5,000 m (16,400 ft)
Rate of fire: 4,000-5,000 rds/min
Magazine: 2,000 rounds
Weight of complete round: 1.224 kg (2.7 lb)
Ammunition types:
Weight:
UOF-84 HE-I: 384 g (13.5 oz)
UOR-84 HE-T: 388 g (13.68 oz)
Fuze: MG-32 point impact (both rounds)

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Bass Tilt fire-control radar

Bass Tilt is an H/I-band fire-control radar which entered service in the mid-1970s and is part of the fire-control system for the AK-630 CIWS. The weapon system and director are mounted on a pedestal, with the drum-shaped antenna radome, 1.2 m (4 ft) in diameter, inclined at an angle of approximately 45°. The director is 2 m high (6.56 ft) and 1.45 m (4.7 ft) long. The radar is probably linked to a ballistic computer and each director controls one or two gun mountings.

Hood Wink

One Hood Wink electro-optic director is fitted in the bridge roof.

RADARS

Plank Shave

Plank Shave (Russian name — Harpun) is mounted atop a small tower on the bridge roof. This is an I-band set used for surface search and targeting and is frequently found in ships armed with SS-N-2 missiles.

Bass Tilt

Bass Tilt is an H/I-band fire-control radar (see 'Weapons Control').

Pechora

Pechora is an I-band navigation radar.

IFF

Salt Pot, Square Head A.

PROPULSION

Veer (K 40) to Nirghat (K 44)

Specifications

System: Combined gas turbine or gas turbine (COGOG)

Main machinery: 2 Nikolayev Type DR 77 gas turbines, 11.77 MW (16,016 hp); 2 Nikolayev Type DR 76 gas turbines with reversible gearboxes, 3.67 MW (4,993 hp).

Shafts: 2

Vibhuti (K 45) onwards

Specifications

System: Combined diesel or gas turbine (CODOG)

Main machinery: 1 General Electric LM 2500 gas turbine; 17.38 MW (23,300 hp); 2 MTU 12V 538 TB92 diesels, 3.76 MW (5,110 hp)

Shafts: 2

FURTHER INFORMATION

PROGRAMME

The 'Veer (Tarantul)' class is intended to replace the Russian-supplied 'Osa' class missile boats in the Indian Navy. The first five of these ships are standard Russian 'Tarantul I' class built for export, while the remainder are being built in India. At one time it was anticipated that 30 (possibly more) would be built at no less than three shipyards — indicating a high degree of satisfaction with the type — but supply problems in Russia have led to a substantial downsizing of the order.

DESIGN

Like other export versions of the 'Tarantul' class, the Indian Tarantul Is do not have the Band Stand radar and Light Bulb datalink. Instead, Plank Shave is used for both surface search and targeting.

The later Indian-built ships are known to have CODOG propulsion, using a combination of a US (General Electric) gas turbine and two German (MTU) diesels. It is, however, possible that the earlier Indian-built ships may be powered by the same COGOG arrangement using Russian-supplied gas turbines, as the Russian-built ships.

There have been reports that the SS-N-2 missiles may be replaced by SS-N-25 in the last pair being built in India.

OPERATIONAL

All the Indian-built Tarantuls currently form the 22nd Squadron.

SURFACE-TO-AIR MISSILES (SAM)

SA-N-5 'GRAIL' (Strela-2M)

There are two, four-missile launchers for the SA-N-5 short-range SAM system. SA-N-5 is the NATO designation for the Russian Strela-2M (Strela = arrow), which is the naval version of the very widely used Strela-2 (NATO = SA-7 Grail) land-based, shoulder-launched short-range missile system. In the naval version, four missiles are mounted on a metal framework, with the operator standing inside the framework, leaning back into a lumbar pad, with the missiles at shoulder level, as in the land-based system.

When the target is acquired, the operator selects a missile and then activates the thermal battery. When the seeker acquires the target the operator receives an audio signal and partially pulls the trigger to activate the missile gyros, which take some four to six seconds to warm up. The operator uses stadia reference marks in the optical sight to compute the lead angle to the target then fully engages the trigger to launch the missile. The booster burns for 0.05 seconds, ejecting the missile from the launch tube at a speed of 28 m/s (92 ft/s) and spinning it up. Then, at a distance of 6 m (20 ft), the sustainer ignites and the trailing fins pop out.

The missile has four small fins of cruciform configuration and two pop-out trailing fins behind the exhaust. The missile homes on the 'hottest' part of the aircraft and probably has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead. In Strela 2M (SA-7B 'Grail' Mod 1) the seeker has a filter for improved performance and the warhead has better fragmentation uniformity.

Specifications

(Strela 2)

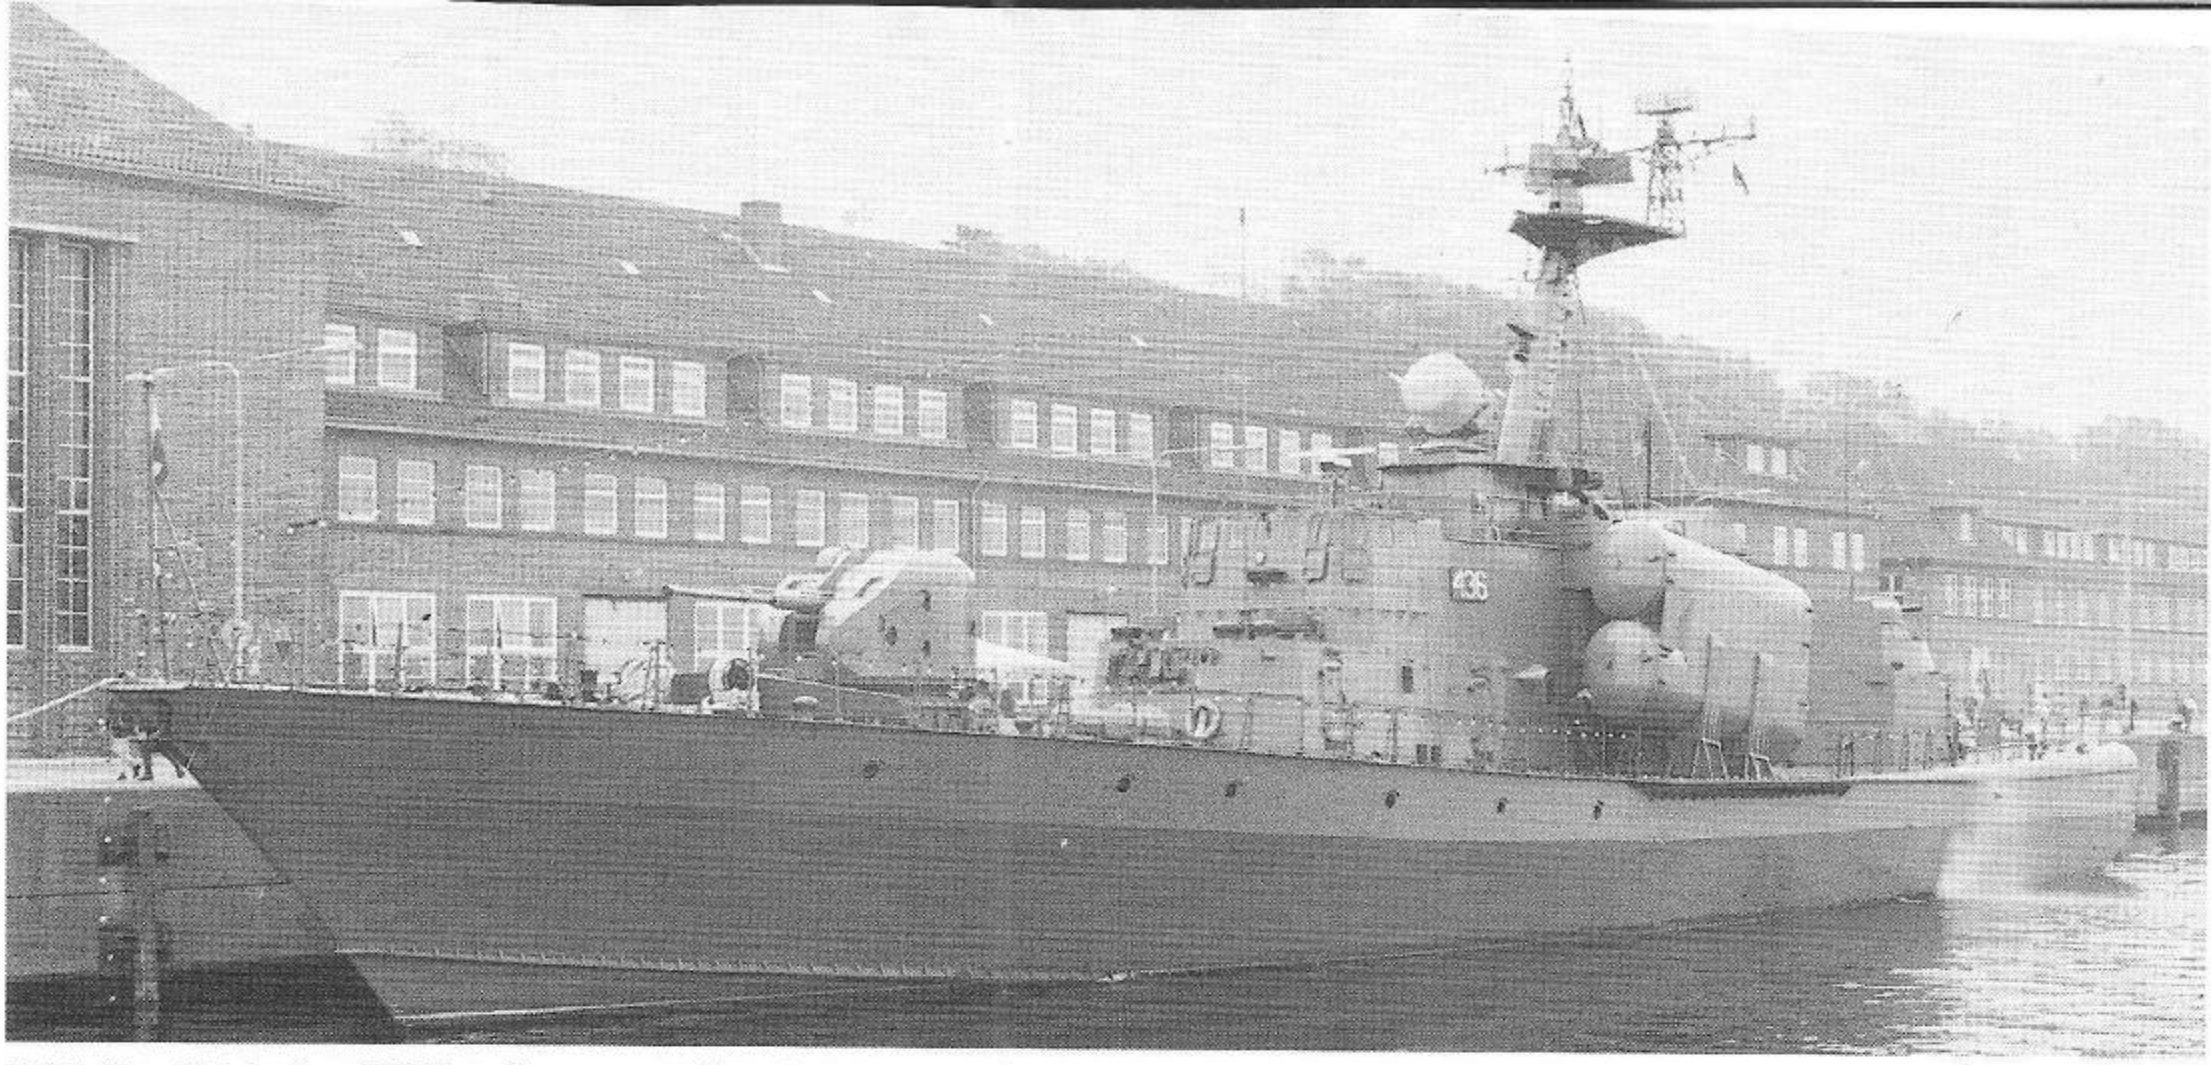
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (21.98 lb)



Polish Navy Metalowiecz *(436) in a German port. Note the twin launcher for SS-N-2c, 76 mm gun forward and Bass Tilt above the bridge* (Jane's/H M Steele)

Speed: Mach 1.7
Range: 18-4,500 m (60-15,000 ft)
Guidance: IR homing

Manufacturer/Contractor
Fakel, Russia.

GUNS

AK-176M 76 mm (3 in)/60

There is one single 76 mm (3 in) gun on the foredeck which is intended for air defence, surface engagement and shore bombardment roles. The AK-176M is a four-man mounting which may be operated from the weapon control centre or from a local control station. The AK-176M is part of a weapon control system based upon the H-band fire-control radar with the NATO designation 'Bass Tilt'. This radar is also associated with the AK-630 and the two may form an integrated weapon system. The radar director is mounted on a pedestal and has an antenna with drum-shaped radome inclined at an angle of approximately 45°. Local control is achieved semi-automatically using the *Kondensor* sight which is installed as a backup in the event of the failure of 'Bass Tilt'. It is a day/night sight which may be used to engage both surface and air targets. In the event of a power failure the crew may use the WD-221 optical sight.

Specifications
Calibre: 76 mm
Length of barrel: 59 calibres
Muzzle velocity: n/k
Traverse: 360° at 35°/s
Elevation: −3 to +85° at 30°/s
Range:
  anti-surface: 3.75 n miles (7 km)
  anti-air: 10,000 m (32,800 ft)
Ammunition weight (total): 16 kg (35.3 lb)
Ammunition carried: 252 rounds (ready use); 150 rounds (magazine)
Rate of fire: 120-130 rds/min

30 mm/65 AK-630 close in weapons system

There are two 30 mm Gatling-type AK-630s mounted side by side on the roof of the after deckhouse. These have five roles, engaging anti-ship missiles, aircraft, small surface vessels, drifting mines and unprotected targets ashore. The AO-18 weapon is a water-cooled, six-barrelled, Gatling-principle weapon with fixed breech block and revolving barrels. The weapon is believed to operate in a similar manner to that of the Phalanx, firing bursts of up to 400 rounds, but unlike the US weapon AK-630 features a separate radar director, Bass Tilt.

Specifications
Calibre: 30 mm
Length of barrel: 65 calibres
Number of barrels: 6
Muzzle velocity: 890 m/s (2,919 ft/s)
Cooling: Water

Metalowiecz *(436). On the afterdeck are two AK-630 30 mm Gatling-type CIWS and two PK-16 decoy launchers. The solid rectangular antenna on the mast platform is Plank Shave (Russian = Harpun-E) and the rectangular lattice antenna at the masthead is Square Head IFF.* (Jane's/H M Steele)

ELECTRONIC WARFARE SYSTEMS

DECOYS

PK-16

There are two 16-barrel chaff/decoy launchers, located on the quarterdeck.

COMMAND AND CONTROL SYSTEMS

RADARS

Plank Shave (Harpun-E)

Plank Shave (Russian name — Harpun-E) is mounted atop a small tower on the bridge roof. This is an I-band set used for surface search and targeting, and is frequently found in ships armed with SS-N-2 missiles.

Navigation radars

Gornik (435) and *Hutnik* only. Kivacz-2
Metalowicz (436) and *Rolnik* (437) only. Peczora-1
These are both I-band navigation radars, produced in Poland. No further details are known.

Bass Tilt (MR-123)

The Bass Tilt (MR-123) weapon control system includes the Bass Tilt H/I-band radar.

IFF

PROPULSION

Specifications

System: Combined gas turbine or gas turbine (COGOG)

Main machinery: 2 Type PR 77 gas turbines; 17.652 MW (24,000 hp); 2 DM 76 gas turbines, 5.884 MW (8,000 hp) with reversible gearbox

Shafts: 2

Ship's services: 2 DGR-2A-200/1500 diesel generators, 400 kW; 1 DGF2A-100/1500 diesel generator, 100 kW

FURTHER INFORMATION

PROGRAMME

These ships were transferred from Russia: 1983-1; 1984-1; 1988-1; 1989-1. Plans to take two more from the former GDR stock have been cancelled.

DESIGN

These are similar to other versions of the Tarantul I exported to India (first five), Romania and Yemen.
It should be noted that these ships have no ASW capability, having neither sonar nor ASW weapons.

OPERATIONAL

Based at Gdynia.

Gornik *(434)* (H & L van Ginderen Collection)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

P-22 Rubezh (SS-N-2c 'Styx') medium-range anti-ship missile

There are two twin launchers for SS-N-2c 'Styx', which is designated KT-138E (P-21/P-22) in Polish service. These launchers are in two vertical pairs of missile launch tubes in the waist, either side of the superstructure. There are no reloads. This relatively large anti-ship missile is powered by a liquid-fuelled rocket motor, with a solid fuel booster attached. Once the target is detected the ship must close, with the aim of being within the optimum engagement distance, some 15 to 20 n miles (28 to 37 km). Once ready to launch, the ship must face the target, maintain a speed of 15 kts or less and hold its course for 20 to 30 seconds before launching the first salvo of two missiles. These may be followed, a minute later, by the second pair. Upon launch the missile climbs at an angle of 45° to one of five preset altitudes (100, 150, 200, 250 or 350 m) (328, 492, 656, 820 or 1,148 ft), where the onboard radar searches for a target and the receiver is switched on for very short periods to receive signals from a designated range, the range gate being 0.54 n miles (1 km) on either side of the target. The radar locks only after eight returns have been received, at distances of 3.5 to 12 n miles (6.5 to 22 km), whereupon the seeker guidance system switches off the autopilot. A throw-off gyroscope takes the missile on target a few seconds before impact as it becomes too close for radar-generated homing signals. Russian Navy tacticians calculate that seven to eight missiles are required to destroy a cruiser-size target and four for a destroyer, making salvo firing a major feature of any tactical engagement scenario with SS-N-2 missiles to ensure destruction of the target.

Specifications
(SS-N-2c)
Length: 6.55 m (21.5 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.87 ft)
Speed: Mach 0.9
Weight (without booster): 2,600 kg (5,732 lb)
Warhead: 454 kg (1,000 lb) hollow-charge
Fuzes: Impact, proximity
Range: 3-54 n miles (5.5-100 km)
Guidance: Autopilot with active radar (supplemented in some with IR)

MS-2 seeker
Frequency: I-band (8-12 GHz) (four presets)
PRF: 300-500 pps (adjustable)
Altitude control: Barometric pressure device

Manufacturer/Contractor
Raduga, Moscow, Russia.

SURFACE-TO-AIR MISSILES (SAM)

SA-N-5 'GRAIL' (Strela-2M)

There are two, four-missile launchers for the SA-N-5 short-range SAM system. SA-N-5 is the NATO designation for the Russian Strela-2M (Strela = arrow), which is the naval version of the very widely used Strela-2 (NATO = SA-7 Grail) land-based, shoulder-launched short-range missile system. In the naval version, four missiles are mounted on a metal framework, with the operator standing inside the framework, leaning back into a lumbar pad, with the missiles at shoulder level, as in the land-based system.

When the target is acquired, the operator selects a missile and then activates the thermal battery. When the seeker acquires the target the operator receives an audio signal and partially pulls the trigger to activate the missile gyros, which take some four to six seconds to warm up. The operator uses stadia reference marks in the optical sight to compute the lead angle to the target then fully engages the trigger to launch the missile. The booster burns for 0.05 seconds, ejecting the missile from the launch tube at a speed of 28 m/s (92 ft/s) and spinning it up. Then, at a distance of 6 m (20 ft), the sustainer ignites and the trailing fins pop out.

The missile has four small fins of cruciform configuration and two pop-out trailing fins behind the exhaust. The missile homes on the 'hottest' part of the aircraft and probably has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead. In Strela 2M (SA-7B 'Grail' Mod 1) the seeker has a filter for improved performance and the warhead has better fragmentation uniformity.

Specifications
(Strela 2)
Length: 1.45 m (4.76 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (21.98 lb)
Speed: Mach 1.7
Range: 2.6 n miles (4.8 km)
Altitude: 18 - 4,500 m (60 - 15,000 ft)
Guidance: IR homing

Manufacturer/Contractor
Fakel, Russia.

GUNS

AK-176M 76 mm (3 in)/60

There is one single 76 mm (3 in) gun on the foredeck which is intended for air defence, surface engagement and shore bombardment roles. The AK-176M is a four-man mounting which may be operated from the weapon control centre or from a local control station. The AK-176M is part of a weapon control system based upon the H-band fire-control radar with the NATO designation 'Bass Tilt'. This radar is also associated with the AK-630 and the two may form an integrated weapon system. The radar director is mounted on a pedestal and has an antenna with drum-shaped radome inclined at an angle of approximately 45°. Local control is achieved semi-automatically using the *Kondensor* sight which is installed as a backup in the event of the failure of 'Bass Tilt'. It is a day/night sight which may be used to engage both surface and air targets. In the event of a power failure the crew may use the WD-221 optical sight.

Romanian Tarantul I (Stefan Terzibaschitsch)

Specifications

Calibre: 76 mm
Length of barrel: 59 calibres
Muzzle velocity: n/k
Traverse: 360° at 35°/s
Elevation: −3 to +85° at 30°/s
Range:
  anti-surface: 3.75 n miles (7 km)
  anti-air: 10,000 m (32,800 ft)
Ammunition weight (total): 16 kg (35.3 lb)
Ammunition carried: 252 rounds (ready use); 150 rounds (magazine)
Rate of fire: 120-130 rds/min

30 mm/65 AK-630 close in weapons system

There are two 30 mm Gatling-type AK-630s mounted side by side on the roof of the after deckhouse. These have five roles, engaging anti-ship missiles, aircraft, small surface vessels, drifting mines and unprotected targets ashore. The AO-18 weapon is a water-cooled, six-barrelled, Gatling-principle weapon with fixed breech block and revolving barrels. The weapon is believed to operate in a similar manner to that of the Phalanx, firing bursts of up to 400 rounds, but unlike the US weapon AK-630 features a separate radar director, Bass Tilt.

Specifications

Calibre: 30 mm
Length of barrel: 65 calibres
Number of barrels: 6
Muzzle velocity: 890 m/s (2,919 ft/s)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Bell Nest

There are two Bell nest radomes. The Bell series is normally associated with an ESM function.

Wine Glass, Half Hat

There are two Wine Glass (formerly known as Football) and two Half Hat radomes in most Tarantul IIs. These have an ESM/ECM function and may be part, with Bell Nest, of an integrated EW suite.

DECOYS

PK-16

There are two Russian PK-16 chaff launchers, which are mounted on the main deck, on either side of the superstructure.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Hood Wink

There is one Hood Wink electro-optic director.

Band Stand

Band Stand is a D/E/F-band radar which is part of the fire-control system for the SS-N-2 missile system, although there may be some connection with the ship's overall air surveillance, as well. The Light Bulb datalink appears to be part of the same system, providing the links between the ship and the missile.

Light Bulb

Light Bulb is the datalink between the ship and the missile and is one of the items which does not appear in export ships.

Bass Tilt fire-control radar

Bass Tilt is an H/I-band fire-control radar which entered service in the mid-1970s and is part of the fire-control system for the AK-630 CIWS. The weapon system and director are mounted on a pedestal, with the drum-shaped antenna radome, 1.2 m (4 ft) in diameter, inclined at an angle of approximately 45°. The director is 2 m (6.56 ft) high and 1.45 m (4.7 ft) long. The radar is probably linked to a ballistic computer and each director controls one or two gun mountings.

RADARS

Plank Shave

Plank Shave is mounted on a small platform at the head of the foremast. This is an I-band set used for surface search and targeting and is frequently found in ships armed with SS-N-2 missiles.

Kivach III

Kivach III is an I-band navigation radar.

Bass Tilt

Bass Tilt is an H/I-band fire-control radar (see Weapons Control).

Shafts: 2

FURTHER INFORMATION

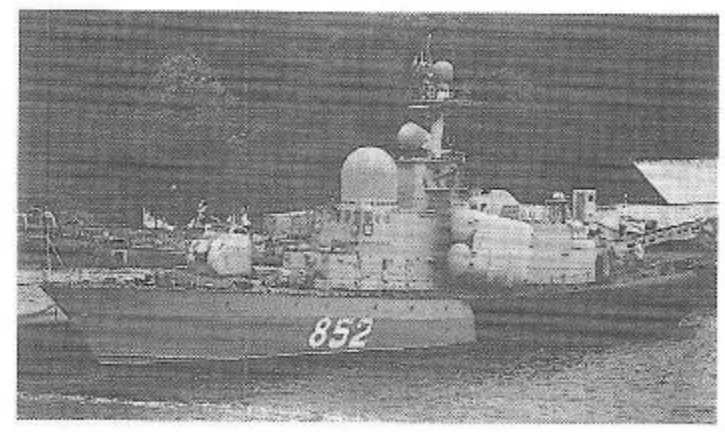
PROGRAMME

Tarantul II was the first production version for the Soviet Navy. It is armed with a new version of SS-N-2 with various guidance features not releasable to foreign navies. One Tarantul II has been sold to Bulgaria and one has been converted as the prototype Tarantul IV.

DEPLOYMENT

The Russian Navy has one Tarantul II in the Caspian Sea and the remainder are split between the Pacific and Black Sea Fleets. Many are not fully operational.

The Bulgarian Tarantul II is based at Sozopol.



A Tarantul II *of the Russian Navy* (Hartmut Ehlers)

Complement: 34 (5 officers)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

SS-N-22 Sunburn Mod 2 3M80 (P270 Moskit)

There are two twin launchers for SS-N-22 'Sunburn' missiles in vertical pairs mounted in the waist. This missile (also known as 3M80 and P-270 Moskit) is ram-jet-powered and has four clipped delta planform wings and four smaller tail surfaces of similar shape in cruciform configuration around the fuselage. All the wings and tail surfaces are folded when the missile is in the launcher. It is also found in the 'Sovremenny' class destroyers.

The system is associated with the 'Band Stand' D/F-band (1-4 GHz) air and surface search radar with a fairly high data rate. This sensor is known to have a secondary tracking function for anti-ship missiles and is part of both the 'Siren' and 'Sunburn' fire-control systems. It is believed the fire-control system can also receive data from the Big Bulge I/J-band radars of the Ka-25 'Hormone B' and Ka-27 'Helix B' although the 'Tarantul' class has no helicopter facilities.

Data on the location of both launcher and target are fed into the missile from the fire-control system, the doors at the front and at the rear of the launcher cell are opened and the booster ignites. The missile may be launched to engage targets in a 120° arc based upon the ship's course. Once the missile clears the launcher the wings and tail surfaces deploy and the missile briefly rises then drops to a cruising altitude of 20 m (65.6 ft), reducing to 7 m (23 ft) on the final run into the target. The active radar seeker then searches for the target and homes upon it when 'lock on' is achieved. In the event of jamming the seeker has a home-on-jam capability. The missile has a high kinetic energy, with a mass of 3,950 kg (8,708 lb) and a speed of Mach 2, which, according to the makers, enable it 'to literally tear apart it's targets'.

The missile takes only 2 minutes to cover its full range and manufacturers state that 1 to 2 missiles could incapacitate a destroyer while 1 to 5 missiles could sink a 20,000 tonne merchantman. An extended range missile, 3M80E is also available.

Specifications
Length: 9.38 m (30.77 ft)
Diameter: 130 cm (51.2 in)
Wing span: n/k
Weight: 3,950 kg (8,708 lb)
Speed: Mach 2
Range: 48 n miles (90 km) (65 n miles (120 km) in 3M80E)
Guidance: Inertial

SURFACE-TO-AIR MISSILES (SAM)

SA-N-5 'Grail' (Strela-2M)

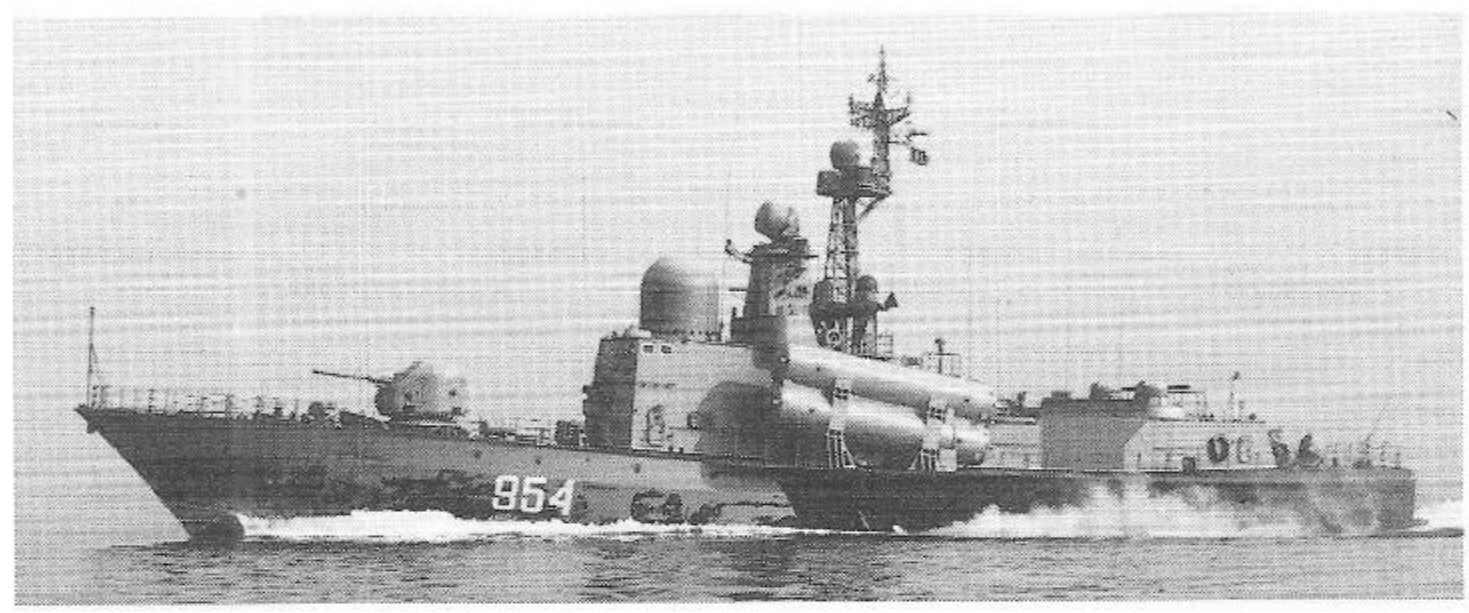
There is one, four-missile launcher for the SA-N-5 short-range SAM system. SA-N-5 is the NATO designation for the Russian Strela-2M (Strela = arrow), which is the naval version of the very widely used Strela-2 (NATO = SA-7 Grail) land-based, shoulder-launched short-range missile system. In the naval version, four missiles are mounted on a metal framework, with the operator standing inside the framework, leaning back into a lumbar pad, with the missiles at shoulder level, as in the land-based system.

When the target is acquired, the operator selects a missile and then activates the thermal battery. When the seeker acquires the target the operator receives an audio signal and partially pulls the trigger to activate the missile gyros, which take some four to six seconds to warm up. The operator uses stadia reference marks in the optical sight to compute the lead angle to the target then fully engages the trigger to launch the missile. The booster burns for 0.05 seconds, ejecting the missile from the launch tube at a speed of 28 m/s (92 ft/s) and spinning it up. Then, at a distance of 6 m (20 ft), the sustainer ignites and the trailing fins pop out.

The missile has four small fins of cruciform configuration and two pop-out trailing fins behind the exhaust. The missile homes on the 'hottest' part of the target and probably has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead. In Strela 2M (SA-7B 'Grail' Mod 1) the seeker has a filter for improved performance and the warhead has better fragmentation uniformity.

Specifications
(Strela 2)
Length: 1.45 m (4.76 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (21.98 lb)
Speed: Mach 1.7
Range: 18-4,500 m (60-15,000 ft)
Guidance: IR homing

Manufacturer/Contractor
Fakel, Russia.



A Russian Navy Tarantul III. *The large containers house SS-N-22 anti-ship missiles. The radome on the bridge roof is Band Stand and above it, on its own tower, is Bass Tilt which is part of the system controlling the 76 mm gun and the 30 mm CIWS. On the masthead platform is Light Bulb, the datalink for the SS-N-22 missiles, which is flanked by two Bell Net ESM arrays. Mid-way on the mast are two Wine Glass jammers* (H & L van Ginderen Collection)

GUNS

AK-176M 76 mm (3 in)/60

There is one single 76 mm (3 in) gun on the foredeck which is intended for air defence, surface engagement and shore bombardment roles. The AK-176M is a four-man mounting which may be operated from the weapon control centre or from a local control station. The AK-176M is part of a weapon control system based upon the H-band fire-control radar with the NATO designation 'Bass Tilt'. This radar is also associated with the AK-630 and the two form an integrated weapon system. The radar director is mounted on a pedestal and has an antenna with drum-shaped radome inclined at an angle of approximately 45°. Local control is achieved semi-automatically using the *Kondensor* sight which is installed as a backup in the event of the failure of 'Bass Tilt'. It is a day/night sight which may be used to engage both surface and air targets. In the event of a power failure the crew may use the WD-221 optical sight.

Specifications
Calibre: 76 mm
Length of barrel: 59 calibres
Muzzle velocity: n/k
Traverse: 360° at 35°/s
Elevation: −3 to +85° at 30°/s
Ammunition (total): 16 kg (35.3 lb)
Rate of fire: 120-130 rds/min
Range:
anti-surface: 3.75 n miles (7 km)
anti-air: 10,000 m (32,800 ft)

30 mm/65 AK-630 close in weapons system

There are two 30 mm Gatling-type AK-630s mounted side by side on the roof of the after deckhouse. These have five roles, engaging anti-ship missiles, aircraft, small surface vessels, drifting mines and unprotected targets ashore. The AO-18 weapon is a water-cooled, six-barrelled, Gatling-principle weapon with fixed breech block and revolving barrels. The weapon is believed to operate in a similar manner to that of the Phalanx, firing bursts of up to 400 rounds, but unlike the US weapon AK-630 features a separate radar director, Bass Tilt.

Specifications
Calibre: 30 mm
Length of barrel: 65 calibres

Number of barrels: 6
Muzzle velocity: 890 m/s (2,919 ft/s)
Cooling: Water
Traverse: 360° at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)

Range:
radar fire control: 4,000 m (13,000 ft)
electro-optic fire control: 5,000 m (16,400 ft)
Rate of fire: 4,000-5,000 rds/min
Magazine: 2,000 rounds
Weight of complete round: 1.224 kg (2.7 lb)

Ammunition types:
Weight:
UOF-84 HE-I: 384 g (13.5 oz)
UOR-84 HE-T: 388 g (13.68 oz)
Fuze: MG-32 point impact (both rounds)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Bell Nest
The Bell series of radomes is normally associated with an ESM function.

Wine Glass, Half Hat
There are two Wine Glass (formerly known as Football) and two Half Hat radomes in most Tarantul IIIs. They have an ESM/ECM function and may be part, with Bell Nest, of an integrated EW suite.

DECOYS

PK-10
There are four PK-10 chaff/decoy launchers. PK-10 is a Russian naval decoy system about which details were first revealed in 1993. The system consists of KT-216 launchers, a control console and three munitions. The launcher is a 10-barrel unit, with the 120 mm barrels fixed at about 45° on a traversing stand. The control console is a relatively simple design with simple controls capable of controlling up to four launchers. The munitions are all for seduction purposes. The SR-50 is a chaff round with a payload of 11 kg (24.25 lb). The SOM-50 is a heat seeker/laser-guided missile seduction round with 7.3 kg (16.1 lb) payload while the SK.50 is a combined round with a 9.1 kg (20 lb) payload.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Hood Wink
There is one Hood Wink electro-optic director.

Band Stand
Band Stand is a D/E/F-band radar which is part of the fire-control system for the SS-N-22 missile system, although there may be some connection with the ship's overall air surveillance, as well. The Light Bulb datalinks may well be part of the same system, providing the links between the ship and the missile.

Light Bulb
Light Bulb is the datalink between the ship and the missile and is one of the items which does not appear in export ships.

Vympel fire-control system
The fire-control system is designated Vympel whose prime component is the Bass Tilt H/I-band fire-control radar which entered service in the mid-1970s. The weapon system and director are mounted on a pedestal, with the drum-shaped antenna radome, 1.2 m (4 ft) in diameter, inclined at an angle of approximately 45°. The director is 2 m (6.56 ft) high and 1.45 m (4.76 ft) long.

RADARS

Plank Shave
Plank Shave is mounted atop a small tower on the bridge roof. This is an I-band set used for surface search and targeting and is frequently found in ships armed with SS-N-2 missiles.

Kivach III
Kivach III is an I-band navigation radar.

Bass Tilt
Bass Tilt is an H/I-band fire-control radar (see 'Weapons Control').

IFF
Square Head. High Pole B.

PROPULSION

Specifications
System: Combined diesel or gas turbine (CODOG)
Main machinery: 2 Nikolayev Type DR 77 gas turbines, 11.77 MW (16,016 hp(m)) sustained; two CM 504 diesels, 5.88 MW (8,000 hp(m))
Shafts: 2

FURTHER INFORMATION

PROGRAMME

The first experimental Tarantul III with four SS-N-22 was completed at Petrovsky in 1981. Since then, 26 production Tarantul IIIs have been built at St Petersburg and Khabarovsk, although the last pair are unlikely to be completed at Khabarovsk.

MODERNISATION

One Tarantul III has served as a trials platform for a modified version of SS-N-22, with a longer range. Designated 3M80E, the presence of this missile can be distinguished by different end caps on the launcher doors.

OPERATIONAL

One Tarantul III is in the Caspian Sea and the remainder are split between the Pacific and Black Sea Fleets. Some may not be fully operational.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

P-22 Rubezh (SS-N-2c 'Styx') medium-range anti-ship missile

There are two twin launchers for SS-N-2c 'Styx', which is designated KT-138E (P-21/P-22) in Polish service. These launchers are in two vertical pairs of missile launch tubes in the waist, either side of the superstructure. There are no reloads. This relatively large anti-ship missile is powered by a liquid-fuelled rocket motor, with a solid fuel booster attached. Once the target is detected the ship must close, with the aim of being within the optimum engagement distance, some 15 to 20 n miles (28 to 37 km). Once ready to launch, the ship must face the target, maintain a speed of 15 kts or less and hold its course for 20 to 30 seconds before launching the first salvo of two missiles. These may be followed, a minute later, by the second pair. Upon launch the missile climbs at an angle of 45° to one of five preset altitudes (100, 150, 200, 250 or 350 m) (328, 492, 656, 820 or 1,148 ft), where the onboard radar searches for a target and the receiver is switched on for very short periods to receive signals from a designated range, the range gate being 0.54 n miles (1 km) on either side of the target. The radar locks only after eight returns have been received, at distances of 3.5 to 12 n miles (6.5 to 22 km), whereupon the seeker guidance system switches off the autopilot. A throw-off gyroscope takes the missile on target a few seconds before impact as it becomes too close for radar-generated homing signals. Russian Navy tacticians calculate that seven to eight missiles are required to destroy a cruiser-size target and four for a destroyer, making salvo firing a major feature of any tactical engagement scenario with SS-N-2 missiles to ensure destruction of the target.

Specifications

(SS-N-2c)
Length: 6.55 m (21.5 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.87 ft)
Speed: Mach 0.9
Weight (without booster): 2,600 kg (5,732 lb)
Warhead: 454 kg (1,000 lb) hollow-charge
Fuzes: Impact, proximity
Range: 3-54 n miles (5.5-100 km)
Guidance: Autopilot with active radar (supplemented in some with IR)

MS-2 seeker
Frequency: I-band (8-12 GHz) (four presets)
PRF: 300-500 pps (adjustable)
Altitude control: Barometric pressure device

Manufacturer/Contractor

Raduga, Moscow, Russia.

SURFACE-TO-AIR MISSILES (SAM)

SA-N-5 'GRAIL' (Strela-2M)

There are two, four-missile launchers for the SA-N-5 short-range SAM system. SA-N-5 is the NATO designation for the Russian Strela-2M (Strela = arrow), which is the naval version of the very widely used Strela-2 (NATO = SA-7 Grail) land-based, shoulder-launched short-range missile system. In the naval version, four missiles are mounted on a metal framework, with the operator standing inside the framework, leaning back into a lumbar pad, with the missiles at shoulder level, as in the land-based system.

When the target is acquired, the operator selects a missile and then activates the thermal battery. When the seeker acquires the target the operator receives an audio signal and partially pulls the trigger to activate the missile gyros, which take some four to six seconds to warm up. The operator uses stadia reference marks in the optical sight to compute the lead angle to the target then fully engages the trigger to launch the missile. The booster burns for 0.05 seconds, ejecting the missile from the launch tube at a speed of 28 m/s (92 ft/s) and spinning it up. Then, at a distance of 6 m (20 ft), the sustainer ignites and the trailing fins pop out.

The missile has four small fins of cruciform configuration and two pop-out trailing fins behind the exhaust. The missile homes on the 'hottest' part of the aircraft and probably has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead. In Strela 2M (SA-7B 'Grail' Mod 1) the seeker has a filter for improved performance and the warhead has better fragmentation uniformity.

Specifications

(Strela 2)
Length: 1.45 m (4.76 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (21.98 lb)
Speed: Mach 1.7
Range: 5.5 km (2.6 n miles)
Altitude: 18 - 4,500 m (60 - 15,000 ft)
Guidance: IR homing

Manufacturer/Contractor

Fakel, Russia.

GUNS

AK-176M 76 mm (3 in)/60

There is one single 76 mm (3 in) gun on the foredeck which is intended for air defence, surface engagement and shore bombardment roles. The AK-176M is a four-man mounting which may be operated from the weapon control centre or from a local control station. The AK-176M is part of a weapon control system based upon the H-band fire-control radar with the NATO desig-

nation 'Bass Tilt'. This radar is also associated with the AK-630 and the two may form an integrated weapon system. The radar director is mounted on a pedestal and has an antenna with drum-shaped radome inclined at an angle of approximately 45°. Local control is achieved semi-automatically using the *Kondensor* sight which is installed as a backup in the event of the failure of 'Bass Tilt'. It is a day/night sight which may be used to engage both surface and air targets. In the event of a power failure the crew may use the WD-221 optical sight.

Specifications

Calibre: 76 mm
Length of barrel: 59 calibres
Muzzle velocity: n/k
Traverse: 360° at 35°/s
Elevation: −3 to +85° at 30°/s
Range anti-surface: 3.75 n miles (7 km)
anti-air: 10,000 m (3,280 m)
Ammunition weight (total): 16 kg (35.3 lb)
Ammunition carried: 252 rounds (ready use); 150 rounds (magazine)
Rate of fire: 120-130 rds/min

30 mm/65 AK-630 close in weapons system

There are two 30 mm Gatling-type AK-630s mounted side by side on the roof of the after deckhouse. These have five roles, engaging anti-ship missiles, aircraft, small surface vessels, drifting mines and unprotected targets ashore. The AO-18 weapon is a water-cooled, six-barrelled, Gatling-principle weapon with fixed breech block and revolving barrels. The weapon is believed to operate in a similar manner to that of the Phalanx, firing bursts of up to 400 rounds, but unlike the US weapon AK-630 features a separate radar director, Bass Tilt.

Specifications

Calibre: 30 mm
Length of barrel: 65 calibres
Number of barrels: 6
Muzzle velocity: 890 m/s (2,919 ft/s)
Cooling: Water
Traverse: 360° at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range:
radar fire control: 4,000 m (13,000 ft)
electro-optic fire control: 5,000 m (16,400 ft)
Rate of fire: 4,000-5,000 rds/min
Magazine: 2,000 rounds
Weight of complete round: 1.224 kg (2.7 lb)
Ammunition types:
Weight:
UOF-84 HE-I: 384 g (13.5 oz)
UOR-84 HE-T: 388 g (13.68 oz)
Fuze: MG-32 point impact (both rounds)

ELECTRONIC WARFARE SYSTEMS

DECOYS

PK-16

There are two 16-barrelled PK-16 chaff/decoy launchers.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Hood Wink

One Hood Wink electro-optic director is fitted in the bridge roof.

Bass Tilt fire control

Bass Tilt is an H/I-band fire-control system which entered service in the mid-1970s and is part of the fire-control system for the AK-630 CIWS. The weapon system and director are mounted on a pedestal, with the drum-shaped antenna radome, 1.2 m (4 ft) in diameter, inclined at an angle of approximately 45°. The director is 2 m (6.56 ft) high and 1.45 m (4.7 ft) long. The radar is probably linked to a ballistic computer and each director controls one or two gun mountings.

RADARS

Plank Shave (Harpun-E)

Plank Shave (Russian name — Harpun-E) is mounted atop a small tower on the bridge roof. This is an I-band set used for surface search and targeting and is frequently found in ships armed with SS-N-2 missiles.

Bass Tilt (MR-123)

The Bass Tilt (MR-123) weapon control system includes the Bass Tilt H/I-band radar.

Spin Trough

Spin Trough is an I-band navigation radar

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

SS-N-22 Sunburn (3M-80 Zubr)

There are two quad launchers for the SS-N-22 located either side of the bridge. SS-N-22 is an active radar homing, sea-skimming, anti-ship missile with a range of 110 km (60 n miles) and a cruising speed of Mach 2.5. It carries a 300 kg (661 lb) HE warhead, although nuclear warheads are presumably still stored ashore.

SS-N-22 is a ramjet-powered missile and the system is associated with the 'Band Stand' D/F-band (1-4 GHz) air and surface search radar with a fairly high data rate. This sensor is known to have a secondary tracking function for anti-ship missiles and is part of both the 'Siren' and 'Sunburn' fire-control system.

Data on the location of both launcher and target are fed into the missile from the fire-control system, the doors at the front and at the rear of the launcher cell are opened and the booster ignites. The missile may be launched to engage targets in a 120° arc based upon the ship's course. Once the missile clears the launcher the wings and tail surfaces deploy and the missile briefly rises then drops to a cruising altitude of 20 m (65.6 ft) by which time the ramjet is operating. The active radar seeker then searches for the target and homes upon it, until 'lock on' is achieved. In the event of jamming, the seeker has a home-on-jam capability.

The missile takes only 2 minutes to cover its full range and manufacturers claim that 1 to 2 missiles could incapacitate a destroyer, while 1 to 5 missiles could sink a 20,000 tonne merchantman. An extended range missile, 9M80E is now available.

Specifications

Length: 9.38 m (30.7 ft)
Diameter: 130 cm (4.2 ft)
Wing span: n/k
Weight: 3,950 kg (8,708 lb)
Speed: Mach 2
Range: 48 n miles (90 km); 65 n miles (120 km) in 3M80E
Guidance: Inertial

SURFACE-TO-AIR MISSILES (SAM)

SA-N-4 Gecko (Osa-M)

There is a single twin-arm launcher for the SA-N-4 semi-active radar homing missile, located at the stern. SA-N-4 has a range of 15 km (8 n miles) at a speed of Mach 2.5 and a total of 20 missiles is carried.

The missile loading and launching system is unusual, being of cylindrical construction and the twin-rail launcher retracts beneath the hinged flat cover plate between launches to reload. This is likely to restrict the firing rate of the system, which must be slowed even further by the need to close the magazine cover before each launch.

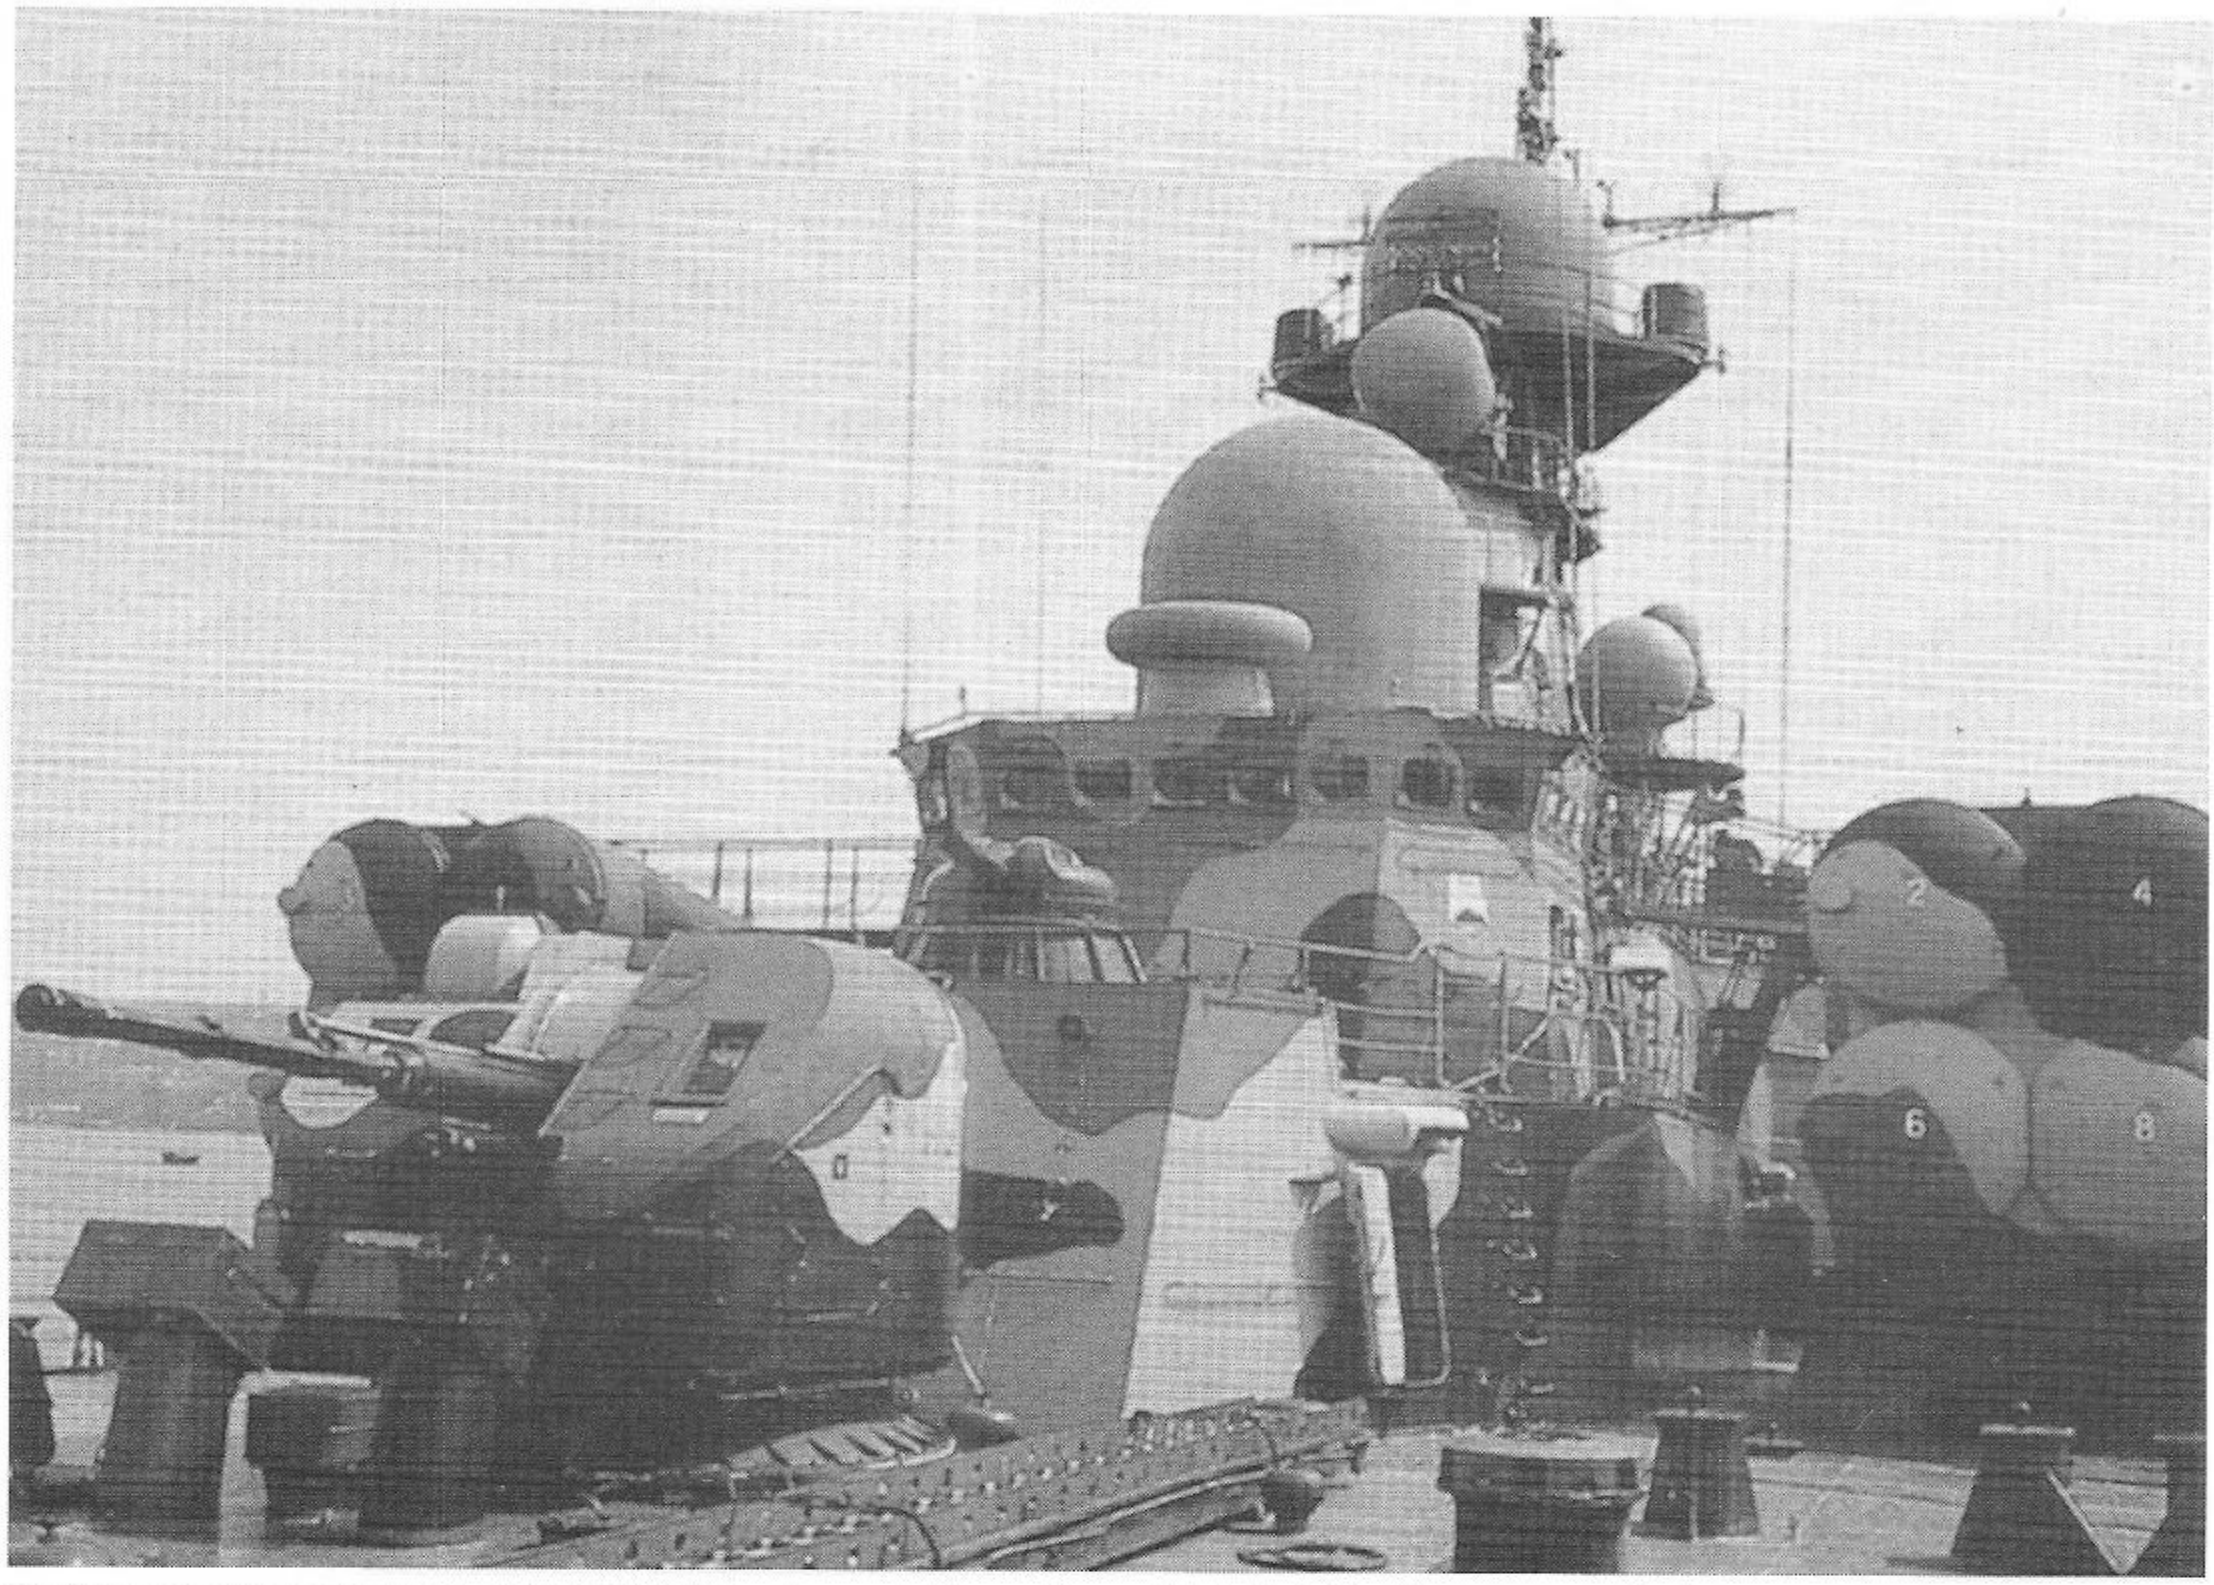
The launcher is about 5 m (16 ft) high, 4.2 m (13.7 ft) in diameter and has a 360° theoretical field of fire in azimuth and 90° in elevation. Below the launcher are four revolving drums each with five missiles while the electromechanical and hydraulic machinery is below that.

The Pop Group fire control system includes a frequency-agile monopulse radar, which has a parabolic rotating search antenna operating in H-band (6-8 GHz) with a typical acquisition range of 16 n miles (30 km). There are two J-band (10-20 GHz) antennas, one of them for a pulse Doppler target-tracking element with a range of 10.75 n miles (20 km) and the smaller parabolic antenna being used to track the missile. Above the prime antennas is a smaller, circular one which emits an I-band (8-10 GHz) uplink capture beam which gathers the missile shortly after launch. The director also has a small, rectangular command uplink emitter.

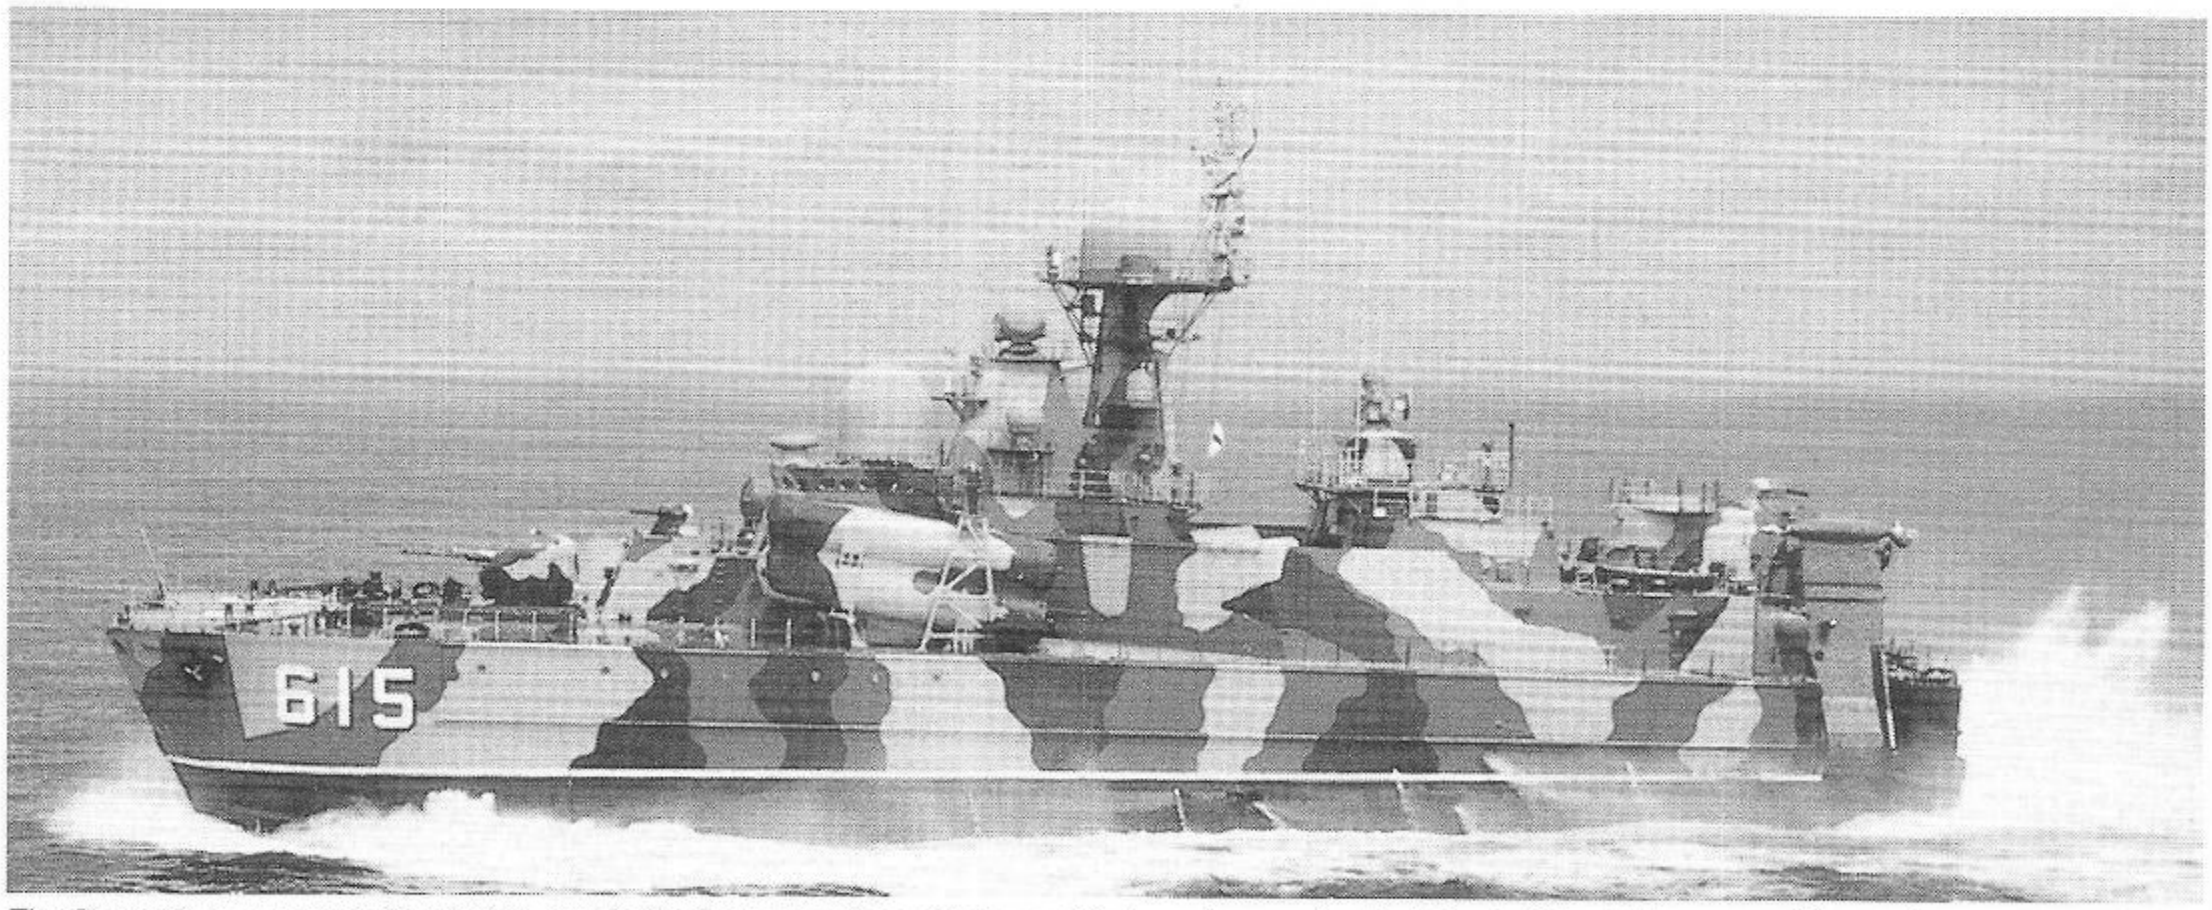
The engagement sequence is likely to see the target acquired by the air search radar. The data is then displayed on a panoramic display in the operator's console where it is designated either automatically or manually. The missile or missiles are launched and while one antenna automatically illuminates the target, the second tracks the missile and transmits command signals. The booster burns for 2 seconds allowing the radar to gather the missile at a range of 0.75 n miles (1.5 km) then the sustainer burns for 15 seconds.

Specifications

Length: 3.1 m (10.1 ft)
Diameter: 21 cm (8.2 in)
Wing span: 64 cm (25 in)



The foredeck with the 76 mm gun and the SS-N-22 launchers; note the numbers, which indicate the firing sequence. The 'squashed mushroom' -shaped device on the bridge roof is Cheese Cake navigation radar and behind it are Cake Stand, Bass Tilt and Cross Dome. Note also the Football A to the right of Bass Tilt



The Dergach is a remarkable design and is the largest surface-effect warship to enter service. In this shot the Z-drive propulsion units are retracted. The armament is concentrated forward, with only a single AK-630 aft of the mast

Weight: 130 kg (287 lb)
Speed: Mach 2
Range: 0.75-8 n miles (1.5-15 km)
Height: 25-5,000 m
Guidance: Radar command

GUNS

AK-176M 76 mm (3 in)/60

There is one AK-176M 76 mm gun mounted on the foredeck. The AK-176M is designed for air defence, surface engagement and shore bombardment roles and is a four-man mounting which may be either operated from the weapon control centre or from a local control station. The barrel is cooled externally by taking seawater from the ship's fire main through a jacket which lies around the liner.

The AK-176M is part of a weapon control system based upon the H-band fire-control radar with the NATO designation 'Bass Tilt'. This radar is also associated with the AK-630 and the two appear to form an integrated weapon system. The radar director is mounted on a pedestal and has an antenna with drum-shaped radome inclined at an angle of approximately 45°. Local control is achieved semi-automatically using the Kondensor sight which is installed as a backup in the event of the failure of 'Bass Tilt'. It is a day-night sight which may be used to engage both surface and air targets. In the event of a power failure the crew may use the WD-221 optical sight. Some vessels appear to have the mounting in a stand-alone configuration supported by other fire-control radars.

Specifications

Calibre: 76 mm
Length of barrel: 59 calibres
Muzzle velocity: 980 m/s (3,214 ft/s)
Traverse: 360° at 35°/s
Elevation: −7 to +85° at 30°/s
Ammunition (total): 16 kg (35 lb)
Rate of fire: 120 rds/min

30 mm/65 AK 630

There are two 30 mm 65 calibre AK-630 Gatling close in weapon systems: one is before the bridge, the second on the stern. These have five roles, engaging anti-ship missiles, aircraft, small surface vessels, drifting mines and unprotected targets ashore. The AO-18 weapon is a water-cooled, six-barrelled, Gatling-principle weapon with fixed breech block and revolving barrels. The weapon is believed to operate in a similar manner to that of the Phalanx, firing bursts of up to 400 rounds, but unlike the US weapon AK-630 features a separate radar director.

Specifications

Calibre: 30 mm
Length of barrel: 65 calibres
Number of barrels: 6
Muzzle velocity: 890 m/s (2,919 ft/s)
Cooling: Water
Traverse: 360° at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range: 4,000 m (radar fire control), 5,000 m (electro-optic fire control)
Rate of fire: 4,000-5,000 rds/min
Magazine: 2,000 rounds
Weight of complete round: 1.22 kg (2.7 lb)
Ammunition types:
UOF-84 HE-I weight: 384 g (13.05 oz)
UOR-84 HE-T weight: 388 g (13.07 oz)
Fuze: MG-32 point impact (both rounds)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Foot Ball A and Half Hat

There are two Foot Ball A radomes and two Half Hats. All appear to serve an ESM or ECM purpose.

DECOYS

PK-16 and PK-10

There are two PK-16 and two PK-10 decoy launchers for chaff. PK-10 consists of KT-216 launchers, a control console and three munitions. The launcher is a 10-barrel unit, with the 120 mm barrels fixed at about 45°. The launcher appears to be turnable. The control console appears to be a relatively simple design capable of controlling up to four launchers and with simple controls. The munitions are all for seduction purposes. The SR-50 is a chaff round with a payload of 11 kg (24.2 lb). The SOM-50 is a heat-seeker/laser-guided missile seduction round with 7.3 kg (16 lb) payload while the SK.50 is a combined round with 9.1 kg (29.8 lb) of payload.

Manufacturer/Contractor

General Export for Defence, Moscow, Russian Federation.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Monolit

The Udaloy II is armed with the same SS-N-22 weapons system as the 'Dergach' class and has a remarkably similar sensor fit, indicating that the sensors serve similar purposes in the two ships. This suggests that the Dergach is fitted with the Monolit targeting system, which consists of the Band Stand missile tracker, the Light Bulb and Bell Nest datalinks

Light Bulb

There are two Light Bulb radomes, which appear to function both as data links to the missile and also to over-the-horizon target acquisition/trackers, such as aircraft.

Bell Nest

There is one Bell Nest datalink, purpose unknown.

Band Stand weapons control radar

Band Stand is the name given by NATO to the Russian D/E/F-band radar identified by its large dome-shaped radome, which appears on all ships armed with SS-N-22. It appears to possess target acquisition and missile control functions.

RADARS

Cross Dome

Cross Dome is an E/F-band air and surface search radar, which is under the large radome at the mast-head. It is also found on 'Parchim II' class frigates.

Bass Tilt

Bass Tilt is an H-band system with its director mounted on the pedestal immediately before the mast. Its antenna is drum-shaped, 1.2 m (3.9 ft) in diameter and is inclined at an angle of approximately 45°. The radar is linked to a ballistic computer and controls the two AK-630 gun mountings. There is usually a standby optical and/or electro-optical control system, the latter possibly based upon the sensor with the NATO code-name 'Tee Plinth', although no evidence of such a system has been seen on this ship.

Pop Group

Pop Group is the weapon control system for the SA-N-4 missile system and is located on the small plinth on the after deck. The director includes an acquisition radar with a long, curved antenna on top of the cab and two target trackers. The latter two are of different size, but presumably the smaller one performs a similar function to the larger, but at higher frequencies, which would enable them to direct two different missiles against the same target. The system operates in the F/H/I-band.

Cheese Cake SRN-207

The I-band navigation radar is a new type with an antenna totally enclosed in a flat-topped circular radome. It has the NATO reporting name 'Cheese Cake'.

Square Head Naval IFF System

The antenna of this shipborne system consists of a broadside array of dipoles with a rectangular reflector/support frame measuring about 1.4 m (4.6 ft) high by 2 m (6.5 ft) wide. It was originally thought to be a long wavelength search radar of modest power, but later evidence confirms that its function is that of an IFF interrogator antenna or directional array for transmission of guidance signals to surface-to-surface missiles. It is most frequently seen on the older types of CIS missile carrying boats and these carry two or four such arrays on sponsons fore and aft of the mainmast. Recent information strongly suggests that the system operates in G-band.

Salt Pot

Salt Pot is another IFF device.

PROPULSION

Specifications

System: Combined diesel or gas turbine (CODOG)
Main machinery: 2 gas turbines, 40.6 MW (55,216 hp); 2 diesels, 7.4 MW (10,064 hp); 2 auxiliary diesels
Propellers: 2 fixed pitch propellers; 2 retractable Z-drives

FURTHER INFORMATION

PROGRAMME

These remarkable ships were built at Zelenodolsk 340, the first being launched in 1987 and commissioned in 1990, followed by the second, which was launched in 1992 and commissioned in 1994. The current two are operated by the Russian Navy but the type has been declared available for export. They are classified as PGGAs (Guided Missile Patrol Air Cushion Vessels).

DESIGN

The large Surface Effect Ships (SES) were designed by Central Marine design Bureau 'Almaz'. They are of twin hull design and are constructed of aluminium-magnesium alloy. They are powered by two gas turbines and two diesels, with two auxiliary diesels for hull-borne slow-speed travel. There are also two, twin-propeller Z-drives which are stowed vertically and swivel through 180° to propel the ship when cushionborne.

DEPLOYMENT

Bora is based in the Black Sea at Sevastopol and *Samum* in the Baltic.

FUTURE

The design is reported to be unreliable and plans to build more have been shelved. Nevertheless, this is a remarkably imaginative design, full of innovations, with a heavy weapons and sensor fit on a corvette-sized hull.

WEAPONS SYSTEMS

WEAPONS FIT

The forward weapons are permanently installed — one 57 mm gun and two 533 mm (21 in) torpedo tubes — as is the single 40 mm cannon aft. The remainder has, however, been designed to be interchangeable. Thus, either eight, four or no RBS-15 SSM launchers can be mounted as can either two additional 533 mm (21 in) or four 400 mm torpedo tubes, or mine rails for 40 mines.

SURFACE-TO-SURFACE MISSILES (SSM)

Saab RBS-15 Mk II

The 'Stockholm' class can carry a maximum of four twin launchers for the Saab RBS-15 Mk II anti-ship missile, mounted in four pairs at the after end of the superstructure. The RBS-15 Mk II missile system features inertial guidance and active radar homing to 54 n miles (100 km) at Mach 0.8. In the missile's nose is the CelsiusTech 9GR400 monopulse J-band (12-18 GHz), broadband, frequency-agile radar, which has two operator-selected modes: active or active/passive lock on. The ship system is operated by one man and consists of control and display panels, a computer, launcher switching units and power supply.

The system receives data from ship sensors, ship fire-control system or from external sensors on land, sea or air. The fire-control panel and the computer are in the ship's combat information centre. The combat mode has preparation and firing sub-modes with the former offering automatic and/or manual selection for target data, missile readiness, tactical parameters and salvo numbers. The tactical parameters' data includes seeker search pattern, target selection logic and trajectory. There is a separate selection of the distance the missile will travel in the high-level cruise phase. Using this and other data, the system calculates missile heading, seeker parameters, tactical boundaries and the time to the point when the missile will enter the low-level cruise phase.

The firing sub-mode is initiated manually but the selected missiles are automatically activated and their container doors are automatically opened. The system compensates for ship motion and ignites the boost motors which burn for approximately three seconds before being jettisoned. As the missile reaches its maximum altitude the turbojet is activated and the missile turns towards the target, the maximum offset being about 90°. It then enters a predetermined high-level cruise phase, which allows it to overfly islands, then descends to the low-level cruise phase. At an appropriate distance from the target the seeker is activated and the predetermined search pattern is adopted. Once the seeker has locked on to the target the missile can then enter its terminal sea-skimming phase.

Specifications

Length: 4.33 m (14.2 ft)
Diameter: 50 cm (19.7 in)
Wing span: 1.4 m (4.6 ft) (unfolded)
Weight (without boosters): 626 kg (1,380 lb)
Speed: In excess of Mach 0.8
Range: 54 n miles (100 km)
Warhead: 200 kg (441 lb) HE (blast fragmentation)

Manufacturer/Contractor

CelsiusTech, Sweden.

TUBES

533 mm (21 in) tubes

There are two fixed 533 mm (21 in) torpedo tubes on the foredeck, one on either side, facing outwards at an angle of about 20°. A further two 533 mm tubes can be mounted aft.

400 mm (15.75 in) torpedo tubes

A maximum of four 400 mm (15.75 in) torpedo tubes can be mounted.

TORPEDOES

FFV Tp 613 533 mm (21 in) heavyweight torpedo

The Tp 613 is a wire-guided weapon with passive homing and a range of 8.2 n miles (15 km) at 45 knots. TP 613 is one of the Tp 61 family of long-range torpedoes with HTP (high-test peroxide) propulsion. Two speeds can be selected before launch and can be changed during the run.

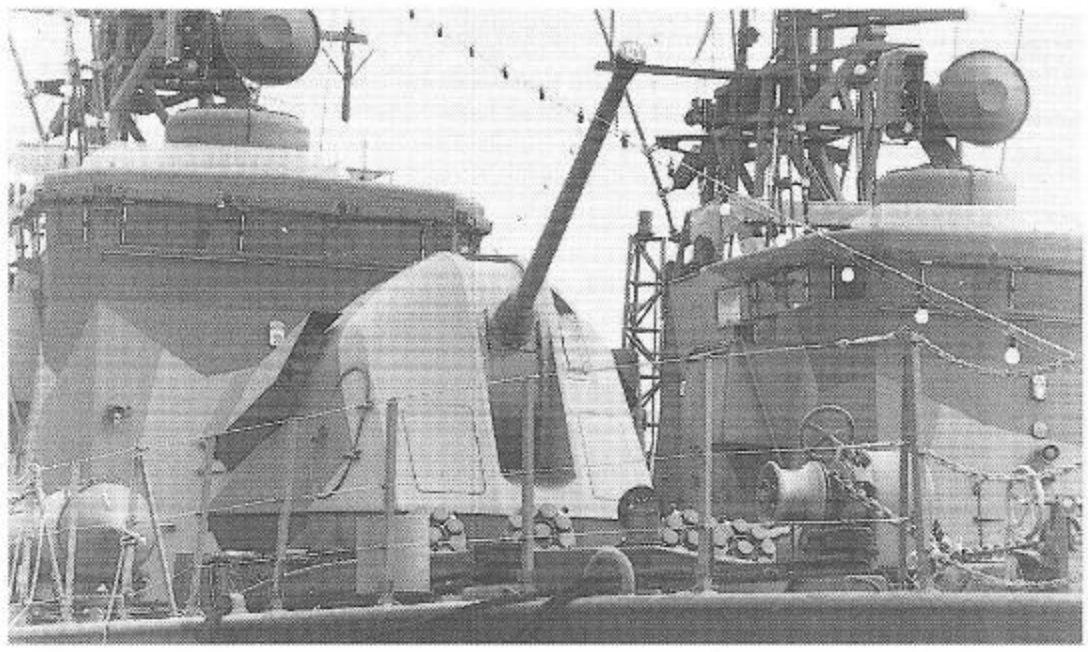
Specifications

Length: 6.98 m (22.9 ft)
Diameter: 533 mm (21 in)
Weight: 1,860 kg (4,100 lb)
Warhead: 240 kg (529 lb)
Speed: 45 kts

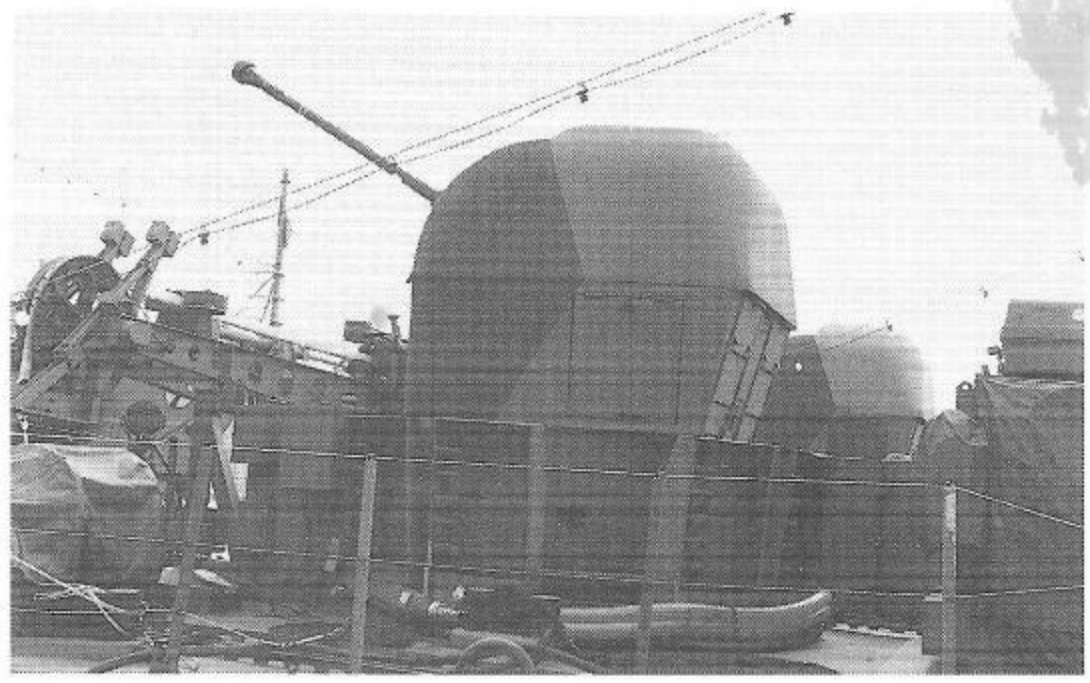
Manufacturer/Contractor

FFV, Sweden.

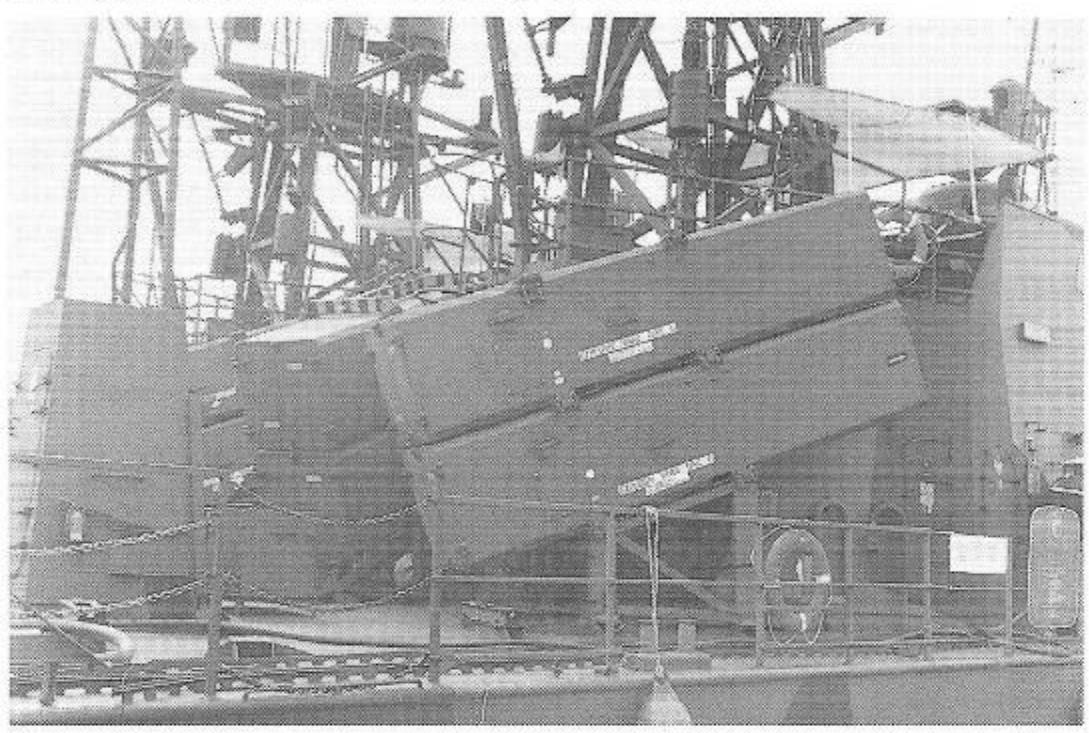
Weapons aboard Malmö *(K 12) (H M Steele)*



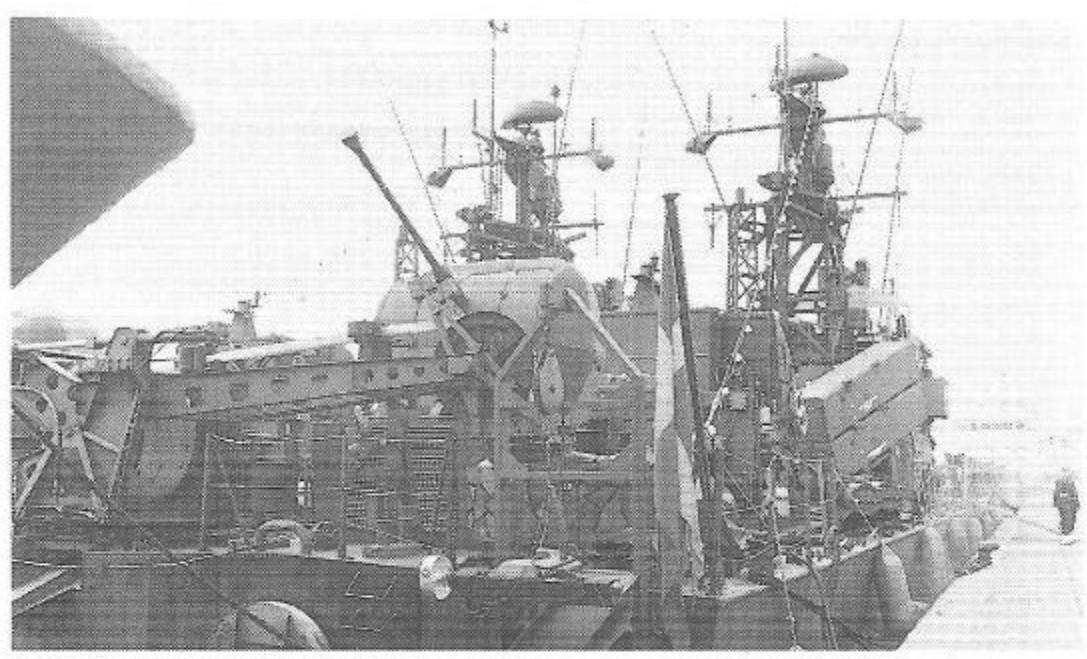
Bofors 57 mm/70 Mk 2 with rocket flares on the side of the gun house. In front of the gun are four Saab Elma ASW grenade launchers



Bofors 40 mm/70 automatic anti-aircraft gun



Saab RBS-15 Mk II anti-ship missile launchers



Stern view showing crane for Thomson-CSF TSM 2642 variable depth sonar, Bofors 40 mm gun, Saab RBS-15 missiles, and below the missile tubes, two 400 mm torpedo tubes

FFV Tp43 400 mm (15.75 in) torpedo

The Tp43 torpedo is a lightweight multirole weapon derived from the Tp41 and Tp42. The weapon is equipped with a 50 kg (110 lb) warhead and three-bladed contrarotating propellers. The propulsion system is based on a SAFT silver/zinc oxide battery. The combination of homing and wire guidance is claimed to result in a very high hit probability. Three different speeds are selectable during the run.

Specifications

Length: 2.64 m (8.66 ft)
Diameter: 400 mm (15.75 in)
Weight: 280/310 kg (617/683 lb) (min/max) including battery and guidance wire
Warhead: 45 kg (99 lb) shaped charge HE
Propulsion: Electric

Manufacturer/Contractor

FFV, Sweden.

GUNS

Bofors SAK 57 L/70 Mk 2

There is a single Bofors SAK 57 L/70 Mk 2 in 'A' position. This is intended to engage air and surface targets and to provide gunfire in support of troops ashore. It is housed inside a 'stealthy' shield.

Specifications

Calibre: 57 mm
Length of barrel: 70 calibres
Traverse: 360° at 55°/s
Elevation: −10 to +77° at 40°/s
Crew: 3
Range: 9 n miles (17 km)
Rate of fire: 220 rds/min
Projectile weight: 2.4 kg (5.3 lb)

Bofors 40 mm L/70

One single Bofors 40 mm anti-aircraft gun is mounted on a platform on the after deck. It has a Glass-Reinforced Plastic (GRP) shield.

Specifications

Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000-1,025 m/s (3,280-3,362 ft/s)
Range:
anti-surface: 6.75 n miles (12.5 km)
anti-air (nominal): 6,900 m (22,630 ft)
Rate of fire: 300 rds/min (practical)
Ammunition: 2.21 kg (4.9 lb)

Manufacturer/Contractor

Bofors Weapon Systems, Sweden.

ANTI-SUBMARINE MORTARS

Saab Elma LLS-920 incident weapon

Four nine-tubed launchers for the Elma ASW grenade. This weapon launches a grenade with a 4.2 kg (9.26 lb) warhead over a range of 350 m (1,148 yd), and was developed to counter submarine incursions in Swedish waters. It is intended to be capable of forcing a submarine to the surface rather than destroying it in the manner of a torpedo; hence the designation 'incident weapon.' Thus, the concept is to dissuade a submarine from entering Swedish waters without the political consequences of destroying it.

The LLS-920 non-magnetic, nine-tube Elma launchers are loaded from the muzzle, with firing initiated from the Combat Information Centre (CIC). A variety of programmable patterns result in carpets of 9, 18, 27 and 36 grenades. The Elma grenade is equipped with a shaped charge warhead the blast jet of which is capable of penetrating a submarine's pressure hull after passing through the water-filled superstructure.

Specifications

Launcher weight: 103 kg (227 lb)
Tube calibre: 100 mm (4 in)
Grenade weight: 4.35 kg (9.6 lb)
System range: 250-350 m (820-1,148 ft)

Manufacturer/Contractor

Saab, Sweden.

DEPTH CHARGES

Depth charges can be carried on and laid from the mine rails.

MINES

A maximum of 40 mines can be laid from the mine rails, if other weapons are removed.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

ARGOSystems AR 700 APECS II radar detection and jamming system

AR 700 APECS II is an advanced modular ESM/ECM system covering frequencies from 0.5 to 18 GHz, which is designed to counter most known radar threats. It is a fully automatic system, identifying and jamming threat emitters using a mixture of IFM receivers and microprocessor-controlled jammers, with high-speed switching enabling up to 16 threats to be jammed simultaneously. The antenna array consists of a mast-mounted ESM antenna assembly with two DF arrays, one omnidirectional unit and two monopulse units; system processing equipment; operator's console and two ECM transmitters (port and starboard) with their antenna systems located inside the transmitter units.

Specifications
ESM frequency coverage: 0.5-18 GHz
High sensitivity: Up to −67 dBm
Detection range: 200 n miles (ships); 50 n miles (aircraft)
DF accuracy: 4° RMS; 2° RMS fine DF
Automatic tracking: 500 active signals in dense signal environment
Signal identification speed: <1s
ECM azimuth coverage: 360° using a 60-beam jammer (one beam per 6° azimuth sector)
Radiated power: 180 kW nominal mid-band
ECM frequency coverage: 7.5-18 GHz

Manufacturer/Contractor
ARGOSystems Inc, Sunnyvale, California, USA.

ELECTRONIC COUNTERMEASURES (ECM)

CelsiusTech 9CM/9EW Philax
The 9CM/9EW system in the 'Stockholm' class is based upon two Philax fixed launchers, each of which consists of four magazines similar to those used in Dagaie with Lacroix munitions. Usually the magazines contain chaff munitions but one may be replaced by an infra-red (IR) munitions magazine. Each chaff magazine has 36 × 40 mm grenades, each weighing 0.35 kg (0.77 lb), with a 0.175 kg (0.38 lb) payload. They are fired at intervals of 0.1 second per group and within 1 second begin to create a cloud with a 1,000 m² radar cross-section, which is complete within up to 5 seconds at a height of 40 to 60 m (131 to 197 ft). The IR container is 131 × 468 × 357 mm and weighs 28.5 kg (63 lb), the munitions covering the 3-5 and 8-14 µm bands.

Specifications
Launchers
Length: 87.5 cm (2.9 ft)
Height: 72 cm (2.4 ft)
Width: 95 cm (3.1 ft)
Weight (unloaded): 180 kg (397 lb)

Control Unit
Length: 32.9 cm (1 ft)
Height: 40.8 cm (1.3 ft)
Width: 49 cm (1.6 ft)
Weight: <20 kg (<44 lb)
Power requirement: 220/115 V, 50/60 Hz

Manufacturer/Contractor
CelsiusTech, Sweden.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

CelsiusTech MARIL 880 command and fire-control system
The MARIL 880 Command and Control Information System (CCIS) is designed to provide ships ranging in size from offshore patrol vessels to destroyers with target detection, identification and tracking facilities together with movement prediction, threat evaluation, weapon co-ordination and unit deployment. There is an optional torpedo fire-control element and the CCIS has built-in facilities for simulation and training. The system features a mainframe architecture using two Censor 932E 32-bit computers with a memory of up to 512 k. One of the computers provides redundancy and the peripherals include an input/output device, data recorder and either a printer or a plotter. Software is written in the Assembler language and involves some 240,000 lines of code.

The system is linked through a single or duplicated CCIS bus to the display system, up to four radars (through a plot extractor), weapon control systems, navigation and communications systems. A datalink terminal is incorporated in the system. The consoles present a raw radar picture with track symbols, labels and bearing-vector lines. They are primarily for compiling the tactical situation as well as for target allocation to weapon systems. They can also be used for weapon co-ordination and control. The MCI which allows the selection of one of four radars and one of the three video channels consists of a roller ball, 11 function keys (each of which may have 12 functions), together with page select, mode select, display select and alphanumeric keys.

Manufacturer/Contractor
CelsiusTech, Sweden.

WEAPONS CONTROL

CelsiusTech 9LV 300
The weapons control system is based on the Mk 2/2.5 derivatives of the 9LV 200 Mk1/2. It uses electro-optical and computing elements from the 9LV 100 electro-optic director. It can engage two air targets simultaneously and for surface engagements, using surface-to-surface missiles, it features a track while scan capability.

Manufacturer/Contractor
CelsiusTech, Sweden.

RADARS

Ericsson Sea Giraffe 50 HC
The Sea Giraffe is used for air and surface search, with the antenna sited at the masthead.

Specifications
Operating frequency: G/H-band
Output power: 60 kW; average power 1,200 W
Antenna rotation rate: 60/30 rpm
Instrumented range: 25, 50, 100 and 150 km
Tracking capacity: More than 30 automatically initiated air targets; more than 50 manually initiated surface targets
Antenna sidelobe levels: −45 dB
Beamwidth bearing: 1.8°
Elevation coverage: 0-70°

Manufacturer/Contractor
CelsiusTech, Sweden.

PN-612
PN-612 is one of the Skanter range of I-band navigation radars.

Manufacturer/Contractor
Terma Elektronik, Denmark.

9LV 200 Mk 3 Sea Viking radar/electro-optic director
There are two Sea Viking directors which control the guns, controlling different weapons in sequence, and with an automated air defence function for use against multiple targets. It takes sensor data, evaluates the threat and automatically deploys the most effective hard or soft kill countermeasure to neutralise each target. The prime sensor is a tracking Ku/J-band radar with stabilised cassegrain monopulse antenna and travelling-wave tube transmitter which operates in the 15.9-17.1 GHz frequency range and permits the combination of pulse Doppler-MTI operation with batch-to-batch frequency agility. Pulse-to-pulse frequency agility is retained for use when return suppression is not required. The radar may be supplemented by a range of electro-optical sensors including a Si-Vidicon CCIR-compatible TV camera with 300 mm lens and 42 × 31 mrad field of view, an 8-12 µm infra-red camera using Cadmium Mercury Telluride detectors with closed-cycle Sterling cooling and fields of view of 52 × 35 mrad and 157 × 105 mrad. There may also be a 1.06 µm Nd:YAG laser rangefinder with a peak power of 4 MW and a PRF of 10 Hz.

Manufacturer/Contractor
CelsiusTech, Sweden

SONARS

Simrad SA 950
The hull-mounted Simrad SA 950 is normally employed as a mine-avoidance sonar, but it appears that in this class it is used as an active attack sonar.

Manufacturer/Contractor
Simrad, Norway.

TSM 2642 Salmon
TSM2642 Salmon is a compact, active, Variable-Depth Sonar (VDS), based on an acoustic array of 24 staves in a streamlined fish, with a towing winch, transmitter and receiver unit and operator console with colour display. Embedded facilities include passive listening, sound ray tracer, integrated onboard simulator, and acoustic propagation prediction.

Specifications
Acoustic array: 24 identical staves of 7 transducers, weight 260 kg (573 lb)
Frequency: 19 kHz approximately
Transmitter: Omnidirectional transmission in CW and FM modes
Receiver: 36 preformed beams; advanced processing coherent in FM with pulse compression and spectrum analysis (FFT) in CW

Manufacturer/Contractor
Thomson-CSF, France.

PROPULSION

Specifications
System: Combined diesel and gas turbine (CODAG)
Main machinery: 1 General Motors/Allison 570-KF gas turbine 4.74 MW (6,540 hp); 2 MTU 16V 396 TB93 diesels 3.1 MW (4,200 hp)
Shafts: 3

FURTHER INFORMATION

PROGRAMME
The order for this class of two was placed in September 1981.

DESIGN
The design was developed from the 'Spica II' class.

MODERNISATION
The RBS-15 missile system was upgraded to Mk II standard from 1994.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Saab RBS 15

The 'Göteborg' class has four twin launchers for the Saab RBS anti-ship missile mounted in four pairs at the after end of the superstructure. The RBS 15 missile system features inertial guidance and active radar homing to 37.8 n miles (70 km) at Mach 0.8, although the missiles are about to be upgraded to Mk II standard which will increase their range to 60 n miles (110 km). In the missile's nose is the CelsiusTech 9GR400 monopulse J-band (12-18 GHz) seeker. The broadband, frequency-agile radar with its digital processing is claimed to provide a high Electronic Counter CounterMeasures (ECCM) performance. The seeker has two modes which may be selected by the operator; active or active-passive lock on. The ship system is operated by one man and consists of control and display panels, a computer, launcher switching units and power supply. The system receives data from ship sensors, ship fire-control system or from external sensors on land, sea or air. The fire-control panel and the computer are in the ship's combat information centre.

There are three modes of operation; test, simulation and combat. The combat mode has preparation and firing sub-modes with the former offering automatic and/or manual selection of target data, missile readiness, tactical parameters and salvo numbers. The tactical parameters' data includes seeker search pattern, target selection logic and trajectory. There is a separate selection of the distance the missile will travel in the high-level cruise phase. Using this and other data the system calculates missile heading, seeker parameters, tactical boundaries and the time to the point when the missile will enter the low level cruise phase.

The firing sub-mode is initiated manually but the selected missiles are automatically activated and their container doors are automatically opened. The system compensates for ship motion and ignites the boost motors which burn for approximately three seconds before being jettisoned. As the missile reaches its maximum altitude, the turbojet is activated and the missile turns towards the target, the maximum offset being about 90°. It then enters a predetermined high-level cruise phase, which allows it to overfly islands, then descends to the low-level cruise phase.

At an appropriate distance from the target the seeker is activated and the predetermined search pattern is adopted. Once the seeker has locked on to the target the missile can then enter its terminal sea-skimming phase.

Specifications

Length: 4.33 m (14.2 ft)
Diameter: 50 cm (19.7 in)
Wing span: 1.4 m (4.6 ft) (unfolded)
Weight (without boosters): 626 kg (1,380 lb)

Speed: In excess of Mach 0.8
Range: In excess of 38 n miles (70 km)
Warhead: 200 kg (440 lb) HE (blast fragmentation)

Manufacturer/Contractor

CelsiusTech, Sweden.

TUBES

400 mm (15.75 in) torpedo tubes

There are four 400 mm (15.75 in) torpedo tubes, all on the starboard side, and all firing aft at an angle of about 20° to the centreline. One pair of tubes is abreast the bridge and one pair on the quarter deck.

TORPEDOES

Bofors 400 mm, Tp 43, anti-submarine torpedoes

The Tp 43 torpedo is a multirole weapon derived from the Tp 41 and Tp 42. The weapon is equipped with a 50 kg (110 lb) warhead and three-bladed contrarotating propellers. The propulsion system is based on a SAFT silver/zinc-oxide battery. The combination of homing and wire guidance is claimed to result in a very

Gälve *(K 22). Note the RBS 15 anti-ship missile launchers and the Bofors 40 mm automatic mount. On the stern is the cable reel and fish for the Thomson-CSF TSM 2643 Salmon VDS* (Jane's/H M Steele)

Gälve *(K 22). The Bofors 57 mm/70 Mk 2 is in a 'stealthy' housing and has flare launchers on the side. On the platform above the gun is a Saab Elma ASW mortar, together with four CelsiusTech Philax flare/chaff launchers* (Jane's/H M Steele)

high hit probability. Three different speeds are selectable during the run.

Specifications
Length: 2.64 m (8.6 ft)
Diameter: 400 mm(15.7 in)
Weight: 280/310 kg (617/683 lb) (min/max) including battery and guidance wire
Warhead: 45 kg (99 lb) shaped charge HE
Propulsion: Electric

Manufacturer/Contractor
Bofors Underwater Systems, Sweden.

GUNS

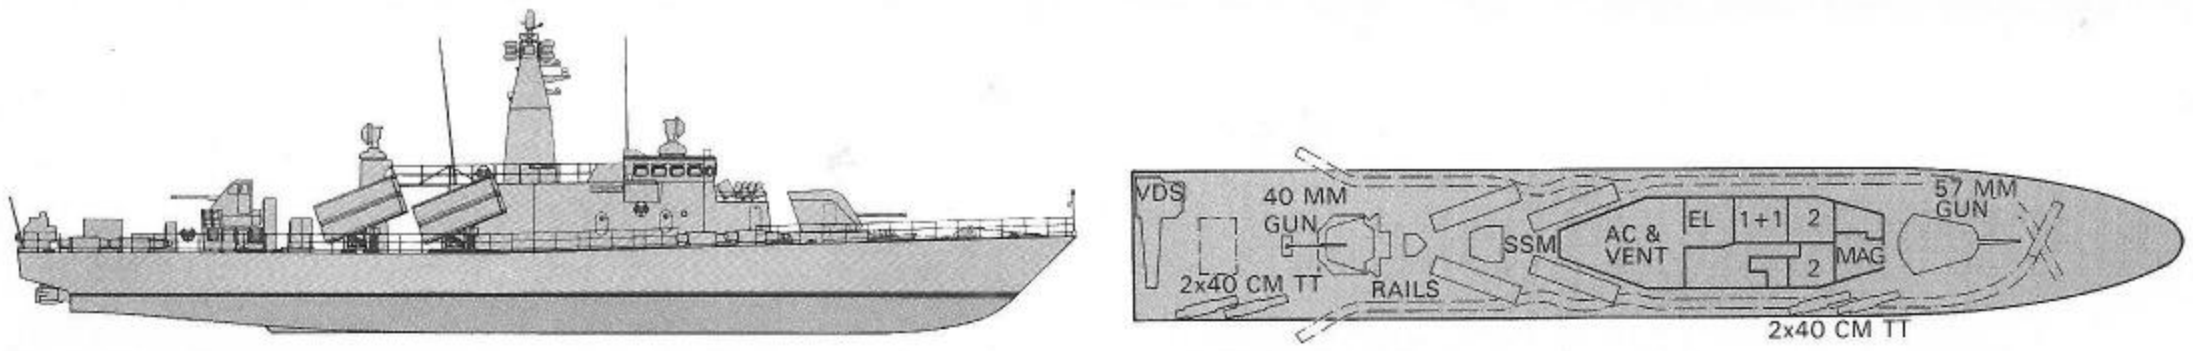
Bofors SAK 57 L/70 Mk 2
There is a single Bofors SAK 57 L/70 Mk 2 in 'A' position. This is intended to engage air and surface targets and to provide gunfire in support of troops ashore. It is housed inside a 'stealthy' shield.

Specifications
Calibre: 57 mm
Length of barrel: 70 calibres
Traverse: 360° at 55°/s
Elevation: −10 to +77° at 40°/s
Crew: 3
Range: 9 n miles (17 km)
Rate of fire: 220 rds/min
Projectile weight: 2.4 kg (5.3 lb)

Bofors 40 mm/70
One single Bofors 40 mm anti-air gun is mounted on a platform on the after deck.

It has a Glass-Reinforced Plastic (GRP) shield.

Specifications
Calibre: 40 mm
Length of barrel: 70 calibres



Views of 'Göteborg' class showing the location of the torpedo tubes and the mine rails (CelsiusTech)

Muzzle velocity: 1,000 - 1,025 m/s (3,280-3,362 ft/s)
Range:
anti-surface: 6.75 n miles (12.5 km)
anti-air (nominal): 6,900 m (22,600 ft)
Rate of fire: 300 rds/min (practical)
Ammunition: 2.21 kg (4.9 lb)

Manufacturer/Contractor
Bofors Weapon Systems, Sweden.

ANTI-SUBMARINE MORTARS

Saab Elma LLS-920
There are four nine-tubed Elma LLS-920 launchers on a small platform deck immediately ahead of the bridge. Described officially as an 'incident weapon,' the LLS-920 was developed to counter submarine incursions in Swedish waters and is designed to force a submarine target to the surface, thus avoiding the political consequences of destroying it. The non-magnetic, nine-tube LLS-920 launchers are loaded from the muzzle and firing is initiated from the Combat Information Centre (CIC), using programmable patterns of 9, 18, 27 and 36 grenades. The Elma grenade has a shaped-charge warhead, which is designed to penetrate a submarine's pressure hull after passing through the water-filled superstructure.

Specifications
Launcher weight: 103 kg (227 lb)
Tube calibre: 100 mm
Grenade weight: 4.35 kg (9.6 lb)
System range: 250-350 m (820-1,148 ft)

DEPTH CHARGES

Depth charges are carried on the mine rails in place of mines.

MINES

All four ships have a minelaying capability.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

ARGOSystems APECS-II radar detection and jamming system
APECS-II (Advanced Programmable Electronic Countermeasures System) is a modular ESM/ECM system covering frequencies from 0.5 to 18 GHz, which is designed to counter most known radar threats. It is a fully automatic system, identifying and jamming threat emitters using a mixture of IFM receivers and microprocessor-controlled jammers, with high-speed switching enabling up to 16 threats to be jammed simultaneously. The antenna array consists of a mast-mounted ESM antenna assembly with two DF arrays, one omnidirectional unit and two monopulse units; system processing equipment; operator's console and two ECM transmitters (port and starboard) with their antenna systems located inside the transmitter units.

Specifications
ESM frequency coverage: 0.5-18 GHz
High sensitivity: Up to −67 dBm
Detection ranges: Ships — 200 n miles; aircraft — 50 n miles
DF accuracy: 4° RMS; 2° RMS fine DF
Automatic tracking: 500 active signals in dense signal environment
Signal identification speed: <1s
ECM azimuth coverage: 360° using a 60-beam jammer (one beam per 6° azimuth sector)
Radiated power: 180 kW nominal mid-band
ECM frequency coverage: 7.5-18 GHz

Manufacturer/Contractor
ARGOSystems Inc, Sunnyvale, California, USA.

ELECTRONIC COUNTERMEASURES (ECM)

CelsiusTech Philax
The 9CM/9EW system in the 'Göteborg' class is based upon the Philax fixed launcher, which consists of four magazines similar to those used in Dagaie with Lacroix munitions. Usually the magazines contain chaff munitions but one may be replaced by an infra-red (IR) munitions magazine. Each chaff magazine has 36 × 40 mm (1.4 × 1.6 in) grenades, each weighing 0.35 kg (0.8 lb), with a 0.175 kg (0.4 lb) payload. They are fired at intervals of 0.1 second per group and within 1 second begin to create a cloud with a 1,000 m² radar cross-section, which is complete within <5 seconds at a height of 40-60 m (131-197 ft). The IR container is 131 × 468 × 357 mm (5.1 × 18.4 × 14 in and weighs 28.5 kg (63 lb).

Specifications
Launchers
Length: 87.5 cm (2.8 ft)
Height: 72 cm (2.3 ft)
Width: 95 cm (3.1 ft)
Weight (unloaded): 180 kg (397 lb)

Control Unit
Length: 32.9 cm (13 in)
Height: 40.8 cm (16 in)
Width: 49 cm (19 in)
Weight: <20 kg (<44 lb)
Power requirement: 220/115 V, 50/60 Hz

Manufacturer/Contractor
CelsiusTech, Sweden.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

CelsiusTech 9LV Mk 3 command and weapon control system
The 9LV Mk 3 command system has a distributed architecture and is based upon a 32-bit computer using Motorola 68020 and 68040 microprocessors and Ada-language software, workstations and Ethernet IEEE 802.3 standard local area networks. Memory consists of 4 MByte RAM and 256 k of Erasable Programmable Read Only Memory (EPROM). The hardware is used to create nodes which may be workstations, processing or interface nodes with a network interface, one or more processing units, power supply, local Programmable Feed Only Memory (PROM), and appropriate interfaces. Memory management is by means of the Motorola 68851 while the floating-point processor is the Motorola 68881. All the software programs run independently but communicate through an Inter-Program Communication 2000 (IPC2000) mechanism. The software is in Ada and the basic system has about 500,000 lines of code but this is usually more than doubled to meet added requirements.

Each system consists of a dual-redundant local area network which interfaces with all sensors, weapon systems and workstations. The system is supported by two processor units (one redundant) which provide command, communications and control as well as a database. The systems are capable of acting as a data handling system compiling the tactical situation, conducting threat evaluation and target designation as well as providing navigation and offboard sensor data (the latter via a datalink) while recording and providing a simulation capability.

Manufacturer/Contractor
CelsiusTech, Sweden.

WEAPONS CONTROL

9LV 200 Mk 3 Sea Viking electro-optic director
There are two Sea Viking directors, which control the guns, controlling different weapons in sequence, and with an automated air defence function for use against multiple targets. It takes sensor data, evaluates the threat and automatically deploys the most effective hard or soft kill countermeasure to neutralise each target. The prime sensor is a tracking Ku/J-band radar with stabilised cassegrain monopulse antenna and travelling-wave tube transmitter which operates in the 15.9-17.1 GHz frequency range and permits the combination of pulse Doppler-MTI operation with batch-to-batch frequency agility. Pulse-to-pulse frequency agility is retained for use when return suppression is not required. The radar may be supplemented by a range of electro-optical sensors including a Si-Vidicon CCIR-compatible TV camera with 300 mm lens and 42 × 31 mrad field of view, an 8-12 μ m infra-red camera using Cadmium Mercury Telluride detectors with closed-cycle Sterling cooling and fields of view of 52 × 35 mrad and 157 × 105 mrad. There may also be a 1.06 μ Nd:YAG laser rangefinder with a peak power of 4 MW and a PRF of 10 Hz.

There are 2 directors per ship, co-located with I/J electro-optic band fire-control radars.

Manufacturer/Contractor
CelsiusTech, Sweden.

9LV 450 SESYM fire-control system
9LV 450 (known in Swedish service as SESYM (*Strids-och Eldlednings System for Marinen*)) features a separate air search radar and integrated EW suite, which permits automatic tracking and threat evaluation of a large number of air and surface targets. There is a standard 23 in (58.4 cm) tactical electronic plot. A high capacity datalink using the Time Division Multiple Access (TDMA) principle is included for exchanging data with

other warships and shore commands. The system can control four guns of different calibres, anti-ship missiles and various ECM systems. A surface-to-air missile capability is an option, but is not included in the 'Göteborg' class.

The ASW subsystem features its own processor and software, and a horizontal console with PPI display which can also show sound path propagation data, alphanumeric display and operator's panels. It uses the ship sonar system for search and tracking, presents and evaluates the data, predicts the target's position, calculates the control data for the ASW weapons and calculates the ship's course. The system is designed to control ASW rockets and torpedoes but can be adapted for use with depth charges

Manufacturer/Contractor
CelsiusTech, Sweden.

CelsiusTech 9EW 400 ESM/ECDI system
9EW400 responds to directions from the APECS-II system and controls the Philax chaff and IR decoy launchers, the active ECM system and laser warning receivers.

Manufacturer/Contractor
CelsiusTech, Sweden.

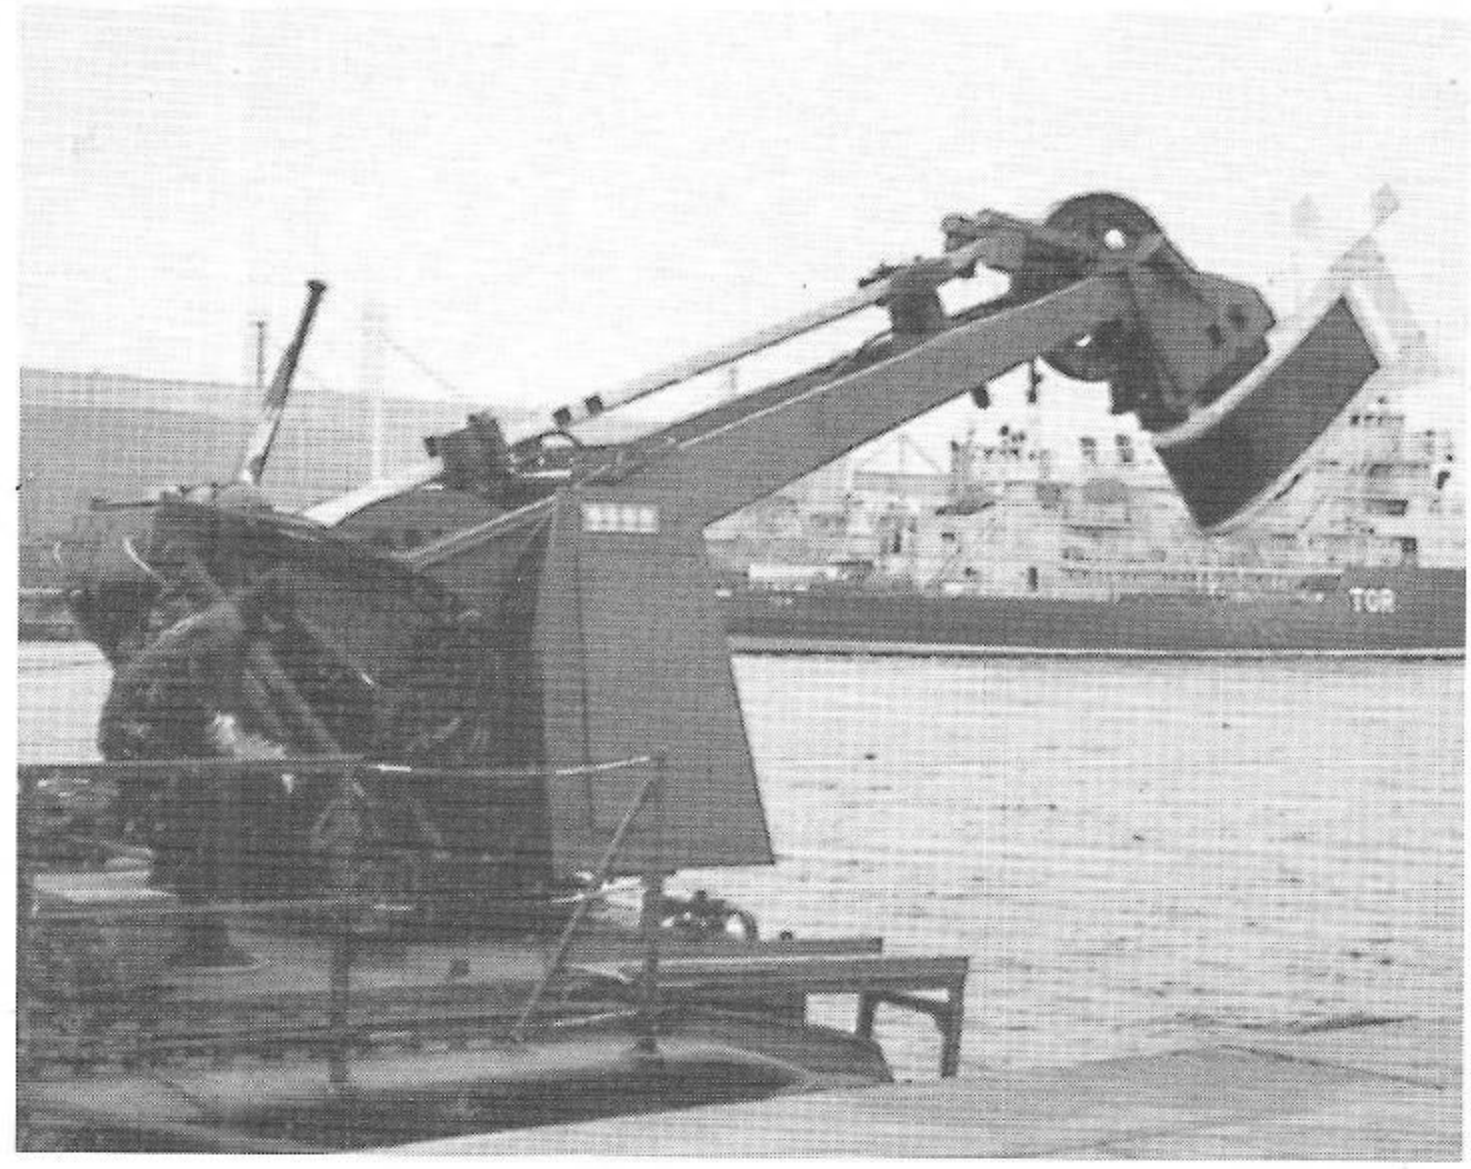
RADARS

Ericsson Sea Giraffe 150 HC
The Sea Giraffe is used for air and surface search, with the antenna sited at the masthead.

Specifications
Operating frequency: G/H-band
Output power: 60 kW; average power 1,200 W
Antenna rotation rate: 30/60 rpm
Instrumented range: 25, 50, 100 and 150 km
Tracking capacity: More than 30 automatically initiated air targets; more than 50 manually initiated surface targets
Antenna sidelobe levels: −45 dB
Beamwidth bearing: 1.8°
Elevation coverage: 0-70°
Accuracy: 20 m range; 0.3° azimuth

Manufacturer/Contractor
CelsiusTech, Sweden.

PN-612
PN-612 is one of the Skanter range of I-band navigation radars.



Thomson-CSF Salmon TSM 2643 VOS with the davit jib extended and the sonar vehicle ('fish') (CelsiusTech)

Manufacturer/Contractor
Terma Elektronik, Denmark.

SONARS

TSM 2643 Salmon
TSM 2643 Salmon is a compact, active, Variable-Depth Sonar (VDS), based on an acoustic array of 24 staves in a streamlined fish, with a towing winch, transmitter and receiver unit and operator console with colour display. Embedded facilities include passive listening, sound ray tracer, integrated onboard simulator and acoustic propagation prediction.

Specifications
Acoustic array: 24 identical staves of 7 transducers, weight 260 kg (573 lb)
Frequency: 19 kHz approximately.
Transmitter: Omnidirectional transmission in CW and FM modes
Receiver: 36 preformed beams; advanced processing coherent in FM with pulse compression and spectrum analysis (FFT) in CW

Manufacturer/Contractor
Thomson Sintra ASM, France.

Simrad SS 304
Simrad SS 304 was developed from one of Simrad's fish-finding sonars and is designed specifically for use in shallow waters. It is a hull-mounted, active sonar, with a transducer which can be rotated to cover the full 360°. The receiver uses 17 preformed receiving beams to cover an 85° arc.

Manufacturer/Contractor
Simrad, Horten, Norway.

PROPULSION

Specifications
System: Diesel
Main machinery: 3 MTU16V 396 TB94, 6.4 MW (8,700 hp)
Water-jets: 3 KaMeWa Type 80 S62/6 water-jets.

FURTHER INFORMATION

PROGRAMME
These four ships were ordered on 1 December 1985 as replacements for the 'Spica I' class.

DESIGN
These are the latest corvettes to enter Swedish service and pack a great deal of firepower into a relatively small hull: eight SSMs, one 57 mm and one 40 mm gun, four ASW torpedo tubes and four rocket launchers on a full load displacement of 450 tonnes. There is also a very comprehensive package of sensors and a full command action information system.

Efforts have been made to reduce radar and IR signatures.

TRIALS
A Bofors Sea Trinity CIWS gun has replaced the 40 mm/70 in *Göteborg* for trials.

Galve is involved in a separate trial, testing an STN Atlas passive towed array streamed from the starboard quarter.

WEAPONS SYSTEMS

TORPEDOES

Plessey PMW 49A/STWS

Two triple Pedestal Mounted Weapons (PMW) launchers are mounted on the upper deck. Shipboard Torpedo Weapons System (STWS) consists of two triple tube launchers, a launch control and presetter unit which are linked to the launchers through local control panels. The launchers are manually trained to an angle of 45° using a training handle installed between the two lower tubes. They are then remotely operated.

PMW 49A is an export system compatible with the Mk 46, the Stingray and the A 244S lightweight torpedoes. The mountings are essentially those of the STWS 2 although the breech mechanism is attached to the tube by a hinged arm. The presetter/launch controller is the Ultra ATLAPS with distributed microprocessors and Coral 66-language software for greater flexibility. The main processor/command unit is in a console with environmentally sealed slave control units mounted close to the launchers. The system is compatible with a variety of databus systems including MIL-STD-1553R and RS 422.

Specifications
Length: 3.65 m (12 ft)
Height: 1.4 m (4.6 ft)
Width: 1.23 m (4 ft)
Weight: 1,560 kg (3,439 lb) (unloaded)

Manufacturer/Contractor
GEC-Marine, Waterlooville, UK.

Sting Ray lightweight torpedo

Sting Ray is capable of active/passive homing to 5.9 n miles (11 km) at 45 kts. Sting Ray has a 35 kg (77 lb) Torpex shaped charge warhead developed by Royal Ordnance and may be used in deep or shallow waters. It is equipped with a pumpjet propulsion system. The onboard sonar is reported to be multimode and narrow beam. The narrowband capability provide good Doppler discrimination against slow or quiet targets and the broadband capability gives good target discrimination range, and bearing resolution.

Khamronsin *(531), the first of three corvettes designed by Vosper Thornycroft in the UK and built by Ital Thai and Bangkok Naval Dockyard in Thailand* (Royal Thai Navy)

Specifications
Length: 2.59 m (8.5 ft)
Diameter: 324 mm
Weight: 267 kg (589 lb)(in air)
Warhead: 35 kg (77 lb)
Speed: 45 kts
Range: 5.9 n miles (11 km)
Depth: 750 m (2,460 ft)

Manufacturer/Contractor
GEC-Marine, Waterlooville, UK.

GUNS

OTOBREDA 76 mm (3 in)/62 Compact

There is one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck for use in either air defence or anti-surface roles. If the weapon is designated to the air-defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission.

Specifications

Calibre: 76.2 mm
Length of barrel: 62 calibres
Traverse: 360° at 70°/sec
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,952 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy.

OTOBREDA 30 mm/70 Twin Compact

There is one OTOBREDA 30 mm/70 Twin Compact mounting aft, consisting of two Mk 30 Model F cannon using the 30 mm × 173 GAU 8/A round. Ammunition is fed into the guns from a magazine below the decks. The 1.99 m (6.5 ft) diameter cylindrical magazine feeds two belts from a total of 34 vertical lockers, each belt folding into half the lockers. The magazine rotates to bring each locker in turn under the hydraulically powered ammunition hoist on each side of the gun. The round is then conveyed into the platform from where it is transferred by flexible chute to the ammunition feed.

Specifications

Calibre: 30 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,040-1,220 m/s (3,411-4,000 ft/s) (HEI/APDS)
Traverse: Unlimited at 130°/s
Elevation: −13 to +85° at 75°/s
Rate of fire: 800 rds/min/barrel
Ammunition: 1.05 kg (2.31 lb) (TP, HEI, HEI-SD, API, APDS)
Mounting weight, with ammunition: 1,330 kg (2,932 lb)

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy.

M2HB 12.7 mm (0.50 in) machine guns

Two M2HB 12.7 mm machine guns are carried and can be mounted on flexible mounts.

Specifications

Calibre: 12.7 mm
Rate of fire: 450-550 rds/min
Muzzle velocity: 883 m/s (2,900 ft/s)
Max effective range:
anti-surface: 6,700 m (7,400 yd)
anti-air: 1,380 m (4,500 ft)

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Nautis P action data automation system

The NAUTIS P action data automation system is based upon the NAUTIC (Naval AUTonomous Intelligent Console) multifunction intelligent workstation. This workstation module uses the Intel iAPX-86 processor with 3 Mbyte RAM together with 2 Mbyte non-volatile magnetic bubble memory. Dual iAPX-286 microprocessors are used in Multibus configurations, while iAPX-186 microprocessors are used for intelligent interfaces. The system capacity is 200 air, surface and submarine tracks and reference points with integral radar autotracking for up to 80 air and surface targets. The workstations are linked by a dual-redundant MIL-STD-1553B highway.

An extensive system database, replicated in each console, covers an area of 2,000 n miles square (3,700 km²) and can include radar and sonar tracks, route/search plans, user-designated tactical maps and synthetic charts. The database can include up to six user-designated tactical maps, 15 synthetic charts, 200 labelled reference points, 5,000 fully detailed underwater contacts and 32 labelled bearing lines. Manually initiated automatic radar tracking is possible for a minimum of 20 tracks.

Workstations accept various combinations of digital, synchro and analogue input/output for the whole range of sensors and weapons and interface options, including point-to-point, the data highway or a general purpose combat system highway. They also interface with optional elements, such as a chart table, plotter/printers and magnetic tape units, either through point-to-point interfaces or via the data highway, which complies with Military Standard-1553B data highway providing 1 MHZ of bandwidth, of which 300 kHz is used.

The 'Khamronsin' class corvettes have three-console systems which interface with the BAe Sea Archer 1 electro-optic fire-control system, Siemens Plessey ASW 4 search radar and STN Atlas DSQS-21C hull-mounted, medium/high frequency, active search/attack sonar.

Manufacturer/Contractor

GEC-Marine, Waterlooville, UK.

WEAPONS CONTROL

Sea Archer 1A Mod 2

Sea Archer 1A provides complete integration of a TV subsystem with below-decks control by joystick, giving improved surveillance capability and the option of a manned/unmanned director on deck. It also has provision for controlling two different types of gun-mounting alternately. The Mod 2 version in the 'Khamronsin' class corvettes includes a thermal imager and auto-track capabilities as in Mod 1 and dual-mode alternate ballistics.

The system comprises: the MSI-Defence Systems Optical Fire Director (OFD) (with combined electro-optic tracking sensors and a laser rangefinder) and a gun-control console containing a predictor operator control panel and system communications. To assist in target acquisition the system accepts information derived from the vessel's surveillance radar to slew the OFD onto the target bearing. Electro-optic sensors, 3.4/4.2 m (11.1/13.8 ft) IR or television tracking cameras are fitted in other configurations to give below-decks operation. The IR camera has a 1.5 × 3° field of view.

Information regarding the target range, training and elevation is automatically transmitted to the weapon control console. The computer, utilising ballistic and meteorological data already entered into the system, then calculates the gun aiming order. To reduce reaction time to a minimum, gun slew occurs as soon as the target is acquired and offset adjustments are then made when a valid prediction solution is computed, which typically takes two seconds.

There are three gun fire-control modes: air defence surface and naval gunfire support. In air defence mode the system is designed to achieve minimum reaction time against fast moving air targets. The director aimer acquires the target and activates the rangefinder. Target data is fed to the control console where the digital weapon controller calculates gun aiming signals. The gun slews into line with the computed data and when the target is within gun range the digital weapon controller indicates that the system is ready to engage the target. Firing can be achieved from the director or the control console. In surface mode the optical director is aimed at the target and the rangefinder is activated to establish the target range. Gun aiming orders are then computed from the target data transmitted by the director. Splash spotting corrections, observed by the director aimer, are applied via the control console. In the naval gunfire support mode the gun is used to bombard shore targets. The target co-ordinates are inserted manually at the control console and gun orders calculated and corrected for ship movement by dead reckoning. Spotting corrections, observed by a shore- or ship-based observer, are applied at the control console.

Specifications

Electro-optical fire director
Arc: Unlimited
Elevation: −20 to +70°
Laser: Nd:YAG
Beamwidth: 2 mrad
Repetition rate: 20 Hz
Console
Weight: 250 kg (551 lb)
Height: 1.48 m (4.8 ft)
Depth: 78.7 cm (2.5 ft) plus 30.4 cm (11.9 in) desk overhang
Width: 56.2 cm (22 in)
Power requirements: 440 V, 50/60 Hz, three phase 3-5 kVA; 24 V DC

Manufacturer/Contractor

BAe, Farnborough, UK.

SONARS

STN Atlas DSQS-21C

DSQS-21 is a hull-mounted, active search and attack sonar, featuring computer-aided detection and tracking, with the information being presented on colour CRT displays to permit Doppler coding and discrimination of data.

Specifications

Diameter of transducer arrays: 1 m (3.2 ft)
Number of preformed beams: 32

Manufacturer/Contractor

STN Atlas Elektronik, Germany.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU 12V 1163 TB93 diesels, 7.34 MW (9,980 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

The contract was signed on 29 September 1987 with Ital Thai Marine of Bangkok for the construction of three ASW corvettes for the Royal Thai Navy. The ship was designed by Vosper Thornycroft and three were built in Thailand, with Ital Thai Marine building the first two ships and then providing technical assistance with a third which was built by Bangkok Naval Dockyard. A fourth of the class, *Srinakarin* (1804), was ordered by the Thai Police in September 1989 and delivered by Ital Thai Marine in April 1992. This ship has the same hull, but a different superstructure and much lighter armament. There are no known plans for any more of the class.

DESIGN

The design is based on the 'Vosper Thornycroft Dhofar' class 56 m design for the Oman. This was stretched by the simple expedient of increasing the frame spacing along the whole length of the hull.

MODERNISATION

Depth charge racks and mine rails may be added.

Longlom *(533). These fast corvettes are capable of 25 knots and are intended for ASW missions in the Gulf of Thailand* (Vosper Thornycroft)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Aerospatiale Exocet MM 40 medium-range anti-ship missile

There are eight MM 40 Exocet launchers in two groups of four mounted immediately before the bridge, firing across the ship. The missile is the MM 40 Block 2.

Specifications

MM 40 Block 2
Length: 5.80 m (19.0 ft)
Diameter: 35 cm (13.78 in)
Wing span: 1.13 m (3.71 ft)
Weight: 870 kg (1,918 lb)
Speed: Mach 0.9
Range: 2-40.5 n miles (4-75 km)
Warhead: 155 kg (342 lb) HE fragmentation
Fuze: Impact/proximity
Guidance: Inertial and active radar

Manufacturer/Contractor

Aerospatiale, France.

SURFACE-TO-AIR MISSILES (SAM)

Thomson-CSF Crotale NG

There is a single eight-cell launcher for Crotale VT1 missiles located aft in 'X' position. There are also eight reload missiles in a below-decks magazine. Crotale NG is based upon the new VT1 missile which can manoeuvre at up to 35 *g* and is stored in a new, slimmer, launcher container. The fire-control system, which can control two missile launchers and the 100 mm gun, is based upon the lightweight Castor radar director, which employs a 12-18 GHz J-band radar with four horn antenna on one side and a daylight TV camera with SAT-IR tracker on the other side. The launcher itself has six launch tubes on either side of the mounting and a 'TV escartometer' which helps automatically to bring the missile into line of sight with the target. The electronics fit weighs 2.6 tonnes while the loading system, which has only eight reloads, weighs 3.2 tonnes.

Specifications

VT-1 missile
Length: 2.34 m (7.68 ft)

Foredeck showing the OTOBREDA 76 mm Super Rapid and the securing apparatus for Exocet launchers (Vosper Thornycroft)

A stern view of Qahir al Amwaj *(Q 31) showing the eight-cell Crotale NG SAM launcher and the associated DRBV-21 51C fire director* (Vosper Thornycroft)

Diameter: 16.5 cm (6.5 in)
Wing span: n/k
Weight: 73 kg (161 lb)
Speed: Mach 3.5
Range: 5.4 n miles (10 km)
Altitude: 4,000 m (13,120 ft)
Fuze: RF proximity fuze
Warhead: 13 kg (29 lb) focused fragment

Manufacturer/Contractor
Thomson-CSF, Division Systèmes Electroniques, France.

TORPEDOES

Torpedo launchers are not currently mounted, but two triple 324 mm torpedo tubes may be fitted in due course.

GUNS

OTOBREDA 76 mm (3 in)/62 Super Rapid
There is one OTOBREDA 76 mm (3 in)/62 calibre Super Rapid gun in a single turret in 'A' position.

Specifications
Elevation: −15 to +85° at 35°/s
Training speed: 60°/s
Muzzle velocity: 925 m/s (3,034 ft/s)
Rate of fire: 120 rds/min
Weight of shell: 6 kg (13.23 lb)
Range: 8.5 n miles (15.75 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Oerlikon/Royal Ordnance 20 mm GAM-BO1
There are two single, unpowered GAM-BO1 mountings, one on either side of the superstructure immediately below the mast. GAM-BO1 is an unpowered, light, compact design for use in patrol operations. The ammunition box with 200 rounds is attached to the front of the mounting and the belt is fed from the right side of the gun. Spent cartridge cases are ejected between the sidewalls of the cradle into a separate compartment while the links are collected in a bag on the other side of the mounting. The GAM-BO1 mounting uses the Oerlikon KAA gun.

Specifications
Length of barrel: 85 calibres
Muzzle velocity: 1,050-1,150 m/s (3,444-3,772 ft/s)
Range:
anti-surface: 1.7 km (1,860 yd)
anti-air: 1.7 km (5,576 ft)
Rate of fire: 900 m/s (2,952 ft/s)
Round weight: 320-345 g (11.29-12.17 oz)
Projectile: 110-125 g (3.88-4.41 oz)

Manufacturers/Contractors
Oerlikon, Switzerland
Royal Ordnance, UK.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Thomson-CSF DR 3000S ESM receiver
The DR 3000S tactical ESM receiver conducts threat detection, direction finding, identification and target designation of enemy radars over the C to J frequency bands. It monitors the tactical situation in a given area, and performs Electronic intelligence (ELINT) functions. The system has a high sensitivity range with a detection capability of nearly 100 per cent, while direction finding accuracy is of the order of 6°. Highly automated operation includes the use of artificial intelligence and allows for very short reaction times. DR 3000S is available in two configurations; a single 40 kg (88 lb) masthead-mounted antenna or a two-unit hexagonal aerial, with six DF antennas.

Specifications
Frequency: C to J-bands
Azimuth coverage: 360°
Elevation coverage: −10 to +45°
Sensitivity: −68 dBm
Dynamic range: Up to 60 dB
Radar modes: 4,000 in library

Manufacturer/Contractor
Thomson-CSF, Radars and Countermeasures Division, Elancourt, France

DECOYS

ML Aviation Barricade countermeasures system
There are two MEL Barricade 12-barrelled chaff and infra-red (IR) launchers. Barricade provides ships with the means of deploying chaff and IR decoys to counter missile attacks using a layered defence against the various types of anti-ship missile. The system uses a 102 mm rocket and a redesigned launcher with four sets of triple-cell launchers. The system has a control unit and a tactical computer. The ammunition lockers each contain 24 rockets. There are four decoy modes: confusion, distraction, dump and centroid.

Manufacturer/Contractor
ML Wallop Defence Systems, Andover, Hampshire, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Tactical Information and Command System (TACTICOS)
TACTICOS is an automatic threat evaluation, weapon assignment and sensor allocation system which can also be used as a planning aid through inputs of intelligence data and decision support facilities. It is a distributed architecture system based upon SIGMA (SIGnaal Modular Architecture) multiprocessor nodes which uses SPARC architecture. These have two to seven SUN-1S type processor boards, each capable of 12.5 Mips and 16 Mbyte RAM. The nodes are housed in Multifunction Operator Consoles (MOCs) and Bus Terminal Servers (BTS). In addition to the SIGMA nodes there is a nodal resource module, a graphics host processor with R3000 32-bit CPU and R3010 FPU with 16 or 32 Mbyte RAM. There are also one or two 200 Mbyte Winchester disk drives and a 60 Mbyte tape streamer.

The package is known as the SIGMA3-S (SIGnaal Modular Architecture release 3) and the software is written in the Ada language but includes SPLICE (Subscription Paradigm for the Logical Interconnection of Concurrent Engines) distributed database and data communication software which operates alongside Unix. The hardware is linked through a dual Ethernet (IEEE 802.3) standard local area network although other standards may be used.

Some subsystems, such as the latest Thomson and Signaal sensors systems, may be linked directly to the local area network through a digital data interface bustap. Those which cannot be so linked use the BTS to interface with the local area network. The BTS has an interface board which will allow NTDS, Military Standard 1553B or other standard subsystem interface to link into TACTICOS. Every such subsystem will have its own BTS. The BTS will also have spare processing power which can be used automatically to compensate for failures in standard processor nodes.

Other hardware available includes an automatic on-line SPL plotting table with 93.5 × 65 cm plotting area, a keyboard/display unit and plasma display unit. It can track nine targets which may be manually entered and 54 from the TACTICOS sensors. There is also a General Support Station (GSS), a standard commercial workstation with 16 in (40.6 cm) raster scan display which is used for system monitoring, database support and training.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

Bridge (Vosper Thornycroft)

Close-up of the STING-EO. This combines the target acquisition and tracking radar (right) with a TV camera, IR camera and laser rangefinder (left) (Signaal)

RADARS

Type	MW 08	STING	DRBV-51C	Type 1007

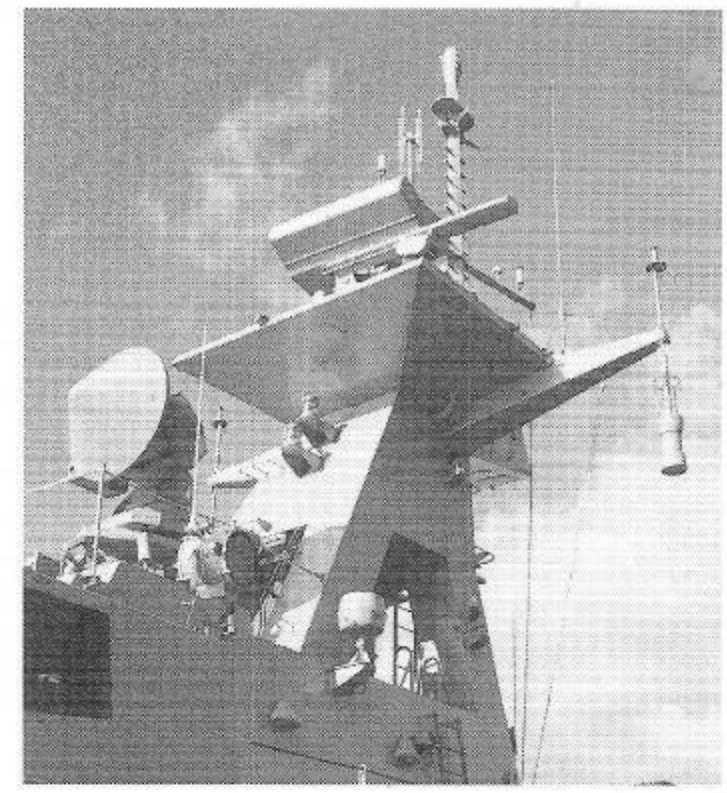
PRF	3,800 pps	I: 1,800/3,600 pps K: 7,200 pps	varied	1,600/800/400 pps
Scan rate	27 rpm	—	30 rpm	26 rpm



The mainmast. On the platform is the Signaal MW-08 air/surface search radar and, immediately below, the Kelvin Hughes Type 1007 navigation radar. Forward of the mast is the Signaal STING-EO combined radar and electro-optic fire controller. The small radome below the forward leg of the mast is probably the jammer element of the Thomson-CSF DR 3000 ECM/ESM suite (Vosper Thornycroft)

COMMUNICATIONS AND DATALINKS

Link YO

The Royal Navy of Oman purchased Link YO, which was developed in the UK by Ferranti as a digital link suitable for sale to non-NATO countries for naval and aircraft use. Different users have versions tailored to their own needs; Link YB, for example, is exclusive to the Brazilian Navy. Link Y, generally, uses a standard message format of two 24-bit words and a transmission speed of 300-1,200 bits/s.

Satcom.

WEAPONS CONTROL

Signaal STING-EO radar fire-control system

STING is a derivative of Signaal's STIR system and has been designed to provide medium-range automatic target acquisition and tracking for a variety of gun and missile systems. The functions of the STING subsystem include:

- target acquisition based on 1D, 2D or 3D target designations
- automatic target tracking with an operator-selected sensor, or automatically with a multisensor combination
- slaving to external data
- direct target handover from another tracking system
- optical surveillance under operator control.

STING provides the capability of acquiring air or surface targets under all weather conditions. The radar tracking unit applies FFT processing and has automatic RF/PRF tuning for optimal target tracking. The system uses the proven combination of I and K-bands for target tracking. This feature provides image-free target tracking under severe clutter conditions. With the added electro-optic sensors STING is capable of tracking a target either with the I and K-band radar system, with the selected electro-optics, or with a combination of the available sensors, making active radar or passive electro-optics tracking possible.

The Omani ships are fitted with STING-EO, which has a dual-frequency band, tracking feature and a TV camera for observation, with an additional IR camera and laser rangefinder with a TV/IR auto-tracking unit.

Specifications

Basic version
Antenna: Single cassegrain, 1.2 m (4 ft) diameter
Polarisation: Vertical
Beams: I and K-band pencil beams, width 1.6° and 0.4°
Transmitter: I and K-band monopulse/TWT transmitter/receiver with FFT processing. Fully coherent chain
Peak power: 2.2 kW (I-band); 30 kW (K-band)
Weight: Total system 1,700 kg (3,748 lb)

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

AVIATION

HELICOPTERS

Helicopter: The flight deck will accommodate 1 medium-sized (Cougar) helicopter. The RNO does not operate any helicopters at the moment.

PROPULSION

Specifications

System: Combined diesel and diesel (CODAD)
Main machinery: 4 Crossley SEMT-Pielstick 16 PA6 V280 STC, 20.7 MW (28,160 hp)
Shafts: 2 cp
Ship's services: 3 350 kW; 1 70 kW

FURTHER INFORMATION

PROGRAMME

Vosper Thornycroft signed the Muheet Project contract for two corvettes on 5 April 1992 and the first steel was cut on 23 September 1992.

NAMES

Qahir al Amwaj = Conqueror of the Waves
Al Mua'zzer = The Supported

STRUCTURE

The ship is based on the 'Vigilance' class design, but is somewhat larger. It also includes extensive stealth features, with both careful shaping and sloping of the hull and superstructure and wide-scale use of RAM (Radar Absorbent Material). The ships are constructed from steel cut by laser-controlled machines, which explains the absence of dimpling on the skin, which was so evident in warships constructed in the 1970s and 1980s.

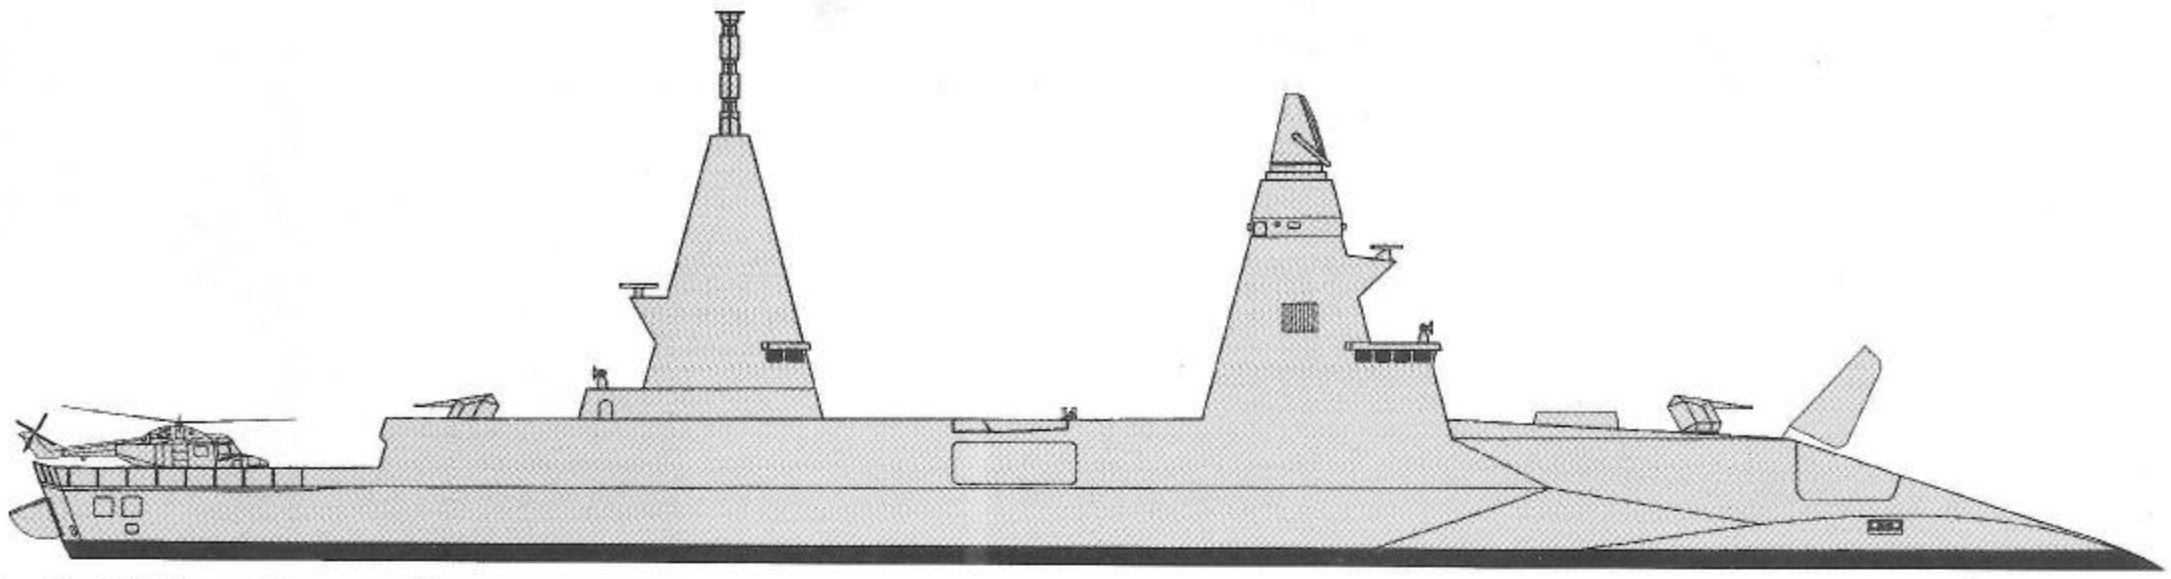
THE FUTURE

Future modifications may include fitting lightweight torpedo tubes and ATAS (Active Towed Array Sonar), which would add another 8 tonnes on the stern but would not affect the helicopter deck.

DEPLOYMENT

Sea trials for the first of class started in August 1995 and for the second in April 1996. The first of class arrived in Omani waters in September 1996.

SEA WRAITH



Sea Wraith (Vosper Thornycroft)

GENERAL SPECIFICATIONS

Country of orgin: UK

Class: SEA WRAITH

Built: Vosper Thornycroft is awaiting a first order before laying down the first of class

Dimensions
Length: 115.0 m (377.3 ft) (oa); 110.0 m (360.9 ft) (pp)
Beam: 15.5 m (50.85 ft)
Draught: 4.5 m (14.76 ft)

Speed:
Max: 28+ kts
Cruise: 15 kts
Range: 2,500+ n miles at 15 kts

Complement: 87 plus 18 spare berths

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Eight launchers mounted in the well between the two towers.

SURFACE-TO-AIR MISSILES (SAM)

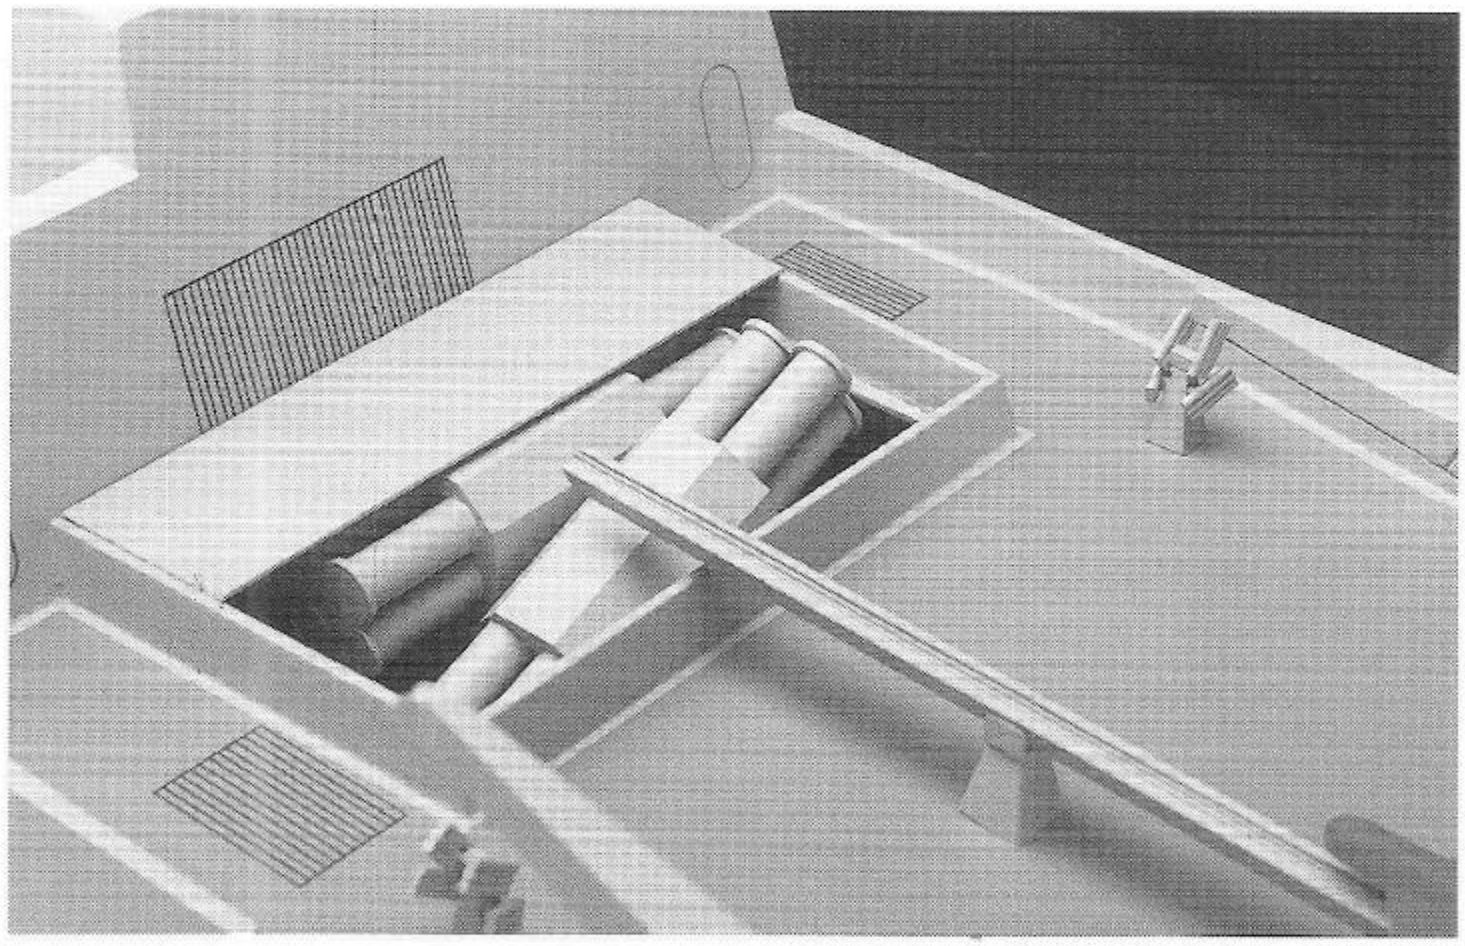
Sixteen vertical launch cells inset in foredeck.

GUNS

Medium calibre. Two with stealth turrets, one in 'A' position, one in 'X' position offset to port.
Small calibre. Two.

ARTILLERY ROCKETS

Two multicell rocket launchers in the well between the towers.



Anti-ship missile launchers are mounted on an elevator which raises them to the firing position (Vosper Thornycroft)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

ESM system integrated with static, four-faced ECM system.

ECM
Water fog system.

DECOYS

Above-water chaff and infra-red decoy system

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

An integrated command and control system will be fitted.

COMMUNICATIONS AND DATALINKs

Two datalinks will be fitted:
- Tactical datalink (for example, Link 11 or Link Y)
- Helicopter datalink (for example, Signaal Vesta)

WEAPONS CONTROL

Two radar fire-control directors.

RADARS

Radars will include:
- Phased-array surveillance radar
- FMCW surface-search radar
- Navigation radar with helicopter transponder receiver.

SENSORS

Towed-array search sonar
Expendable bathythermograph (XBT)
ASW decoys (optional)

AVIATION

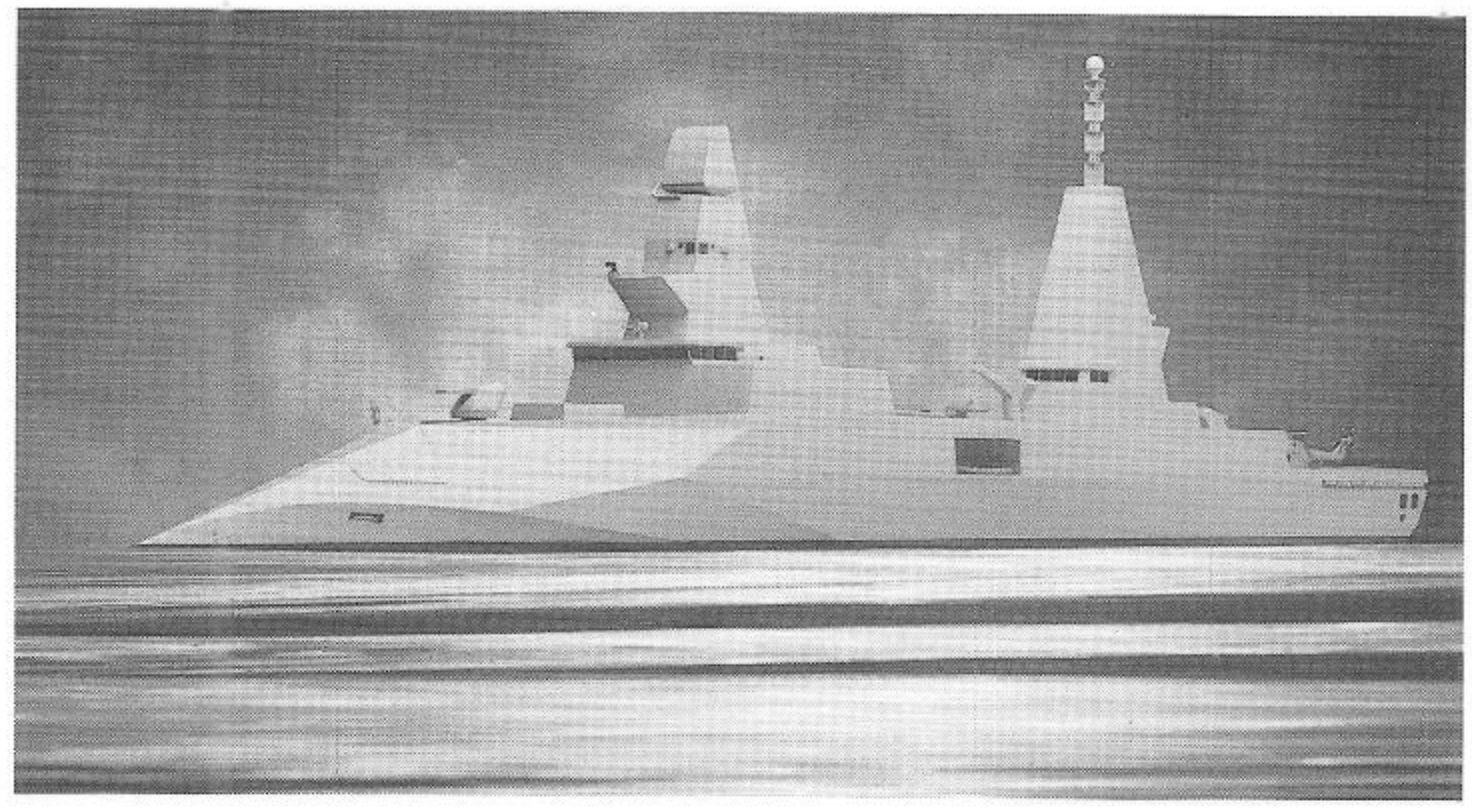
AVIATION FACILITIES

Specifications
Flight deck: 17.6 × 15.5 m (58 × 51 ft)
Hangar: Hangar for one medium/small helicopter

HELICOPTERS

One medium helicopter (for example, Lynx, SH-2, Panther).
Unmanned Aerial Vehicle (UAV)
Several ramp-launched, recoverable UAVs.

The extraordinary lines of Sea Wraith *could prove as revolutionary for ship design as the Lockheed F 117's Stealth fighter has been for aircraft design. Every feature of the ship's design is intended to enhance its stealth characteristics*
(Vosper Thornycroft)



PROPULSION

Specifications
System: Combined gas turbine and electric
Main machinery: 1 Westinghouse/Rolls-Royce WR-21 ICR gas turbine, 23.5 MW at 25° C; 2 electric motors, each 2.1 MW
Shafts: 2

FURTHER INFORMATION

DESIGN

Vosper Thornycroft has produced a unique design for a 'stealthy' corvette, which constitutes a fresh approach to several aspects of warship architecture. The aim is to produce a medium-sized warship in which Radar Cross-Section (RCS), and infra-red, noise and visual signatures have all been reduced to the minimum, thus introducing a high degree of uncertainty into hostile active and passive target acquisition systems. Among the features contributing to this are:

- A radical hull design with a wave-piercing bow, uncluttered topsides and two asymmetric towers.
- A deliberately ambiguous RCS to generate angular, range and automatic gain control disturbance within an attacking missile control system.
- A selectively variable RCS
- Radio antennas enclosed within the mast structure on the after tower, which can be raised and lowered to alter the ship's radar signature.
- A radar, atop the forward tower, that can radiate while the ship itself remains stealthy.
- A self-generated cloud of water fog to cover the ship when operating in low-thermal image diesel-electric propulsion mode.
- Large calibre weapons capable of long-range shore bombardment, naval gunfire support and anti-ship engagements.
- ASW capability, incorporating ship-mounted towed array sensor and helicopter-delivered weapons suitable for both littoral and ocean missions.
- A modern, multifunction combat suite controlling surface-to-surface missiles, surface-to-air defence systems and artillery rocket systems.
- Low manning levels afforded by a high degree of automation of the ship control and weapons command and control systems.
- Unmanned UAVs for long-range target classification and target spotting for fire missions.

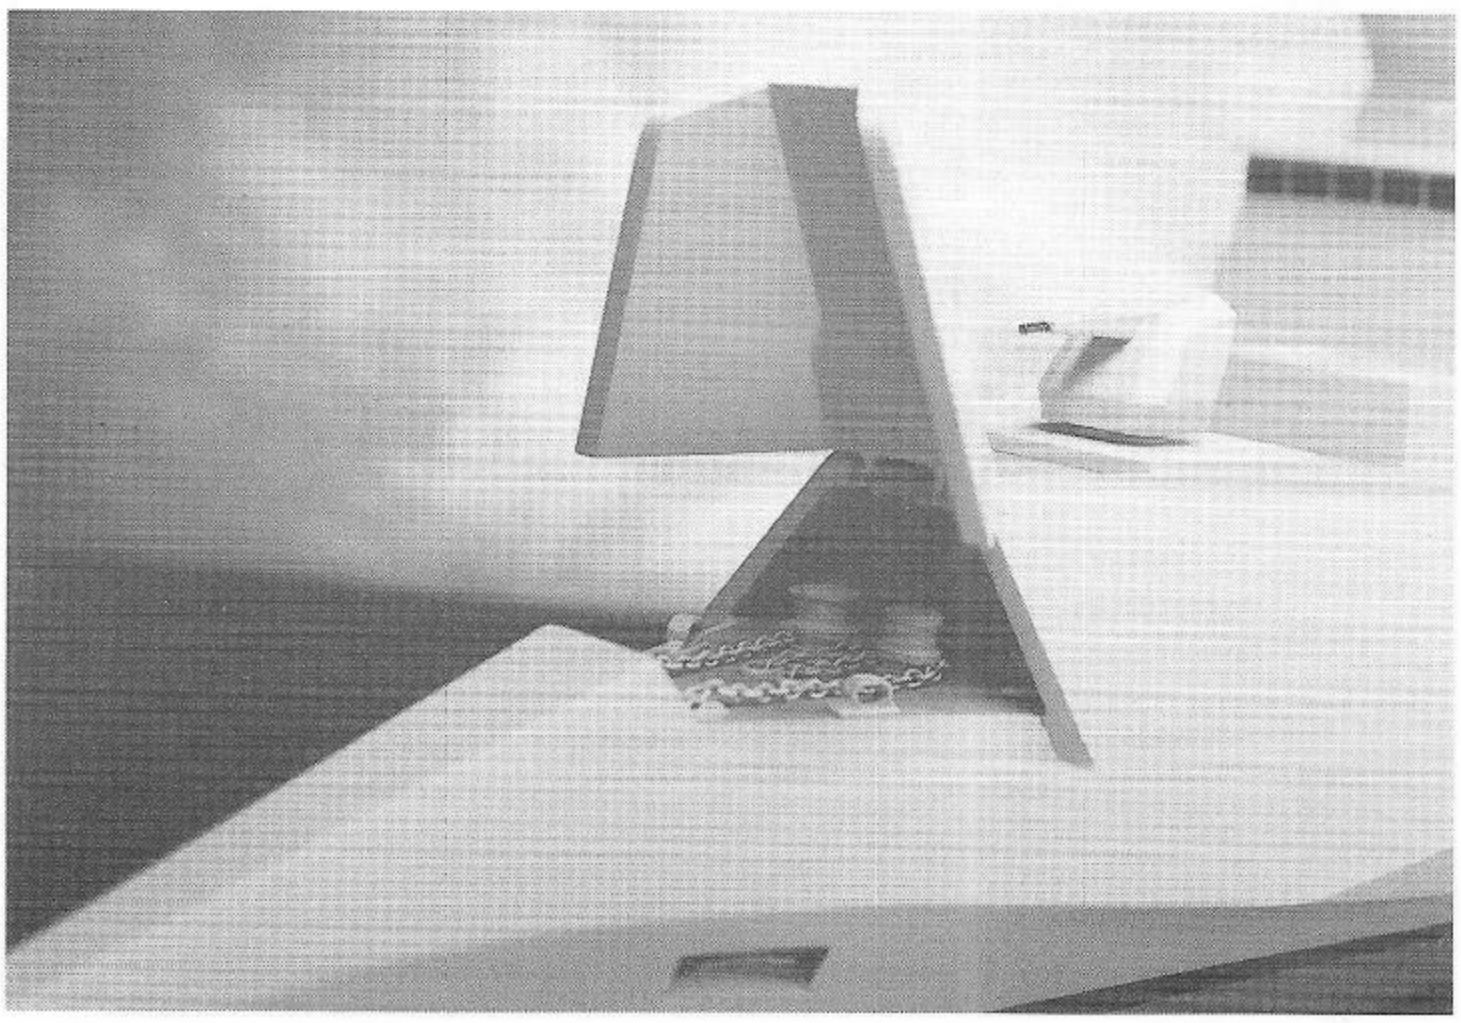
THE FUTURE

The design has been produced as a company-funded venture by Vosper Thornycroft and has been aimed at the light frigate/corvette market as being the most likely area to attract an order. The company foresees the primary roles which could be filled by the Sea Wraith as:

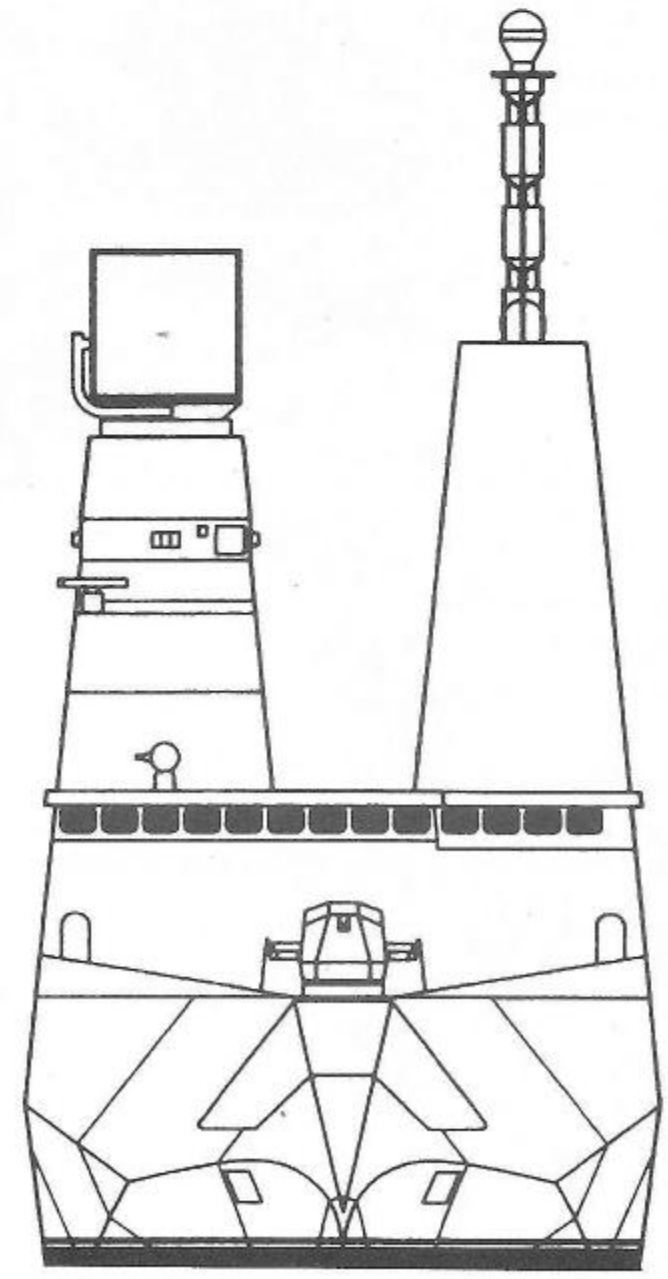
- Deterrent patrols and low-intensity operations
- Anti-submarine operations
- Naval gunfire support
- Command and control

Secondary roles could include:

- Anti-smuggling operations
- Fisheries protection
- Search and rescue
- Disaster relief



A forecastle hatch hides the capstans and chains (Vosper Thornycroft)



Sailors are used to symmetrical designs, as are the seekers in anti-ship missiles. Sea Wraith *is deliberately asymmetric to cause confusion*
(Vosper Thornycroft)

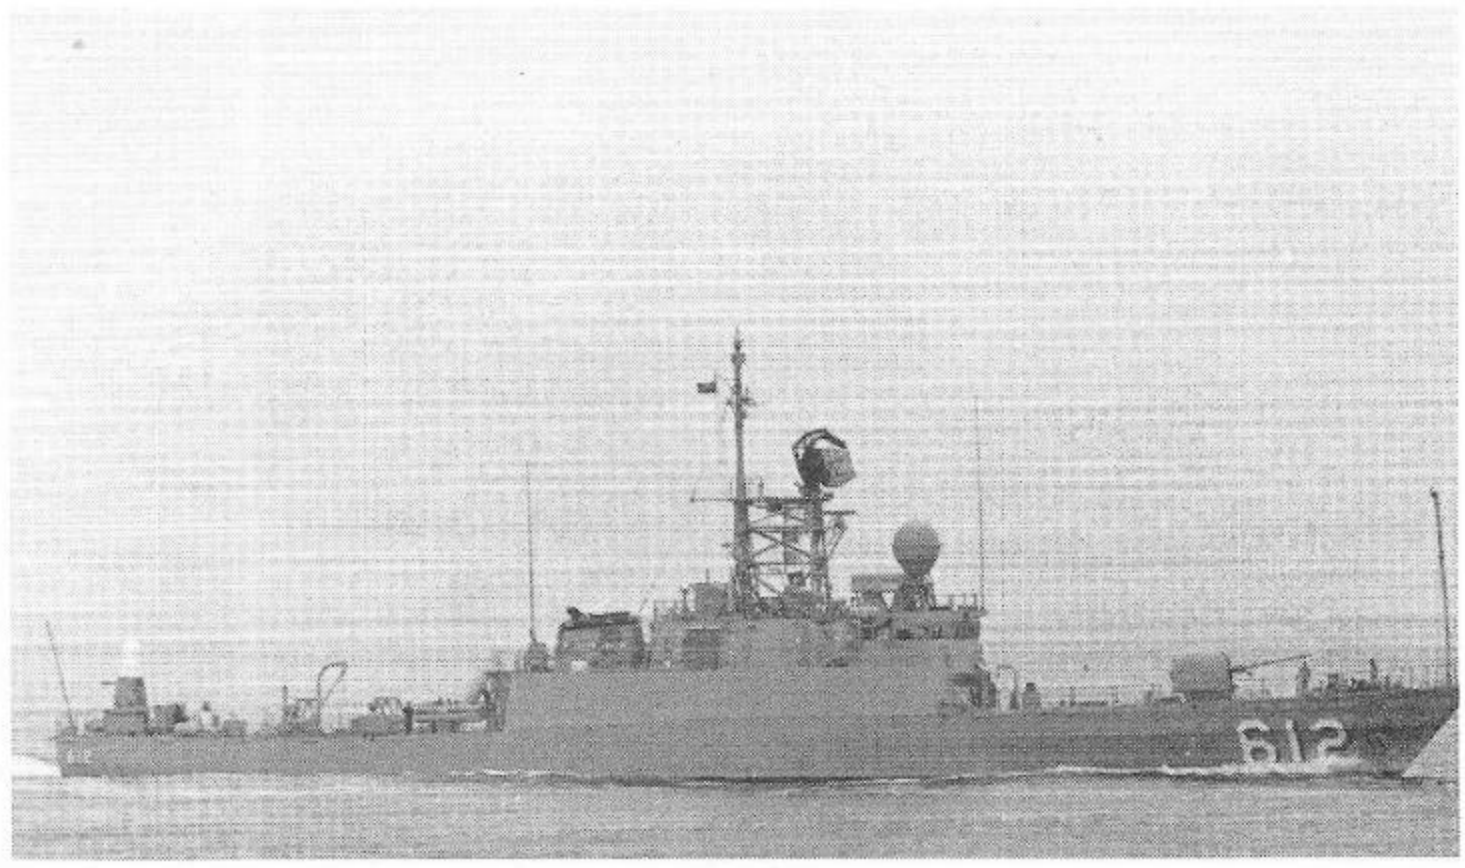
WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84C Block 1C Harpoon

Eight Harpoon anti-ship missile canisters are mounted on the quarterdeck. There are two groups of four launchers, with each group pointing across the ship to the opposite beam. The missiles are the Block 1C version, which has additional options, compared to previous blocks, one of which is to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications
Block 1C
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)



Badr *(612) one of four corvettes designed and constructed in the USA for the Royal Saudi Navy between 1979 and 1983. All are currently being refitted in Saudi Arabia with US help* (H & L van Ginderen Collection)

Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 kg)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors

McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

TUBES

US 324 mm Mk 32 torpedo tubes

Two Mk 32 triple torpedo launchers are carried.

TORPEDOES

Alliant Techsystems Mk 46 324 mm torpedo

The Mk 46 is a lightweight anti-submarine torpedo with active/passive homing to 11 km (5.9 n miles) at 40 kts. The Mk 46 is a deep diving high-speed torpedo fitted with active/passive homing head and is intented mainly for use against submarines. After water entry it uses a helical search pattern and is capable of multiple re-attacks if required. It has a maximum speed of 40 kts.

Specifications

Length: 2.59 m (8.5 ft)
Diameter: 324 mm (12.75 in)
Weight: 231 kg (509 lb)
Warhead: 44 kg (97 lb) PBXN-103 HE
Speed: 40 kts
Range: 5.94 n miles (11.0 km)

Manufacturer/Contractor

Alliant Techsystems, US.

GUNS

United Defense/OTOBREDA 76 mm (3 in)/62 Mk 75 Compact

There is one United Defense/OTOBREDA 76 mm (3 in) gun sited on the foredeck.

Specifications

Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres (4.72 m; 15.49 ft)
Traverse: 360° at 70°/sec
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,953 ft/s)
Max rate of fire: 85 rds/min
Range: 8.6 n miles (16 km)

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy.

Hughes 20 mm Mk 15 Phalanx

There is one Hughes 20 mm Mk 15 Phalanx Close in Weapon System (CIWS) situated at the stern. The mount consists of a 20 mm M61A1 Vulcan, six-barrel, Gatling-principle gun with a cylindrical magazine and feeding mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications

Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,380 ft/s)
Rate of fire: 3,000 rds/min (Block 0, Block 1 Baseline 0), 4,500 rds/min (Block 1 Baseline 1)
Range: 0.75 n miles (1.38 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor

Hughes Missile Systems, Tucson, Arizona, USA.

Oerlikon 20 mm/80

Two single Oerlikon 20 mm guns are mounted either side of the stack.

Specifications

Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,739 ft/s)
Range:
anti-surface: 1.5 km (4,920 ft)
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +55°

Manufacturer/Contractor

Oerlikon, Switzerland.

M252 81 mm mortar

This is usually an army weapon, but one is carried in each ship.

Specifications

Calibre: 81 mm
Max range: 5,775 m (6,316 yd)
Min range: 100 m (110 yd)
Rate of fire (sustained): 15 rds/min

Mk 19 40 mm Automatic Grenade Launcher

Two Mk 19 grenade launchers are carried in each ship. These are essentially close-range infantry weapons and it is assumed that they are used in close-quarter engagements with small, lightly-armed ships, such as blockade runners and smugglers. It is not particularly accurate and time of flight to 2,000 m (2,187 yd) is about 17 seconds.

Specifications

Range: 2,200 m (2,400 yd)
Muzzle velocity: 240 m/s (785 ft/s)
Rate of fire: 350-400 rds/min

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

AN/SLQ-32(V)1 ESM suite

AN/SLQ-32(V)1 detects all Band 3 radar frequency signals at all azimuths, covering all potential enemy radar-guided, anti-ship missiles and their associated supporting radars, and provides alert facilities to an attack on the ship and also allows for the control of the Mk 36 chaff rocket system.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launchers

There are two Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units.

Specifications

Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)
Barrels: 6

Rounds
Mk 182: 1,209 × 130 mm; 22.7 kg
Super Chaffstar: 1,209 × 130 mm; 20.9 kg
Super Gemini: 451 × 130 mm; 5.5 kg
Super Hiram III: 1,220 × 130 mm; 13.6 kg
Super Hiram IV: 467 × 130 mm; 3.8 kg
Super Loroc: 734 × 130 mm; 13.2 kg

Manufacturers/Contractors

Loral Hycor Inc, Woburn, Maryland, USA.
Tracor Aerospace Inc (SCIP), Austin, Texas, USA.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Mk 24 optical director

There is one Mk 24 optical director.

Mk 309 Mod 1 anti-submarine fire-control system

Officially designated Control Panel Mk 309, this compact anti-submarine fire-control system was developed in the late 1960s and combines basic displays with the capabilities needed to direct anti-submarine operations involving tube-launched torpedoes. The bulkhead-mounted panel combines the functions of a target-bearing and range indicator, a repeater of own-ship heading, a torpedo presetter and a firing panel. It also displays attack recommendations, defining the direction of the torpedo track and the firing range most suitable for a given tactical situation, as well as generating course-to-steer orders for transmission to remote indicating equipment. Where interlocks are required they are related only to basic safety requirements. The panel does not have a computer but uses a memory based upon a series of shore-developed simulations incorporating the experience of 40,000 torpedo attack exercises, which have been analysed to produce a range of attack solutions for both ship and weapons. During an attack, data is fed to the panel from the gyrocompass and the hull-mounted sonar (range and bearing) and the data is then compared with the attack solutions in the memory to find the appropriate one. The Mk 309 recommends which courses to steer for interception then launching the torpedoes. It also indicates the minimum and maximum ranges at which the torpedo should be launched, based upon the tubes being at a 45° angle, and which angle-on-bow approach should be taken. It will also indicate when the ship should turn to unmask the launchers.

Mk 92 Mod 5 fire-control system

Mk 92 is an Americanised version of the Signaal WM28 system, produced under licence by Unisys. Mk 92, with its distinctive egg-shaped housing, together with the STIR (Signaal Track and Illuminating Radar), provides continuous air and surface search around a ship even in an ECCM environment. It has a fast reaction time and is capable of simultaneous engagement of up to four

surface targets, or two air and two surface targets. The system can engage air, surface or shore targets with guns or missiles. It is fully compatible with Naval Tactical Data Systems (NTDS) and interfaces with the Mk 13 Mod 4 missile handling/launching system, the Mk 75 gun and the Mk 15 Phalanx CIWS.

The Mk 92 consists of a combined antenna system, a separate track illuminating radar, a computer system, weapon control consoles and ancillary equipment, and has a crew of four. The Mk 53 Combined Antenna System (CAS) consists of a monopulse track radar with CW injection above and a track-while-scan radar. Their antennas share a stabilised mount with the monopulse antenna above and the TWS antenna below. The monopulse radar can detect, track and illuminate one target in the air or on the surface. The TWS radar can detect and track up to two surface or shore targets simultaneously, as well as low-altitude targets.

The Lockheed STIR (in American terminology Separate Track Illuminating Radar) is an I/K-band monopulse tracking radar with CW injection which is designed to provide an additional channel of fire for a single air or surface target. It consists of a Mk 54 director with antenna.

There are two 32-bit AN/UYK-7 computers, each with 256 k memory and an optimum operating speed of 667 kops, the second computer having been added to improve the processing of ASW data. There are two Weapons Control Consoles (WCC) in the Combat Information Centre (CIC) to provide a Human Computer Interface (HCI) for acquiring and tracking targets, engagement control, launcher assignment, missile firing and post-engagement evaluation. The Mk 106 WCC supports the CAS and the Mk 107 WCC supports the STIR, but both also receive video data from ship search radars. Between the WCCs are the CIWS and Harpoon control stations and the CIC also has five consoles from the AN/UYA-4 family.

Manufacturer/Contractor
Unisys Corporation, Government Systems Group.

SONAR

AN/SQS-56 (DE 1160)
DE-1160 is a hull-mounted, active search and attack, medium frequency, digital sonar, which uses an active/passive pre-formed beam, panoramic echo ranging and panoramic (DIMUS) passive surveillance. All signal processing is accomplished with digital hardware. All signal data are presented on flicker-free, digitally refreshed television type raster scan CRT displays with symbol and alphanumeric facilities. A single operator can search for, track, classify and designate multiple targets from the active system while simultaneously maintaining anti-torpedo surveillance on the passive display.

Manufacturer/Contractor
Raytheon, USA.

PROPULSION

Specifications
System: Combined diesel or gas turbine (CODOG)
Main machinery: 1 General Electric LM-2500 gas turbine, 17.2MW (23,000 hp); 2 MTU 12V 652 TB91 diesels; 2.55 MW (3,470 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These four corvettes were ordered from Tacoma in 1977 and were delivered between 1980 and 1983 at the start of a major programme to update the Royal Saudi Navy.

DESIGN

These were very similar in design and layout to the rather smaller 'Al Siddiq' class of fast attack craft, which were being built concurrently. Both types have an identical propulsion system and on double the displacement, the 'Badr' class carries only two more Harpoons and the twin 324 mm torpedo tubes.

It is a curious feature of both classes that their weapons fit includes an 81 mm mortar and two 40 mm grenade launchers. These are high-angle, low-velocity weapons, whose accuracy, particularly in a heavy sea, must be very low. The ships are fitted with roll dampers.

MODERNISATION

All four 'Badr' class ships are being refitted in Saudi Arabia with US assistance.

OPERATIONAL

All four are currently based at Al Jubail on the east coast.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas RGM-84D-1A Block 1C Harpoon

Eight Harpoon anti-ship missile canisters are mounted immediately abaft the mainmast; there are two groups of four launchers each, with one group pointing across the ship to the opposite beam. The missiles are the Block 1C version, which has additional options, compared to previous blocks, one of which is to fly at a relatively high altitude for the first part of its path to avoid friendly ships or intervening low landmasses. A second option is to approach the target indirectly, using up to three preselected waypoints, where course can be changed at angles greater than 15°. Block 1C missiles can also use selectable seeker search expansion patterns, and for the terminal phase have the alternatives of a sea-skimming approach or a low-apogee 'pop-up' trajectory.

Specifications

(Block 1C)
Length:
with booster: 4.63 m (15.19 ft)
without booster: 3.84 m (12.59 ft)
Diameter: 34 cm (1.12 ft)
Wing span: 83 cm (2.72 ft)
Weight:
with booster: 681.9 kg (1,503 kg)
without booster: 519.3 kg (1,145 lb)
Max speed: Mach 0.85
Range: 67 n miles (124 km)
Propulsion: Teledyne CAE J402-CA-4000 single-spool turbojet; 2.92 kN st.
Booster: Thiokol or Aerojet rocket; 5,400 kg thrust for about 2.9 s.
Warhead: 221.6 kg (488.5 lb) semi-armour-piercing
Fuze: Contact delay
Guidance: Inertial and active radar

Manufacturers/Contractors

McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

SURFACE-TO-AIR MISSILES (SAM)

The Albatros system comprises three elements:
Riva-Calzoni launcher
Aspide missile
WM 25 fire-control system

Riva-Calzoni Albatros launcher

The single, eight-cell Albatros launcher is located on the quarterdeck in 'Y' position. Produced by Riva-Calzoni, it has eight launch cells, four on each side of the mounting, each with a frangible front and rear cover. Each cell contains a loading guide to which the launching rail of the missile is electrically and mechanically connected. The 16 reload missiles are stored horizontally in a hydraulically-operated store and reload system in the deckhouse forward of the launcher; they are in four rows of four missiles each, their location corresponding to that of the launcher cells, and each storage cell has an autonomous missile travel device.

Specifications

(Albatros launcher)
Height: 2.98 m (9.8 ft)
Width: 3.82 m (12.5 ft)
Length: 3.82 m (12.5 ft)
Weight (loaded): 8.5 t
Traverse: 360° at 45°/s
Elevation: −5 to +80° at 25°/s.

Alenia Aspide missile

The system uses the Alenia Aspide SAM, a missile developed by Alenia from the US Sparrow. Targets are detected by the ship's primary search radar and then allocated to the Signaal WM 25 fire-control system. The target is acquired by the fire-control system radar and the CW transmitter group injects signals into the fire-control system tracker as the launcher slews in the target's direction. The missile control system selects the missile or missiles which the power supply units then prepare for launch. Total system reaction time is 8 seconds. When the decision is made to engage the target with missiles the reversible pre-launch commands are issued. The firing command itself can be issued automatically or manually, the operator also having the options of a single shot or salvo mode. In the latter, two missiles are launched sequentially against the same target, the maximum firing rate of the system being one missile every 2.5 seconds. Upon launch, the missile is gathered into the tracker-illuminator's beam through a direct signal to the rear receiver and homes on the reflected energy from the target. Up to three missiles at

once may be controlled by the tracker, according to the manufacturer. They also claim the system can engage horizontal targets at up to 8.1 n miles (15 km), vertical ones at 2.7 n miles (5 km) and lateral ones at 4.3 n miles (8 km). A short reaction time gives the system the ability to destroy anti-ship missiles even when detection is late.

Specifications
(Aspide missile)
Length: 3.7 m (1 ft)
Diameter: 20.3 cm (8 in)
Wing span: 80 cm (2.6 ft)
Weight: 220 kg (485 lb)
Speed: Mach 2.5
Range: 7 n miles (13 km)
Altitude: 15-5,000 m (49-16,400 ft)
Warhead: 33 kg (73 lb)
Guidance: Semi-active radar

Manufacturers/Contractors
Alenia Elsag Sistemi Navali, Rome, Italy (system/ missile).
Riva-Calzoni, Bologna, Italy (launcher).

TUBES

Six 324 mm US Mk 32 torpedo tubes in two triple mounts are located on the after superstructure immediately ahead of the Harpoon launchers.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width: 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

TORPEDOES

Sting Ray lightweight anti-submarine weapon
The 'Rattanakosin' class carries British Sting Ray torpedoes. Sting Ray features active/passive homing to 5.9 n miles (11 km)at 45 kts and a 35 kg (77 lb) Torpex shaped charge warhead developed by Royal Ordnance and may be used in deep or shallow waters. It is equipped with a pumpjet propulsion system. The onboard sonar is reported to be multimode and narrow-beam. The narrowband capability provides good Doppler discrimination against slow or quiet targets and the broadband capability gives good target discrimination, range and bearing resolution.

Sukhothai *(442). Two of these corvettes were built for the Royal Thai Navy by Tacoma, Washington in 1984-87* H & L van Ginderen Collection)

Specifications
Length: 2.59 m (8.5 ft)
Diameter: 324 mm
Weight: 267 kg (588 lb) (in air)
Warhead: 35 kg (77 lb)
Speed: 45 kts (estimated)
Range: 6 n miles (11 km) (estimated)
Endurance: Approximately 8 minutes
Depth: 750 m (2,460 ft)

Manufacturer/Contractor
GEC-Marconi Underwater Weapons Systems Ltd, Waterlooville, Hampshire, UK.

GUNS

OTOBREDA 76 mm (3 in)/62 Compact
There is one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck for use in either air defence and anti-surface roles. If the weapon is designated to the air-defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission.

Specifications
Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres
Traverse: 360° at 70°/sec
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,952 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Oerlikon 20 mm
Two single Oerlikon 20 mm guns are mounted on the upper deck either side of the foremast.

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,739 ft/s)
Range:
anti-surface: 1.5 km (4,920 ft)
anti-air: 1,150 m (3,770 ft)
Rate of fire: 450 rds/min
Round weight: 241 g (8.5 oz)
Projectile: 122 g
Elevation: −15 to +55°

OTOBREDA 40 mm/70 Compact (Type 70) twin mounting
One twin 40 mm turret is mounted forward in 'B' position.

Specifications
Traverse: 360° (nominal) at 90°/s
Elevation: −13 to +85° at 60°/s
Rate of fire: 600 rds/min/mount)
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 4,000 m (13,120 ft)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Elettronica Newton EW suite
These ships carry the Elettronica Newton EW suite, which consists of an ESM section and an ECM section, with the related antennas, controlled from an operator console. The ESM section (ELT/211 receiver) provides 100 per cent intercept probability, passive surveillance, automatic instantaneous warning of programmed threat, automatic analysis of threat parameters, automatic identification and tracking of threats, a synthetic data display, instantaneous Direction Finding (DF) and broad frequency coverage. The ECM section provides self-protection by noise jamming using the ELT/318 jammer.

Manufacturer/Contractor
Elettronica SpA, Rome, Italy.

DECOYS

CSEE DAGAIE Mk 2 countêrmeasures system
The decoy system uses French CSEE DAGAIE Mk 2 ten-barrelled, trainable launchers. These can be loaded with either infra-red (IR) or chaff rockets. The firing sequence runs automatically once triggered by a missile alarm from a variety of sources, such as radar, ESM systems, or optical sights, thus providing a very short reaction time. The firing direction is optimised in accordance with the threat bearing, wind speed and direction, ship heading and speed data.
The launching of radar and IR decoys is so arranged that advanced mixed-guidance missile systems cannot discriminate them and thus collocation of both decoys is achieved. The installation is a double mounting and comprises two trainable mountings carrying 10 replaceable containers (suitcases), each of which is loaded with either IR or I/J-band chaff projectiles.

A wide range of ammunition is provided by Etienne Lacroix Defense providing seduction, distraction and seduction/ dissimulation modes. The electromagnetic decoys are normally based upon aluminised fibreglass chaff with rapid bloom time and they cover the I and J frequency bands. The infra-red decoys cover both the 3-5 and the 8-14 µm bands.

Specifications
Traverse: 330° at 21°/s
Average reaction time: Within 4 s
REM rocket dimensions: 850 × 127 mm (33.5 × 5 in)
Rocket weight: 13 kg (28.66 lb)
Container dimensions: 900 × 130 mm (35.4 × 5.1 in)
Container weight: 20 kg (44.1 lb)
LIR/LEM container dimensions: 780 × 630 × 134 mm (30 × 24.8 × 5.3 in)

Manufacturer/Contractor
CSEE Dèfense, Paris, France.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Sensor Weapon Control and Command System (SEWACO)
The export version of Signaal's SEWACO system is named FORESEE (Command, Communications, Control and Co-ordination or 4C), with the version for Thailand being designated 'FORESEE TH'. At the heart of the system is the C^2 system (FORESEE) which is designed to present raw and/or processed sensor data from search and fire-control radars together with IFF, sonar, electronic warfare and electro-optic systems to create a picture of the tactical situation. This data is provided by onboard or offboard sensors through a tactical datalink. The data may also be used to designate

targets to weapon systems and to assist in operations with auxiliary functions such as ASW helicopter direction and tactical navigation.

The C² systems of the 1980s feature a mainframe architecture which uses up to three Signaal computers of the SMR family. The SMR is a mainframe computer designed to be plugged into standard 19 in racks and in a variety of memory sizes, originally 8 to 64 k. In this SMR the maximum capacity of the main memory was 65,538 24-bit words and memory access time was 0.625 µs. The SMR family has been improved to reduce physical size and to increase memory and speed leading to the SMR-MU micro-mainframe computer for general purpose, real-time, processing.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

Signaal LIROD 8 optronic director
LIROD (Lightweight Radar Optronic Director) is a lightweight fire-control system based upon a K-band tracking radar and a TV camera and is designed for simultaneous control of two dual-purpose guns while tracking one air and one surface target. The system reaction time from detection to the beginning of the engagement is about 4.5 seconds. It is based upon a 0.6 m (1.97 ft) diameter parabolic antenna with monopulse cluster. It has a very narrow pencil beam and is resistant to clutter through the application of pulse Doppler tracking combined with FFT techniques. There are also sophisticated Electronic Counter-CounterMeasures (ECCM) facilities. The radar can track fighter-size targets up to 9.7 n miles (18 km) away and is capable of tracking targets with a maximum speed of 1,000 m/s (3,280 ft/s). In addition to the radar there is a militarised TV camera with CCIR standard video format, which can detect fighter-size targets at about 5.44 n miles (10 km) and large surface ships at about 10.9 n miles (20 km).

Specifications
Director
Traverse: 360°/s at 120°/s

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Netherlands.

SONARS

STN Atlas DSQS-21C
DSQS-21C is a hull-mounted, active search and attack sonar operating at medium frequency. The DSQS-21 features computer-aided detection and tracking and the information is presented on colour CRT displays to permit Doppler coding and discrimination of data.

Specifications
Diameter of transducer arrays: 1 m (3.28 ft)
Number of preformed beams: 32

Manufacturer/Contractor
STN Atlas Elektronik, Bremen, Germany.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU 20V 1163 TB83, 10.83 MW (14,730 hp)

Shafts: 2
Propellers: 2 KaMeWa

FURTHER INFORMATION

PROGRAMME
The contract with Tacoma was signed on 9 May 1983, but the initial intention to build a third was overtaken by the decision to order the 'Khamronsin' class (Vosper) corvettes. The first of class was laid down on 6 February 1984 and launched on 11 March 1986, followed by the second which was laid down on 26 March 1984 and launched on 20 July 1986.

DESIGN
These ships are very similar in size to the 'Badr' class ships built by Tacoma for Saudi Arabia, which were launched in 1980-81, although they have a much more substantial superstructure. Also the Saudi ships have CODAG propulsion, while these Thai ships have two diesels.

One of the features of these ships is the multisourcing of systems and subsystems, which must have led to some problems of integration when working up, and cause maintenance and supply problems to this day. Thus, the ships were built in the USA but have German engines, American SSMs, Italian SAMs, Italian and Swiss guns, US torpedo tubes firing British torpedoes, French decoys triggered by an Italian ESM system and a German sonar, all tied together by a Dutch command system.

FUTURE
Weight has been allowed for a Phalanx system, for which space has already been earmarked on the roof of the deckhouse aft of the Harpoon launchers.

Guidance: Inertial and active radar

Manufacturers/Contractors

McDonnell Douglas Aerospace, St Louis, Missouri, USA (prime and missile).
US Naval Weapons Center, China Lake, California, USA (warhead).
Thiokol, Elkton, Maryland, USA (booster).

Gabriel II

Eight single Gabriel launchers are located in the waist, four on each side. The Israeli missile complements Harpoon and uses radar or optical guidance and semi-active homing out to a range of 19.4 n miles (36 km) at a speed of Mach 0.7. The earlier Gabriel I has a semi-active seeker and is powered by a booster producing 3,600 kg (7,937 lb) of thrust for 3 seconds and a sustainer which burns for 100 seconds, while Gabriel II has improved guidance and a larger sustainer which burns for 200 seconds.

The Gabriel system consists of the fire-control radar, a Display Control and Processing Unit (DCPU), a vertical reference unit, a remotely-operated optical sight and a launcher switch. It requires two operators, one for the DCPU and the other for the optical sight. In addition to this hardware, the system includes a bridge control unit which also indicates missile status and a helmsman unit which indicates which course to steer in order to bring the selected launcher to the correct bearing.

The DCPU consists of a computer, target/missile tracking, missile guidance and missile selection/firing units, power supply and operating panel. The launching system is linked to the DCPU by a launcher switch and a launcher power unit. The missile is mounted on a rail inside a hermetically sealed, steel container with a hydraulically-operated container door.

Targets acquired by the ship's search radar are presented on the DCPU display screen. The operator then selects a missile or missiles, provides target range and bearing, sets the cruise-phase height then initiates the launch sequence. When this occurs the launcher opens, the booster is ignited and then carries the missile away from the ship and towards the target at a height of 35 m (115 ft), enabling the system to gather the missile within the radar beam which controls

direction. At about the same time the sustainer ignites and the missile enters the cruise phase, dropping to a height of 17 to 20 m (56 to 66 ft). It informs the ship of its location through the downlink and the DCPU controls its direction through the uplink, the radio altimeter ensuring that it maintains the correct height.

When the seeker acquires the target through reflected energy, the missile then descends lower for the low-level terminal phase at a height of 2.5 to 3.5 m (8.2 to 11.5 ft).

There is an alternative manual/optical control system for use in severe ECM conditions, in which the optical periscope operator aligns the missile to the target manually using a joystick to control the missile. In addition Gabriel II is reported to have a home-on-jam capability to meet the same conditions.

Specifications
Gabriel II
Length: 3.42 m (11.2 ft)
Diameter: 34 cm (13.4 in)
Wing span: 1.35 m (4.4 ft)
Weight: 522 kg (1,151 lb)
Speed: Mach 0.7
Range: 19 n miles (35 km)
Warhead: 150 kg (330 lb)
Guidance: Semi-active radar and manual

Manufacturer/Contractor
Israel Aircraft Industries (IAI), Ben Gurion International Airport, Israel.

SURFACE-TO-AIR MISSILES (SAM)

Barak-I point defence system
Each ship has two Barak-1 vertical launch units, each containing 32 missiles: one is mounted aft of the stack, the other on the fordeck immediately forward of the bridge screen. The Barak-1 point defence missile system is designed to protect ships against both manned aircraft and anti-ship missiles; it has a quick reaction time, typically 3 seconds, which includes 0.6 seconds to turn-over in the anti-missile role. The Barak-1 missile is powered by a triple-thrust rocket motor, giving it a speed of approximately Mach 2.

The fire-control system is based upon the Elta EL/M-2221GM I/J and K-band monopulse coherent tracking and illumination radar which is supplemented, on its right-hand side, by a Rafael thermal imager. The radar has a dish antenna with front feed on four 'legs', with an elevation of −25 to +85°. Search acquisition and tracking may be conducted in either I/J (8-20 GHz) or K-bands (20-40 GHz) and it can track the target or targets while controlling two missiles. The system can also be used to control guns, possibly with the assistance of a separate ballistic computer. The Fire-Control Console (FCC) is used to control both the Barak weapon system (through the missile control unit) and also guns (through the gun control unit) and it acts as interface between the Barak weapons system and other ship systems. Upon acquisition of the target/targets by the ship's search radar, the fire-control radar designates the targets and the system automatically calculates the level of threat from each target, allocates a missile or missiles and automatically launches them. In the anti-ship missile role the Barak-1 leaves the launcher vertically and is then 'turned over' towards the target by the thrust vector control system which is automatically discarded, presumably by explosive bolts, upon completion of the task. The missile is acquired and controlled by the fire-control radar which then guides it towards the target. The missile is capable of engaging targets 2 m (6.56 ft) above the sea and can manoeuvre at 25 *g*.

Specifications
Length: 2.17 m (7.12 ft)
Diameter: 17 cm (6.7 in)
Wing span: 68.4 cm (27.0 in)
Weight: 97.9 kg (215.8 lb)
Speed: Mach 2 (580 m/s (1,900 ft/s))
Range:
anti-aircraft: 500 m to 12 km (6.5 n miles)
anti-missiles: approximately 5 km (16,000 ft)
Guidance: Command/line of sight or optical
Warhead: 22 kg (48.5 lb) HE fragmentation

Eilat *(501) with Phalanx, Barak and Harpoon weapons installed* (Ingall's Shipbuilding)

Manufacturers/Contractors
Israel Aircraft Industries (IAI), Ben Gurion International Airport, Israel (prime).
Rafael, Haifa, Israel (launch unit).

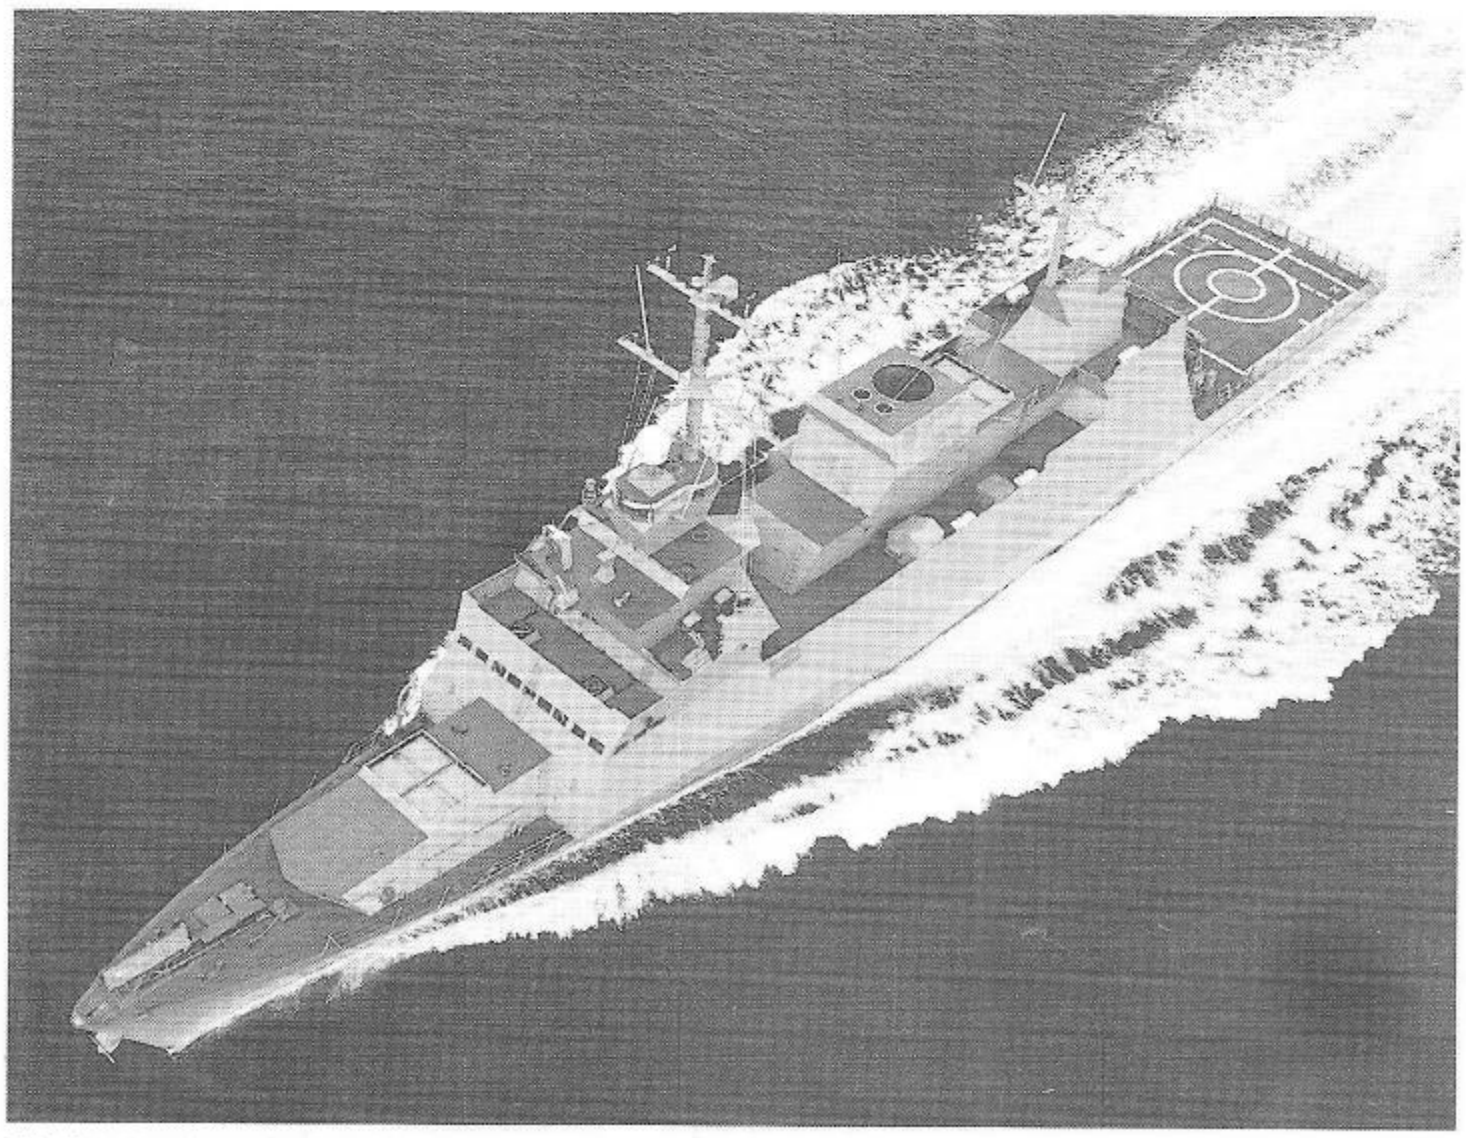
TUBES

324 mm Mk 32 torpedo launcher
Two triple 324 mm US Mk 32 Mod 9 torpedo tubes are located in the waist; each group of three is inside the superstructure and launches the torpedoes through a hatch in the ship's side.

TORPEDOES

Alliant Techsystems Mk 46 324 mm torpedoes

Specifications
Length: 2.59 m (8.5 ft)
Diameter: 324 mm (12.75 in)
Weight: 230 kg (507 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,510 ft) (estimated)



Eilat *(501) prior to the installation of weapons. The forward deckhouse has a mounting for the gun module (76 mm, 57 mm or 30 mm CIWS) and a housing for the 64-round Barak I vertical launcher. Note the profusion of angles and the IR filters on the stack, all designed to reduce the ship's image to hostile radars and IR seekers* (Ingall's Shipbuilding)

GUNS

These ships have a unique facility, in that in 'A' position there is a special deck mounting which enables the actual mount to be rapidly changed between an OTO-BREDA 76 mm main gun, a Bofors 57 mm and a Phalanx close in weapons system. This ability to change the mount appears to be exercised and it is thus impossible to predict which of the three weapons the ships will be armed with at any one time. It is also not known what tactical criteria would be applied by the Israeli Navy in selecting any one system or how long a change would take.

OTOBREDA 76 mm (3 in)/62 Compact
The OTOBREDA 76 mm (3 in) gun is for use in either air defence or anti-surface roles. If the weapon is designated to the air-defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission.

Specifications
Calibre: 76.2 mm (3.0 in)
Length of barrel: 62 calibres
Traverse: 360° at 70°/sec
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,952 ft/s)
Max rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Hughes MK 15 CIWS Phalanx

The second alternative in 'A' position is a single Hughes Mk 15 Phalanx Close In Weapons Systems (CIWS) to provide the innermost layer of defence against anti-ship missiles. The 20 mm M61A1 Vulcan, six-barrel, Gatling-principle gun has a cylindrical magazine with the feed mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications

Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,380 ft/s)
Rate of fire: 3,000 rds/min
Range: 0.75 n miles (1.38 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor

Hughes Missile Systems, Tucson, Arizona, USA.

Bofors SAK 57 L/70 Mk 2

The third alternative in 'A' position is the Bofors SAK 57 L/70 Mk 2, which is intended to engage air and surface targets and to provide gunfire in support of troops ashore. It is house inside a 'stealthy' shield.

Specifications

Calibre: 57 mm
Length of barrel: 70 calibres
Traverse: 360° at 55°/s
Elevation: −10 to +77° at 40°/s
Crew: 3
Range: 9 n miles (17 km)
Rate of fire: 220 rds/min
Projectile weight: 2.4 kg (5.3 lb)

Manufacturer/Contractor

Bofors Weapon Systems, Sweden.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Elisra NS-9003A ESM system

The NS-9003A naval ESM system operates in a dense environment to carry out ESM and is able to cope with frequency agility, frequency-hopping, and staggered or wobbulated PRI emitters. The system automatically receives, analyses and identifies over-the-horizon radar signals with a 100 per cent probability of intercept over the frequency range from 2 to 18 GHz (0.5 to 40 GHz optional). The direction of arrival is instantaneously measured per pulse, using an accurate multibeam antenna array. This instantaneous direction finding enables the system to locate any exotic-type radar signal in the reception range within a fraction of a second. The analysed information is presented on a 19 in graphic situation display in several operator-selected modes for various EW tasks. The system has built-in power management provisions for ECM and chaff/flare activation. The NS-9003A antenna assembly includes a multibeam static antenna array with associated RF video and digital DF processing hardware, and an omni-directional antenna array. Other units in the system are: receiving and processing equipment and an operator console. Interface to radar blankers, gyro equipment, weapon system, ECM jamming and deception system, chaff/flare equipment and satellite navigation system can also be provided.

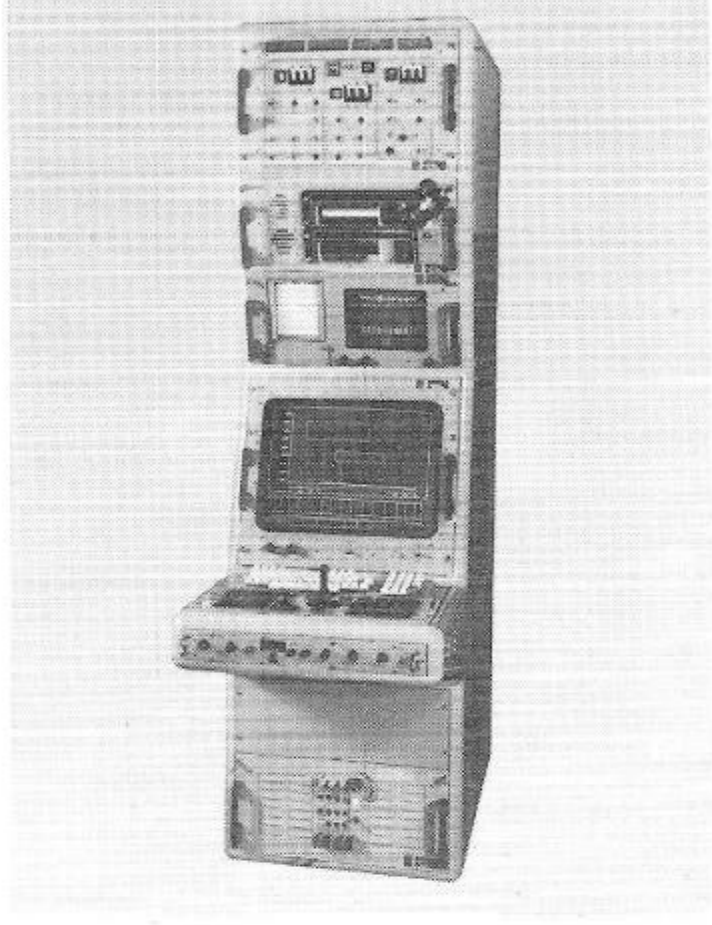
Although an integrated EW suite consisting of the NS-9003A and the NS-9005 jamming and deception system is available the Israeli Navy has selected the Rafael RAN-101 jammer for this installation (see next entry).

Specifications

Frequency range: 2-18 GHz (0.5-40 GHz optional)
DF accuracy: 1° I- and J-bands; 2° E/F- and G/H-bands
Sensitivity: −70 dBm
Frequency measurement: Instantaneous 2 MHz resolution

Manufacturer/Contractor

Elisra Electronic Systems, Bene Baraq, Israel.



NS-9003A naval ESM system

ELECTRONIC COUNTERMEASURES (ECM)

Rafael RAN-1010 jammers

There are two RAN-1010 jammers. RAN-1010 is a multi-beam array transmitter, designed to provide very high Effective Radiated Power (ERP), ultra-high speed electronic beam steering and the capability for jamming several signals simultaneously. This enables the jamming system to provide protection against simultaneous threats from a number of different directions in a multimissile attack. The use of LENS technology for a beam forming network enables the equipment to provide a wide frequency beamwidth and instantaneous azimuth coverage, as well as very high ERP and beam-steering.

Specifications

Frequency coverage: 7.5-18 GHz
ERP: 78 dBm typical
Instantaneous azimuth coverage: 360°
Beamwidth: Azimuth 6° min; elevation 25°
Number of beams: 32
Beam switching time: 150 ns

Manufacturer/Contractor

Rafael, Haifa, Israel.

DECOYS

Elbit Deseaver decoy control and launching system

There are four Deseaver launchers. Deseaver is a decoy control and launching system which responds to data received from the ship's command and control system and/or its sensors. The system then launches a barrage of expendable decoys with precise priority and timing. The Deseaver system performs the following tasks:

- evaluates the threat picture and selects appropriate passive countermeasures in conjunction with the EW defence system
- computes deployment procedures
- recommends preferred ship's course and speed as part of the anti-missile defence procedures
- launches defence decoys
- controls up to six types of EW rockets (chaff and IR)
- allocates resources and launches rockets according to selected programmes
- deploys tactical decoys
- provides the commanding officer with a display of the threat and decoy environment

Deseaver has three operating modes: automatic, semi-automatic and manual. In the latter, most functions are still performed automatically, but operator approval is required for target designation and rocket launch.

The stabilised rocket launching unit coverage is ±170° relative to a preset azimuth heading line. In elevation, coverage is according to the selected launch angle, from +15 to +55° relative to the horizon. Velocity in azimuth traverse is 180° in four seconds, and in elevation is 45° in up to 1.5 seconds.

Manufacturer/Contractor

Elbit Ltd, Haifa, Israel.

AN/SLQ-25 Nixie noisemaker

One AN/SLQ-25 Nixie (Phase 1), a solid-state, modular design electro-acoustic countermeasures decoy system is used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming/recovering the towed bodies and a coaxial switching unit which selects the appropriate cable or load and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body. The winch and two towed bodies are located in a stern compartment, with the towed bodies being deployed through the transom or in a partially or totally enclosed location on the main deck. Immediately forward of the winch compartment is the Nixie electrical room where the winch motor controller, the coaxial switching unit dummy loads and the transmitter are located. Each winch can stream and recover the 488 m (1,600 ft) of cable at 30.5 m/min (100 ft/min), each cable weighing 408 kg (900 lb). The towed bodies, streamlined to prevent cavitation and with all exposed aluminium parts anodised for corrosion resistance, are 95 cm long (3.10 ft), 15.24 cm (6 in) in diameter and weigh 18 kg (40 lb). They receive amplifier outputs, convert them into acoustic signals and project them. Usually one towed body is deployed at a time.

Manufacturer/Contractor

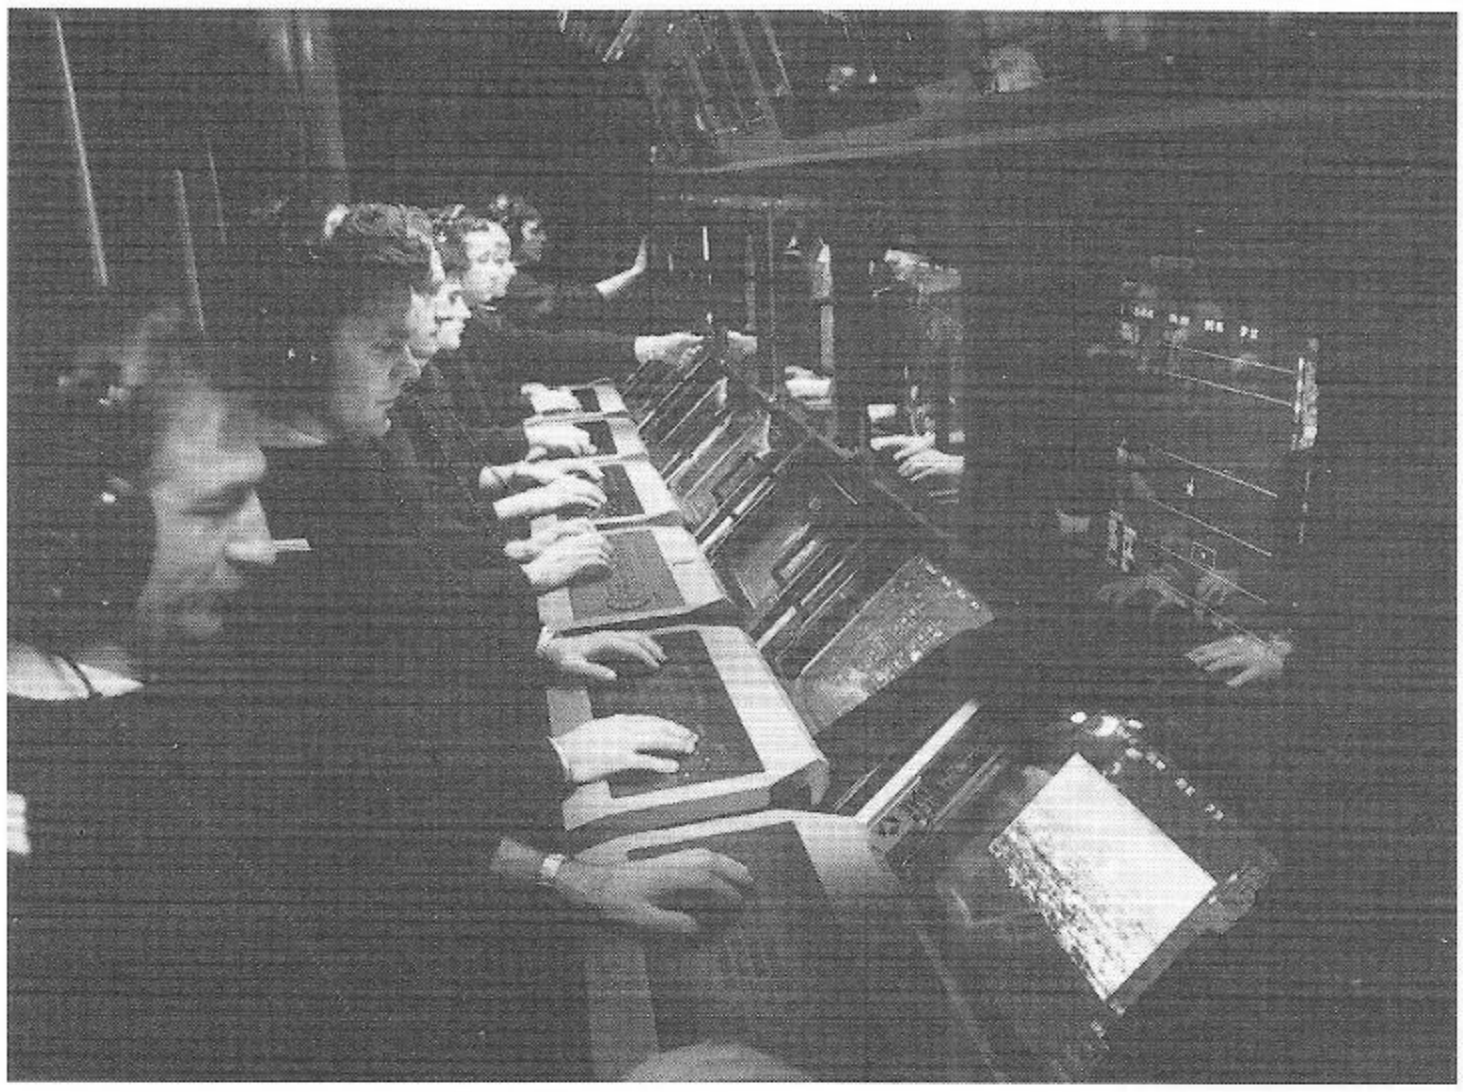
Aerojet ElectroSystems, Sacramento, California, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

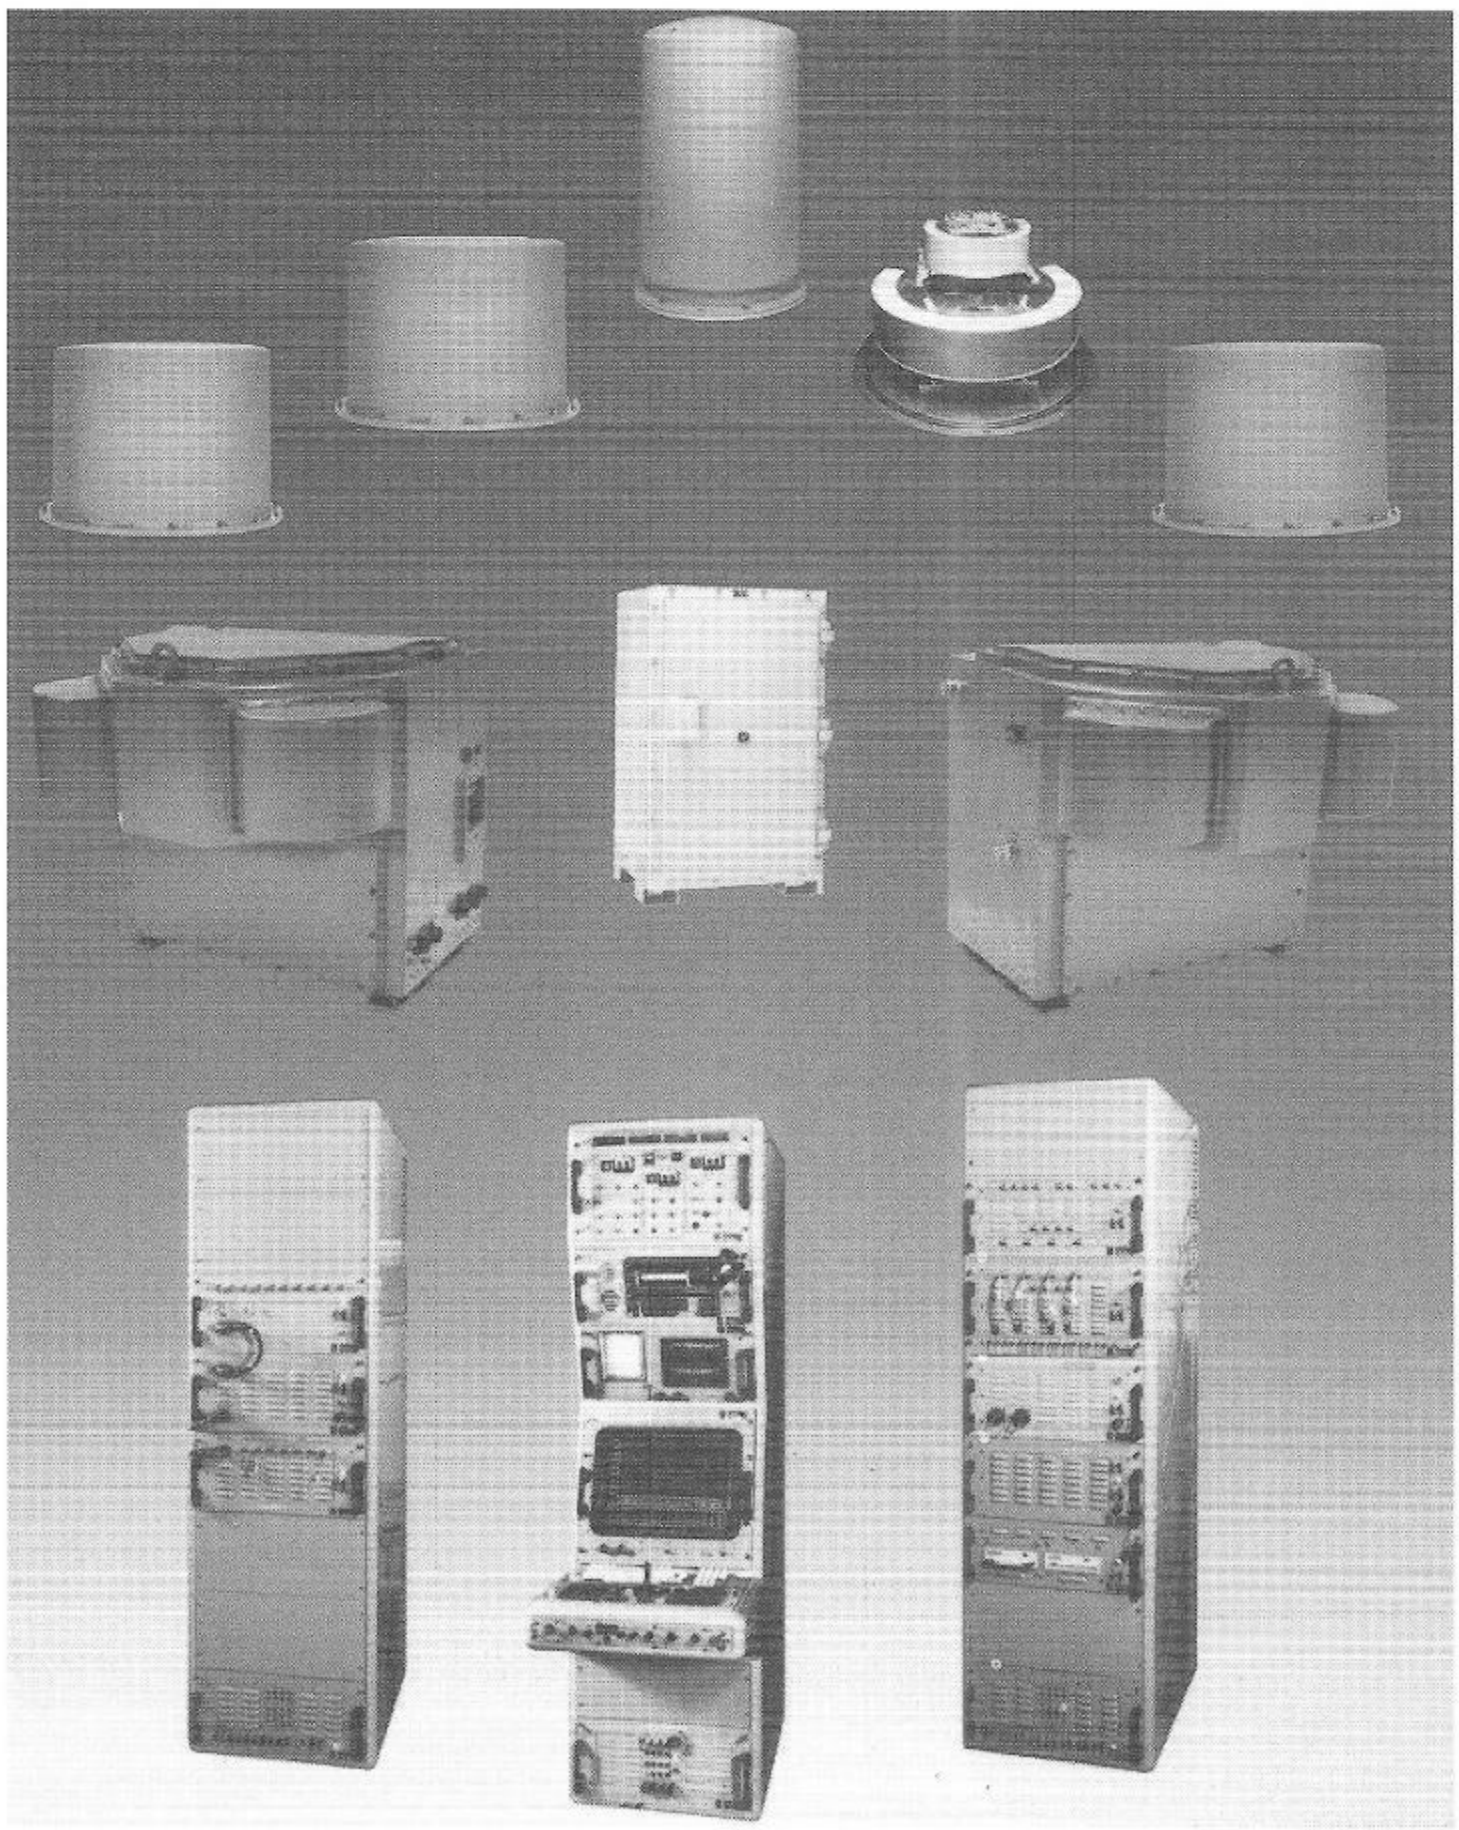
Elbit AIO III (NTCCS)

The latest version of Elbit's Action Information Organisation (AIO) system is AIO III, which entered service in the 'Sa'ar 5' class corvettes. AIO III accelerates the decision-making process by providing data on potential targets, friendly forces and weapon system status using inputs from shipborne sensors and those of friendly forces. System highlights include extracting and updating target data, track-while-scan operation, the ability to process two radars simultaneously with real-time handling of up to 50 air and surface targets. It also processes and displays navigation data, exchanges messages with shore-based headquarters and records tactical data for future debriefing.

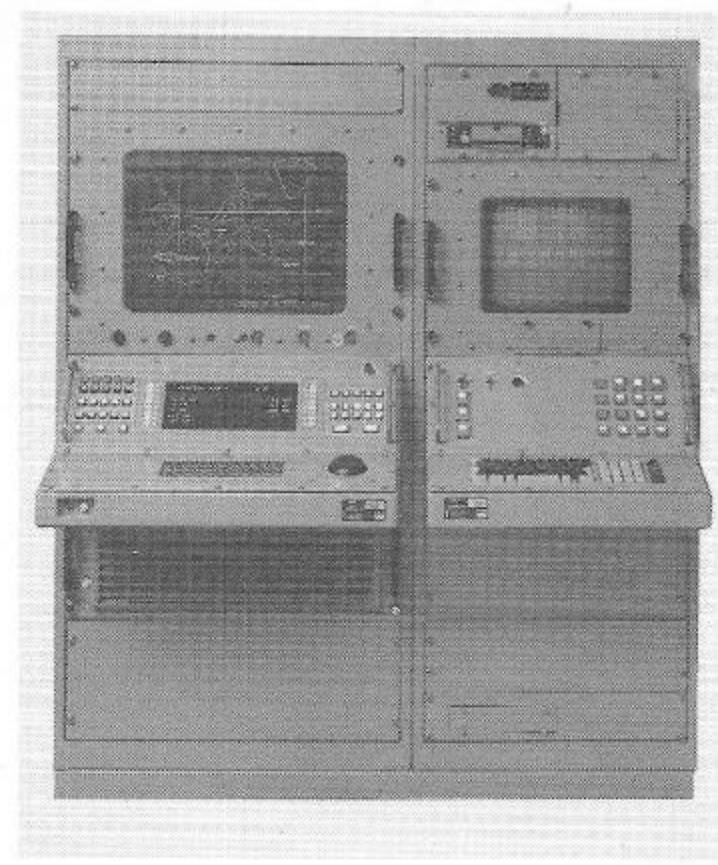


EI-Op MSIS

AIO III features a distributed architecture but with two Elta EL/S-9000 computers for system support (one is redundant). The EL/S-9000 are based upon Motorola 68040 microprocessors and use Ada software language using the 2167A development standard. They are linked to workstations by the Tadiran Shipboard Databus (SDB-2) local area network which uses Ethernet (10 Mb/s) or RS-232C (19.2 Kb/s) or RS-449 (38.4 Kb/s) interfaces and a number of parallel databuses. They are linked through Bus Interface Nodes (BIN) consisting of a VME-based processor (Motorola 68020). The workstations are the Astronautics Corporation of America's Operator Control Console (OCC). This has three processors based upon the Motorola 68020 as display, console and MMI processors each capable of 5-6 mips. The display and MMI processors use the



Elements of the NS-9003A system



Elbit AIO console

MTOS-UX operating system and are linked by a common memory with a combined 2 Mbyte Erasable Programmable Read-Only Memory (EPROM) and 2 Mbyte RAM. The console processor has two graphics engines each with three high-speed processors operating in parallel to provide a true rate of 6 million pixel/s random draw and 48 million pixel/s rectangle fill. The generator can accept 40 MHZ digital, and RS-170, RS-343A and RS-412 standard analogue video inputs. The MCI consists of two displays, a QWERTY standard keyboard, function keys, rollerball and joystick. The prime display is a 19 in (48.26 cm) raster scan screen with 1,280 × 1,024 pixel resolution. This may be supplemented either by another 19 in screen or two 9 in (22.86 cm) medium resolution (640 × 512 pixel) displays. The 'Sa'ar 5' class has a Combat Information Centre (CIC) subdivided into 'attack' and 'defence' areas with the former including positions for the ship commander and navigation officer. The 'attack' area is designed to provide target designation and engagement functions with integrated weapon assignment and to monitor the progress of an engagement. The 'defence' area provides threat engagement data and priorities, designates the appropriate systems and is responsible for the exchange of threat reports via datalink.

Manufacturer/Contractor
Elbit Computers Ltd, Israel.

COMMUNICATIONS AND DATALINKS

There is a datalink, designation unknown.

WEAPONS CONTROL

EI-Op MSIS

There are three electro-optic directors in each ship. MSIS is a multisensor electro-optic system which is used for day/night surveillance, target recognition, passive target tracking and for fire control of guns up to 76 mm. There is a four-axis gimballed platform with line of sight stabilisation of 20 rad, and a sensor package consisting of an 8-12 micron FLIR, TV camera and Nd:YAG laser rangefinder capable of engaging targets as close as 300 m (984 ft). The below decks element consists of an electronic unit, a power supply unit, a video tracker and a command/display unit.

The sensors are in a lightweight, ball-shaped turret, which provides low wind resistance, enhancing resolution and tracking accuracy. Detection ranges quoted for the FLIR include 9 n miles (17 km) against an FAC and 10 n miles (18.5 km) for an aircraft (with atmospheric visibility at 8.1 n miles (15 km) while for the TV camera the ranges are 7.56 n miles (14 km) and 9.2 n miles (17 km), respectively (meteorological visibility at 12.4 n miles (23 km). In similar meteorological conditions recognition ranges quoted for the FLIR are 5.94 n miles (11 km) and 4.32 n miles (8 km) against FACs and aircraft while for the TV camera they are 5.4 n miles (10 km) and 3.24 n miles (6 km).

The command and display unit consists of a small monochrome TV screen, six function switches and a similar number of buttons. There is also a small joystick.

Specifications
Turret
Height: 65 cm (25.6 in)
Diameter: 55 cm (21.7 in)
Weight: 60 kg (132 lb)
Elevation: −15 to +85°
Azimuth: 360° (nominal)
Slewing rate: 60°/s
Fields of view: 25.7 × 9.2, 7.4 × 5.5, 2.1 × 1.57°

Manufacturer/Contractor
El-Op, Rehovot, Israel.

RADARS

Elta EL/M-2218S
The EL/M-2218S is a 3D version of Elbit's 2200 series of naval radars and is used for air/surface search.

Manufacturer/Contractor
Elta, Israel

Cardion AN/SPS-55
The cardion AN/SPS-55 is used as the surface search radar.

Specifications
Band: I
Beam: 1.5 × 20°
Peak power: 130 kW
Gain: 31 dB
Pulsewidth: 0.12/1 µs
PRF: 2,250/750 pps
Scan rate: 16 rpm

Manufacturer/Contractor
Cardion, Woodbury, New York, USA.

Elta EL/M-2221 GM STGR
The EL/M-2221 GM STGR is the I/K/J-band radar used in the fire-control system for the Gabriel missiles. There is only one fitted initially but it is planned to fit three eventually.

Manufacturer/Contractor
Elta, Israel.

SONARS

EDO Type 796 Mod 1
A hull-mounted medium-frequency search and attack sonar, one of a family of modular sonars with simultaneous active/passive search, tracking and classification. Operating at around 7 kHz, the Type 796 sonar enables the operator to conduct 360° active/passive search operations while automatically tracking and analysing targets of interest. Display formats include panoramic B-scan detection, panoramic B-scan tracking and identification, expanded range versus speed target Doppler indicator, expanded range versus bearing sector scan indicator, 360° passive bearing versus time search and numerous others. The Mod 1 version of the Type 796 has been adapted to use a customer-furnished console and also features automatic multiple target tracking, multicolour display, increased target capacity, and flexible software-based display formats.

Manufacturer/Contractor
EDO Corporation, USA.

Rafael towed array sonar
The ships are currently fitted for but not with (FFBNW) a Variable Depth Sonar (VDS), which, if installed, is likely to be the Rafael CORIS-TAS, low frequency, critical angle towed array, which is based on a towed array with wide aperture hydrophones.

AVIATION

AVIATION FACILITIES

Specifications
Flight deck: 20 × 11.9 m (66 × 39 ft)
Hangar: There is a large hangar, with full refuelling and rearming facilities
Helicopter: The helicopter operated from these ships is currently the Aerospatiale SA 366G Dauphin, although it is planned to operate the Sea Panther in due course

Dauphin SA 366G

Specifications
Dimensions:
main rotor diameter: 11.94 m (39.17 ft)
fenestron diameter: 1.10 m (3.61 ft)
length, overall, rotor turning: 13.68 m (44.88 ft)
length, fuselage: 12.11 m (39.73 ft)
height (top of rotor head): 3.52 m (11.55 ft)
Weights:
empty (standard aircraft): 2,262 kg (4,987 lb)
max take-off: 4,250 kg (9,370 lb)
Radius of action:
anti-shipping mission:
four missiles: 135 n miles (250 km)
two missiles: 150 n miles (278 km)
search-and-rescue: 130 n miles (241 km)
Performance (at average mission weight of 4,000 kg; 8,818 lb):
never-exceed speed (VNE): 160 kts (296 km/h)
cruising speed at sea level: 148 kts (274 km/h)
max rate of climb at sea level: 420 m (1,380 ft)/min
hovering ceiling:
in ground effect: 2,600 m (8,530 ft)
out of ground effect: 1,860 m (6,100 ft)
Power plant: 2 Turbomeca Arriel 1M1 turboshafts, each giving 558 kW (749 shp) for take-off and 487 kW (653 shp) continuously
Accommodation: 12 (pilot, co-pilot. The cabin can hold up to 10 passengers).

Manufacturer/Contractor
Aerospatiale Helicopters, France.

PROPULSION

Specifications
System: Combined diesel or gas turbine (CODOG)
Main machinery: 1 General Electric LM-2500 gas turbine, 22.38 MW (30,000 hp); 2 MTU 12V 1163 TB82 diesels, 4.86 MW (6,600 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

One of the most unusual of current warships, the Sa'ar 5 design was prepared by John J McMullen Associates Inc for Israeli Shipyards, Haifa, in conjunction with Ingalls Shipbuilding Division of Litton Corporation, which was authorised to act as main contractor using FMS funding. The contract was awarded on 8 February 1989.

It was originally planned to order eight, but this was then reduced to four and an order for three was placed with an option on a fourth. In the event, the option has not been taken up and only three have been built.

All three ships are built and run trials in the USA, but are then delivered to Israel for the combat systems to be installed. The latter has proceeded much more slowly than expected, but should complete in 1997.

DESIGN

These ships have a steel hull and aluminium superstructure, with particular requirements being a heavy armament and a strong emphasis on stealth features. The latter include very dramatic shaping of the hull and superstructure, Prairie Masker Bubbler system, infrared filters on 'hot-spots' and resilient mounts for main machinery.

The 'Eilat' class is described as being ' . . . tonne for tonne, the most heavily armed ship in the world' and is referred to in some quarters as a 'pocket cruiser.' However, one of the consequences of so much weaponry is a reported top weight problem and although this may be eased by keeping the tanks fully topped up as far as possible, there could be problems in severe weather.

A secondary operations room is fitted aft.

OPERATIONAL

The main role of the 'Eilat' class is to counter threats in main shipping routes.

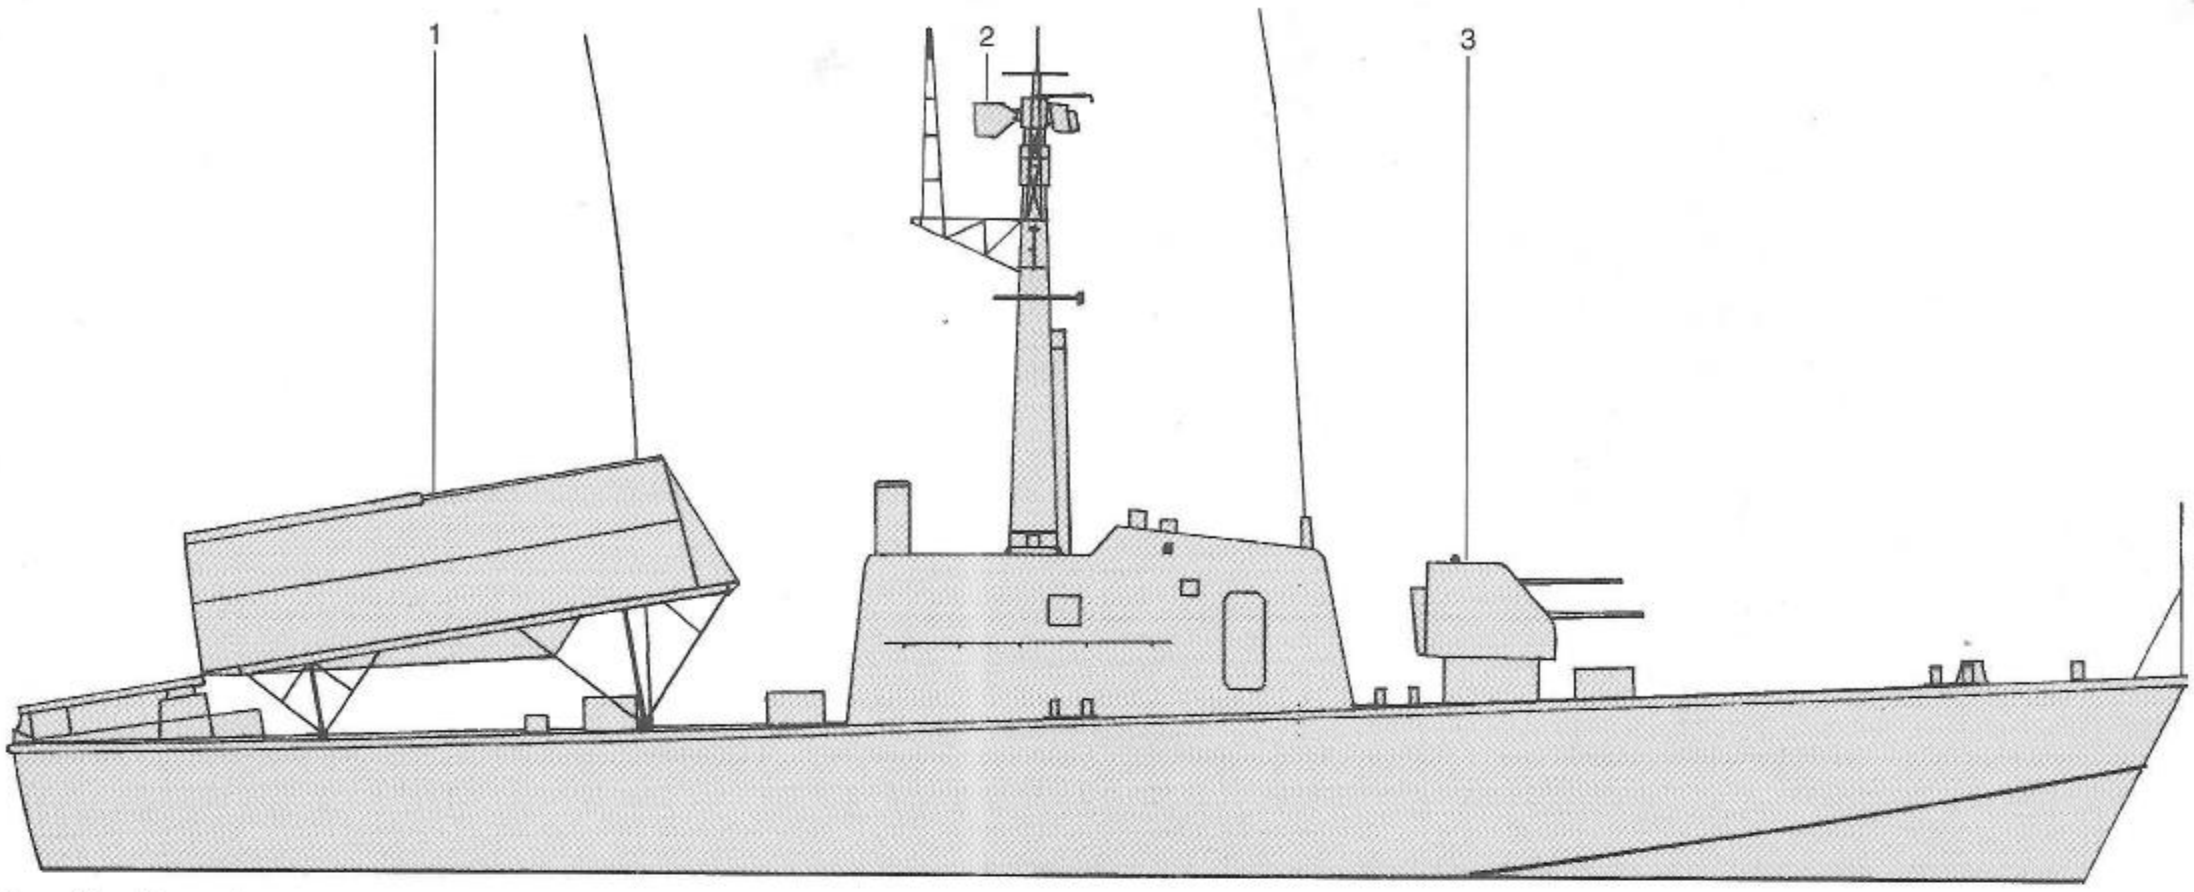
FAST ATTACK CRAFT (FAC)

INTRODUCTION

The term Fast Attack Craft (FAC) was coined in the 1970s in an attempt to provide a comprehensive description for small, heavily armed, high-speed warships and especially those armed with anti-ship missiles. Over the years, however, the term has been extended to include a much wider range of small warships including those also called Fast Patrol Boat, Missile Boat, Torpedo Boat, Motor Torpedo Boat, Motor Gun Boat and PT Boat. Moreover, the term has become so diluted as to lose almost all meaning, indeed sometimes a class described as a Fast Attack Craft, Gun by one navy may be referred to by another as a patrol boat.

For this reason, vessels armed only with a medium calibre (35 mm to 76 mm) gun are excluded and the basic definition of FACs has been used. On this basis an FAC is defined as a warship of less than 499 tonnes displacement, which is designed to conduct offensive anti-surface warfare (ASuW) operations against larger vessels using missiles or torpedoes.

HEGU/HEMA (TYPE 024)



Hegu (Ian Sturton)
1 *SY-1 (CSS-N-1) anti-ship missiles (two)* **2** *Type 331 (Square Tie) in some; Pot Head in others* **3** *Norinco twin 25 mm cannon (23 mm in Egyptian boats)*

GENERAL SPECIFICATIONS

Country of Origin: China, People's Republic
Operators: Bangladesh ('Durbar'), China, Egypt, Pakistan ('Haibat')
Type: FAC, Missile

Class: HEGU/HEMA (TYPE 024)

Built: 85
Active: 59

Displacement:
standard: 68 t
full load: 79.2 t

Dimensions
Length: 27 m (88.6 ft) ('Hegu'); 28.6 m (93.8 ft) ('Hema')
Beam: 6.3 m (20.7 ft)
Draught: 1.3 m (4.3 ft)

Speed: 37.5 kts
Range: 400 n miles (740 km) at 30 kts

Complement: 17 (2/4 officers)

SHIPS

Bangladesh: *Durbar* (P 8111); *Duranta* (P 8112); *Durvedya* (P 8113); *Durdam* (P 8114); *Uttal* (P 8141)

China: 48 (+35 in reserve)

Egypt: 609, 611, 613, 615, 617, 619

Pakistan: *Haibat* (P 1021); *Jalalat* (P 1022); *Jurat* (P 1023); *Shujaat* (P 1024)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

SY-1 (CSS-N-1 'Scrubbrush')

These ships carry two forward-facing launchers for Shang Yao 1 (SY-1) anti-ship missiles on the quarterdeck, angled slightly outboard.

Specifications

Length: 5.8 m (19 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.8 ft)
Weight: 2,300 kg (5,071 lb), excl 570 kg (1,257 lb) boosters
Speed: Mach 0.9
Range: 21.5 n miles (40 km)
Warhead: 454 kg (1,000 lb)
Guidance: Autopilot and active radar

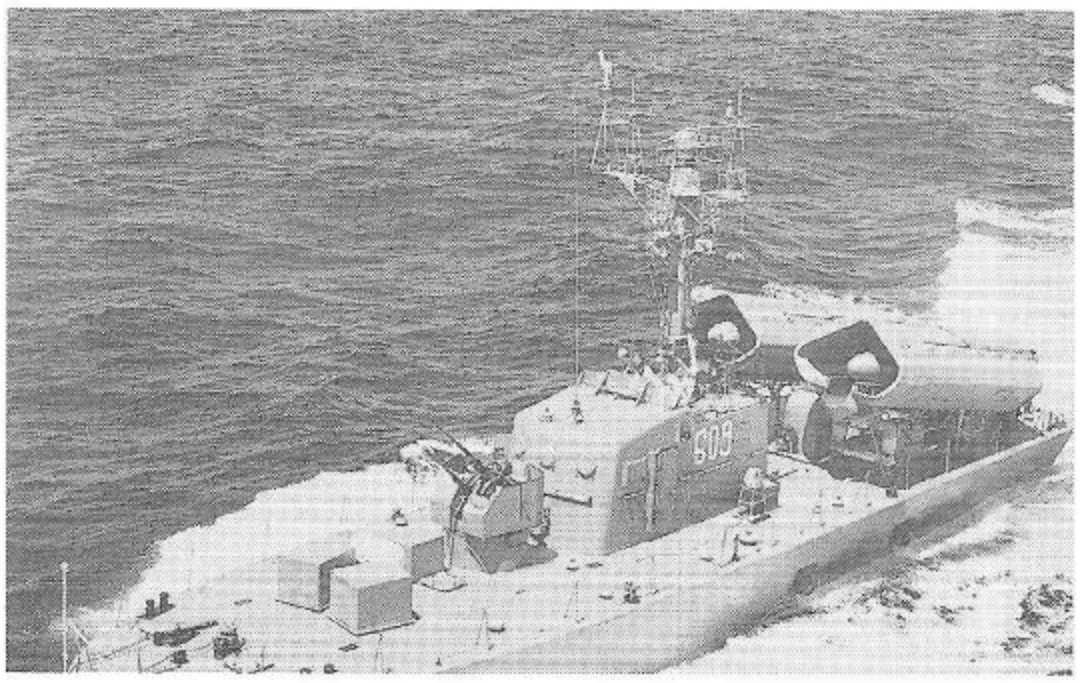
Manufacturer/Contractor

China Precision Machinery Import and Export Corporation, Beijing, China.

GUNS

Type 61

A Type 61 twin 25 mm gun mounting is installed forward of the bridge. In the Egyptian vessels there is a twin 23 mm mount, which consists of two Egyptian-made 23 mm cannons (possibly copies of the Russian 23 mm/81) in a Russian 2-M-3 mount, which is normally used for 25 mm weapons. The 'Hema' class has two Type 61 mountings.



'Hegu' class FAC of the Egyptian Navy. The mounting on the foredeck consists of a Russian mount designed for 25 mm guns, but with Egyptian-made 23 mm guns

Pakistani 'Hegu' class FAC, Jalalat (Pakistan Navy)

Specifications
Calibre: 25 mm
Length of barrel: 80 calibres
Muzzle velocity: 910 m/s (2,980 ft/s)
Rate of fire: 270 rds/min
Range: 1.5 n miles (3 km)

Calibre: 23 mm
Length of barrel: 81 calibres
Muzzle velocity: 970 m/s (3,180 ft/s)
Rate of fire: 200 rds/min/barrel
Range (effective): 2,800 m (3,000 yd)

Mounting
Weight: n/k
Traverse: 360°
Elevation: −10 to +85°

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

These vessels use 'High Pole A' IFF systems but details of other ESM systems are not known. Egyptian vessels have the Litton Triton ESM system of which no details are available.

ELECTRONIC COUNTERMEASURES (ECM)

Not known.

COMMAND AND CONTROL SYSTEMS

RADARS

Type 331 (Square Tie)

Specifications
Role: Surface search and missile fire control
Band: I-band
Peak power: 20 kW
PRF: There are believed to be three modes; search (1,000 pps), target acquisition (2,000 pps) and target tracking (4,000 pps)
Scan rate: 5 or 15 rpm
Typical range: 25 n miles (46 km) against destroyer-size targets

Pot Head

Specifications
Pakistan
Role: Surface search
Band: I-band
Beam: 3°
Peak power: 100 kW
Pulsewidth: 0.25-1 µs
PRF: 1,600-1,650, 3,200-3,300 pps
Scan rate: 2.5/4 or 5/6 rpm

Note
The Russian designation for 'Pot Head' is Reya.

PROPULSION

Specifications
System: Diesel
Main machinery: 4 Type L-12V-180 diesels; 3.53 MW (4,800 hp)
Shafts: 4

FURTHER INFORMATION

The 'Hegu' class was built for the PLAN as a successor to the imported Russian 'Komar' class, but with steel instead of wooden hulls. The launchers were re-sited clear of the bridge and further inboard to eliminate sponsons, and the lattice mast was replaced by a pole.

The single 'Hema' was a hydrofoil derivative with a longer hull and a semi-submerged foil forward.

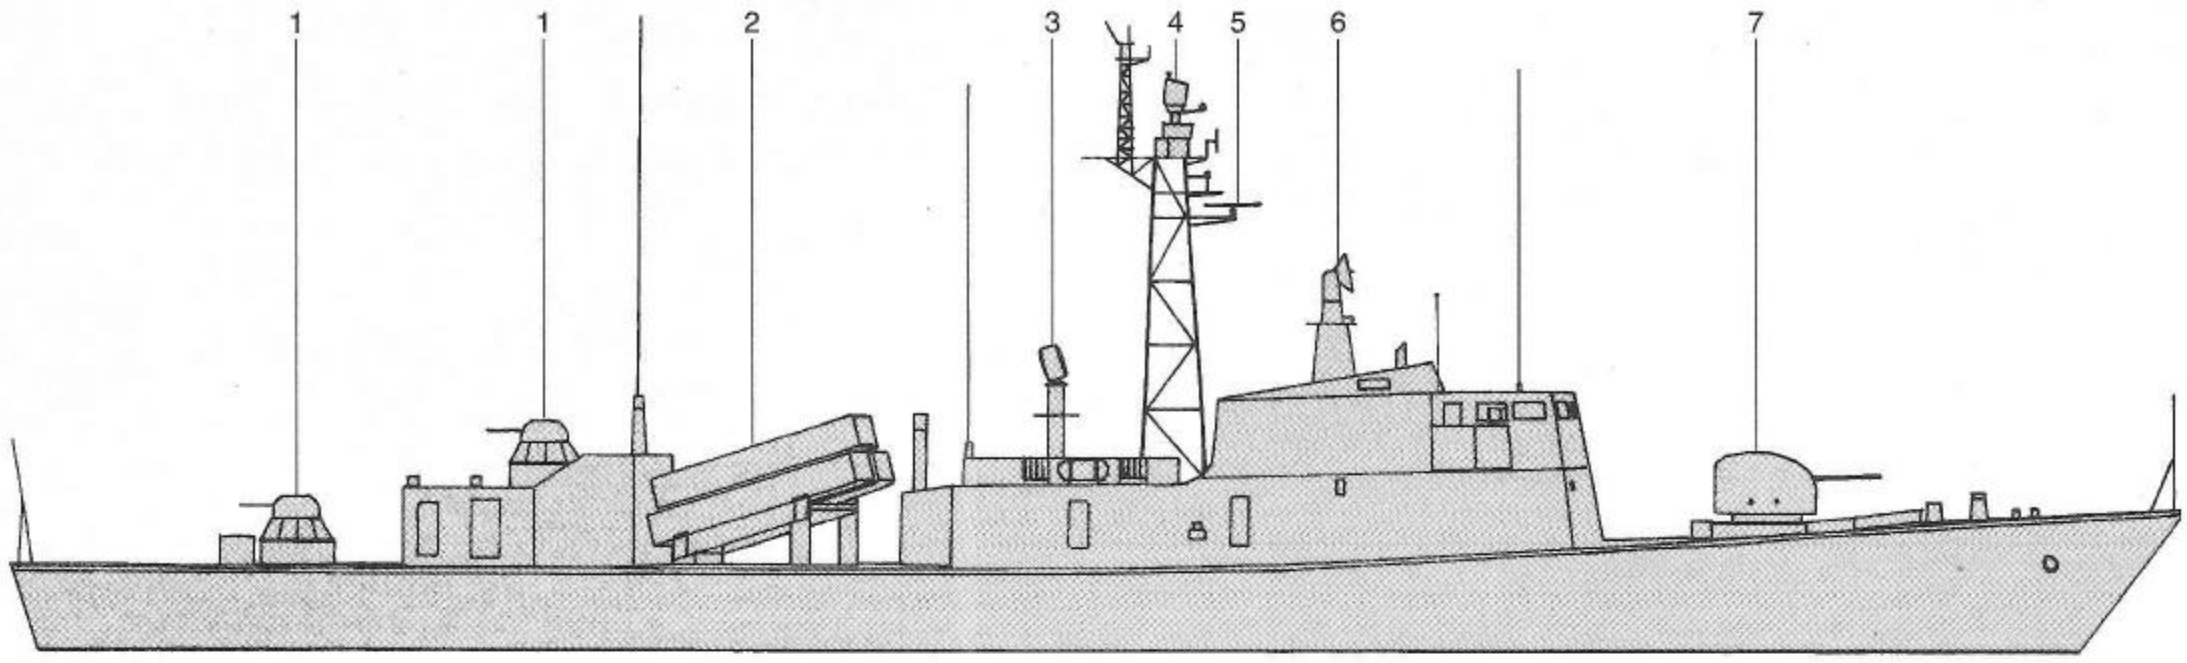
The 'Durbar' class was built for Bangladesh and commissioned between 1983 and 1992.

The Egyptian vessels were transferred in 1984.

'Hegu' class FAC of the PLAN (A Sheldon Dupleix)

Duranta, *a 'Hegu' class FAC of the Pakistani Navy. Note the efflux guides for the missiles, designed to carry the flames and heat clear of the stern* (G Jacobs)

HOUJIAN (TYPE 037/2)



Houjian (Ian Sturton)
1 *Type 69 twin 30 mm/65 cannon* **2** *YJ-1 (C-801) anti-ship missile (six)* **3** *Type 88C fire control (for Type 69 mounts)* **4** *Square Tie surface search radar* **5** *Type 765 navigation radar* **6** *Rice Lamp fire-control radar* **7** *Type 76A twin 37 mm/63 cannon*

GENERAL SPECIFICATIONS

Operator: China, People's Republic
Type: FAC, Missile

Class: HOUJIAN (TYPE 037/2)

Built: 2
Active: 2

Displacement:
standard: 520 t

Dimensions
Length: 65.4 m (214.6 ft)
Beam: 8.4 m (27.6 ft)
Draught: 2.4 m (7.9 ft)

Speed: 33.5 kts
Range: 1,800 n miles (3,335 km) at 18 kts

Complement: 75

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

YJ-1 (C-801) (CSS-N-4 'Sardine')

There are two triple launchers for the YJ-1 (C-801) anti-ship missile amidships, between the superstructure and the deck house. They are trained forward and outboard.

Specifications
Length: 5.81 m (19.5 ft)
Diameter: 36 cm (14.17 in)
Wing span: 1.18 m (3.87 ft)
Weight: 815 kg (1,797 lb)
Speed: Mach 0.9
Range: 4.5-23 n miles (8-42 km)
Warhead: 165 kg (364 lb)
Guidance: Inertial and active radar

Manufacturer/Contractor
China Precision Machinery Import and Export Corporation, Beijing, China.

GUNS

One Type 76A twin 37 mm is mounted forward of the bridge, with two Type 69 twin 30 mm gun mountings on the rear superstructure. The export version is being offered with a single OTOBREDA 76 mm (3 in)/62 Compact in place of the Type 76A twin 37 mm.

Type 76A

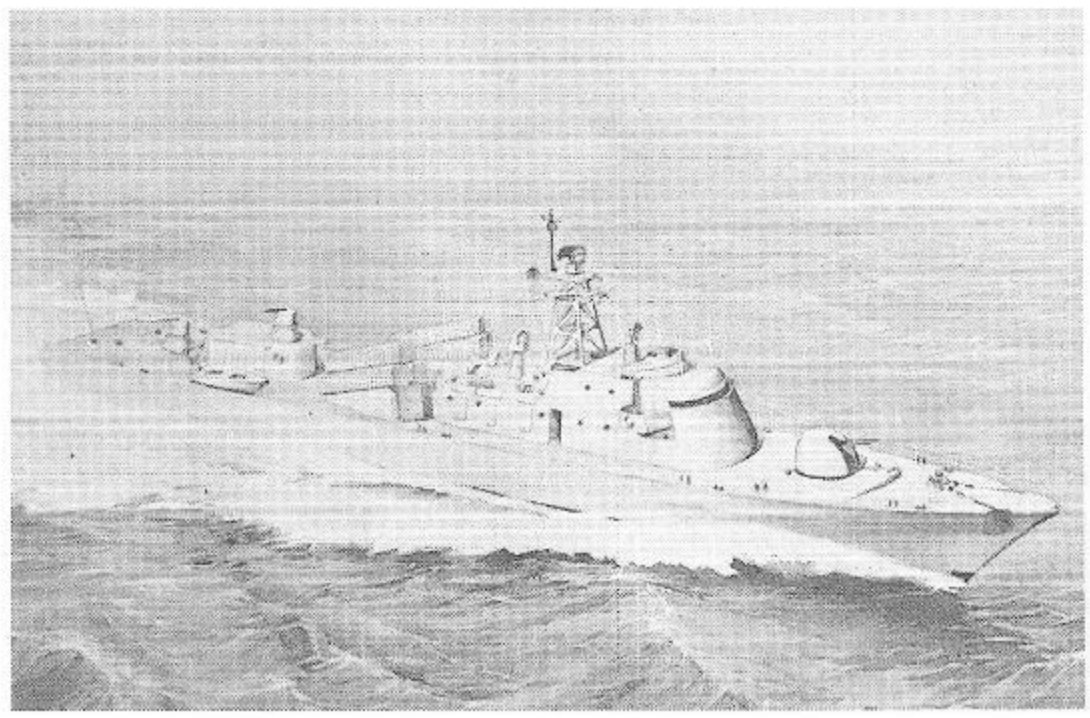
Specifications
Gun
Calibre: 37 mm
Length of barrel: 62.8 calibres
Muzzle velocity: 880 m/s (2,887 ft/s)
Range: 2.2 n miles (4 km)

Type 69

Gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,445 ft/s)
Rate of fire: 1,000 rds/min (per gun)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,120 ft)

Mounting
Weight: 1.9 t
Traverse: 360°
Elevation: −12 to +87°

Manufacturer/Contractor
Norinco, Beijing, China.



An artist's impression of a 'Houjian' class FAC as offered for export. This is identical with the PLAN version, except that it has an OTOBREDA 76 mm gun in place of the twin 37 mm (CSSC)

PROPULSION

Specifications
System: Diesel
Main machinery: 3 SEMT-Pielstick 12 PA6V 280 MPC; 12.7 MW (15,840 hp)
Shafts: 3

FURTHER INFORMATION

Laid down in 1989 these FACs (sometimes called the 'Huang' class) were originally designed for the export market but then attracted the interest of the PLAN, and at least two more are being built. An OPV version is reported to be in production for the export market as Type 037/1. The export version is being offered with an OTOBREDA 76 mm (3 in)/62 gun in place of the twin 37 mm mount currently in the PLAN version. The export version also specifies SEMT-Pielstick engines and it is assumed that these are also in the PLAN vessels.

Dimensions
Length: 62.0 m (203.4 ft)
Beam: 7.2 m (23.6 ft)
Draught: 2.3 m (7.5 ft)

Speed: 32 kts
Range: 750 n miles (1,390 km) at 18 kts

Complement: 60

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

YJ-1 (C-801) (CSS-N-4 'Sardine')

These vessels carry two twin launchers with the YJ-1 (C-801) anti-ship missile on the quarterdeck, the launchers being trained forward and outboard.

Specifications
Length: 5.81 m (19.5 ft)
Diameter: 36 cm (14.17 in)
Wing span: 1.18 m (3.87 ft)
Weight: 815 kg (1,797 lb)
Speed: Mach 0.9
Range: 4.5-23 n miles (8-42 km)
Warhead: 165 kg (364 lb)
Guidance: Inertial and active radar

Manufacturer/Contractor
China Precision Machinery Import and Export Corporation, Beijing, China.

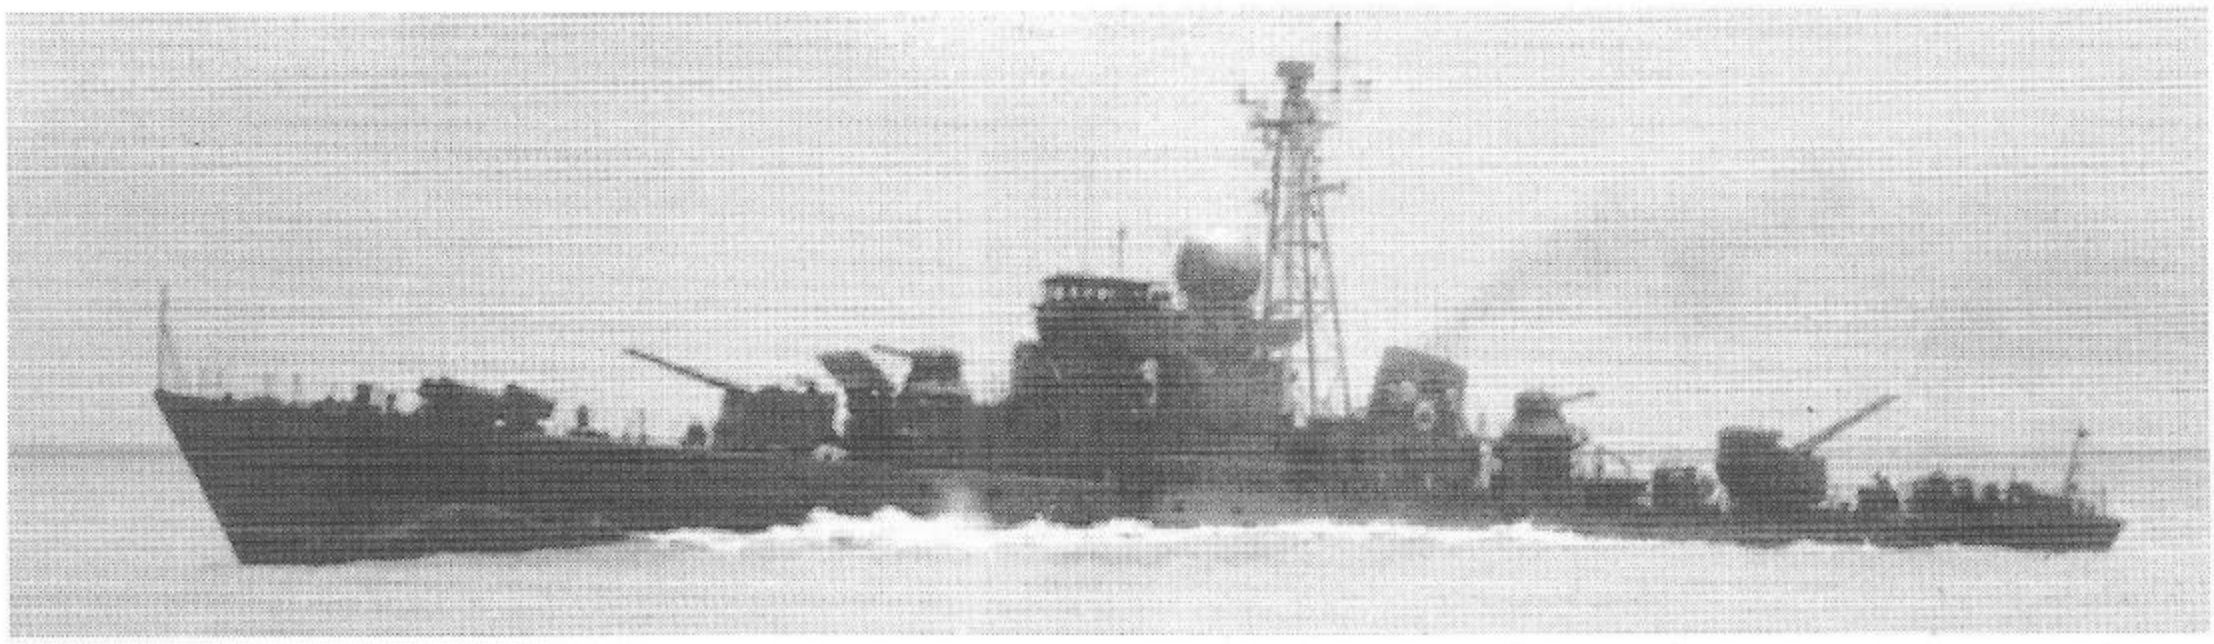
A group of 'Houxin' class FACs (Paul Beaver)

GUNS

Type 76A

There are two Type 76A twin 37 mm, one forward of the superstructure and the other on the rear of the superstructure. There are also two twin 14.5 mm machine gun mountings on the superstructure forward of the bridge.

Specifications
Gun
Calibre: 37 mm
Length of barrel: 62.8 calibres
Muzzle velocity: 880 m/s (2,887 ft/s)
Rate of fire: n/k
Range: 2.2 n miles (4 km)



Four ships of the 'Haijui' class were built in the early 1980s. They appear to have served as prototypes for the 'Houxin' class and were essentially lengthened 'Hainan' class vessels with a revised armament and a Round Ball radome on the bridge roof. One of the class was also seen with two missile launchers on the foredeck in place of the 57 mm mount (CSSC)

Iran: 10

Pakistan: 4

Yemen: 3

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

The 'Huangfen' class carry four Hai Ying-2 (HY-2) anti-ship missiles in the rear half of the vessel, although Yemeni vessels have C-801 (YJ-1). The 'Hudong' class carry four anti-ship missile launchers in the stern with either C-801 (YJ-1) or C-802 (YJ-2).

Some export vessels have four launchers for the YJ-1 anti-ship missile.

HY-2 (CSS-N-3 'Seersucker')

Specifications
Length: 7.36 m (24.1 ft)
Diameter: 76 cm (30 ins)
Wing span: 2.4 m (7.8 ft)
Weight: 2,500 kg (5,512 lb) without 570 kg (1,257 lb) boosters
Speed: Mach 0.9
Range: 51 n miles (95 km)
Warhead: 454 kg (1,001 lb)
Guidance: Autopilot and active radar

YJ-1 (CSS-N-4 'Sardine' or C-801)

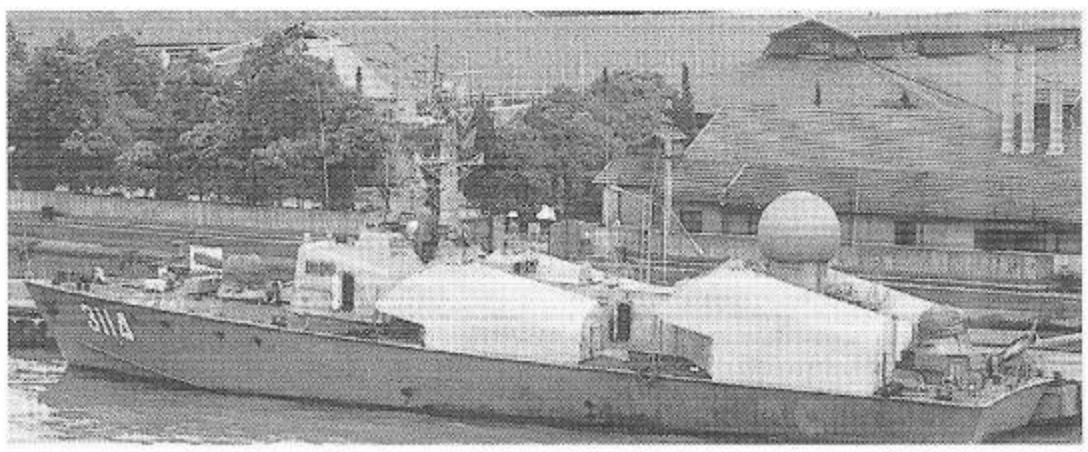
Length: 5.81 m (19.5 ft)
Diameter: 36 cm (14.17 in)
Wing span: 1.18 m (3.87 ft)
Weight: 815 kg (1,797 lb)
Speed: Mach 0.9
Range: 4.5-23 n miles (8-42 km)
Warhead: 165 kg (364 lb)
Guidance: Inertial and active radar

Manufacturer/Contractor
China Precision Machinery Import and Export Corporation, Beijing, China.

YJ-2 (CSS-N-8 'Saccade' or C-802)

Length: 6.39 m (12.10 ft)
Diameter: 36 cm (14.17 in)
Wing span: 1.18 m (3.87 ft)
Weight: 715 kg (1,576.5 lb)
Speed: Mach 0.9
Range: 8-65 n miles (15-120 km)
Warhead: 165 kg (364 lb)
Guidance: Inertial and active radar

Manufacturer/Contractor
China Precision Machinery Import and Export Corporation, Beijing, China.



'Huangfen' class FAC of the PLAN. This is the later version with Round Ball fire-control radar and twin 30 mm cannon, but with the same HY-2 missiles as the earlier vessels

An export version of the 'Huangfen' class with the Yemeni Navy. This has YJ-1 anti-ship missiles and Rice Lamp fire-control radar (CSSC)

GUNS

The 'Huangfen' class has two gun mountings which are either the Type 61 twin 25 mm (China, Yemen) or the Type 69 twin 30 mm (Bangladesh) mountings forward of the bridge and in the stern. The 'Hudong' class has one Type 69 mounting forward of the bridge. The 'Hola' class has no guns.

Type 69

Specifications
Gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,445 ft/s)
Rate of fire: 1,000 rds/m (per gun)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,120 ft)

Mounting
Weight: 1.9 t
Traverse: 360°
Elevation: −12 to +87°

Manufacturer/Contractor
Norinco, China.

Type 61

Specifications
Gun
Calibre: 25 mm
Length of barrel: 80 calibres
Muzzle velocity: n/k
Rate of fire: 270 rds/m
Range: 1.5 n miles (3 km)

Mounting
Traverse: 360°
Elevation: −10 to +85°

Manufacturer/Contractor
Norinco, China.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

These ships have the domestically produced BM/HZ 8610 emitter direction-finding and analysis system as well as either the 'Square Head' or 'High Pole A' IFF systems. The BM/HZ 8610 has two antennas each with eight monopulse ports covering E/I and H/J-bands with sufficient accuracy to cue both radar and optical weapon control systems.

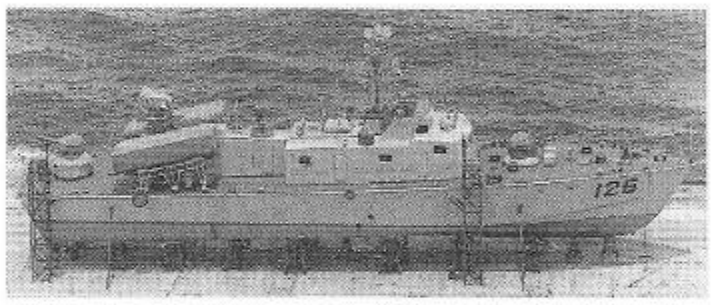
ELECTRONIC COUNTERMEASURES (ECM)

Not known.

COMMAND AND CONTROL SYSTEMS

RADARS

The 'Huangfen' class has Type 331 surface search radar, 'Round Ball' gun fire-control radar (not in the Bangladeshi FACs) or 'Rice Lamp' weapon control radar in ships with YJ-1 anti-ship missiles. It should be noted that Russian Osas have a Drum Tilt fire-control radar for the guns, which is lacking in the earlier Chinese 'Huangfens'. Round Ball clearly makes up this deficiency.



'Huangfen' class FAC on delivery voyage to Yemen in 1995. This version has four YJ-1 anti-ship missiles and twin 25 mm cannon. In other versions of the 'Huangfen', 20 mm mounts are accompanied by Round Ball radar, whereas 25 mm mounts have no radar; in this vessel, however, there is clear evidence of a radar aft, although the protective packaging prevents clear identification (92 Wing RAAF)

'HUANGFEN' CLASS

Chinese designation	Type 331	Type 341	—
US/NATO designation	Square Tie	Rice Lamp	Round Ball
Role	Surface search/ target designation	Gun control	Gun control
Band	I	I	I
Peak power	20 kW	n/k	n/k
PRF	1,000, 2,000, 4,000 pps	n/k	n/k
Scan rate	5, 15 rpm	n/k	n/k
Typical range	25 n miles (46 km)	n/k	n/k

'HUDONG' CLASS

	SR-47A	**Type 341**	**FM-1070**
Role	Search	Gun control	Navigation
Band	I	I	I

PROPULSION

Specifications
System: Diesel
Main machinery:
'Huangfen', 'Hola': 3 Type 42-160; 8.8 MW (12,000 hp)
'Hudong': 3 of unknown type; 7.94 MW (8,025 hp)
Shafts: 3

FURTHER INFORMATION

PROGRAMME

Four 'Osa I' class FACs were delivered by the (then) USSR to China in the mid-1960s, following with China producing its own version: the 'Huangfen' class. Approximately 100 'Huangfen' class boats were built, of which most were for the PLAN, but the type was also exported: Pakistan — 4 (1984); Bangladesh — 4 (1988), North Korea — 4 (1980); and Yemen — 3 (1995). A further ten of a modified 'Hudong' design have been sold to Iran; five in 1994 and five in 1996.

DESIGN

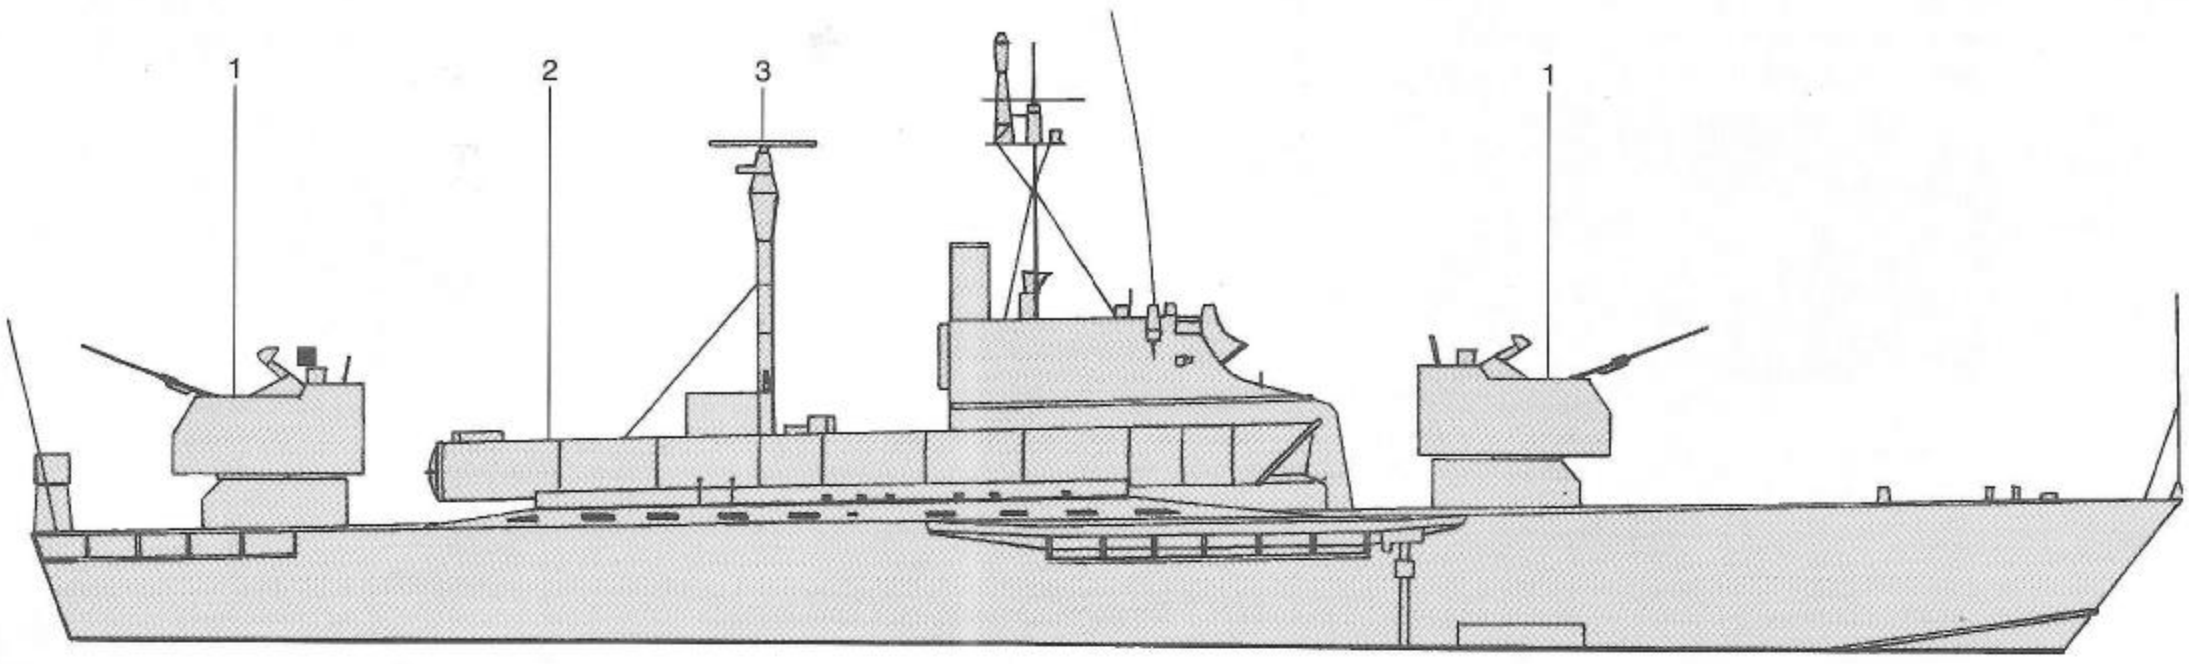
The design is essentially similar to that of the Russian 'Osa I', but in such a lengthy production run there have, inevitably, been changes. The standard missile in the PLAN boats in the HY-2 (CSS-N-2 'Seersucker'), with four missiles in individual launch bins. Most PLAN boats are armed with two twin 25 mm mounts; one forward of the bridge, the second aft. In recent boats, however, these are replaced by two twin 30 mm mounts, accompanied by a large spherical radome, currently designated 'Round Ball' as its Chinese designation is not known.

The export versions to Pakistan, Bangladesh and North Korea are standard PLAN versions. The boats recently sold to Yemen, however, have a longer superstructure and are fitted with four YJ-1 missile launchers and a Rice Lamp fire director.

The Iranian 'Huangdong' boats have the same hull as the 'Huangfen' class but are armed with four YJ-1 missiles set further back on the stern than with the Yemen's boats, displacing the aft twin 30 mm AK-230 mount. There is also a short lattice mast, supporting two I-band radars.

Only one 'Hola' class was produced which was slightly longer (42 m) (137.8 ft), and had a large spherical radome on the bridge roof and a folding mast aft.

HUCHUAN (TYPES 025/026)



Chinese Huchuan (newer version) (Ian Sturton)
1 *Twin 14.5 mm machine gun* **2** *533 mm (21 in) torpedo tubes (two)* **3** *Chinese Type 753 radar*
Note: *Two versions exist with minor variations in weapons and radar. In the other version the after machine gun mount is in the same position at the stern but the forward mount is abaft the bridge and the radar antenna is mounted on the top of the small mast*

GENERAL SPECIFICATIONS

Country of origin: China, People's Republic
Operators: Albania, Bangladesh, China, Romania, Tanzania
Type: FAC, Hydrofoil, Torpedo

Class: HUCHUAN (TYPES 025/026)

Built: 160
Active: 56

Displacement:
standard: 39 t
full load: 45.8 t

Dimensions
Length: 21.8 m (71.5 ft); 22.5 m (73.8 ft) (Bangladesh)
Beam: 6.3 m (20.7 ft); 5 m (16.4 ft) (Bangladesh)

Draught: 3.6 m (11.8 ft) (hullborne); 2.1 m (6.9 ft) (Bangladesh, foil)

Speed: 50 kts (foilborne)
Range: 500 n miles (925 km) at 30 kts

Complement: 23 (3 officers)

SHIPS

Albania: 24

Bangladesh: 8

China: 60

Romania: 20

Tanzania: 4

WEAPONS SYSTEMS

TUBES

Two 533 mm (21 in) torpedo tubes are carried outboard of the superstructure. These are reputed to launch the Russian SAET 60 torpedo.

TORPEDOES

SAET 60

Specifications
Length: 7.8 m (25.6 ft)
Diameter: 533 mm (21 in)
Weight: 1,600 kg (3,528 lb)
Propulsion: Electric
Speed: 40 kts
Range: 8.1 n miles (15 km)
Warhead: 400 kg (882 lb)
Guidance: Passive sonar

GUNS

14.5 mm machine guns
All versions are armed with two twin 14.5 mm machine guns in open 'tub' mounts. In some, both mounts are aft of the bridge, in others there is one mount forward of the bridge and one at the stern.

DEPTH CHARGES

The Romanian version only is fitted with rails for depth charges.

Number 55 of the Romanian Navy. Note the forward twin machine gun mounting is ahead of the bridge. This is the only version to carry depth charges

S 208 of the Albanian Navy

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

These FACs have the domestically produced BM/HZ 8610 emitter direction-finding and analysis system. This has two antennas each with eight monopulse ports covering E/I and H/J-bands with sufficient accuracy to cue both radar and optical weapon control systems.

ELECTRONIC COUNTERMEASURES (ECM)

Not known.

COMMAND AND CONTROL SYSTEMS

RADARS

Type 753

Specifications
Role: Surface search/fire control
Band: F
Beam: 17°
Peak power: 80 kW
Gain: n/k
Pulsewidth: 1 μs
PRF: 400 pps
Scan rate: n/k
Typical range: 17 n miles (31.5 km)

Note
The Type 753 is the Chinese version of the Russian 'Skin Head' or Zarnista radar.

PROPULSION

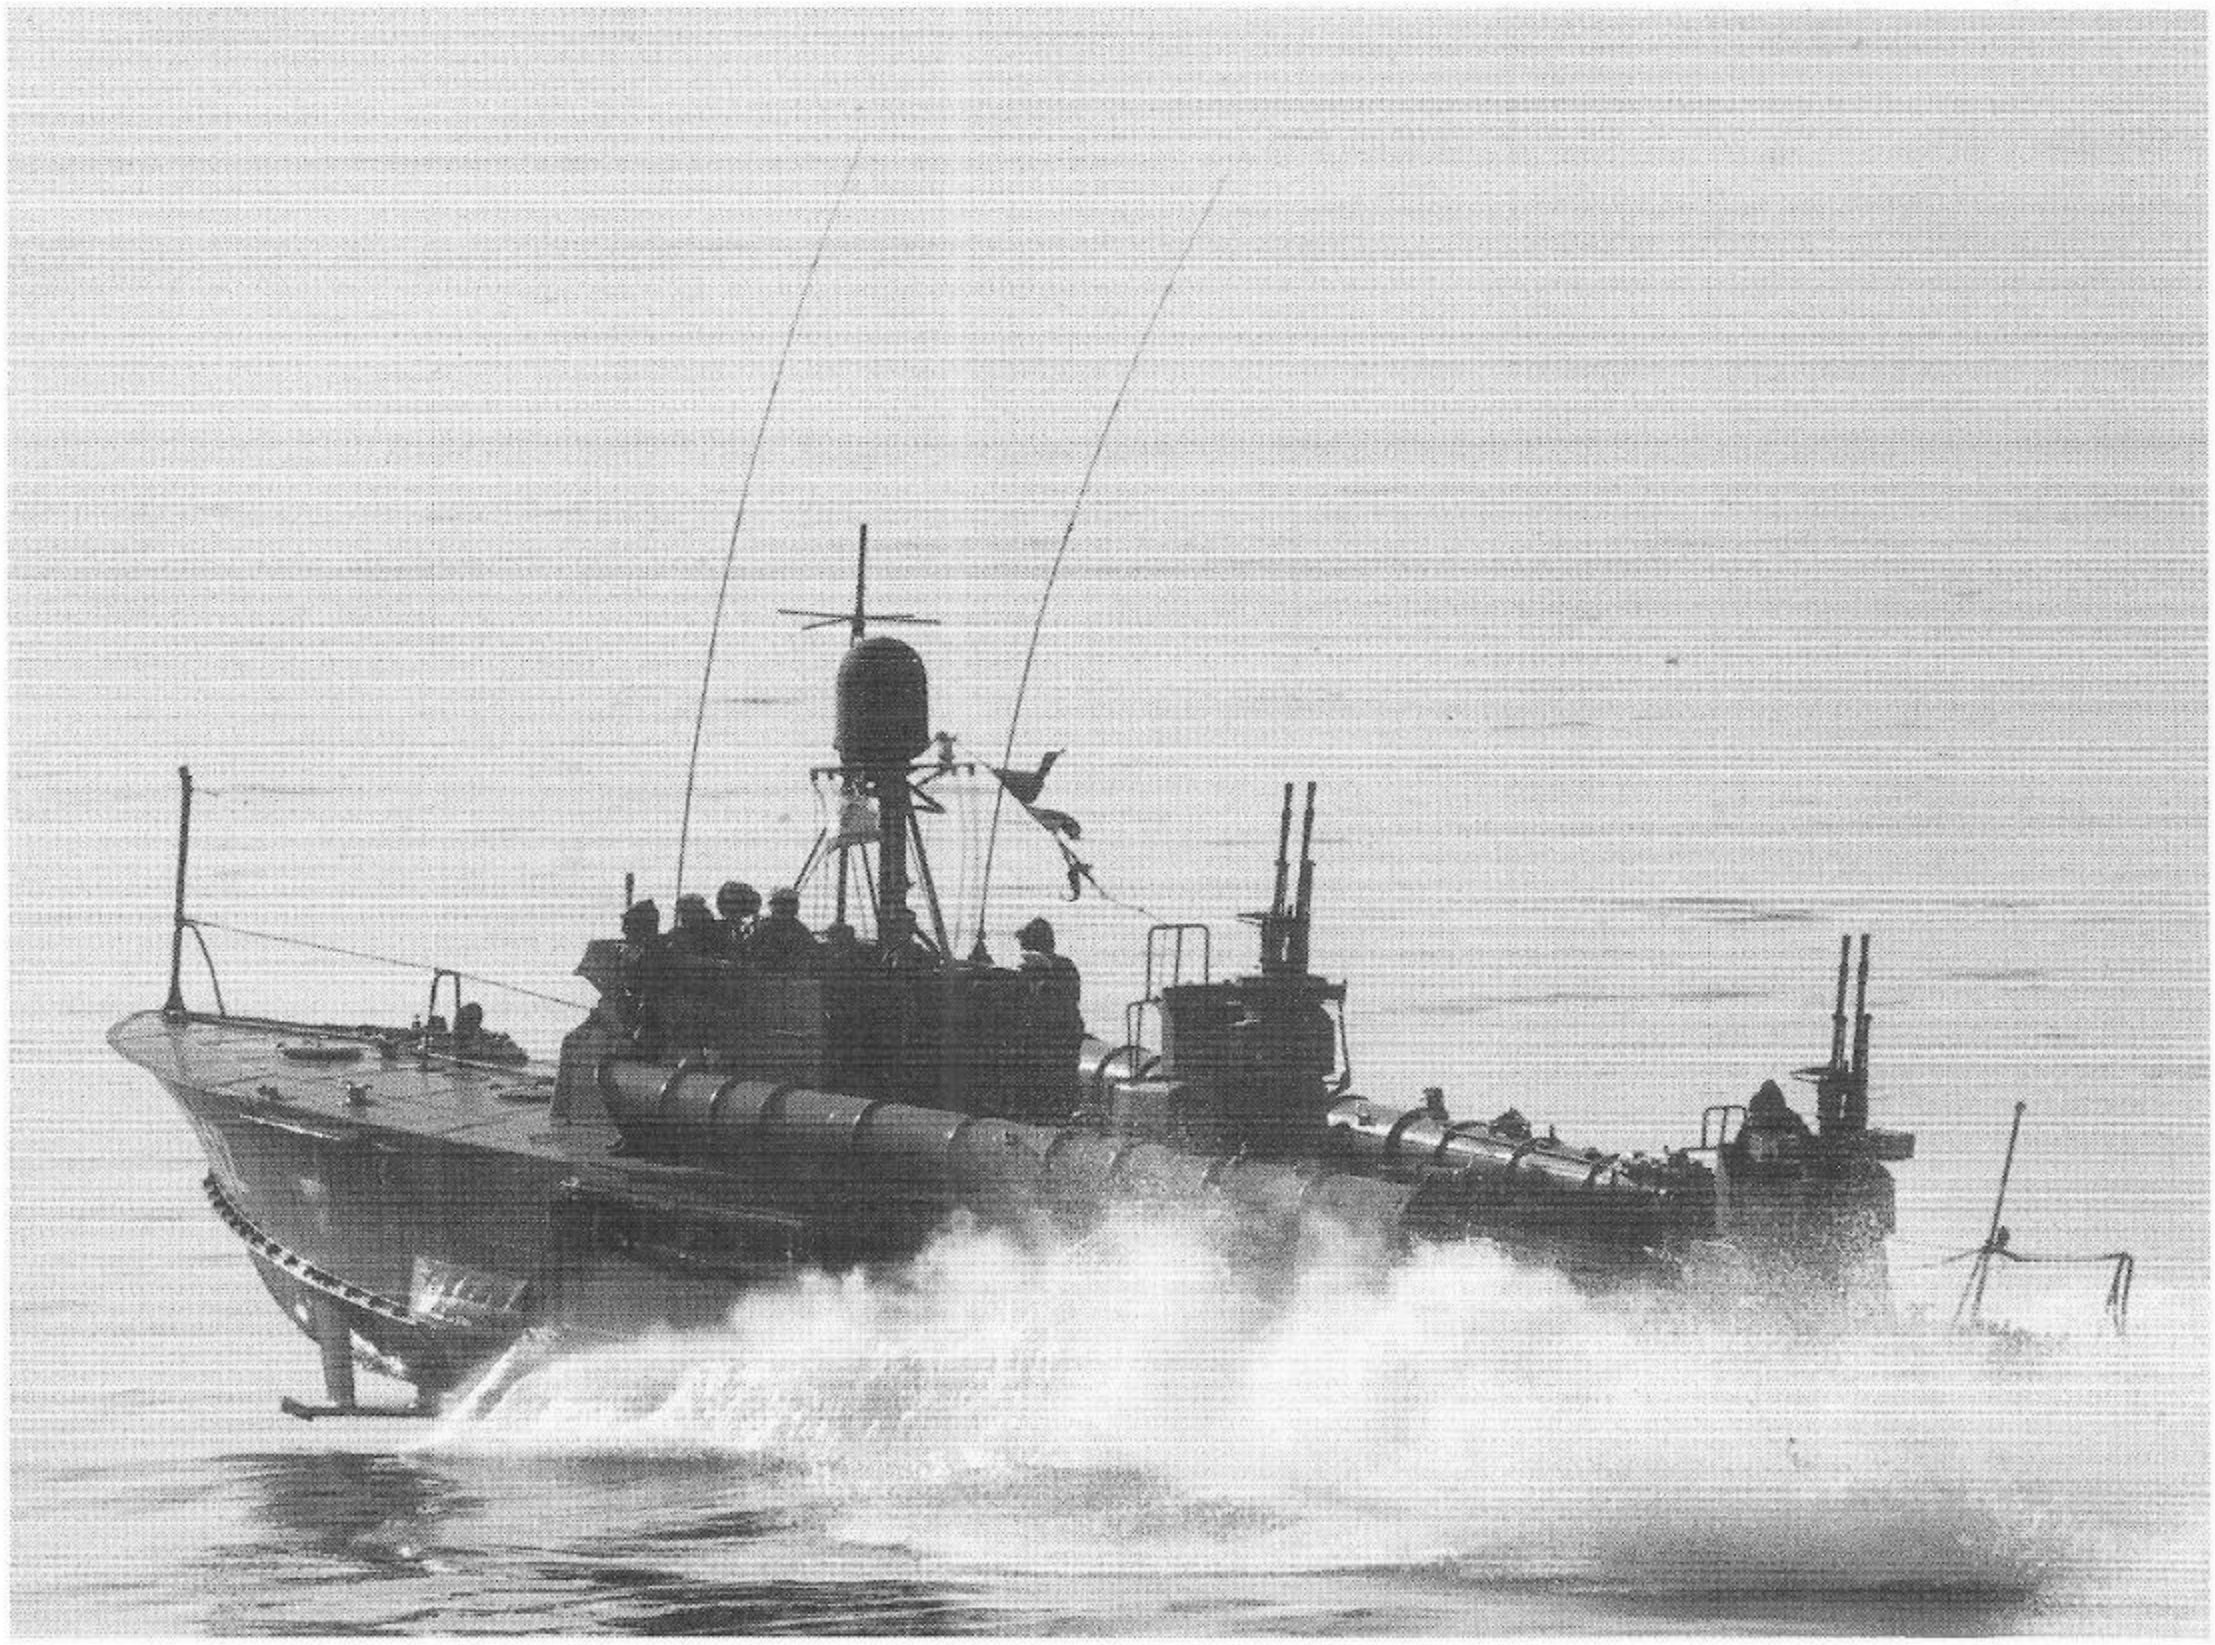
Specifications
System: Diesel
Main machinery: 3 Type M 50F; 2.4 MW (3,300 hp)
Shafts: 3

FURTHER INFORMATION

These vessels were built at the Hudong Shipyard, Shanghai and were formerly known as the 'Hu Chwan' class. They are of all-metal construction and the forward pair of hydrofoils may be recessed into the hull, although some vessels do not have hydrofoils.

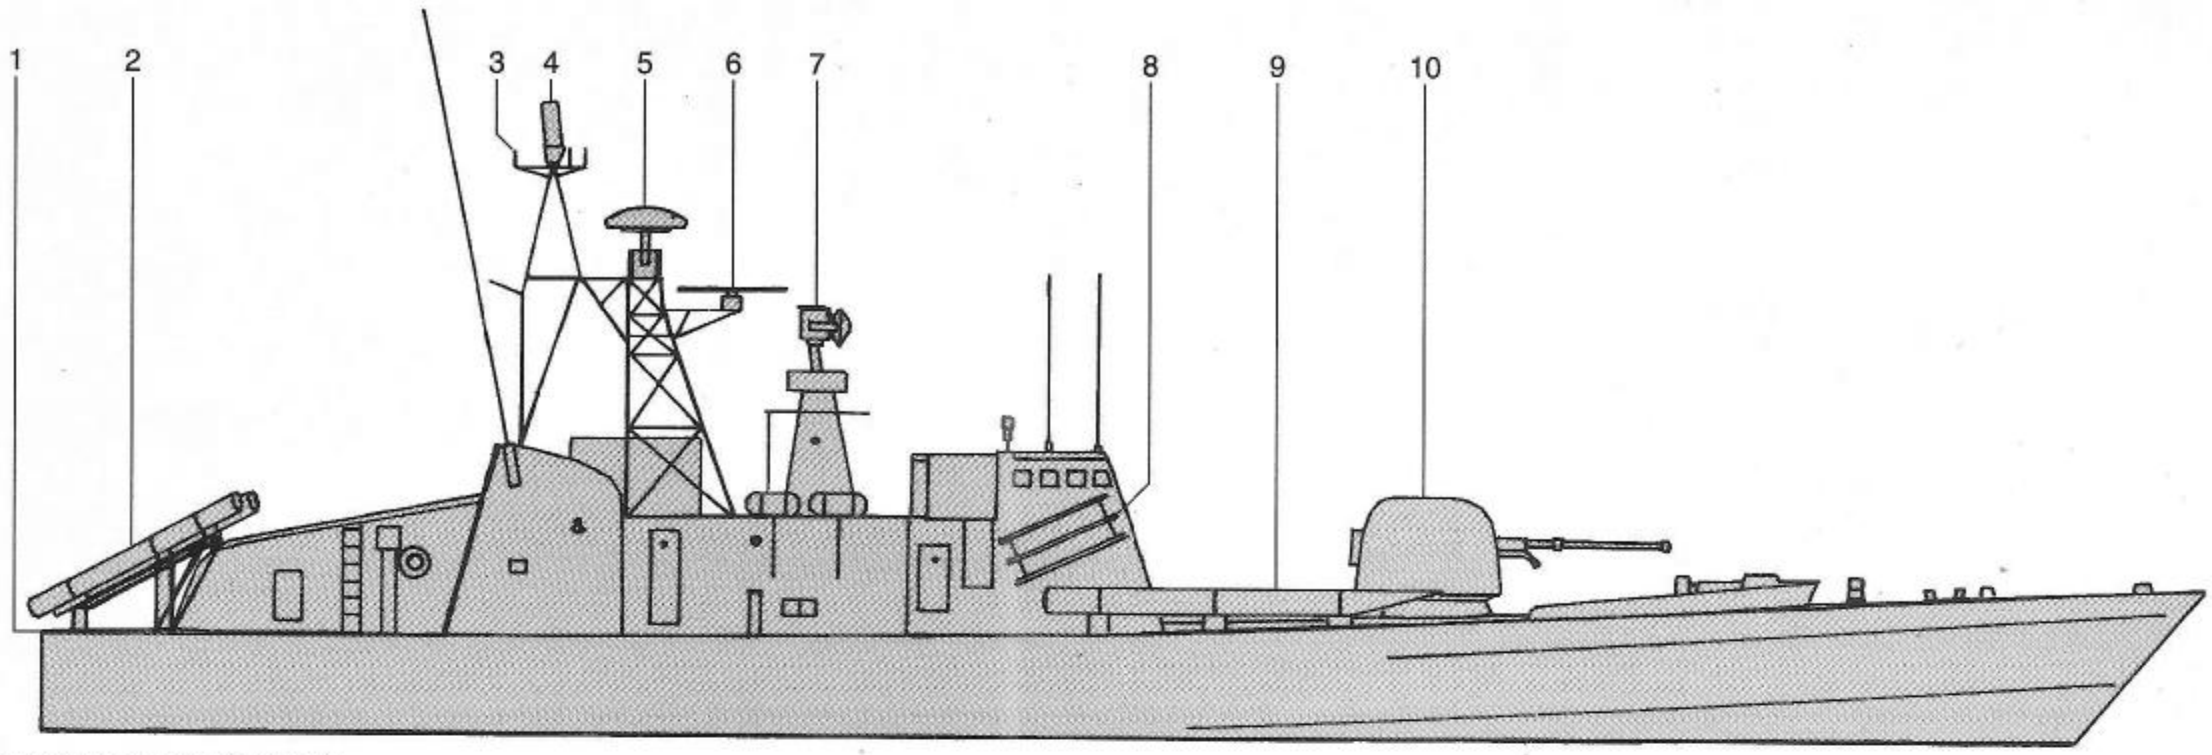
Two versions exist, the Type 025 has the bridge forward of the torpedo tubes' forward edge and the gun mountings amidships and astern while the Type 026 has the bridge about level with the tubes' forward edge, the midships gun mounting moved forward of the bridge and a radome replacing it.

Albania received 32 between 1968 and 1974. Some do not have hydrofoils, but those that do, have the foils near the bow and use the stern for planing.



Huchuan hydrofoil FAC of the PLAN. Using the forward hydrofoils and the planing stern these ships are capable of a speed of 50 knots. Note the two twin 14.5 mm machine guns, two 533 mm (21 in) torpedo tubes and the Skin Head surface-search radar

WILLEMOES



Willemoes (Ian Sturton)
1 *Minerails for 20 mines (in place of Harpoon launchers)* **2** *McDonnell Douglas Harpoon anti-ship missiles (maximum of eight)* **3** *Racal-Decca Cutlass ESM* **4** *DASA Telegon HF/DF* **5** *CelsiusTech 9GA 208 air/surface search radar* **6** *Terma Elektronik 20T 48 Super navigation radar* **7** *CelsiusTech 9LV200 fire-control radar* **8** *103 mm flare launchers (six in total)* **9** *533 mm (21 in) torpedo tubes* **10** *OTOBREDA 76 mm (3 in) compact automatic gun*

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Harpoon 1C
Between four and eight launchers for the McDonnell Douglas Harpoon 1C may be embarked on the quarter-deck pointing forward.

Specifications
Length: 4.63 m (15.18 ft) (with booster)
Diameter: 34 cm (13.38 in)
Wing span: 83 cm (32.67 in)
Weight: 681.9 kg (with booster)
Speed: Mach 0.85
Range: 67 n miles (124 km)
Warhead: 221.6 kg (500 lb)
Guidance: Inertial navigation and active radar

Manufacturer/Contractor
McDonnell Douglas Missile Systems Company.

TUBES

Either two or four 533 mm (21 in) torpedo tubes may be embarked. These are for Bofors Tp 617 torpedoes.

TORPEDOES

Tp 617

Specifications
Length: 6.98 m (23.0 ft)
Diameter: 533 mm (21 in)
Weight: 1,860 kg (4,101 lb)
Propulsion: Hydrogen peroxide/alcohol
Speed: 45 kts
Range: 10.75 n miles (20 km)
Warhead: 240 kg (529 lb)
Guidance: Wire and active/passive sonar

GUNS

OTOBREDA 76 (3 in)/62 Compact
The 'Willemoes' class has a single OTOBREDA 76/62 Compact gun mounting almost amidships, forward of the bridge.

Specifications
Gun
Calibre: 76 mm
Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 85 rds/min
Range: 8.5 n miles (16 km)

Mounting
Weight: 8.5 t (loaded)
Traverse: 360°
Elevation: −15 to +85°

The foredeck of Hammer *P 425 showing the OTOBREDA 76 mm gun and 533 mm torpedo tubes* (Jane's/David Miller)

Hammer *(P 542). Sensors above the bridge are: 9LV200 fire control (lowest); Terma 20T 48 Super navigation (slotted reflector just above 9LV200); 9GA 208 air search; and Telegon HF/DF (masthead)* (Jane's/David Miller)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

MINES

If the missile launchers are removed, rails carrying up to 20 mines can be mounted, instead.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Racal-Thorn Cutlass
Cutlass uses the same antenna as RDL and provides bearings, CW bearing and instantaneous frequency measurement over the E/J-band. The system can incorporate a responsive noise jammer as well as providing spot or barrage noise. It may also be integrated with decoy launchers.

DASA Telegon
There is a DASA Telegon High-Frequency Direction-Finding (HF/DF) set.

Manufacturer/Contractor
DASA, Ulm, Germany.

DECOYS

Danish Aerotech DL-6T
These ships have the Danish Aerotech DL-6T decoy launcher system with two six-tube launchers. The 130 mm tubes have different angles.

Manufacturer/Contractor
Danish Aerotech, Denmark.

Flare launchers
There are two sets of three 103 mm flare launchers either side of the bridge.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Terma Tactical Date System (TDS)
These ships have the Terma Tactical Data System (TDS). The TDS is a distributed architecture system based upon Motorola 68020 processors with three display systems and it can track 50 targets simultaneously.

CelsiusTech 9LV200 Mk 2
The 9LV200 Mk 2 is a radar-based weapon control system of mainframe architecture using the Philips P800 minicomputer for the control of one medium- and one light-calibre gun mounting as well as surface-to-surface missiles. There is a tactical display system and two gun control displays, for ASuW and AAW operations.

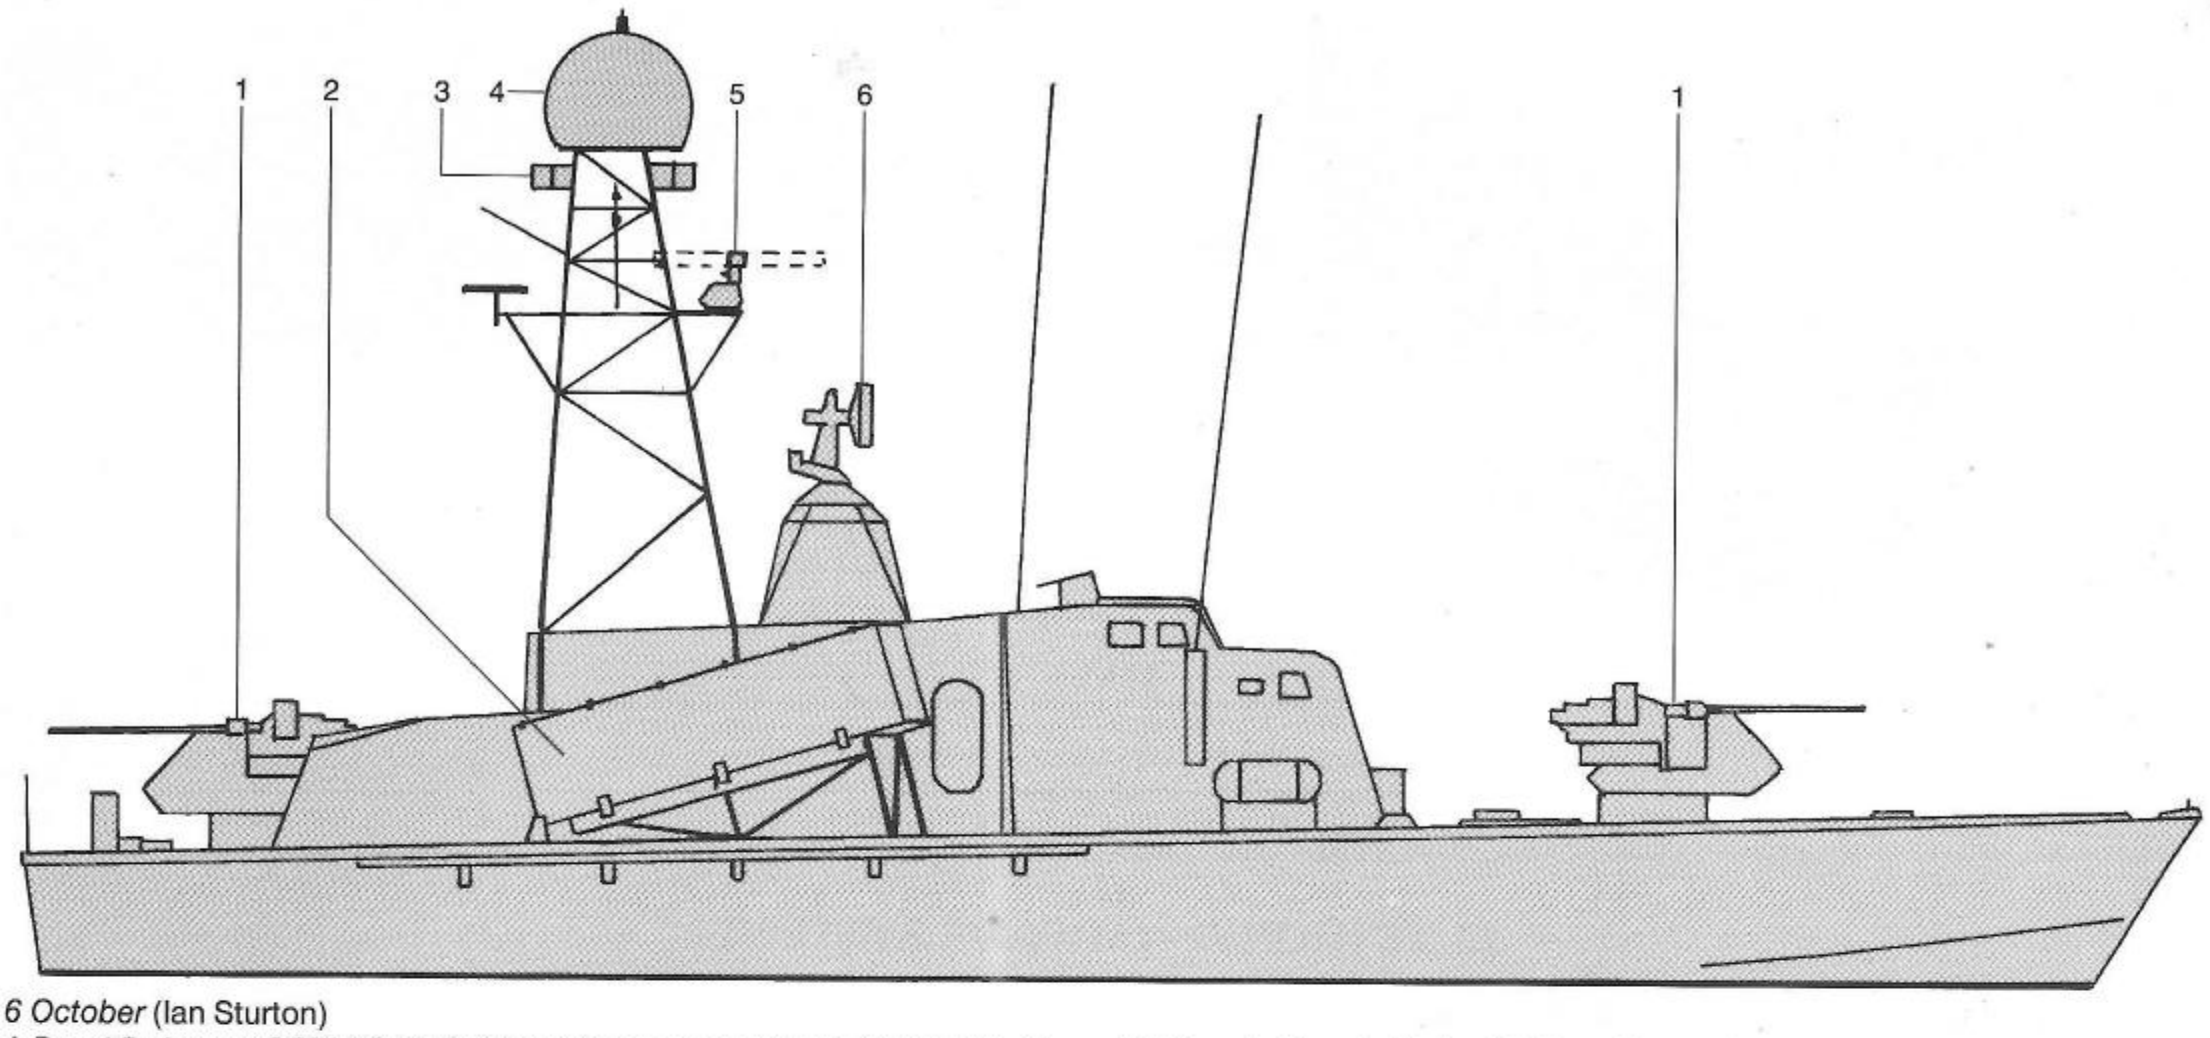
PROPULSION

Specifications
System: Combined diesel or gas turbine (CODOG)
Diesel engines: 2 General Motors 8V-71, 343 kW (460 hp)
Gas-turbine engines: 3 Rolls Royce 52M/544; 9.51 MW (12,750 hp)
Shafts: 3
Propellers: Controllable pitch

FURTHER INFORMATION

These vessels have long forecastles and, for their size, a particularly heavy armament. The design was prepared by Lürssen and was based on that of the 'Spica II' of the Royal Swedish Navy, which was also a Lürssen design. The lead ship was laid down in 1974 and commissioned in 1976 while the last ships were commissioned in 1978. The weapons mixture matches the mission, which rarely exceeds 36 hours.

6 OCTOBER (KOMAR)



6 October (Ian Sturton)
1 *Royal Ordnance GCM-AO1 twin 30 mm/75 cannon* **2** *Alenia/Matra BAe Otomat Mk 1 anti-ship missile (two)* **3** *Racal-Decca Cutlass ESM* **4** *GEC-Marconi S 810 air/surface search radar* **5** *Navigation radar (unidentified)* **6** *GEC-Marconi ST802 fire-control radar*

GENERAL SPECIFICATIONS

Country of origin: Russia
Operator: Egypt
Type: FAC, Missile

Class: 6 OCTOBER (KOMAR)

Built: 6
Active: 6

Displacement:
standard: 71 t
full load: 82 t

Dimensions
Length: 25.5 m (84 ft)
Beam: 6.1 m (20 ft)
Draught: 1.3 m (5 ft)

Speed: 40 kts
Range: 400 n miles (740 km) at 30 kts

Complement: 20

SHIPS

781, 783, 785, 787, 789, 791

WEAPONS SYSTEMS

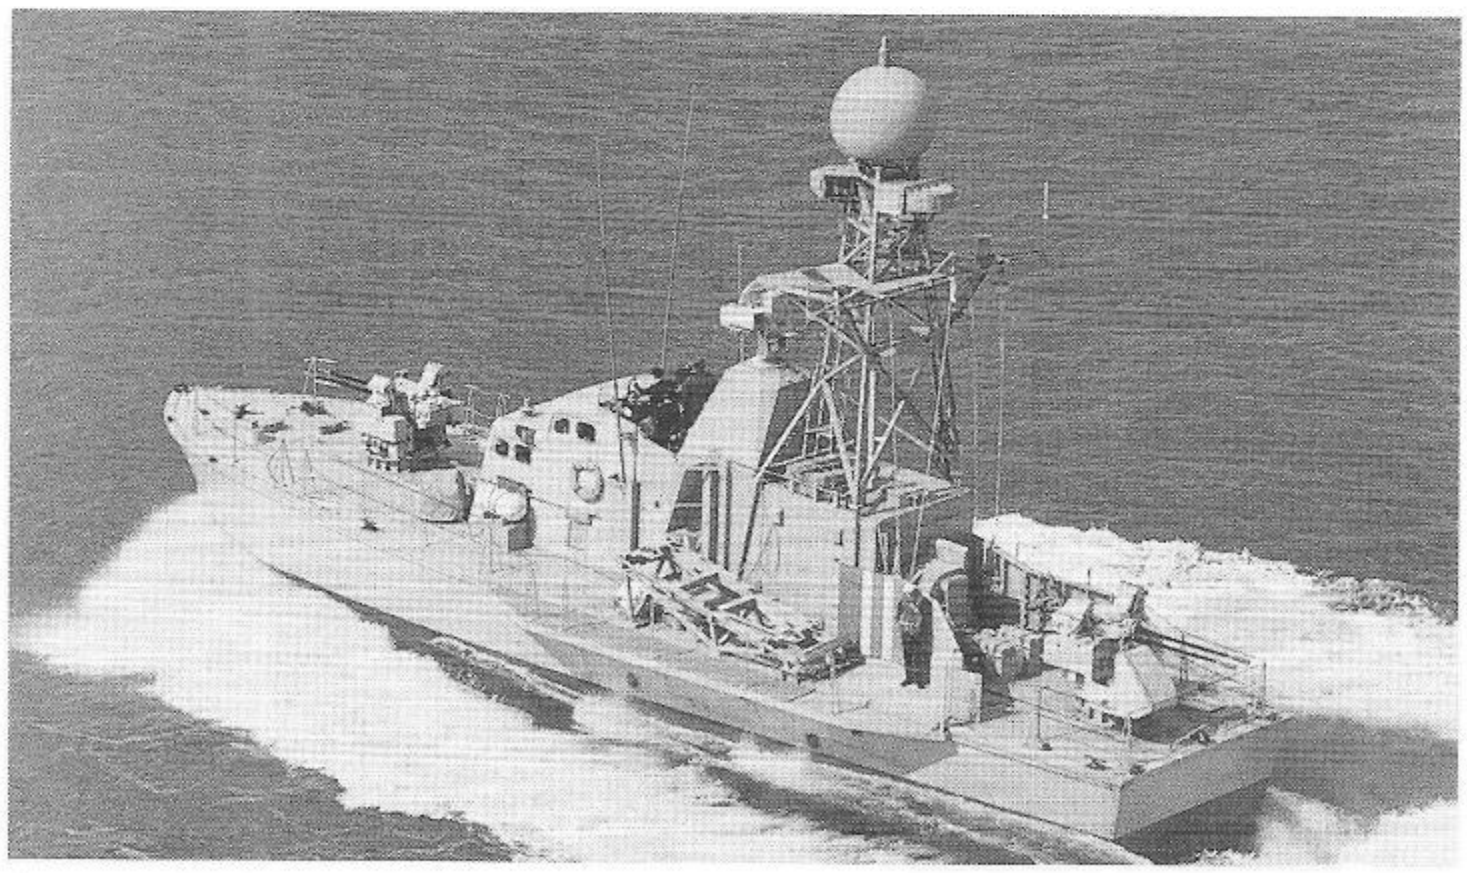
SURFACE-TO-SURFACE MISSILES (SSM)

Otomat Mk 1

There are two launchers, one either side of the superstructure, for Alenia/Matra Otomat Mk 1 anti-ship missiles.

Specifications
Length: 4.66 m (15.28 ft)
Diameter: 46 cm
Wing span: 1.36 m (4.46 ft)
Weight: 770 kg (2,526 lb) (with boosters)
Speed: Mach 0.9
Range: 35 n miles (65 km) (Longer ranges require helicopter support)
Warhead: 210 kg (465 lb)
Guidance: Inertial with active radar homing

Manufacturer/Contractor
Alenia Missile Systems/Matra BAe Dynamics.



A converted '6 October'. Note the racks for Otomat missiles, twin BMARC/Oerlikon 20 mm mounts and new lattice mast, topped by the GEC-Marconi S 810 radar. Note also the new platform to provide a walk-way around the missile launcher (Vosper Thornycroft)

GUNS

Royal Ordnance GCM-AO1

The '6 October' class has two Royal Ordnance GCM-AO1 (formerly A.32) twin 30 mm gun mountings, one on the foredeck, the other on the stern.

Specifications
Gun
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,547 ft/s)
Rate of fire: 650 rds/m (per gun)
Range: 1.5 n miles (3 km) and 3,500 m (11,500 ft)

Mounting
Weight: 2.26 t
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
Royal Ordnance, London, UK.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Racal-Thorn Cutlass

Cutlass uses the same antenna as RDL and provides bearings, CW bearing and frequency measurement over the E/J-band with instantaneous frequency measurement. The system can incorporate a responsive noise jammer as well as providing spot or barrage noise. It may also be integrated with decoy launchers.

DECOYS

These ships have the Racal-Thorn Protean decoy launcher system. Each launcher has four magazines with 36 × 40 mm chaff or infra-red payload grenades. The former fire at intervals of 0.1 s per magazine and within 1 s create a 1,000 m² decoy cloud while the infra-red ones cover both the 3-5 µm and 8-14 µm bands.

Manufacturer/Contractor
Racal-Thorn, UK.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

BAe Sapphire

These ships have the British Aerospace Systems and Equipment Sapphire weapon control system. Sapphire is a radar and electro-optical weapon control system for guns based upon the Sea Archer 1 predictor. The system is operated from a single console.

Manufacturer/Contractor
BAe, UK.

RADARS

	S810	ST802
Maker	GEC-Marconi	GEC-Marconi
Role	Search	Weapon control
Frequency	I-band	I-band
Beam	2.2, 25°	2.4°
Peak power	180 kW	150 kW
Gain	29.5 dB	36.5 dB

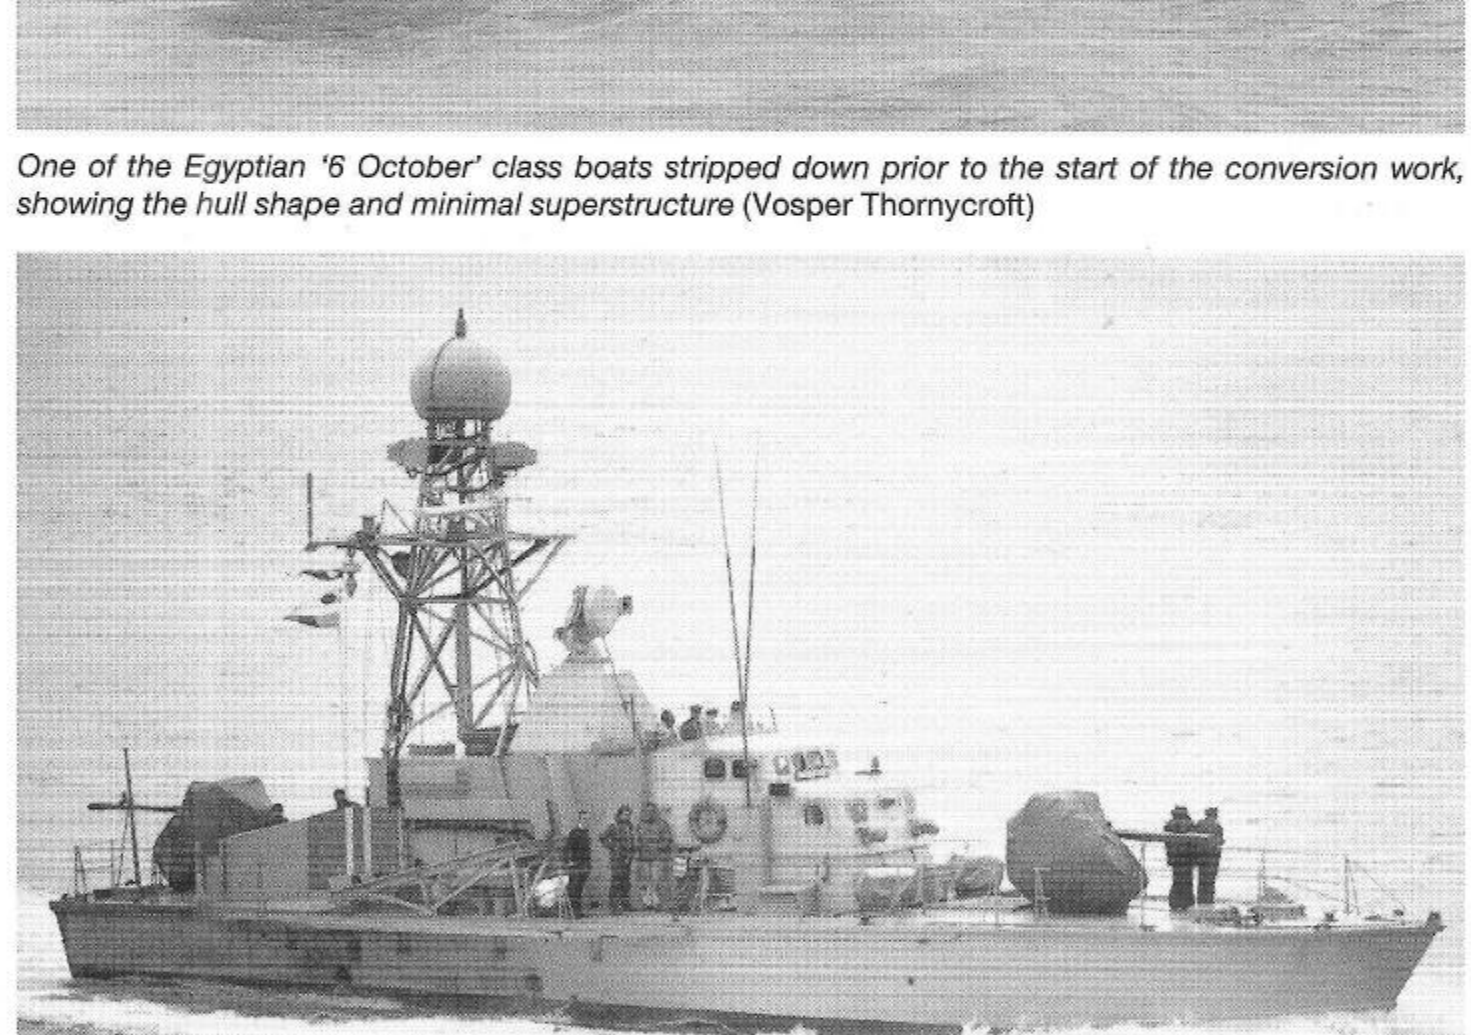
PRF	1,500 pps	3,000 pps
Scan rate	24 rpm	20 rpm
Typical range	13.5 n miles (25 km)	21.5 n miles (40 km)

Note:
There is also an (unidentified) nayigation radar.



One of the Egyptian '6 October' class boats stripped down prior to the start of the conversion work, showing the hull shape and minimal superstructure (Vosper Thornycroft)

A converted '6 October' class FAC-M of the Egyptian Navy (H & L van Ginderen Collection)

PROPULSION

Specifications
System: Diesel
Main machinery: 4 CRM 12 D/SS; 3.67 MW (5,000 hp)
Shafts: 4

FURTHER INFORMATION

These wooden-hulled vessels were built in Alexandria between 1975 and 1976 using the hull design of the 'Komar' class. They were refitted by Vosper Thornycroft in 1979/1981 and given new weapons and electronics, plus a GRP operations room which can be removed to give access to the engine hatches.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

RBS 15M

The 'Helsinki' class has up to four twin launchers on the after deck for the RBS 15M anti-ship missile. The launchers are trained forward with two pairs on the starboard side and the other two pairs on the port side.

Specification
Length: 4.35 m (14.26 ft)
Diameter: 50 cm (19.68 in)
Wing span: 1.4 m (4.6 ft)
Weight: 780 kg (1,720 lb) (with boosters)
Speed: Mach 0.8
Range: 38 n miles (70 km)
Warhead: 200 kg (440 lb)
Guidance: Inertial navigation with active radar homing

Manufacturer/Contractor
Saab Missiles AB, Linkoping, Sweden.

Kotka *(63) alongside a 'Turunmaa' class corvette at the completion of BALTOPS '96. Note the 57 mm gun with 103 mm flare launchers on the sides and the RBS 15M missile launchers aft* (H M Steele)

SURFACE-TO-AIR MISSILES (SAM)

Mistral

A Sako-made barbette with either twin 23 mm guns or six Matra BAe Dynamics Mistral surface-to-air missiles is installed at the rear of the superstructure.

Specifications
Length: 1.81 m (5.9 ft)
Diameter: 9.2 cm (3.6 in)
Wing span: 11.1 cm (4.4 in)
Weight: 18.4 kg (40.5 lb)

Speed: Mach 2.6
Range: 2.7 n miles (5 km)
Warhead: 2.95 kg (6.5 lb)
Guidance: Infra-red passive homing

Manufacturer/Contractor
Matra BAe Dynamics.

GUNS

SAK 57 Mk 2
There is one Bofors SAK 57 Mk 2 57 mm/70 on the foredeck.

Specifications
Gun
Calibre: 57 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,020 m/s (3,347 ft/s)
Rate of fire: 220 rds/min
Range: 9 n miles (17 km)

Mounting
Weight: 6.7 t
Traverse: 360°
Elevation: −10 to +77°

Manufacturer/Contractor
Bofors Ordnance, Sweden.

Sako twin 23 mm mounting
The alternative weapon fit for the Sako barbette is a pair of Sako-made Russian 23 mm/87 cannon.

Specifications
Gun
Calibre: 23 mm
Length of barrel: 87 calibres
Muzzle velocity: 970 m/s (3,182 ft/s)
Rate of fire: 200 rds/min
Range: 1.1 n miles (2 km)

Mounting
Weight: 1.7 t
Traverse: 360°
Elevation: −15 to +80°

Manufacturer/Contractor
Sako, Riihimaki, Finland.

Kotka (63). Sensors above the bridge are: 9GR 60 weapon control (bridge roof); SPS-69 navigation radar (lower platform on mast); AR-700 ESM (upper platform) and 9GA 208 surface search radar (masthead). Immediately behind the 9GA 208 is the log periodic carried by most Finnish warships (Pär-Henrik Sjöström)

MINES

Two minerails can be fitted in place of the stern missile launchers.

DEPTH CHARGES

There are two depth charge racks.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

ArgoSystems AR-700A
These ships have an ARGO AR-700A receiver system which covers the C/J-bands. The wide open, monopulse, direction-finding and parallel instantaneous frequency receiver approach ensures there is no channelisation or band-stepping to degrade performance.

ELECTRONIC COUNTERMEASURES (ECM)

CelsiusTech Philax decoy launcher
The CelsiusTech Philax decoy launcher system consists of trainable 875/720/950 mm launchers, weighing 180 kg (397 lb). Each has four magazines with 36, 40 mm chaff or infra-red payload grenades. The former fire at intervals of 0.1 s per magazine and within 1 s create a 1,000 m² decoy cloud while the infra-red ones cover both the 3-5 µm and 8-14 µm bands.

Manufacturer/Contractor
CelsiusTech, Sweden.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

9LV 200 Mk 2 fire-control system
The basic 9LV 200 system (LV — *Luftvarn* (anti-aircraft)) fire-control system controls the guns, anti-ship missiles and wire-guided torpedoes. The system can direct one or more guns against one or more targets simultaneously and includes a CelsiusTech 9GR600 radar. The 9LV 200 family has a mainframe architecture, using Philips P800 minicomputers with a memory of 128 k which may be expanded to 512 k, the Mk 2 being a digital version. There is a tactical display and missile control console together with one gun control console for surface engagements one for air engagements and a torpedo control console. The tactical display and missile control unit is a three-man console (tactical picture compiler, principal warfare officer and the commanding officer) with 40 cm (16 in) tactical displays and two alphanumeric displays for surveillance, target acquisition and target designation. There is automatic track-while-scan of up to 16 air and surface targets with weapon systems exchanging target data. Also available is an external VHF/UHF voice channel and short burst transmission for exchanging target data with other ships. The principal warfare officer designates surface targets to either guns or missiles but also launches missiles either from integrated controls or a nearby missile firing panel. Surface targets to be engaged by gunfire are transferred to the appropriate gun console depending upon whether or not the target is to be tracked by the director or by track-while-scan, if the search radar is used.

Manufacturer/Contractor
CelsiusTech, Sweden.

RADARS

	9GA 208	9GR600	SPS-69 ARPA
Maker	CelsiusTech	CelsiusTech	Raytheon

Pulsewidth	0.25, 1.0 µs	0.25, 1.0 µs	0.08, 0.5, 0.25 µs
PRF	1,000, 3,000 pps	1,000, 3,000 pps	750, 1,500, 2,250 pps
Scan rate	60 rpm	60 rpm	24 rpm
Typical range	n/k	n/k	32 n miles (59 km)

SONARS

Simrad Marine SS 304
There are two sonars: the hull-mounted Simrad Marine SS 304 and a Finnyards Sonac PTA (Passive Towed Array). The SS 304 is a searchlight-type sonar operating at 34 kHz with 17 preformed receiving beams covering an 85° sector. The transducer may be turned and tilted −105 to +15°.

Finnyards SONAC passive towed array
The passive towed array has a 78 m (256 ft) array at the end of a 600 m (1,969 ft) cable which operates down to a depth of 100 m (328 ft) at a maximum speed of 12 knots.

ELECTRO-OPTIC SENSORS

Saab EOS-400

EOS-400 uses a Saab television tracker for automatic tracking in conjunction with a laser rangefinder, both units being mounted on a common training and elevating stabilised platform. This unit is the only above-deck item of equipment, (apart from the weapon being controlled) and below deck the control/display unit is located in the operations room. The control/display unit contains a TV monitor and a joystick for sensor platform operation, a mode selector and target data displays. The system tracks one target among several in close formation, tracking when radar tracking is not possible, and is equally effective against both surface and air targets. Inputs from other systems include the ship's surveillance radar and reference data from ship's compass. The system calculates ballistics for several guns and gives gun-laying data.

Specifications

Tracking parameters
Training: 360°
Elevation: −30 to +85°

Platform
Angular speeds, azimuth and elevation: 150°/s
Angular accelerations:
azimuth: 2 rad/s²
elevation: 3 rad/s²
Tracking: Digital correlation

Contrast selection: Automatic black/white
Lock on area: Whole field

Daylight camera
Scanning standard: 625 lines
Camera tube: Si-vidicon
Night camera: IR camera optional

Laser rangefinder
Wavelength: 1.06 µm
Repetition rate: 10 Hz
Beamwidth: 1.5 mrad

Manufacturer/Contractor

CelsiusTech, Sweden.

PROPULSION

Specifications

System: Diesel
Main machinery: 3 MTU 16V 538 TB92; 7.52 MW (10,230 hp)
Shafts: 3

FURTHER INFORMATION

PROGRAMME

First of class, *Helsinki* (60) was ordered in October 1978 and launched in 1980. The second, third and fourth ships were not ordered until 1983 and were commissioned in 1985-86.

More would have been ordered, but it was then decided to switch to the 'Rauma' class (sometimes known as the 'Helsinki II' class.

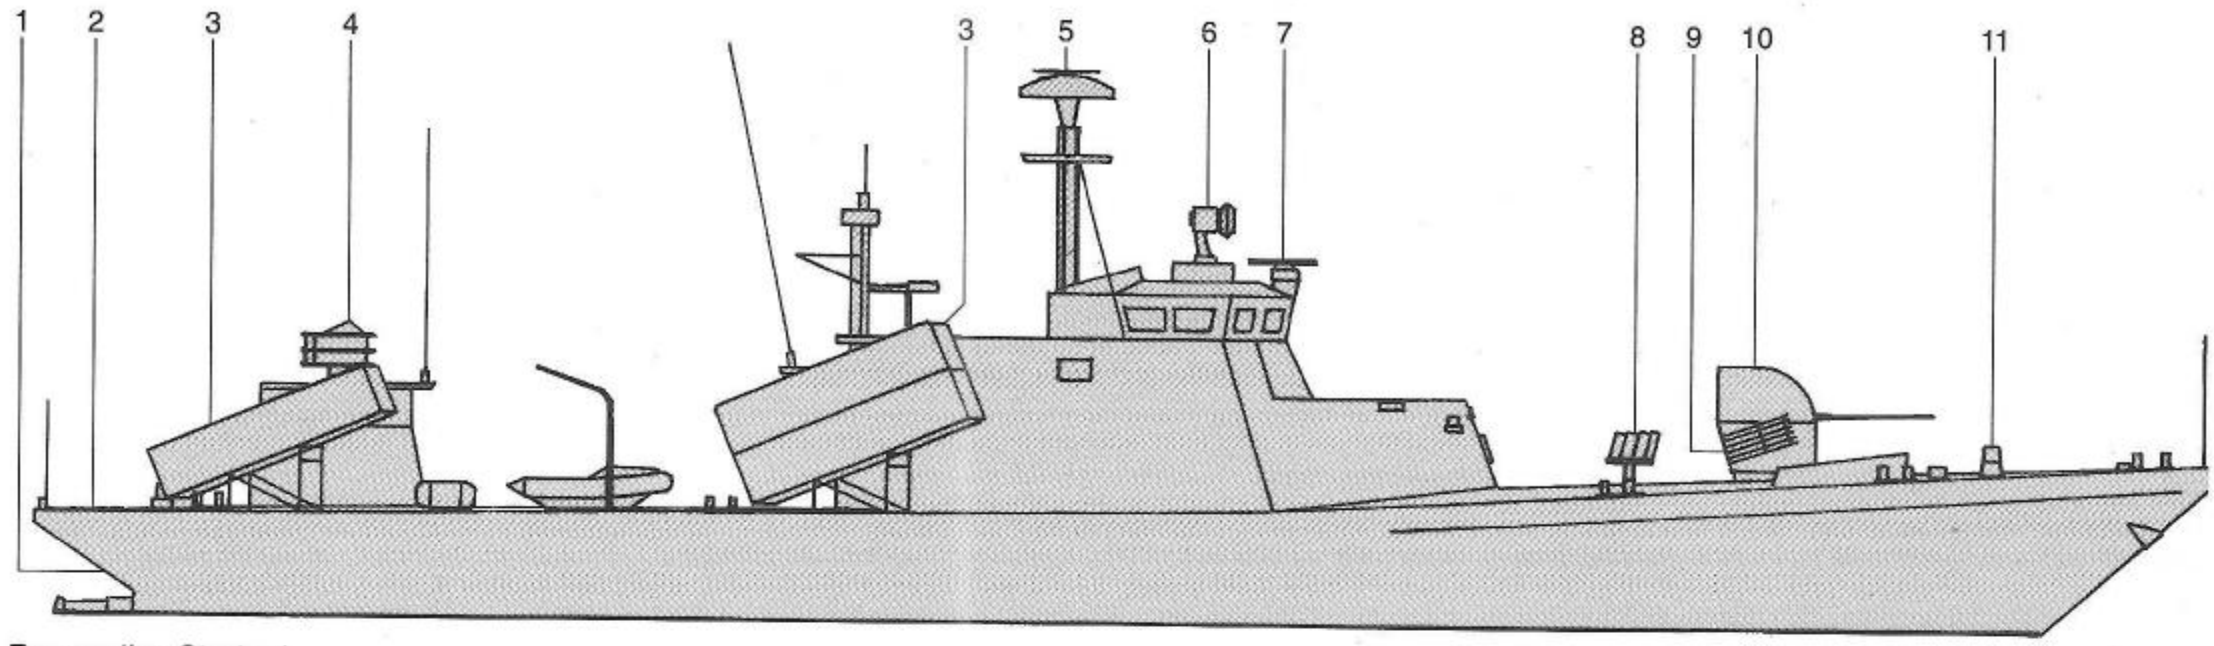
DESIGN

These ships have an aluminium alloy hull and superstructure. The second and subsequent ships were built with a revised armament and bridge and *Helsinki* was later brought up to the same standard.

The Seko barbette enables either Mistral SAMs or twin 23 mm cannon to be carried. Also, the after missile launchers can be replaced by two minerails.

Turku (61) *with a full load of eight RBS-15 anti-ship missiles* (Pär-Henrik Sjöström)

RAUMA



Rauma (Ian Sturton)
1 *Undercut stern* **2** *Minerails (if missile launchers removed)* **3** *Saab RBS-15M anti-ship missiles (maximum of eight)* **4** *Sako barbette for either six Matra/BAe Mistral SAM or twin 23 mm ZV-23 cannon* **5** *CelsiusTech 9GA 208 search radar* **6** *CelsiusTech 9GR 600 weapon-control radar* **7** *Raytheon SPS-69 ARPA navigation radar* **8** *CelsiusTech Philax chaff launcher* **9** *103 mm flare launchers* **10** *Bofors 40 mm/70 automatic gun* **11** *Saab Elma ASW mortar*

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Saab RBS 15M
Six or eight Saab Dynamics RBS 15M missiles may be embarked. Single or double missile launchers are embarked outboard of the after end of the superstructure and on the port and starboard quarters.

Specifications
Length: 4.35 m (14.26 ft)
Diameter: 50 cm (19.68 in)
Wing span: 1.4 m (4.6 ft)
Weight: 780 kg (1,720 lb) (with boosters)
Speed: Mach 0.8
Range: 38 n miles (70 km)
Warhead: 200 kg (440 lb)
Guidance: Inertial navigation with active radar homing

Manufacturer/Contractor
Saab Missiles AB, Sweden.

SURFACE-TO-AIR MISSILES (SAM)

Mistral
A Sako barbette with six Matra BAe Dynamic Mistral missiles may be embarked.

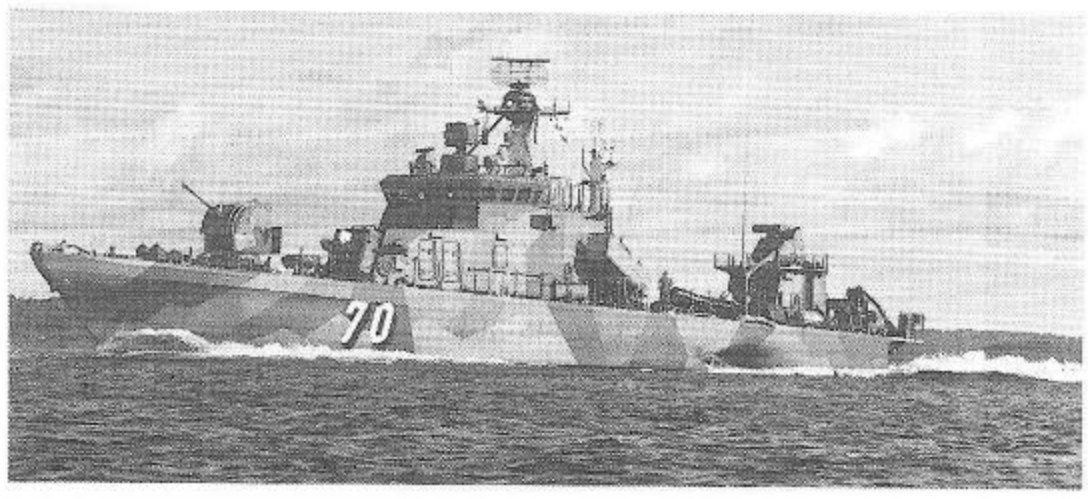
Specifications
Length: 1.81 m (5.9 ft)
Diameter: 9.2 cm (3.6 in)
Wing span: 11.1 cm (4.4 in)
Weight: 18.4 kg (40.5 lb)
Speed: Mach 2.6
Range: 2.7 n miles (5 km)
Warhead: 2.95 kg (6.5 lb)
Guidance: Infra-red passive homing

Manufacturer/Contractor
Matra BAe Dynamics.

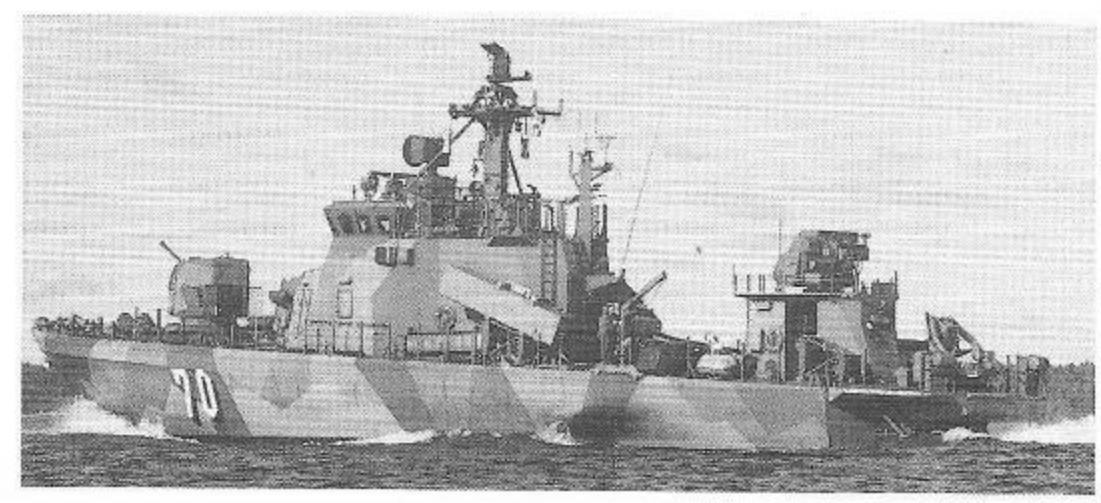
GUNS

Sako twin 23 mm mounting
If missiles are not carried, the Sako barbette has two 23 mm guns.

Specifications
Gun (Russian)
Calibre: 23 mm



Rauma *(70). Forward of the Bofors 40 mm/70 are four Saab Elma ASW mortars. Sensors above bridge are Raytheon navigation radar, CelsiusTech 9LV 225 fire-control director and (at the masthead) 9GA 208 surface search radar.*



Rauma *(70) from astern. The FAC is carrying only two missile launchers. Note the Sako barbette on top of the aft deckhouse, the platform sticking out over the stern and the two depth charges on the stern rails* (Pär-Henrik Sjöström)

Length of barrel: 87 calibres
Muzzle velocity: 970 m/s (3,182 ft/s)
Rate of fire: 200 rds/min
Range: 1.1 n miles (2 km)

Mounting
Weight: 1.7 t
Traverse: 360°
Elevation: −15 to +80°

Manufacturer/Contractor
Sako, Riihimaki, Finland.

12.7 mm machine guns
There are two 12.7 mm machine guns.

Saab Elma ASW mortars
Four nine-tubed launchers for the Elma ASW grenade. This weapon launches a grenade with a 4.2 kg (9.26 lb) warhead over a range of 350 m (1,148 yd), and was developed to counter submarine incursions in Swedish waters. It is intended to be capable of forcing a submarine to the surface rather than destroying it in the manner of a torpedo; hence the designation 'incident weapon.' Thus, the concept is to dissuade a submarine from entering Swedish waters without the political consequences of destroying it.

The LLS-920 non-magnetic, nine-tube Elma launchers are loaded from the muzzle, with firing initiated from the Combat Information Centre (CIC). A variety of programmable patterns result in carpets of 9, 18, 27 and 36 grenades. The Elma grenade is equipped with a shaped charge warhead the blast jet of which is capable of penetrating a submarine's pressure hull after passing through the water-filled superstructure.

Specifications
Launcher weight: 103 kg (227 lb)
Tube calibre: 100 mm (4 in)
Grenade weight: 4.35 kg (9.6 lb)
System range: 250-350 m (870-1,148 ft)

Manufacturer/Contractor
Saab, Sweden.

MINES

Minerails
Two minerails can be mounted in place of the missile launchers on the stern.

DEPTH CHARGES

One depth-charge rail is mounted.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Racal-Thorn Matilda
These vessels have the Racal-Thorn Matilda which is a lightweight system whose antenna provides a broad vertical beam to detect sea-skimmers and high-angle dive attack missiles. It covers the H/J-band with bearing resolution of 45° and features a visual and audio warning system.

Log Periodic Antennas
These vessels have the same type of log periodic antennas as the 'Turunmaa' corvettes. These are mounted on a pole mast amidships, with one horizontally and one vertically polarised. These could serve either an ESM or a communications function.

DECOYS AND ILLUMINANTS

CelsiusTech Philax
The CelsiusTech Philax decoy launcher system consists of trainable 875/720/950 mm launchers weighing 180 kg (397 lb). Each has four magazines with 36 40 mm chaff or infra-red payload grenades. The former fire at intervals of 0.1 s per magazine and within 1 s create a 1,000 m² decoy cloud, while the infra-red grenades cover both the 3-5 µm and 8-14 µm bands.

103 mm Flare Launchers
There are six launcher rails for 103 mm illuminating rockets.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

CelsiusTech 9LV Mk 3
These vessels have the CelsiusTech 9LV Mk 3 weapon control system. This is a radar-based, distributed architecture system based upon Motorola 68020 and 68040 processors with an Ethernet-standard local area network linking two workstations.

SONARS

Simrad Subsea ST 570 Toadfish
The 'Rauma' class has Simrad Subsea ST 570 Toadfish variable depth and Finnyards Sonac PTA towed array sonars. The Toadfish is a lightweight active sonar operating at 57 kHz and creating 64 digitally formed beams with a range of 6.5 n miles (12 km).

Finnyards Sonar PTA
The PTA (Passive Towed Array) sonar has a 78 m array at the end of a 600 m (1,969 ft) cable which operates down to a depth of 100 m (328 ft) at a maximum speed of 12 knots.

Typical range	n/k	n/k	32 n miles (59 km)

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU 16V 538 TB93; 5.52 MW (7,510 hp)
Shafts: None.
Waterjets: These FACs are propelled by two Riva Calzoni waterjets

FURTHER INFORMATION

PROGRAMME

The 'Rauma' class was developed from the 'Helsinki' class and also has aluminium alloy hull and superstructure. *Rauma* and *Raahe* were built by Hollming at Rauma and commissioned in 1990 and 1991, while *Naantali* and *Porvoo* were built by Finnyards and commissioned in 1992. These vessels were ordered in 1987 and a fifth was ordered in 1996; a further seven are planned.

The ships are primarily anti-ship platforms but also possess an ASW capability.

DESIGN

The design is based on that of the 'Helsinki' class, but is 3 m (9.9 ft) longer and with 50 per cent less draught (1.5 m (4.5 ft) versus 3 m (9.9 ft)). This is one of the smallest ships to carry a towed array, Finnyards Sonac PTA, which can be towed at speeds up to 12 knots. One unusual feature is the stern deck extension which carries the towed array cable and gives an 'undercut' appearance.

GENERAL NAZAIRE BOULINGUI

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

SS 12M
These vessels carry a launcher with four Aerospatiale SS 12M anti-ship missiles.

Specifications
Length: 1.86 m (6.1 ft)
Diameter: 21 cm (8.26 in)
Wing span: 65 cm (25.6 in)
Weight: 76 kg (167.5 lb)
Speed: Mach 0.6
Range: 0.5-3 n miles (1-5.5 km)
Warhead: 28.38 kg (62.5 lb)
Guidance: Wire command to line of sight

Manufacturer/Contractor
Aerospatiale Missiles, Paris.

GUNS

S.20
One Rheinmetall Rh-202 20 mm gun is installed aft of the superstructure.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 85 calibres
Muzzle velocity: 1,050-1,250 m/s (3,445-4,101 ft/s)
Rate of fire: 800-1,000 rds/min
Range: 1 n mile (1.8 km)

Mounting
Weight: 418 kg (922 lb)
Traverse: 360°
Elevation: −10 to +55°

Manufacturer/Contractor
Rheinmetall Wehrtechnik, Germany.

12.7 mm machine gun
One M2HB 12.7 mm machine gun is carried.

COMMAND AND CONTROL SYSTEMS

RADARS

Racal-Decca Type 1226

Specifications
Role: Surface search
Band: I
Beam: 1.2°
Peak power: 25 kW
Pulsewidth: 0.05, 0.25, 1.0 µs
PRF: 1,300 pps
Scan rate: 25 rpm
Typical range: 20 n miles (37 km)

Manufacturer/Contractor
Racal-Decca, UK.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU 12V 331 TC 81; 1.92 MW (2,610 hp)
Shafts: 2

FURTHER INFORMATION

These wooden-hulled vessels were ordered by the Cyprus Government from Chantiers Navals de l'Esterel and built in 1974/1975. Due to the Turkish invasion they were not delivered and were acquired instead by Greece. They were commissioned in 1975.

WEAPONS SYSTEMS

TABLE II: WEAPON SUMMARY

	Germany	Greece		Iran	Libya	Malaysia
Class	Tiger (Type 148)	Anninos	Votsis	Kaman	Sharaba	Perdana
Missiles, anti-ship	4 × Exocet MM 38	4 × Exocet MM 38	4 × Exocet MM 38	4 × Harpoon or 4 × Chinese YJ-1	4 × Otomat Mk 2	2 × Exocet MM 38
Guns						
main	1 × OTOBREDA 76 mm/62 (1 × 1)	4 × Oerlikon 35 mm/90 (2 × 2)	1 × OTOBREDA 76 mm/62 (1 × 1)	1 × OTOBREDA 76 mm/62 (1 × 1)	1 × OTOBREDA 76 mm/62 (1 × 1)	1 × Bofors 57 mm/70 (1 × 1)
secondary	1 × Bofors 40 mm/70 (1 × 1)	4 × Oerlikon 35 mm/90 (2 × 2)	1 × Bofors 40 mm/70 (1 × 1)	1 × Breda 40 mm/70 (1 × 2)	2 × Breda 40 mm/70 (1 × 1)	1 × Bofors 40 mm/70 (1 × 1)
Torpedoes	–	2 × 533 mm	–	–	–	–
Mines	Yes	–	Yes	–	–	–

SURFACE-TO-SURFACE MISSILES (SSM)

All vessels have two twin missile launchers aft of the superstructure, the forward pair trained to starboard and the after pair trained to port, except for the Malaysian vessels which have only two launchers. The missiles are usually Aerospatiale Exocet MM 38 (Greece, Germany) although Iranian vessels were designed to carry four Harpoon 1A missiles but now normally carry Chinese missiles (either C-801 (YJ-1) or C-802 (YJ-2)) while Libyan vessels carry Matra-Alenia Otomat Mk 2.

Aerospatiale Exocet MM 38

Specifications
Length: 5.21 m (17.08 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 22.5 n miles (42 km)
Warhead: 165 kg (365 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles, France.

Chinese C-801 (CSS-N-4 'Sardine' or YJ-1)

Specifications
Length: 5.81 m (19.5 ft)
Diameter: 36 cm (14.17 in)
Wing span: 1.18 m (3.87 ft)
Weight: 815 kg (1,797 lb)
Speed: Mach 0.9
Range: 23 n miles (42 km)
Warhead: 165 kg (364 lb)
Guidance: Inertial and active radar

Manufacturer/Contractor
China Precision Machinery Import and Export Corporation, Beijing, China.

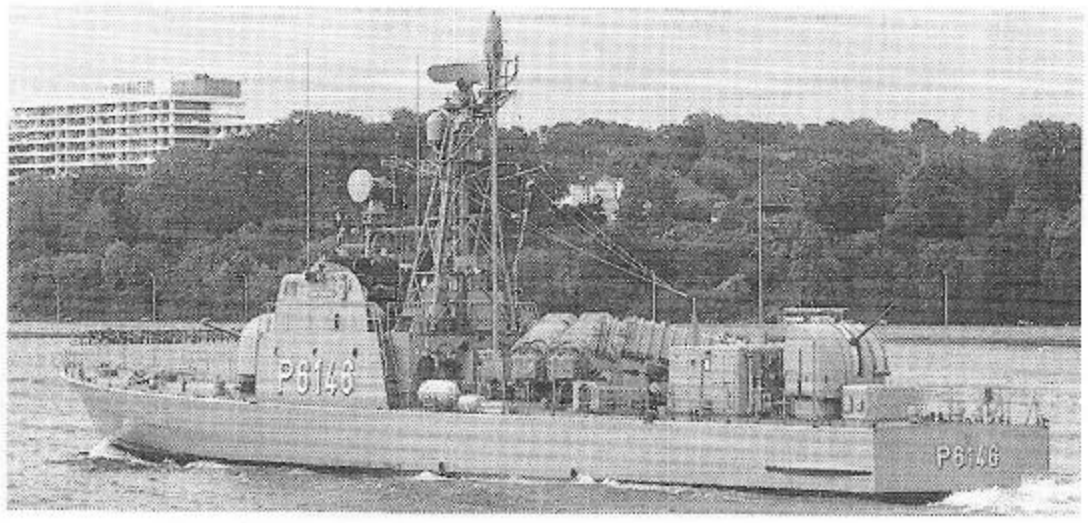
Chinese C-802 (CSS-N-8 'Saccade' or YJ-2)

Specification
Length: 6.39 m (12.10 ft)
Diameter: 36 cm (14.17 in)
Wing span: 1.18 m (3.87 ft)
Weight: 715 kg (1576.5 lb)
Speed: Mach 0.9
Range: 65 n miles (120 km)
Warhead: 165 kg (364 lb)
Guidance: Inertial and active radar

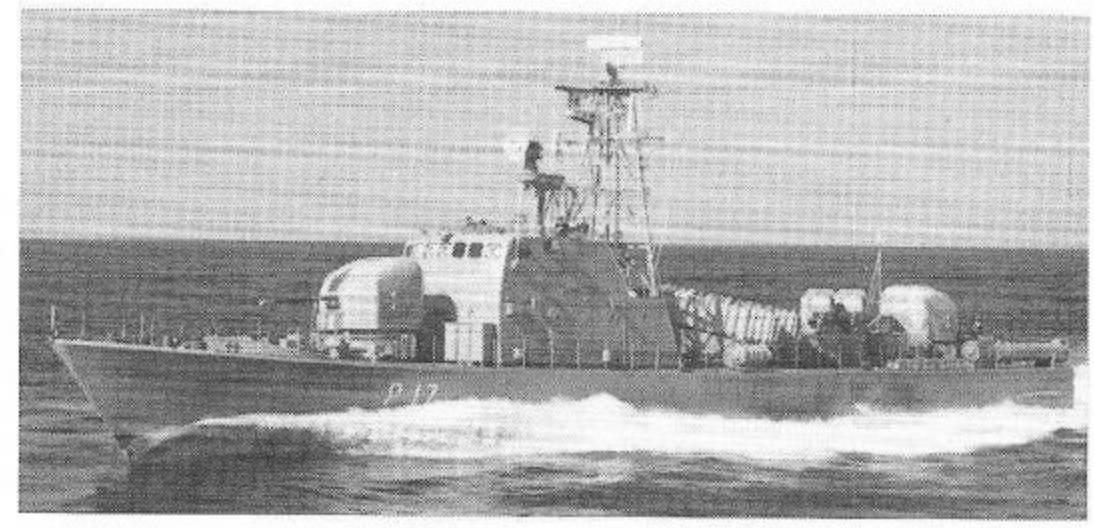
Manufacturer/Contractor
China Precision Machinery Import and Export Corporation, Beijing, China.

Matra/Alenia Otomat Mk 2

Specifications
Length: 4.46 m (14.62 ft)
Diameter: 46 cm (18.1 in)



The classic FAC of the 1970s was the La Combattante II, epitomised here by Reiher *(P 6159) of the Federal German Navy. The design was fast (36 knots) and packed a great deal of weaponry into a small hull* (H & L van Ginderen Collection)



Ipoploiarhos Batsis, *one of four La Combattante IIs purchased by the Greek Navy in 1971/72. These have twin Oerlikon 35 mm/90 s fore and aft, four MM 38 Exocet, and are the only La Combattante IIs to carry torpedo tubes* (Hellenic Navy)

Wing span: 1.36 m (4.46 ft)
Weight: 770 kg (1,698 lb) (with boosters)
Speed: Mach 0.9
Range: 35 n miles (65 km) (Longer ranges require helicopter support)
Warhead: 210 kg (465 lb)
Guidance: Inertial with active radar homing

Manufacturer/Contractor
Alenia Missile Systems/Matra BAe Dynamics.

TUBES

The Greek 'La Combattante II' class have two 533 mm (21 in) torpedo tubes with STN Atlas SST-4 torpedoes on each side of the aft gun mounting.

TORPEDOES

SST-4

Specifications
Length: 6.55 m (21.5 ft) (with guidance wire dispenser)
Diameter: 533 mm (21 in)
Weight: 1,420 kg (3,131 lb) (without dispenser)
Propulsion: Electric
Speed: 35 kts
Range: 15 n miles (28 km)
Warhead: 260 kg (573 lb)
Guidance: Wire and active/passive sonar

GUNS

'Kaman' and 'Sharaba' class vessels have an OTOBREDA 76/62 Compact mounting forward and an OTOBREDA twin 40 mm Compact aft. The 'Tiger' and 'Votsis' classes are similar but with a Bofors 40 mm SAK 40 L/70-350 aft. 'Perdana' class vessels have a single 57 mm Bofors SAK 57 Mk 1 forward and a Bofors 40 mm L/70 aft while the 'Anninos' class has two Oerlikon-Contraves GDM-A twin 35 mm gun mountings fore and aft.

OTOBREDA 76/62 Compact

Specifications
Gun
Calibre: 76 mm
Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 10-85 rds/min
Range: 8.5 n miles (16 km)

Mounting
Weight: 8.5 t (loaded)
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Bofors SAK 57 Mk 1

Specifications
Gun
Calibre: 57 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,020 m/s (3,347 ft/s)
Rate of fire: 200 rds/min
Range: 9 n miles (17 km)

Mounting
Traverse: 360°
Elevation: −10 to +75°

Manufacturer/Contractor
Bofors Ordnance, Sweden.

Bofors SAK 40 L/70-350

Specifications
Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 300 rds/min
Range: 6.75 n miles (12.5 km)

Mounting
Traverse: 360°
Elevation: −9 to +85°

Manufacturer/Contractor
Bofors Ordnance, Sweden.

OTOBREDA 40 mm/70

Specifications
Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 600 rds/min
Range: 3.25 n miles (12.5 km)

Mounting
Weight: 5.5 t (unloaded)
Traverse: 360°
Elevation: −13 to +85°

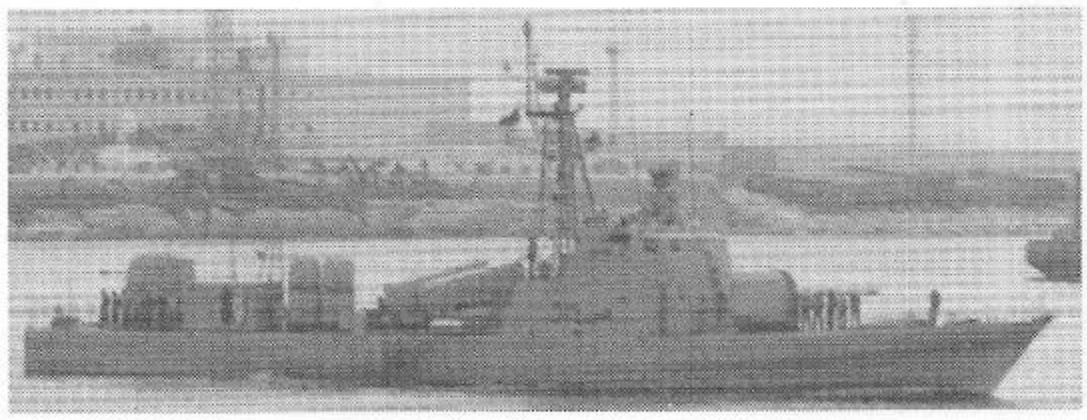
Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Oerlikon GDM-A 35 mm/90

Specifications
Gun
Calibre: 35 mm
Length of barrel: 90 calibres
Muzzle velocity: 1,175 m/s (3,855 ft/s)
Rate of fire: 550 rds/min/barrel
Range: 2.7 n miles (5 km)

Mounting
Weight: 6.52 t
Traverse: 360°
Elevation: −15 to +85

Manufacturer/Contractor
Oerlikon-Contraves, Switzerland.



Shafak. *The Libyan vessels are armed with Matra/Alenia Otomat anti-ship missiles. They also have one 76 mm/62 gun and a twin 40 mm/70 mount*

Weihe *(P 6157), following recent modification. The navigation radar antenna is now on the bridge roof and a new radome is mounted on the mast above the Thomson-CSF Castor fire director. At the mast head is an ESM antenna and below it the Thomson-CSF Tritor air/surface search radar*
(H & L van Ginderen Collection)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

'Anninos', 'Kaman', 'Perdana', 'Sharaba' classes. These classes have a Thomson-CSF DR 2000S ESM system. This is an F-band analysis receiver designed to detect pulse and CW signals using six direction-finding antennas in a radome. Greek 'Combattante' ('Anninos' class) also have the Siemens-Plessey Mk 10 IFF system.

'Kaman' class. The Iranian ships have the Thomson-CSF Dalia (TMV 433) radar analyser which operates over the E to J-bands and uses instantaneous frequency measurement. They also have the UPZ-27N/AP-72 IFF system.

'Tiger', 'Votsis' classes. The 'Tiger' and 'Votsis' (ex-'Tiger') classes are equipped with a Racal-Thorn Octopus electronic warfare suite based upon the Racal-Thorn Cutlass B1 ESM and Scorpion ECM systems with DASA threat library. The Cutlass B1 uses the Anaren DESM antenna and provides bearings, CW bearing and frequency measurement over the E/J-band with instantaneous frequency measurement. There is also the DASA Telegon 6 modular, high-frequency direction-finding system.

ELECTRONIC COUNTERMEASURES (ECM)

'Kaman' class. Iranian vessels have the Thomson-CSF Alligator dual-mode (noise deception) I-band jammer with instantaneous frequency measurement to measure the radar threat.

'Perdana' class. Malaysian vessels have four 103 mm decoy rocket launchers attached to the SAK 57 mounting.

'Tiger', 'Votsis' classes. The 'Tiger' and 'Votsis' classes have a Racal-Thorn Scorpion wide-band jammer covering the E/J-band. The dual-beam antenna can call upon 50 kW of radiated power and the system can deal with between five and eight targets. It is supported in the 'Tiger' class by a Wolke chaff launcher.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

'Anninos', 'Sharaba' classes. Greek and Libyan vessels have a Thomson-CSF Vega radar-based weapon control system. This has a mainframe architecture, with CDE mini-computer, as well as radar display, gun and surface-to-surface missile weapon control consoles.

'Kaman' class. Iranian vessels have a Signaal WM28 radar-based weapon control system with mainframe architecture, based upon the SMR mini-computer, and a two-man display and control console. It can operate against two targets simultaneously using two guns or surface-to-surface missiles.

'Tiger', 'Votsis' classes. The 'Tiger' and 'Votsis' classes have a Thomson-CSF Vega I radar-based weapon control system of mainframe architecture, with BCH mini-computer, as well as radar display, gun and surface-to-surface missile weapon control consoles. This is supplemented by a PALIS active/passive tactical data system using Link 11 which automatically transfers data between vessels of the same squadron.

'KAMAN' CLASS

	1226C	WM28
Maker	Racal-Decca	Signaal
Role	Search	Weapon control
Band	I	I
Beam	1.2°	1.5, 7°, 2.4°
Peak power	25 kW	200 kW

FURTHER INFORMATION

PROGRAMME

The 'La Combattante II' class (the La Combattante I was an experimental design) was derived from the Lürssen TNC 42 design, but for political reasons they were built by CMN in France.

The Greek vessels ('Anninos' class) were ordered in 1969 from CMN and were commissioned between 1971 and 1972. They were the platforms for the first Exocet order.

The Iranian vessels ('Kaman' class) were ordered in 1974 and the first nine were commissioned between 1977 and 1978. Delivery of the remainder was delayed by the outbreak of the Iranian Revolution but they were eventually delivered in 1981 and commissioned the same year. In addition to the vessels mentioned above, Iran received the *Joshan* and *Peykan* which were sunk in action with Iraqi and US forces.

The Libyan 'La Combattante IIG' vessels ('Sharaba' class) were ordered in 1977 and completed between 1982 and 1983. They have steel hulls and alloy superstructures. Another ship, *Waheed*, was sunk by US forces in 1986.

The Malaysian vessels ('Perdana' class) were ordered in 1970 and delivered in 1973. In addition to the armament they have six 103 mm rails for rocket illuminants on the SAK 57 turret.

The 'Tiger' class (actually 'La Combattante IIA but designated Type 148 by the German Navy) was ordered in 1970 and built by CMN, although many were outfitted by Lürssen, and they were commissioned between 1972 and 1975. Four were transferred to Greece in 1993 and 1994.

DESIGN

They have steel hulls and aluminium superstructures. They generally have about 115 m² of living space and have a fuel capacity of up to 42.5 tonnes although the Greek, Malaysian and 'Tiger' class carry 39 tonnes while Iranian vessels carry 41 tonnes.

German 'Tiger' class, armed with OTOBREDA 76 mm/62 gun, Bofors 40 mm/70 aft and four MM 38 Exocet (H & L van Ginderen Collection)

SURFACE-TO-SURFACE MISSILES (SSM)

Twin or quad launchers for surface-to-surface missile launchers are between the forward and aft superstructures, with the forward launchers pointing to port and the after ones pointing to starboard. The Greek *Antipliarhos Laskos, Ipopliarhos Mikonios, Ipopliarhos Troupakis* and *Plotarhis Blessas,* as well as Nigerian vessels have two twin launchers for Exocet MM 38 while Qatari and Tunisian vessels have two quad launchers for Exocet MM 40 (the Tunisian vessels having MM 40 Block 2). The remaining Greek vessels have six launchers for the Penguin Mk 2 anti-ship missile with three launchers, pointing to port and three to starboard.

Exocet MM 38

Specifications
Length: 5.21 m (17.08 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 22.5 n miles (42 km)
Warhead: 165 kg (365 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles.

Exocet MM 40 Block 1

Specifications
Length: 5.78 m (18.95 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.13 m (3.7 ft)
Weight: 855 kg (1,885 lb)
Speed: Mach 0.9
Range: 38 n miles (70 km)
Warhead: 155 kg (340 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles.

Exocet MM 40 Block 2

Specifications
Length: 5.80 m (19.02 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.13 m (3.7 ft)
Weight: 870 kg (1,918 lb)
Speed: Mach 0.9
Range: 40.5 n miles (75 km)
Warhead: 155 kg (340 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles.

Penguin Mk 2

Specifications
Length: 3.0 m (9.84 ft)
Diameter: 28 cm (11.02 in)
Wing span: 1.4 m (4.65 ft)
Weight: 340 kg (750 lb)
Speed: Mach 0.8
Range: 14 n miles (27 km)
Warhead: 120 kg (264.6 lb)
Guidance: Inertial navigation with infra-red homing

Manufacturer/Contractor
NFT, Norway.

TUBES

The Greek ships have two 533 mm (21 in) torpedo tubes with STN Atlas SST-4 torpedoes trained aft on either side of the aft gun mounting.

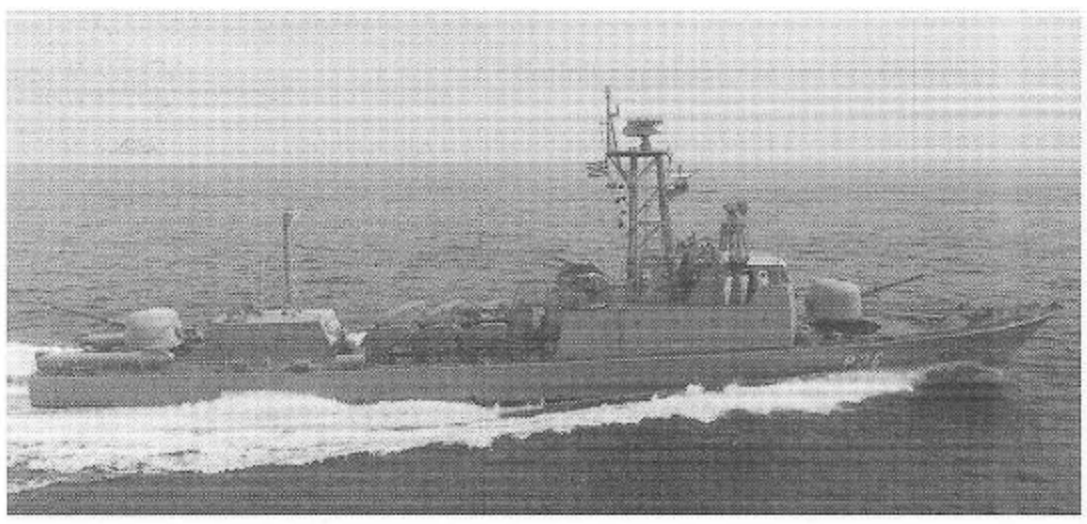
TORPEDOES

SST-4

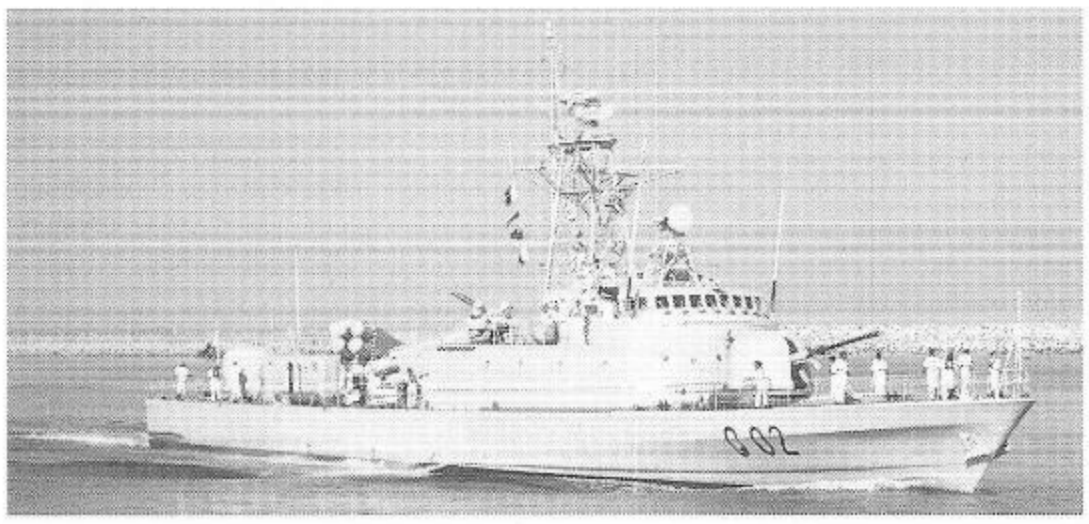
Specifications
Length: 6.55 m (21.5 ft) (with guidance wire dispenser)
Diameter: 533 mm (21 in)
Weight: 1,420 kg (3,131 lb) (without dispenser)
Propulsion: Electric
Speed: 35 kts
Range: 15 n miles (28 km)
Warhead: 260 kg (573 lb)
Guidance: Wire and active/passive sonar

GUNS

The Greek ships have two OTOBREDA 76/62 Compact mountings and two twin Esco (formerly Emerlec) 30 mountings at the rear of the superstructure. Nigerian ships have a single 76/62 Compact forward of the bridge, two Esco 30 mountings at the rear of the superstructure and an OTOBREDA twin 40 mm Compact at the stern. Qatari and Tunisian vessels have a single 76/62 forward of the bridge, an OTOBREDA twin 40 mm Compact at the stern and two Royal Ordnance twin 30 mm GCM-AO1 (Qatar) or GCM-AO3-2 (Tunisia) in the superstructure.



Ipoploiarhos Degiannis *(P 26), one of the Greek ships armed with six Norwegian-designed Penguin Mk 2 anti-ship missiles. The Greek ships also have two 76 mm guns and two 533 mm torpedo tubes* (Hellenic Navy)



Al Ghariyah *(Q 02), one of three La Combattante III M FACs operated by Qatar. Armament includes eight MM 40 Exocet missiles, one 76 mm gun, one twin 40 mm, and two twin 30 mm* (H M Steele)

OTOBREDA 76/62 Compact

Specifications
Gun
Calibre: 76 mm
Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 10-85 rds/min
Range: 8.5 n miles (16 km)

Mounting
Weight: 8.5 t (loaded)
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
OTOBREDA.

OTOBREDA twin 40 mm L/70 Compact

Specifications
Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 600 rds/min
Range: 3.25 n miles (12.5 km)

Mounting
Weight: 5.5 t (unloaded)
Traverse: 360°
Elevation: −13 to +85°

Manufacturer/Contractor
OTOBREDA.

Emerlec 30

Specifications
Gun
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Rate of fire: 600 rds/min/barrel
Range: 3.25 n miles (6 km)

Mounting
Weight: 3.88 t
Traverse: 360°
Elevation: −15 to +80°

Manufacturer/Contractor
Systems and Electronics Inc.

GCM-AO1

Specifications
Gun
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Rate of fire: 650 rds/min/gun
Range: 1.5 n miles (3 km) and 3,500 m (11,500 ft)

Mounting
Weight: 2.26 t
Traverse: 360°
Elevation: −15 to +85°

Manufacturers/Contractors
Royal Ordnance, UK.
Oerlikon, Switzerland.

GCM-AO3-2

Specifications
Gun
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Rate of fire: 650 rds/min/gun
Range: 1.5 n miles (3 km) and 3,500 m (11,500 ft)

Mounting
Weight: 2.56 t
Traverse: 360°
Elevation: −13 to +75°

Manufacturers/Contractors
Royal Ordnance, UK.
Oerlikon, Switzerland.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Greece
Not known.

Tunisia
These vessels have an unidentified French ESM system.

Nigeria
The Racal-Thorn RDL-2 system covers the 1-18.5 GHz range and in addition to the automatic pulse analyser it includes a frequency measurement capability.

Qatar
The Racal-Thorn Cutlass uses the same antenna as RDL and provides bearings, CW bearing and frequency measurement over the E/J-band with instantaneous frequency measurement. The associated Cygnus is a narrowband tracking jammer covering the D/J-bands and designed to operate with Cutlass for spot or barrage jamming. With one transmitter and two antennas it can jam two targets simultaneously, the 300 kW jammer being tuned by instantaneous frequency measurement.

ELECTRONIC COUNTERMEASURES (ECM)

Greece
The Greek ships have the Buck-Wegmann Hot Dog (infra-red) and Silver Dog (chaff) decoy launchers. These systems consist of 12 or 24—76 mm grenade launchers which weigh 115 or 220 kg (253 or 485 lb). Each group of three launcher tubes is 196 mm wide, 710 mm long and 420 mm high. The Hot Dog grenade weighs 0.74 kg (1.63 lb) while that for the Silver Dog weighs 0.95 kg (2.1 lb), the chaff of the latter being deployed within 2 s of launching.

Tunisia, Qatar
The CS Défense DAGAIE Mk 2 is a trainable mounting with 10 replaceable containers loaded with a mixture of 3/5 and 8/14 µm IR or I/J-band chaff projectiles produced by Etienne Lacroix Défense.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Thomson-CSF Vega II
Apart from the Greek ships equipped with Penguin, all these vessels have a Thomson-CSF Vega II radar-based weapon control system. This has a mainframe architecture, with CDE mini-computer, as well as radar display, gun and surface-to-surface missile weapon control consoles.

NFT PFCS 2
The Greek Penguin-equipped ships have the Kongsberg PFCS 2 (Penguin Fire-Control System) which is a mainframe architecture system based upon the KS500 mini-computer with a console which has tactical situation, radar and weapon control displays.

Thomson-CSF Tavitac
Tunisian vessels augment their Vega systems with the Thomson-CSF Tavitac tactical data system. This has a federated architecture based upon the CIMSA Sintra 15M125 mini-computer with one display console capable of tracking 16 targets simultaneously.

FURTHER INFORMATION

PROGRAMME

La Combattante III is a version of the 'La Combattante II' which was designed in response to customer requests for a larger derivative with better sea-keeping qualities, together with more comprehensive weapon and electronics fits, and which might also be employed as a leader for smaller missile boats.

The Greek Exocet-equipped vessels were ordered from CMN in 1974 and were commissioned in 1977 and 1978. The Penguin-equipped vessels were ordered from Hellenic Shipyards, Skaramanga in 1978 and commissioned in 1980 and 1981. All have three Jeomont Schneider 150 kW generator sets (440 V, 60 Hz, three phase) while the 76 mm gun has 360 rounds and the Emerlec has 3,600 rounds.

The Nigerian 'La Combattante IIB' vessels were ordered in 1977 but financial problems meant they were not delivered until 1982. A third vessel, *Siri,* has been cannibalised.

Qatari 'La Combattante IIIM' vessels were ordered in 1980 and commissioned between 1982 and 1983.

The Tunisian vessels were ordered in 1981 and were commissioned in 1985. They have a 405 kVA electricity generation system and a CS Défense Sylosat navigation system.

DESIGN

These vessels have round-bilge hull forms with some 125 m² of living space and carry between 50 and 70 tons of fuel.

VELARDE (PR-72)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Aerospatiale Exocet MM 38

These vessels carry two twin launchers for Exocet MM 38 missiles aft of the superstructure, with the forward pair angled to starboard and the after pair angled to port.

Specifications
Length: 5.21 m (17.08 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 22.5 n miles (42 km)
Warhead: 165 kg (365 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles, France.

GUNS

One OTOBREDA 76/62 Compact is on the foredeck, with an OTOBREDA twin 40 mm Compact aft.

OTOBREDA 76/62 Compact

Specifications
Gun
Calibre: 76 mm

Herrera *(CM 24) on builders trials in 1979. These large FACs were built in the late 1970s, part of a worldwide move towards small, fast, missile-armed attack craft* (Thomson-CSF)

Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 10/85 rds/min
Range: 8.5 n miles (16 km)

Mounting
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

OTOBREDA twin 40 mm L/70 Compact

Specifications
Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 600 rds/min
Range: 3.25 n miles (12.5 km)

Mounting
Traverse: 360°
Elevation: −13 to +85°

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Thomson-CSF DR 2000
There is a Thomson-CSF DR2000 ESM system, an F-band analysis receiver designed to detect pulse and CW signals using six direction-finding antennas in a radome.

DASA Telegon 4
They also have a DASA Telegon 4 high-frequency direction-finding system with egg-shaped ferrite antenna which limits it to intercepting ground waves.

COMMAND AND CONTROL SYSTEM

WEAPONS CONTROL

Thomson-CSF Vega II
These ships have a Thomson-CSF Vega II radar-based weapon control system. This has a mainframe architecture, with CDE mini-computer, as well as radar display, gun and surface-to-surface missile weapon control consoles.

ELECTRO-OPTIC SENSORS

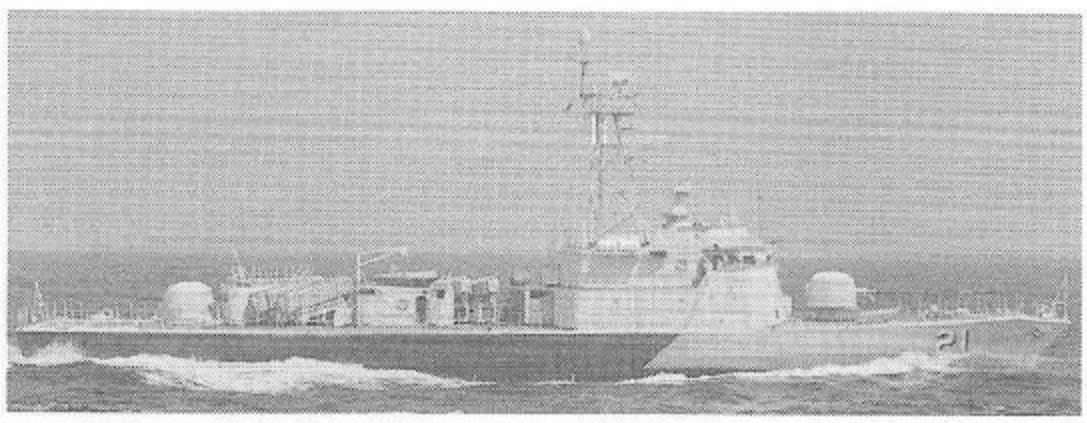
FURTHER INFORMATION

PROGRAMME
These Peruvian ships were ordered in 1976 and built by SFCN, although the hulls of *Velarde, De Los Heros,* and *Larrea* were subcontracted to the Lorient Naval Yard. They were commissioned between 1980 and 1981.

DESIGN
These vessels have round-bilge hulls of steel with aluminium superstructures and carry some 85 tonnes of fuel and have some 235 m² of living space. Their electricity generation systems provide 560 kW.

Patrol boat versions are used by Morocco and Senegal.

These vessels are classified as corvettes by the Peruvian Navy.



Velarde *(CM 21)* (Peruvian Navy)

Herrera *(CM 24) in 1995. Note the curved tip to the bows, designed to enable the gun to fire dead ahead, which is also a feature of many French destroyer and frigate designs* (Peruvian Navy)

TYPE P48

GENERAL SPECIFICATIONS

Country of Origin: France
Operators: Cameroon, Tunisia ('Bizerte')
Type: FAC, Missile

Class: TYPE P48

Built: 4
Active: 4

Cameroon vessel, Bakassi *(P 104)* (SFCN)

SHIPS

Cameroon
BAKASSI (P 104)
Builder SFCN, Villeneuve-la-Garonne
Launched 22 Oct 1982
Commissioned 9 Jun 1984

Tunisia
BIZERTE (P 301)
Builder SFCN, Villeneuve-la-Garonne, France.
Commissioned 10 Jul 1970

HORRIA (P302)
Builder SFCN, Villeneuve-la-Garonne, France.
Commissioned Oct 1970

MONASTIR (P 304)
Builder SFCN, Villeneuve-la-Garonne, France.
Commissioned 25 Mar 1976

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

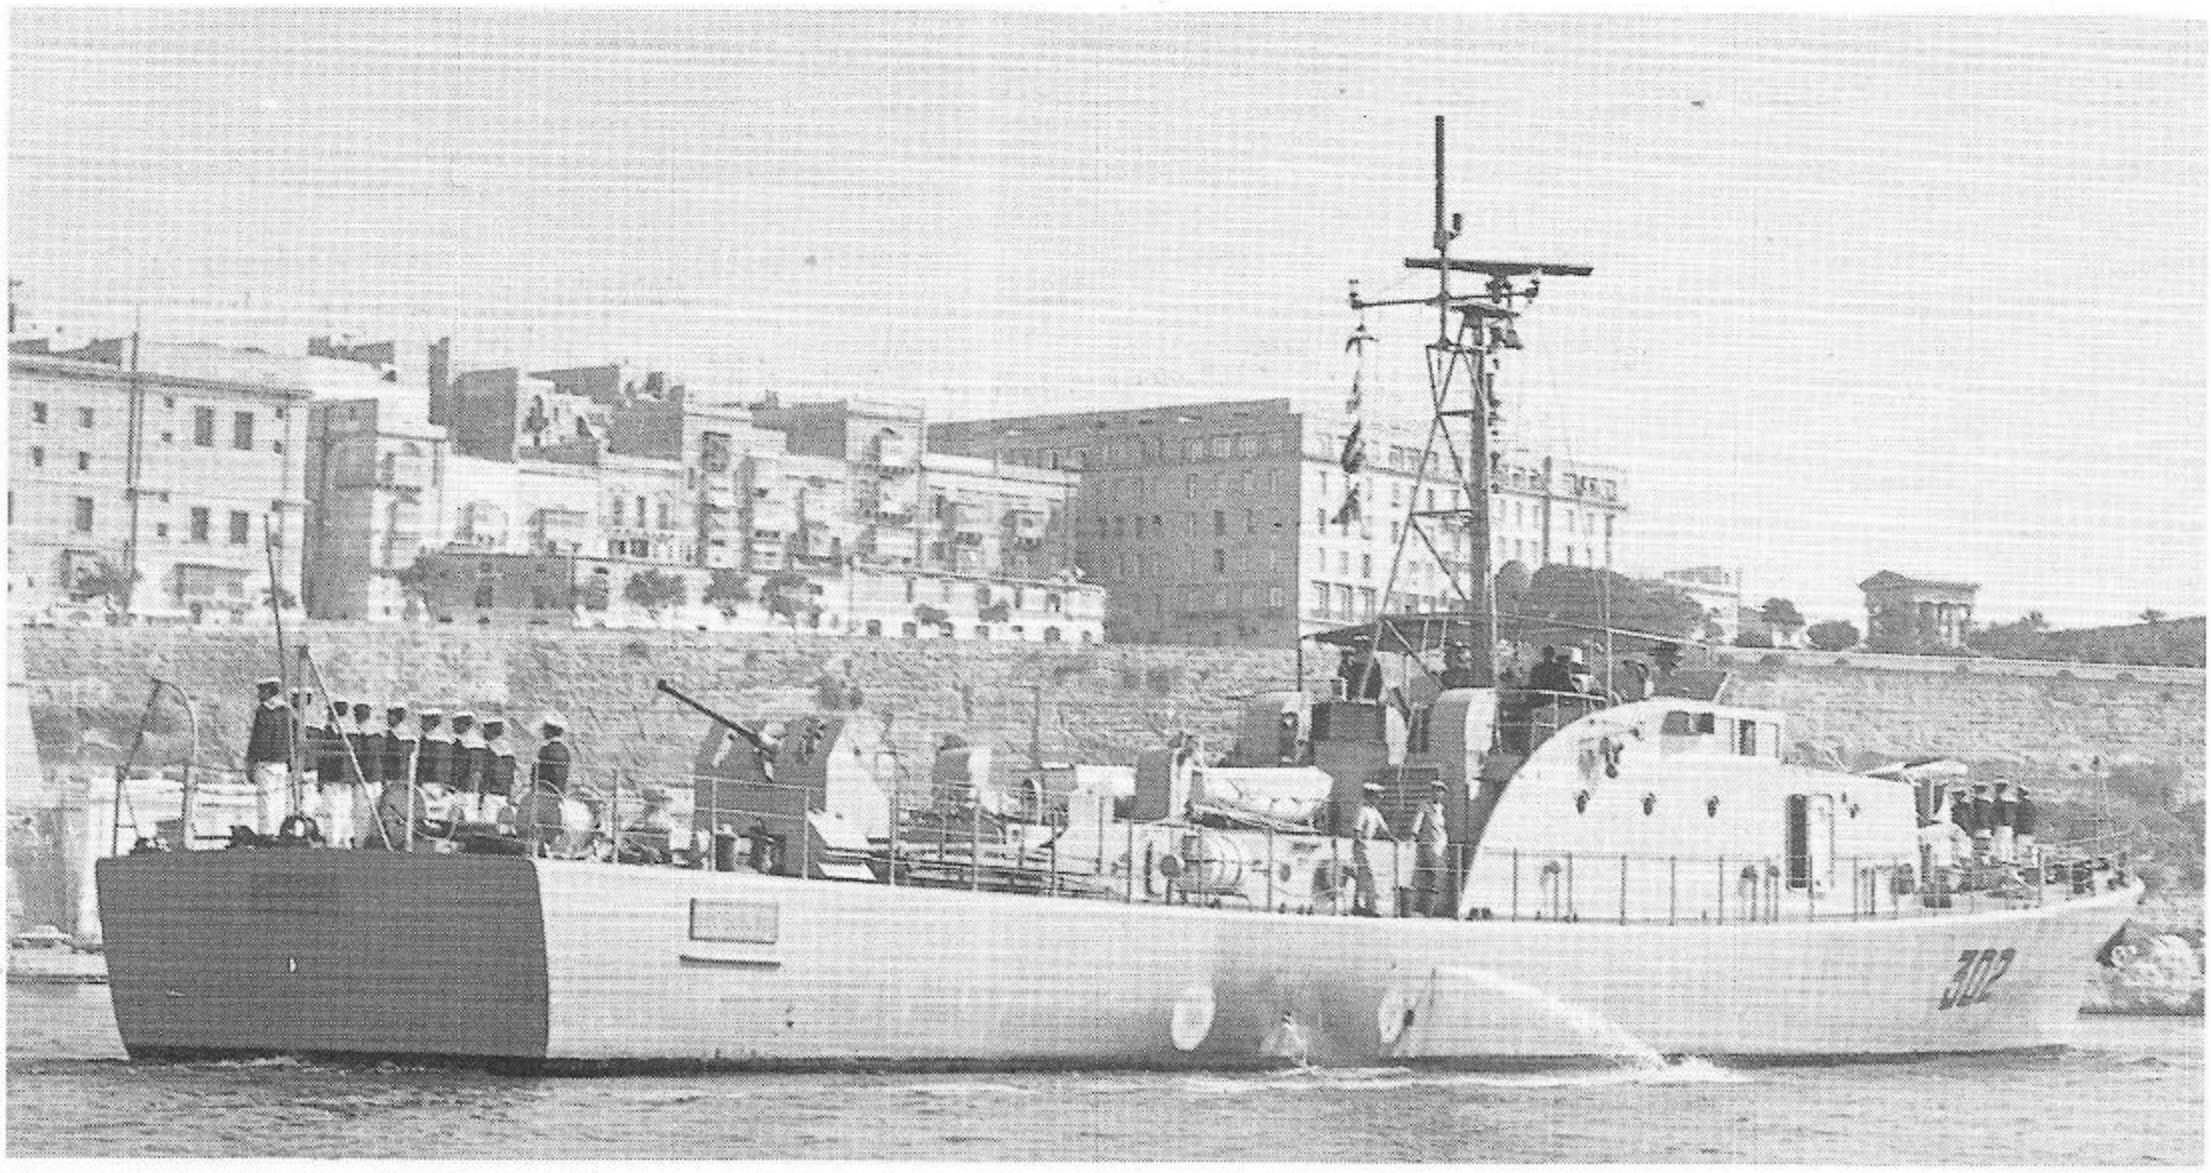
This class carries two quad launchers for anti-ship missiles. The Cameroon vessel has Aerospatiale Exocet MM 40 launchers aft of the superstructure. Tunisian ships carry SS 12M.

Aerospatiale Exocet MM 40 Block 1

Specifications
Length: 5.78 m (18.95 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.13 m (3.7 ft)
Weight: 855 kg (1,885 lb)

Speed: Mach 0.9
Range: 38 n miles (70 km)
Warhead: 155 kg (340 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles, Paris, France.



Horria *(P 302) of the Tunisian Navy in 1982, armed with single Bofors 40 mm/70 guns* (H & L van Ginderen Collection)

Aerospatiale SS 12M

Specifications
Length: 1.86 m (6.1 ft)
Diameter: 21 cm (8.26 in)
Wing span: 65 cm (25.6 in)
Weight: 76 kg (167.5 lb)
Speed: Mach 0.6
Range: 3 n miles (5.5 km)
Warhead: 28.38 kg (62.5 lb)
Guidance: Wire command to line of sight

Manufacturer/Contractor
Aerospatiale Missiles, Paris, France.

GUNS

The Cameroon ship has two single Bofors 40 mm L/70, while the Tunisian ships have two twin 37 mm mountings, fore and aft of the superstructure.

Bofors 40 mm L/70

Specifications
40 mm L/70
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 300 rds/min
Range: 6.75 n miles (12.5 km)

Mounting
Traverse: 360°

Manufacturer/Contractor
Bofors Ordnance, Sweden.

Twin 37 mm/63

The Tunisian ships have exhanged their Bofors 40 mm for twin 37 mm mounts, which are almost certainly of Chinese origin as these are used in several other Tunisian naval vessels.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

There is a Thomson-CSF DR 2000S ESM system. This is an F-band analysis receiver designed to detect pulse and CW signals using six direction-finding antennas in a radome.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

This class has a CS Défense RADOP 30 weapon control system. This includes a Racal Defence Systems CANE, a mainframe tactical data handling system which uses a navigation radar display and automatic plotting table. This is integrated with the Naja electro-optical director.

RADARS

Racal-Decca Type 1226 (2)

Specifications
Maker: Racal-Decca
Role: Surface search
Band: I
Beam: 1.2°
Peak power: 25 kW
Pulsewidth: 0.05, 0.25, 1.0 µs
PRF: 1,300 pps
Scan rate: 25 rpm
Typical range: 20 n miles (37 km)

Note
Cameroon ships have two Racal-Decca 1226 while Tunisian vessels have one (French Navy designation DRBN 32).

ELECTRO-OPTIC SENSORS

CS Défense Naja (Cameroon)

Specifications
Weight: 480 kg (1,058 lb)
Elevation: −25 to +65°
Sensors: TV camera, laser rangefinder

PROPULSION

Cameroon

Specifications
System: Diesel
Main machinery: 2 SACM 195 V16 CZSHR; 5.88 MW (8,000 hp)
Shafts: 2

Tunisia

Specifications
System: Diesel
Main machinery: 2 MTU 16V 652 TB81; 3.4 MW (4,600 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

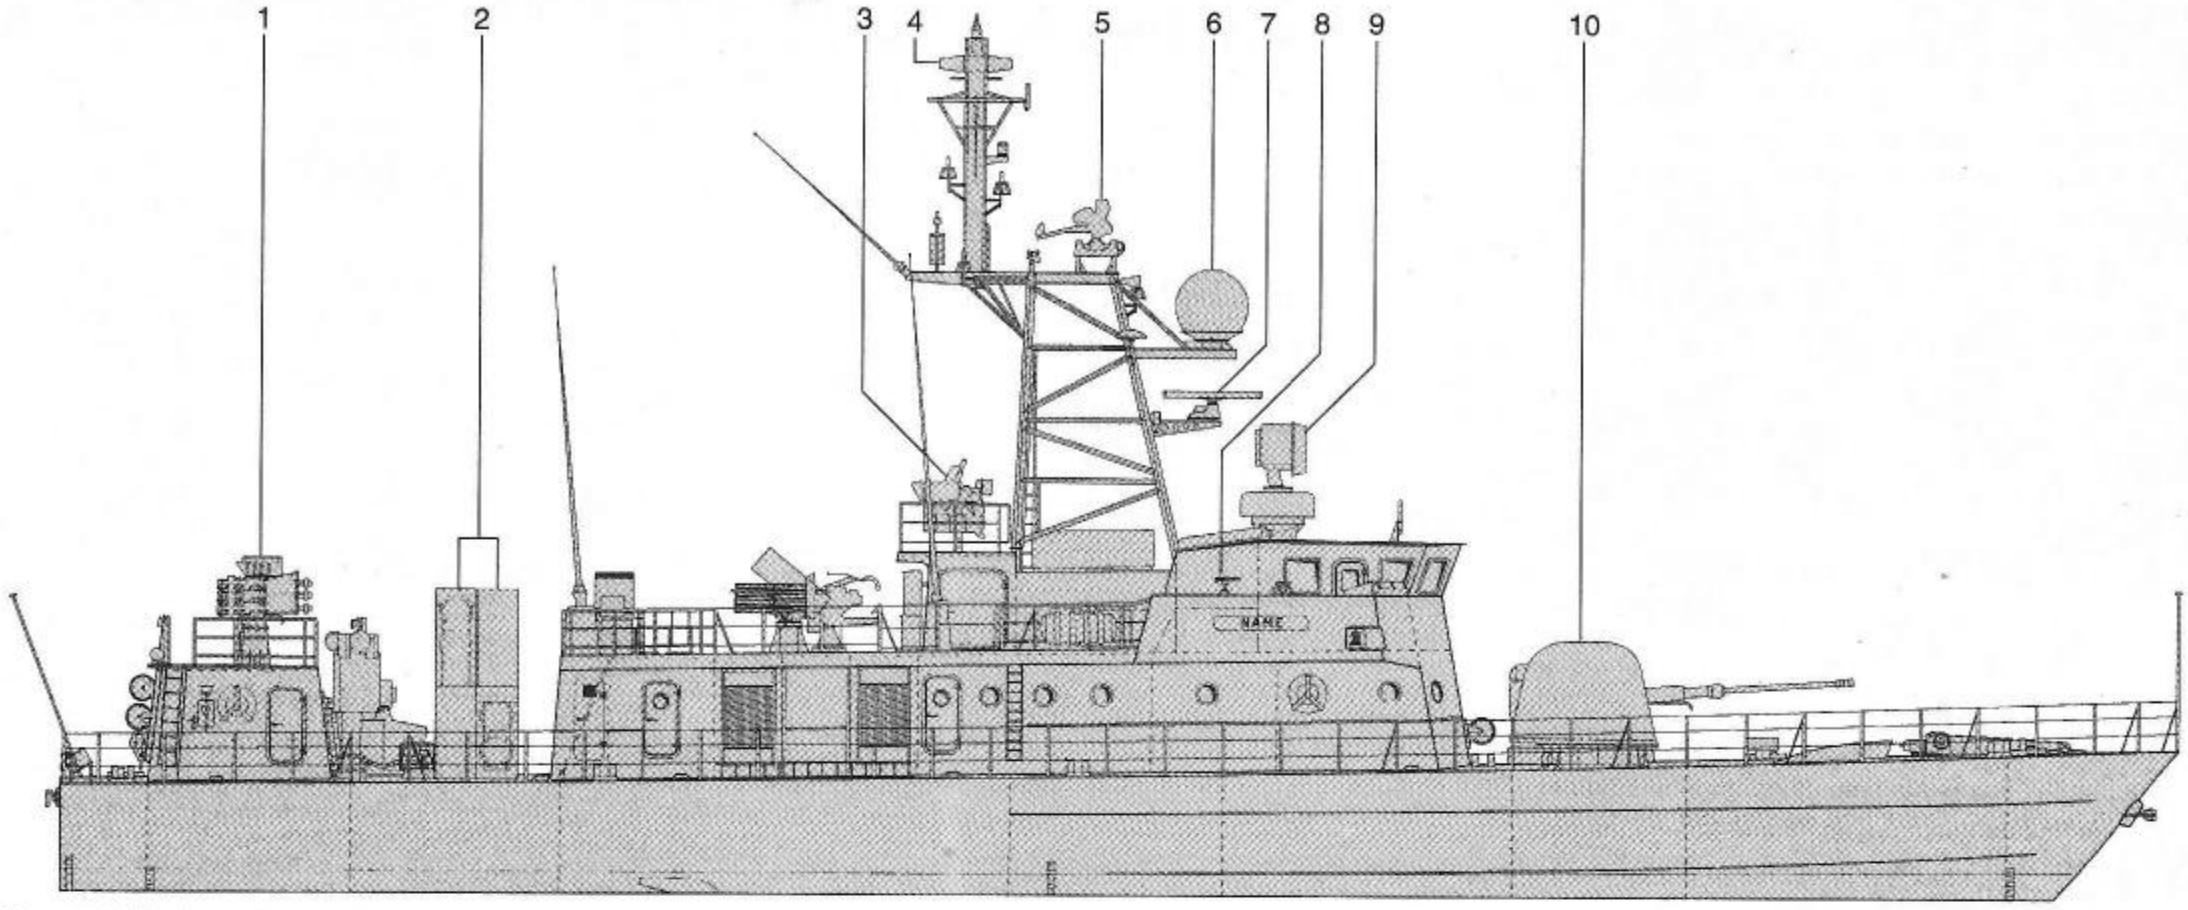
The Cameroon vessel was ordered in January 1981, launched 22 months later and commissioned in January 1984. It has a 280 kW electricity generation system. The radars have since been updated with a Decca RM1230 replaced by a second TM1229C.

The Tunisian vessels *Bizerte* and *Horria* were ordered in 1968 and commisisoned in 1970. The *Monastir* was ordered in 1973 and commissioned in 1975. In 1994 the W-11-M mountings replaced Bofors 40 mm L/70.

DESIGN

This design was produced by SFCN of Villeneuve-La-Garonne with steel hulls and an aluminium superstructure. There is some 290 m² of living space and they carry 116 tonnes of fuel.

LÜRSSEN FPB 44



Lürssen FBP 44 (Fr Lürssen)
1 *Aerospatiale MM 40 Exocet anti-ship missiles (four)* **2** *Matra Sadral launcher for Mistral SAM (six rounds)* **3** *CS Defense Najir electro-optic director (for SAM)* **4** *Racal-Thorn Cutlass E ESM* **5** *CelsiusTech Sea Giraffe 50HC search radar* **6** *Racal-Thorn Cygnus jammer* **7** *Racal-Decca 1226 navigation radar* **8** *MG3 7.62 mm light machine gun (two)* **9** *CelsiusTech 9GR 600 fire-control radar (gun)* **10** *OTOBREDA 76 mm/62-C Mod 6 automatic gun*

GENERAL SPECIFICATIONS

Country of origin: Germany
Operator: UAE ('Mubarraz' class)
Type: FAC, Missile

Class: LÜRSSEN FPB 44

Built: 2
Active: 2

Displacement:
standard: 275.6 t
full load: 307.2 t

Dimensions
Length: 43.75 m (143.53 ft)
Beam: 7.20 m (23.62 ft)
Draught: 2.68 m (8.79 ft)

Speed: 32.5 kts
Range: 500 n miles (925 km) at 38 kts; 2,200 n miles (4,033 km) at 15 kts

Complement: 29 (5 officers)

SHIPS

MUBARRAZ (P 4401)
Builder Lürssen, Vegesack, Bremen, Germany
Commissioned Aug 1990

MAKASIB (P 4402)
Builder Lürssen, Vegesack, Bremen, Germany
Commissioned Aug 1990

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Exocet MM 40 Block 1

These FACs have four launchers in crossover configuration aft of the superstructure for Aerospatiale Exocet MM 40 anti-ship missiles. The forward pair of launchers point to port and the after pair point to starboard.

Specifications
Length: 5.78 m (18.95 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.13 m (3.7 ft)
Weight: 855 kg (1,885 lb)
Speed: Mach 0.9
Range: 38 n miles (70 km)
Warhead: 155 kg (340 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles, Paris, France.

SURFACE-TO-AIR MISSILES (SAM)

Mistral

There is a six-round Sadral launcher for Matra Mistral point defence missiles mounted on the stern deckhouse. This is also the magazine and contains three complete reloads, for a total of 24 missiles.

Specifications
Length: 1.81 m (5.9 ft)
Diameter: 9.2 cm (3.6 in)
Wing span: 11.1 cm (4.4 in)
Weight: 18.4 kg (40.5 lb)
Speed: Mach 2.6
Range: 2.7 n miles (5 km)
Warhead: 2.95 kg (6.5 lb)
Guidance: Infra-red passive homing

Manufacturer/Contractor
Matra BAe Dynamics.

GUNS

OTOBREDA 76/62-C Mod 6 Super Rapid

A single OTOBREDA 76/62 Super Rapid is mounted forward of the bridge, making this one of the smallest vessels to mount a 76 mm gun.

Specifications
Gun
Calibre: 76 mm
Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 120 rds/m
Range: 8.5 n miles (16 km)

Mounting
Weight: 9.5 t (loaded)
Traverse: 360°
Elevation: −15 to +85°
Ammunition: 225 rounds

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

MG3 machine guns

Two MG3 7.62 mm machine guns are mounted in the bridge wings.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Racal-Thorn Cutlass E
Cutlass E provides bearings, CW bearing and frequency measurement over the E/J-band with instantaneous frequency measurement.

ELECTRONIC COUNTERMEASURES (ECM)

Racal-Thorn Cygnus
Cygnus is a narrowband tracking jammer covering the D/J-bands and designed to operate with Cutlass for spot or barrage jamming. With one transmitter and two antennas it can jam two targets simultaneously, the 300 kW jammer being tuned by instantaneous frequency measurement.

DECOYS

CS Défense DAGAIE Mk 2
This is a trainable mounting with 10 replaceable containers loaded with a mixture of IR or I/J-band chaff projectiles produced by Etienne Lacroix Défense.

Manufacturer/Contractor
CS Défense, Paris, France.

COMMAND AND CONTROL SYSTEMS

WEAPON CONTROL

CelsiusTech 9LV 200 Mk 2
The 9LV 200 Mk 2 is a radar-based weapon control system of mainframe architecture using the CelsiusTech P800 mini-computer for the control of the one medium and one light calibre gun mountings as well as the surface-to-surface missiles. There is a tactical display system and two gun control displays, for ASuW and AAW operations.

Manufacturer/Contractor
CelsiusTech, Sweden.

ELECTRO-OPTIC SENSORS

CS Défense Najir director

Specifications
Weight: 560 kg (1,235 lb)
Elevation: −20 to +70°
Sensors: Thermal imager, TV camera, laser rangefinder

Manufacturer/Contractor
CS Defense, Paris, France.

Shafts: 2
Ships services: 2 152 kVA diesel generator sets

FURTHER INFORMATION

PROGRAMME

These two ships were ordered in 1987 and delivered in 1991.

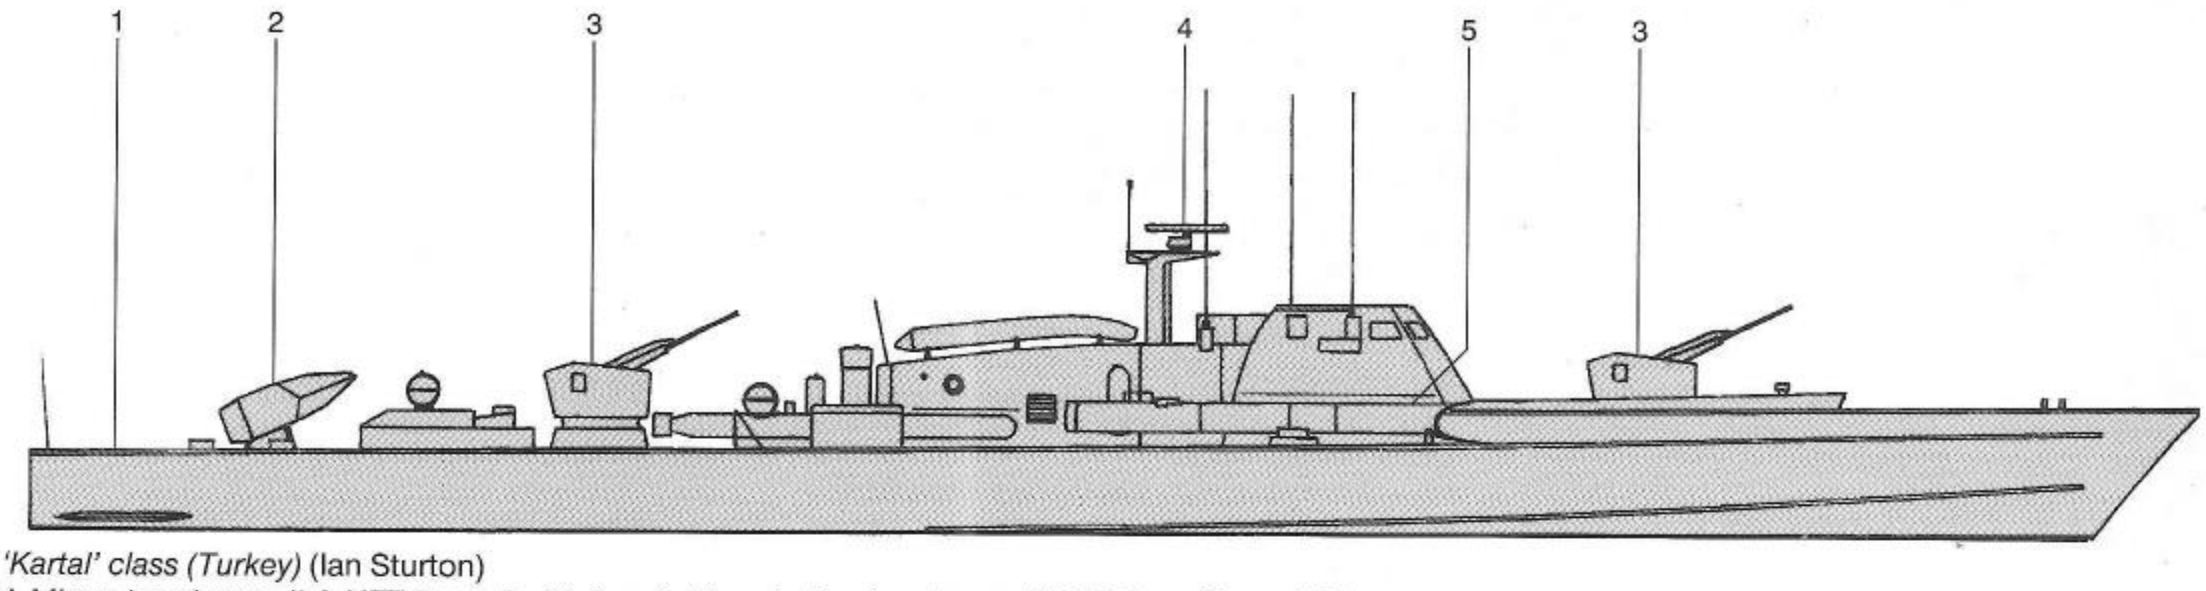
DESIGN

The FPB 44 is actually a modified FPB 38 design, with the usual steel hull and alloy superstructure. It is a larger development of the FPB 38 to allow for a more comprehensive weapon fit. The UAE vessels were the first export platforms for the Sadral/Matra SAM system. The missiles are controlled by a CS Defense Najir electro-optic director sited immediately aft of the mast.

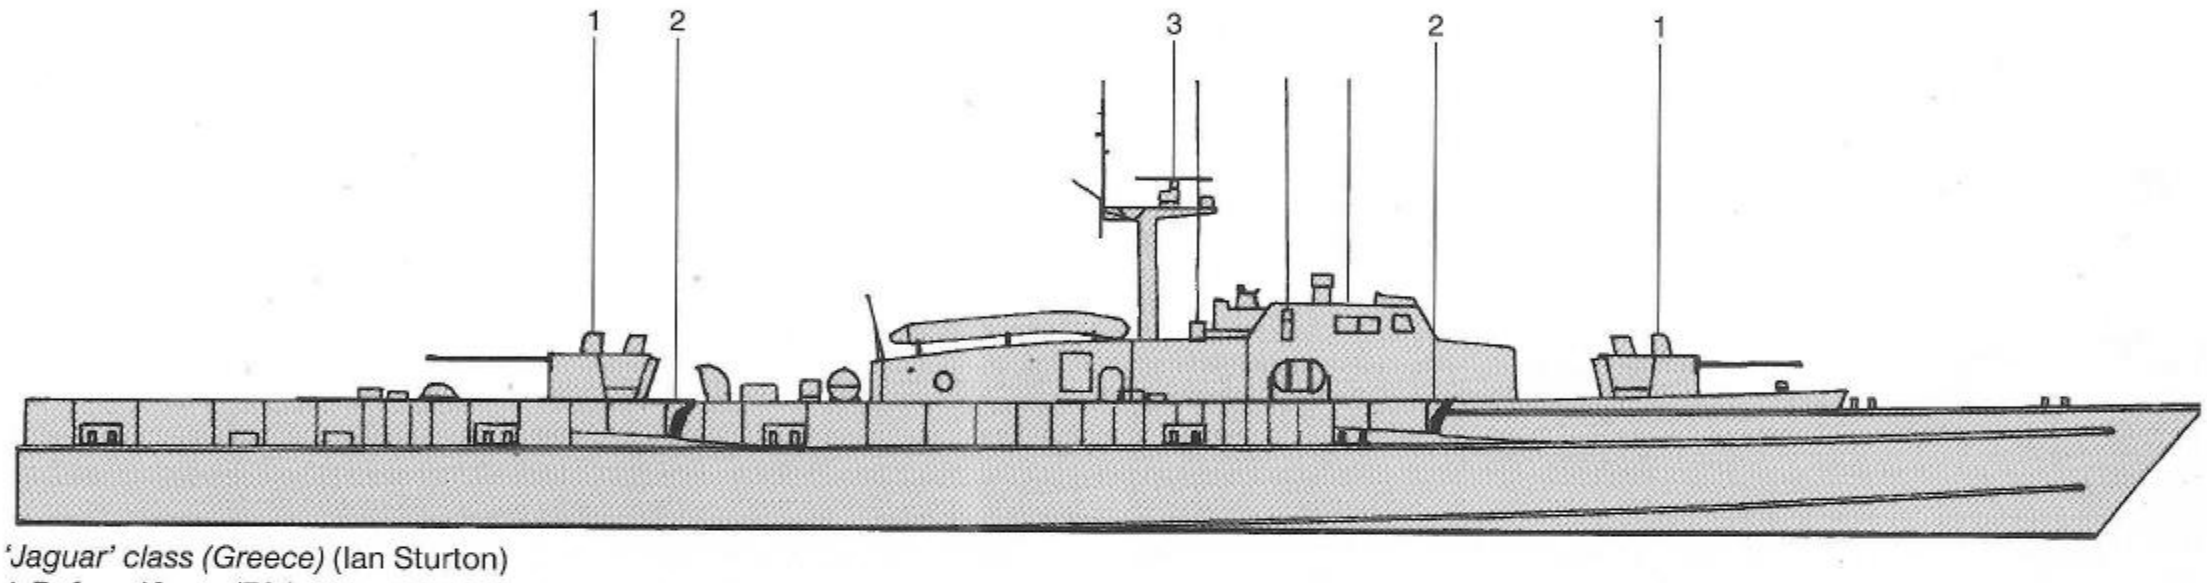
Lürssen FPB 44 is an enlarged version of the FPB 38 design, prepared to meet the operational requirements of the UAE. It is one of the smallest vessels to mount the OTOBREDA 76 mm gun. Note also the Sadral SAM launcher aft (Fr Lürssen)

Mubarraz *(P 4401). The large radome on the mast is for the Cygnus jammer* (H & L van Ginderen Collection)

LÜRSSEN TNC 42 (TYPE 140/141)



'Kartal' class (Turkey) (Ian Sturton)
1 *Mines (maximum 4)* **2** *NFT Penguin Mk 2 anti-ship missiles (maximum 4)* **3** *Bofors 40 mm/70 (gun mount)* **4** *Racal-Decca 1226 navigation radar* **5** *533 mm torpedo tube (two)*



'Jaguar' class (Greece) (Ian Sturton)
1 *Bofors 40 mm/70 in open mounts* **2** *533 mm (21 in) torpedo tube (four)* **3** *Racal-Decca 1226 navigation radar*

GENERAL SPECIFICATIONS

Country of origin: Germany
Operators: Greece ('Jaguar'), Turkey ('Kartal')
Type: FAC, Torpedo (Greece); FAC, Missile (Turkey)

Class: LÜRSSEN TNC 42 (TYPE 140/141)

Built: 30 ('Jaguar'), 9 ('Kartal')
Active: 4 ('Jaguar'), 8 ('Kartal')

Displacement:
standard: 160 t
full load: 190 t

Dimensions
Length: 42.5 m (139.4 ft)
Beam: 7.2 m (23.6 ft)
Draught: 2.4 m (7.9 ft)

Speed: 42 kts
Range: 500 n miles (925 km) at 40 kts, 1,000 n miles (1,850 km) at 32 kts

Complement: 39

SHIPS

Commissioned 25 Nov 1967

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Penguin Mk 2

'Kartal' class (Turkey). Turkish vessels have two or four stern launchers for Penguin Mk 2 anti-ship missiles.

Specifications

Length: 3.0 m (9.84 ft)
Diameter: 28 cm (11.02 in)
Wing span: 1.42 m (4.65 ft)
Weight: 340 kg (750 lb)
Speed: Mach 0.8
Range: 14 n miles (27 km)
Warhead: 120 kg (265 lb)
Guidance: Inertial navigation with infra-red homing

Manufacturer/Contractor

NFT, Kongsberg, Norway.

TUBES

Greek vessels carry four 533 mm (21 in) torpedo tubes with STN Atlas SST-4 torpedoes. One pair of tubes is outboard of the bridge while the second pair is either side of the after gun mounting. Turkish vessels have two such torpedo tubes but the torpedoes have not been identified.

TORPEDOES

SST-4

Specifications

Length: 6.55 m (with guidance wire dispenser)
Diameter: 533 mm (21 in)
Weight: 1,420 kg (3,131 lb) (without dispenser)
Propulsion: Electric
Speed: 35 kts
Range: 15 n miles (28 km)
Warhead: 260 kg (573 lb)
Guidance: Wire and active/passive sonar

Manufacturer/Contractor

STN Atlas, Bremen, Germany.

GUNS

There are two single Bofors 40 mm SAK 40 L/70-350 gun mountings forward of the bridge and atop the after end of the superstructure.

SAK 40 L/70-350

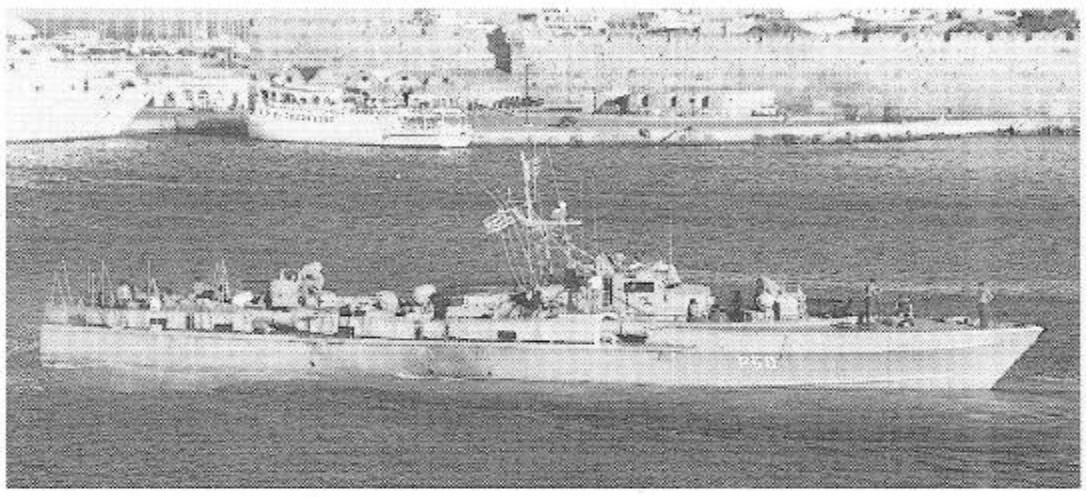
Specifications

Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 300 rds/min
Range: 6.75 n miles (12.5 km)

Mounting
Traverse: 360°
Elevation: −9 to +85°

Manufacturer/Contractor

Bofors Ordnance, Sweden.



Hesperos *(P 50) of the Hellenic Navy served in the Federal German Navy from 1958 to 1977 before being transferred. The Greek vessels are armed with two Bofors 40 mm guns and four 533 mm torpedo tubes* (H & L van Ginderen Collection)

A Turkish 'Kartal' class FAC-missile, armed with two Penguin anti-ship missiles (a maximum of four can be carried) (H M Steele)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

All vessels have a Thomson-CSF DR 2000S ESM system. This is an F-band analysis receiver designed to detect pulse and CW signals using six direction-finding antennas in a radome.

COMMAND AND CONTROL SYSTEMS

RADARS

Racal-Decca 1226

Pulsewidth: 0.05, 0.25, 1.0 µs
PRF: 1,300 pps
Scan rate: 25 rpm
Typical range: 20 n miles (37 km)

Manufacturer/Contractor

Racal-Decca, UK.

PROPULSION

Specifications

System: Diesel
Main machinery: 4 MTU MD 16V 538 TB 90; 8.82 MW (12,000 hp)
Shafts: 4

FURTHER INFORMATION

Designed as *Schnellboot* 55 by Lürssen and adopted by the (then) West German Navy as Type 140/141 FACs (later 'Jaguar' class), these vessels with steel frames, wooden hull and aluminium superstructures, were launched from 1957 to 1960. They have a raised turtle deck forecastle with a semi-well for the gun. Their generation systems produce 192 kW of electricity.

The Greek vessels, all Type 141 with Maybach diesels, were transferred in 1976/1977 and were re-engined circa 1992/1993. The torpedo tubes may be replaced by mine rails and eight (Greece) or four (Turkey) mines may be carried.

The 'Kartal' class is of similar design but was built for Turkey by Lürssen between 1967 and 1971.

BAN YAS (P 4501)
Builder Lürssen Werft, Vegesack, Germany
Commissioned Nov 1980

MARBAN (P 4502
Builder Lürssen Werft, Vegesack, Germany
Commissioned Nov 1980

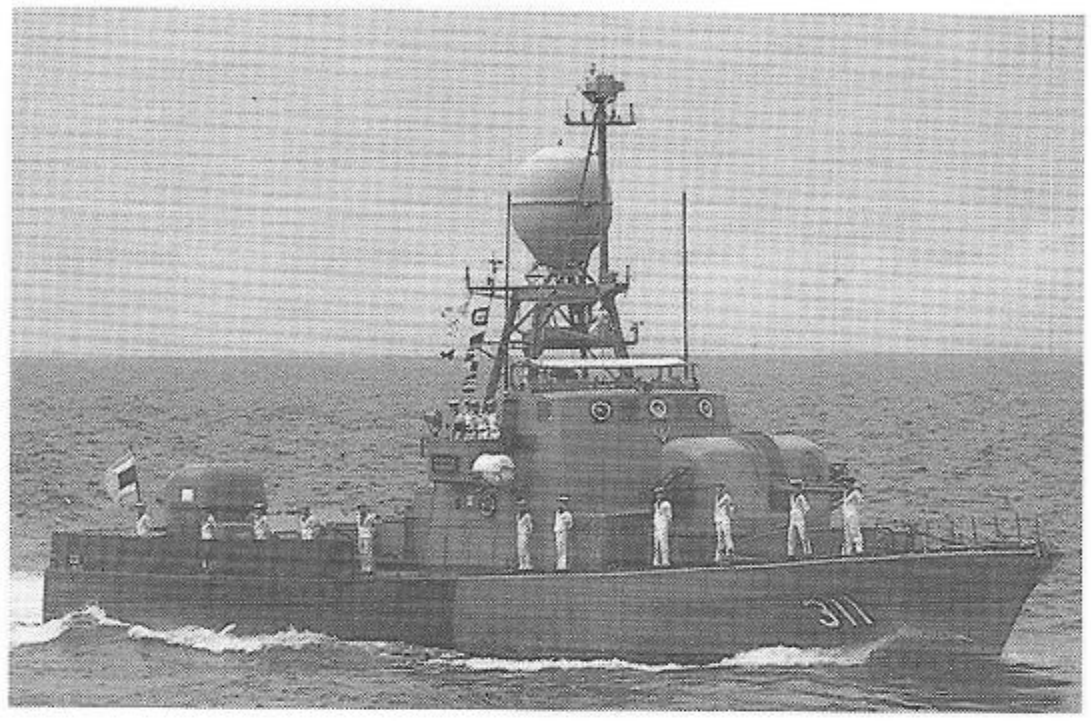
RODOM (P 4503)
Builder Lürssen Werft, Vegesack, Germany
Commissioned Jul 1981

SHAHEEN (P 4504)
Builder Lürssen Werft, Vegesack, Germany
Commissioned Jul 1981

SAGAR (P 4505)
Builder Lürssen Werft, Vegesack, Germany
Commissioned Sep 1981

TARIF (P 4506)
Builder Lürssen Werft, Vegesack, Germany
Commissioned Sep 1981

Iquique *(32) of the Chilean Navy. A Lürssen TNC-45 design, it was built in France and served in the Israeli Navy for some years before being sold to Chile* (Chilean Navy)



Prabparapak *(311) one of three Lürssen TNC-45s built in Singapore for the Royal Thai Navy* (Royal Thai Navy)

WEAPONS SYSTEMS

ANTI-SHIP MISSILES

Most ships have two twin launchers in forward-facing, crossover configuration aft of the superstructure, the forward pair trained to port and the rear pair to starboard. They usually have Exocet MM 40 anti-ship missiles (MM 38 in Ecuador) but the Singapore Navy ships have McDonnell Douglas Harpoon 1C (trained directly starboard and port) while the Thai ships have one triple and two single launchers for the IAI Gabriel 1 (the single launchers are often not embarked). Chilean vessels carry three pairs of Gabriel II missiles on the afterdeck.

TABLE II: ANTI-SHIP MISSILES — SUMMARY

	Exocet MM 8	Exocet MM 40	Harpoon	Gabriel I	Gabriel II
Bahrain		4			
Chile					6
Ecuador	4				
Kuwait		4			
Singapore			4		
Thailand				5	
UAE		4			

Exocet MM 38

Specifications
Length: 5.21 m (17.08 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 22.5 n miles (42 km)
Warhead: 165 kg (365 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles, France.

Exocet MM 40 Block 1

Specification
Length: 5.78 m (18.95 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.13 m (3.7 ft)
Weight: 855 kg (1,885 lb)
Speed: Mach 0.9
Range: 38 n miles (70 km)
Warhead: 155 kg (340 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles, France.

Harpoon 1C

Specifications
Length: 4.63 m (15.18 ft) (with booster)
Diameter: 34 cm (13.38 in)
Wing span: 83 cm (32.67 in)
Weight: 681.9 kg (with booster)
Speed: Mach 0.85
Range: 67 n miles (124 km)
Warhead: 221.6 kg (500 lb)
Guidance: Inertial navigation and active radar

Manufacturer/Contractor
McDonnell Douglas Missile Systems Company, USA.

Gabriel I

Specifications
Length: 3.35 m (11 ft)
Diameter: 34 cm (13.4 in)
Wing span: 1.35 m (4.4 ft)
Weight: 430 kg (950 lb)
Speed: Mach 0.7
Range: 10.75 n miles (20 km)
Warhead: 150 kg (330 lb)
Guidance: Semi-active radar and manual

Manufacturer/Contractor
Israel Aircraft Industries, Tel Aviv, Israel.

Gabriel II

Specifications
Length: 3.42 m (11.2 ft)
Diameter: 34 cm (13.4 in)
Wing span: 1.35 m (4.4 ft)
Weight: 522 kg (1,151 lb)
Speed: Mach 0.7
Range: 19 n miles (36 km)
Warhead: 150 kg (330 lb)
Guidance: Semi-active radar and manual

Manufacturer/Contractor
Israel Aircraft Industries, Tel Aviv, Israel.

SURFACE-TO-AIR MISSILES (SAM)

Mistral

The Singapore vessels have a Simbad twin launcher for Matra Mistral point defence missiles.

Specifications
Length: 1.81 m (5.9 ft)
Diameter: 9.2 cm (3.6 in)
Wing span: 11.1 cm (4.4 in)
Weight: 18.4 kg (40.5 lb)
Speed: Mach 2.6
Range: 2.7 n miles (5 km)
Warhead: 2.95 kg (6.5 lb)
Guidance: Infra-red passive homing

Manufacturer/Contractor
Matra BAe Dynamics.

GUNS

There are two gun mountings, one on the foredeck, the other aft, and the operators use a variety of weapons:

TABLE III: GUNS — SUMMARY

	Forward mount	After mount
Bahrein	OTOBREDA 76/62 Compact	OTOBREDA twin 40 mm/L70 Compact
Chile	OTOBREDA 76/62 Compact	None
Ecuador	OTOBREDA 76/62 Compact	Oerlikon-Contraves GDM-A twin 35 mm
Kuwait	OTOBREDA 76/62 Compact	OTOBREDA twin 40 mm/L70 Compact
Singapore	Bofors single 57 mm SAK 57 Mk 1	OTOBREDA twin 40 mm/L70 Compact
Thailand	Bofors single 57 mm SAK 57 Mk 1	OTOBREDA-Bofors 40 mm L/70 at the stern
UAE	OTOBREDA 76/62 Compact	OTOBREDA twin 40 mm/L 70 Compact

OTOBREDA 76/62 Compact

Specifications
Gun
Calibre: 76 mm
Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 10/85 rds/min
Range: 8.5 n miles (16 km)

Mounting
Weight: 8.5 t (loaded)
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
OTOBREDA.

SAK 57 Mk 1

Specifications
Gun
Calibre: 57 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,020 m/s (3,347 ft/s)
Rate of fire: 200 rds/min
Range: 9 n miles (17 km)

Mounting
Weight: 6.3 t
Traverse: 360°
Elevation: −10 to +75°

Manufacturer/Contractor
Bofors Ordnance.

OTOBREDA twin 40 mm L/70 Compact

Specifications
Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 600 rds/min
Range: 3.25 n miles (12.5 km)

Mounting
Weight: 5.5 t (unloaded)
Traverse: 360°
Elevation: −13 to +85°

Manufacturer/Contractor
OTOBREDA, La Spezi, Italy.

OTOBREDA 40 mm L/70

Specifications
Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 300 rds/min
Range: 6.75 n miles (12.5 km)

Mounting
Traverse: 360°

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

GDM-A

Specifications
Gun
Calibre: 35 mm
Length of barrel: 90 calibres
Muzzle velocity: 1,175 m/s (3,855 ft/s)
Rate of fire: 550 rds/min/barrel
Range: 2.7 n miles (5 km)

Mounting
Weight: 6.52 t
Traverse: 360°
Elevation: −15 to +85

Manufacturer/Contractor
Oerlikon-Contraves, Switzerland.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Racal-Thorn RDL 2
'Ahmed el Fateh' (Bahrain), 'Prabparapak' (Thailand). This system covers the 1-18.5 GHz range and in addition to the automatic pulse analyser it includes a frequency measurement capability.

Racal-Thorn Cutlass
'Al Sanbouk' (Kuwait), 'Ban Yas' (UAE). Cutlass uses the same antenna as RDL and provides bearings, CW bearing and frequency measurement over the E/J-band with instantaneous frequency measurement. The system can incorporate a responsive noise jammer as well as providing spot or barrage noise. It may also be integrated with decoy launchers.

Alenia RQN-3B and TDF 205
'Sea Wolf' class (Singapore). The Alenia RQN-3B is a digital interceptor with instantaneous frequency measurement covering the D/J-bands. It is usually associated with the RIN-1 display system and provides automatic control of decoy-launching systems. It is supported by a Tadiron TDF 205 direction-finding system of which no details are available.

Elta MN-53
'Iquique' class (Chile). This is a passive intercept system which measures features including band, PRF and pulsewidth with both manual and automatic direction-finding and analysis.

Racal-Thorn Cygnus
'Ahmed el Fateh' (Bahrain). Cygnus is a narrowband tracking jammer covering the D/J-bands and designed to operate with Cutlass for spot or barrage jamming. With one transmitter and two antennas it can jam two targets simultaneously, the 300 kW jammer being tuned by instantaneous frequency measurement. It is not installed in *Ahmad el Fateh* or *Al Jibiri*.

Rafael Rattler
'Iquique' (Chile). The Rattler jammer can engage three targets covering the E/J-bands simultaneously. It uses a high-powered, broadband amplifier wth low-power exciter. The system is supported by four single-tube decoy launchers and the Elbit Automatic Countermeasures Dispensing System (ACDS) with six 24-tube launchers. These use the Rafael Short-Range Chaff Rocket (SRCR) and the Long-Range Chaff Rocket (LRCR), the launchers weighing 22 (48.5) and 12.5 kg (27.5 lb) respectively. The rockets weigh 3.2 kg (7.0 lb) (SRCR) and 9.4 kg (20.7 lb) (LRCR).

DECOYS

CS Défense DAGAIE Mk 2
'Ahmad el Fateh' (Bahrain), 'Al Sanbouk' (Kuwait), 'Bon Yan (UAE). DAGAIE is a trainable mounting with 10 replaceable containers loaded with a mixture of 3/5 and 8/14 µm IR or I/J-band chaff projectiles produced by Etienne Lacroix Défense.

Loral Hycor Mk 36 Mod 1
Sea Wolf (Singapore). The Mk 36 SRBOC Mod 1 (Super Rapid Bloom Offboard Countermeasures) decoy system has two Mk 137 launchers, each with six barrels. These are 160 × 43 × 86 cm mortar systems which fire a variety of 130 mm chaff and infra-red munitions from cartridges weighing 3.8-22.7 kg (8.4-50 lb) which create chaff clouds up to 2.5 n miles (4.5 km) from the ship. There are also two Rafael twin-tube launchers in the Singapore ships.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

CelsiusTech 9LV 200 Mk 2
'Ahmed al Fateh' (Bahrain), 'Al Sanbouk' (Kuwait), 'Ban Yas' (UAE). The 9LV 200 Mk 2 is a radar-based weapon control system of mainframe architecture using the Philiips P800 mini-computer for the control of one medium and one light calibre gun mounting as well as surface-to-surface missiles. There is a tactical display system and two gun control displays, for ASuW and AAW operations.

Manufacturer/Contractor
Celsius Tech, Sweden.

Thomson-CSF Vega
'Quito' (Ecuador). The Thomson-CSF Vega I radar-based weapon control system has a mainframe architecture, with BCH mini-computer, as well as radar display, gun and surface-to-surface missile weapon control consoles.

Manufacturer/Contractor
Thomson-CSF, Paris, France.

Signaal WM28
'Sea Wolf' (Singapore), 'Prabparapak' (Thailand). The WM28 radar-based weapon control system has a mainframe architecture based upon the SMR mini-computer with a two-man display and control console. It can operate against two targets simultaneously using two guns or surface-to-surface missiles.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

IAI system
'Iquique' (Chile). These vessels have an IAI fire-control system with a one-man display control and processing console which interfaces with Gabriel surface-to-surface missiles and the main gun.

Ecuador

Specifications
System: Diesel
Main machinery: 4 MTU 16V 396 diesels; 10 MW (13,640 hp)
Shafts: 4

FURTHER INFORMATION

One of the most widely used FAC designs, these vessels were a larger version of the TNC 42 and have the usual Lürssen export philosophy with steel hulls and aluminium superstructures. In most cases the electricity system generates 405 kW and they carry 250 rounds of 76 mm and 1,800 rounds of 40 mm ammunition.

The Bahraini ships were ordered in 1979 (first pair) and 1985 (second pair) and commissioned in 1984 and 1986/1989 respectively. The vessels carry 45 tonnes of fuel and three 7.62 mm machine guns.

The Ecuador ships were launched in 1975/1976 and commissioned in 1976/1977. These vessels carry 39 tonnes of fuel oil, 250 rounds of 76 mm and 1,100 rounds of 35 mm ammunition. The electricity system generates 330 kW. They originally had MTU 16V 538 diesels but these were replaced in 1994/1995.

The Israeli Navy selected the design as the basis of its FAC force but, for political reasons, they were built by CMN shipyard in France as the 'Sa'ar' class, which differed in armament installation. The Sa'ar 1 had 40 mm guns, the Sa'ar 2 were ASW optimised variants and supplemented the 40 mm gun with sonar and lightweight torpedoes. When Gabriel missiles were fitted to Sa'ar 2, the 'Sa'ar 1' class was upgraded and given the same designation. The Sa'ar 3 added a 76 mm gun and could also carry Harpoon anti-ship missiles as well as Gabriel. Two 'Sa'ar 3' class (commissioned by the Israeli Navy in 1969) were transferred to Chile in May 1989, but with Harpoon removed.

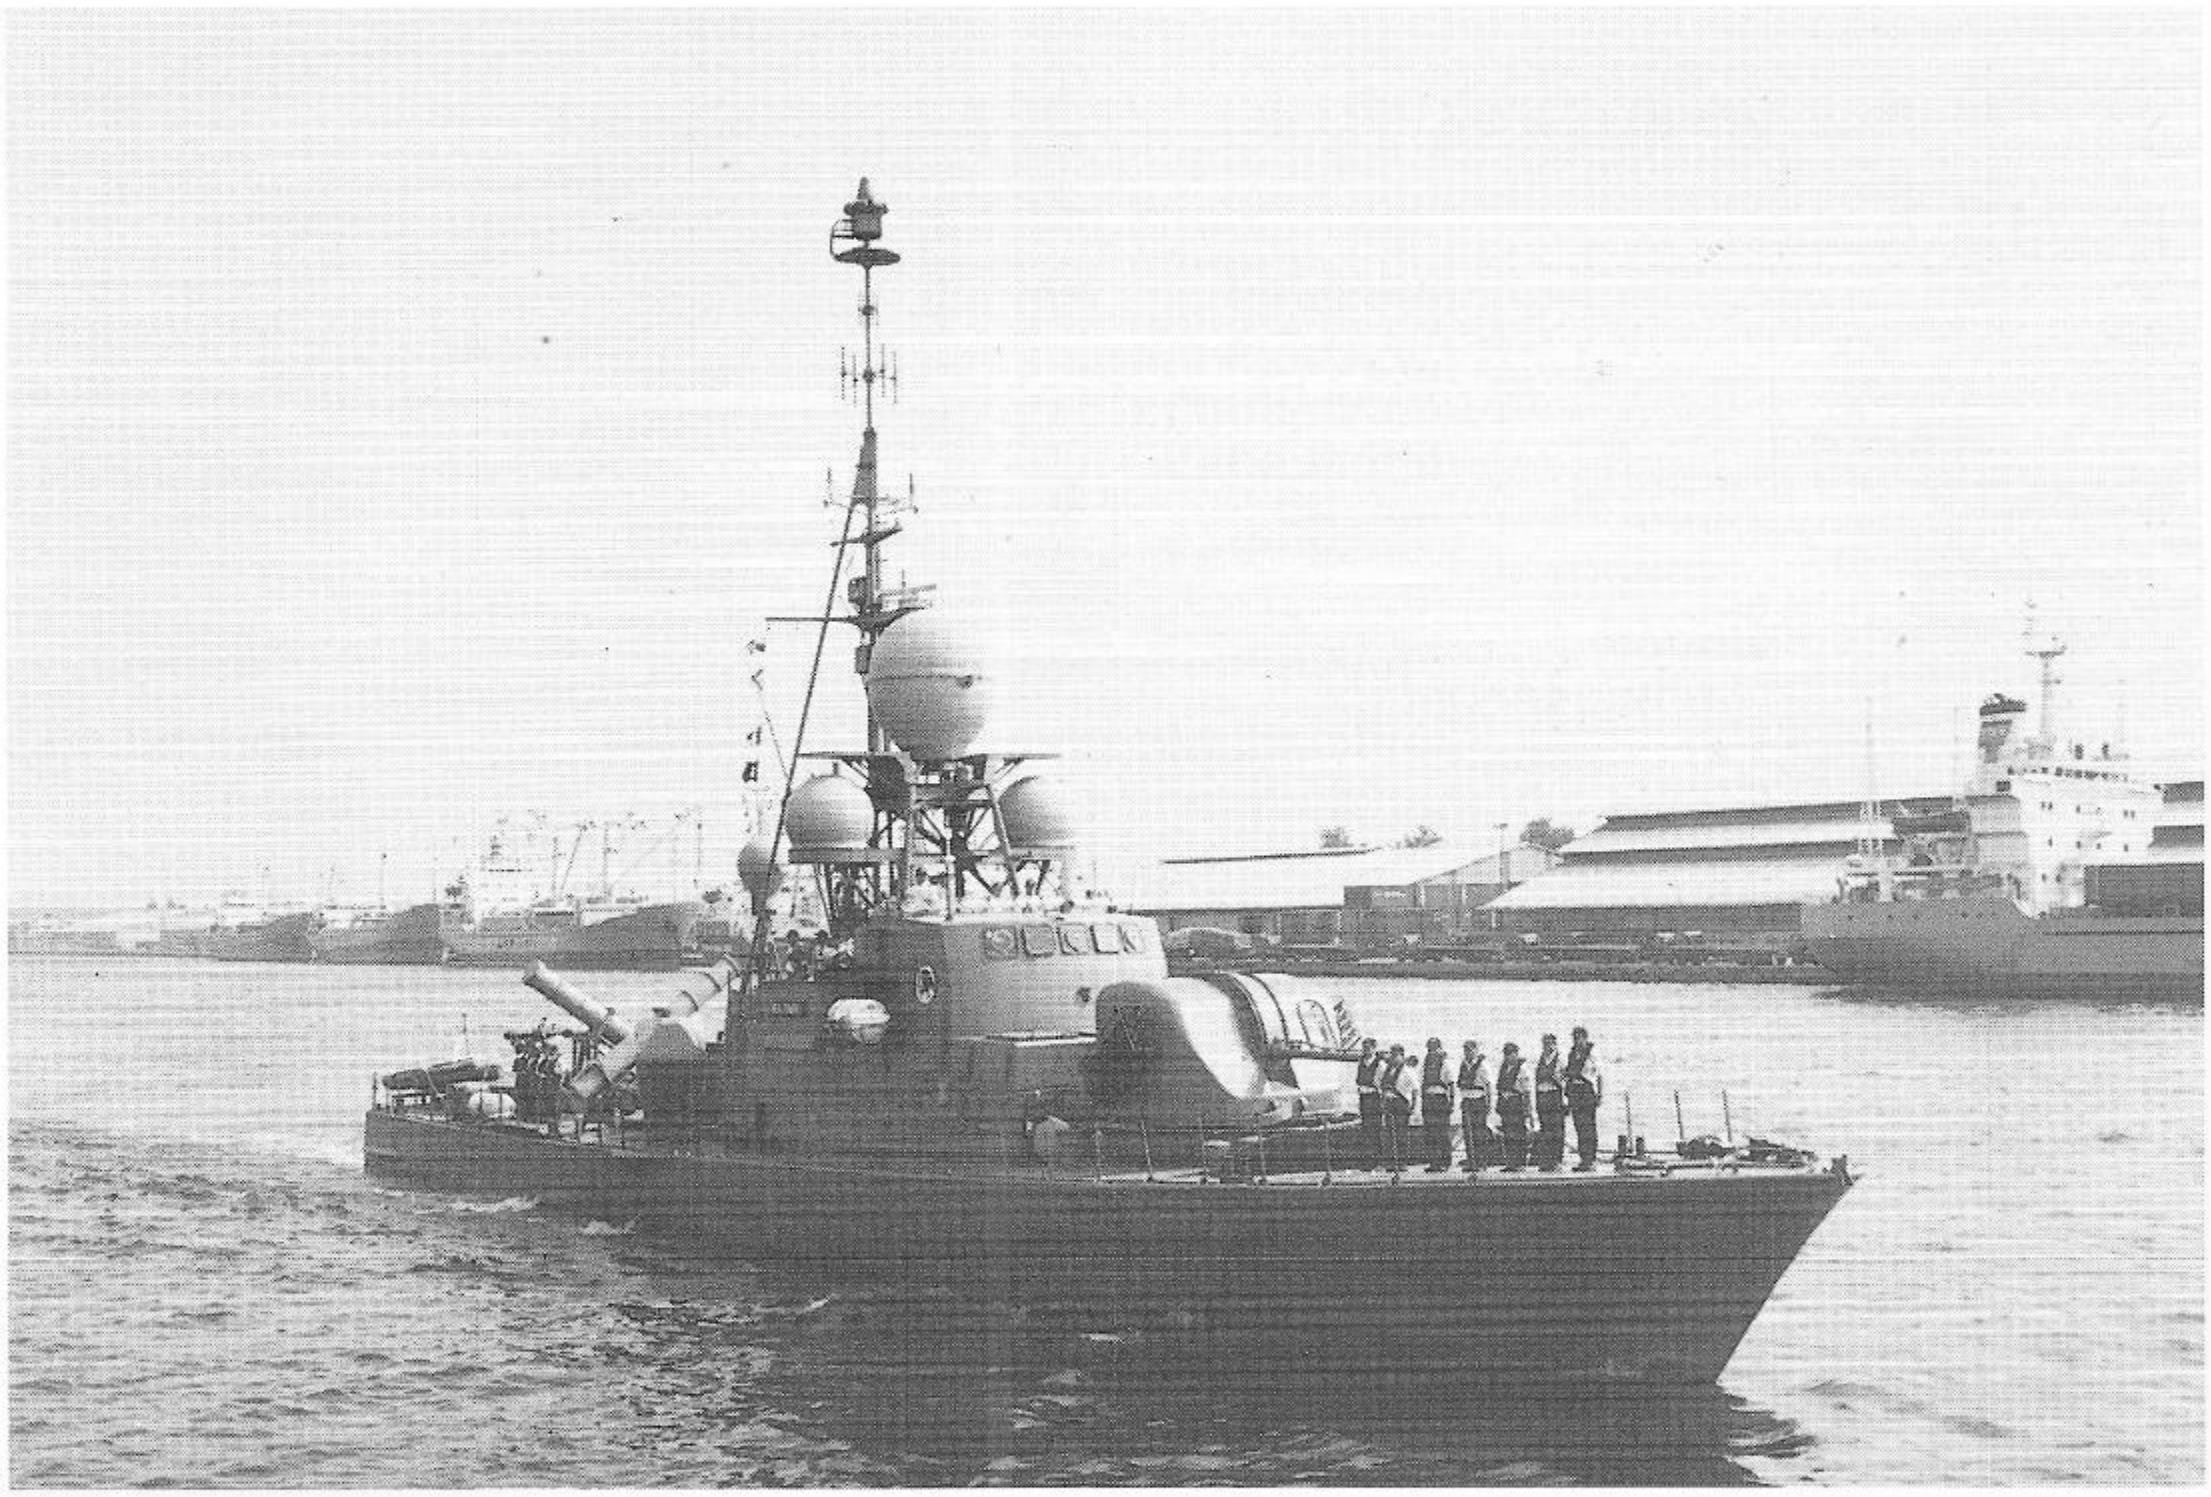
The Kuwaiti vessels were ordered from Lürssen in 1980 and delivered between 1982 and 1984. Also delivered, were *Al Abdali, Al Ahmadi, Al Boom, Al Betteel* and *Al Saadi* but these were captured and pressed into service by Iraq, and subsequently sunk by the Allies during the Gulf War.

Ordered in 1970, the first two Singapore vessels (*Sea Lion, Sea Wolf*) were built by Lürssen and commissioned in 1972 while the remainder were built by Singapore Shipbuilding and Engineering, Jurong, being commissioned between 1974 and 1976. They were the first export platforms for the Gabriel missile system. They were originally armed with the 57 mm gun (504 rounds), three launchers for Gabriel anti-ship missiles and a Bofors 40 mm L/70 gun (1,008 rounds), but from January 1988 they were refitted with Harpoon and Mistral. They also received RQN-3B electronic warfare suite, satellite navigation and GPS equipment, the work requiring some changes to the superstructure. Since 1994 they have been subject to a service life extension programme (SLEP). In addition to the weapons mentioned above, the Singapore ships have eight rails for illuminant rockets on the SAK 57 mounting.

The Thai versions of this design were built by Singapore Shipbuilding and Engineering, based upon the 'Sea Wolf' class. They were commissioned in 1976 and 1977.

The UAE vessels were ordered from Lürssen in 1977 and commissioned between 1980 and 1981. They were the first to be equipped with Exocet MM 40 and in addition to these weapons and the gun mountings mentioned above, they carry two 7.62 mm machine guns. These ships are currently being upgraded at the Abu Dhabi Dry Dock Company in a programme which will be completed in mid-1998.

Patrol boat versions of this design are used by Argentina (2), Ghana (2), Malaysia (6), and by the Indian coastguard as the 'Jija Bai Mod 1' (11).



Sea Tiger *(P 79) of the Republic of Singapore Navy. The large radome is a Signaal 'egg' for the WM28 fire-control radar, which is flanked by two radomes for the RQN 3B ESM/ECM system. Note also the Bofors 57 mm gun and Harpoon anti-ship missiles which are unique to the Singaporean version of the TNC-45.* (H & L Van Ginderen Collection)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

The Kuwaiti and Moroccan ships have four launchers aft of the superstructure with Exocet MM 40 (Kuwait) and Exocet MM 38 (Morocco). The Turkish ships have two quad launchers for McDonnell Douglas Harpoon 1C in V formation on the outer deck, trained inboard and forward.

Exocet MM 38

Specifications
Length: 5.21 m (17.08 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 22.5 n miles (42 km)
Warhead: 165 kg (365 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles, France.

Exocet MM 40 Block 1

Specifications
Length: 5.78 m (18.95 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.13 m (3.7 ft)
Weight: 855 kg (1,885 lb)
Speed: Mach 0.9
Range: 38 n miles (70 km)
Warhead: 155 kg (340 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles, France.

Harpoon 1C

Specifications
Length: 4.63 m (15.18 ft) (with booster)
Diameter: 34 cm (13.38 in)
Wing span: 83 cm (32.67 in)
Weight: 681.9 kg (1,502 lb) (with booster)
Speed: Mach 0.85
Range: 67 n miles (124 km)
Warhead: 221.6 kg (500 lb)
Guidance: Inertial navigation and active radar

Manufacturer/Contractor
McDonnell Douglas Missile Systems Company, USA.

Doğan *(P340) a Lürssen FPB-57 of the Turkish Navy. Armament comprises and OTOBREDA 76 mm gun, eight Harpoon anti-ship missiles and an Oerlikon twin 35 mm at the stern. The Signaal 'egg' covers a WM28/41 fire-control radar and beneath it is a circular receiver array for the Susie ESM radar warner* (Lürssen)

GUNS

All the ships have an OTOBREDA 76/62 Compact mounting forward but the aft gun mounting is an OTOBREDA 40 mm twin Compact in the Kuwaiti and Moroccan vessels and an Oerlikon-Contraves GDM twin 35 mm mounting in the Turkish ones. The Moroccan vessels also have two Royal Ordnance GAM-BO1 20 mm guns in the superstructure.

OTOBREDA 76/62 Compact

Specifications
Gun
Calibre: 76 mm
Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 10-85 rds/min
Range: 8.5 n miles (16 km)

Mounting
Weight: 8.5 t (loaded)
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

OTOBREDA twin 40 mm L/70 Compact

Specifications
Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 600 rds/min
Range: 3.25 n miles (12.5 km)

Mounting
Weight: 5.5 t (unloaded)
Traverse: 360°
Elevation: −13 to +85°

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Oerlikon — Contraves GDM-A

Specifications
Gun
Calibre: 35 mm
Length of barrel: 90 calibres
Muzzle velocity: 1,175 m/s (3,855 ft/s)
Rate of fire: 550 rds/min/barrel
Range: 2.7 n miles (5 km)

Mounting
Weight: 6.52 t
Traverse: 360°
Elevation: −15 to +85

Manufacturer/Contractor
Oerlikon-Contraves, Switzerland.

Royal Ordnance GAM-BO1

Specifications
Gun
Calibre: 20 mm
Length of barrel: 85 calibres
Muzzle velocity: 1,050-1,150 m/s (3,445-3,773 ft/s)
Rate of fire: 900 rds/min
Range: 0.9 n miles (1.7 km)

Mounting
Weight: 500 kg
Traverse: 360°
Elevation: −15 to +60°

Manufacturer/Contractor
Royal Ordnance, UK.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Racal-Thorn Cutlass

'Istiqlal' (Kuwait), 'Yildiz' (Turkey). Cutlass and provides bearings, CW bearing and frequency measurement over the E/J-band with instantaneous frequency measurement. The system can incorporate a responsive noise jammer as well as providing spot or barrage noise. It may also be integrated with decoy launchers. There is also the DASA Telegon 6 modular, high-frequency direction-finding system.

Manufacturer/Contractor
Racal-Thorn, UK.

Racal-Thorn Susie-1

'Doğan' (Turkey), Susie is a solid-state system operating in the E/J-band range which automatically correlates band, pulsewidth and bearing then displays the data with an accuracy of 3.5° in fine mode. The system can automatically track up to seven signals. There is also the DASA Telegon 8 digital high-frequency direction-finding system with a bearing accuracy of 1°.

Manufacturer/Contractor
Racal-Thorn, UK.

DASA Telegon

'Lazaga' class (Morocco). Moroccan ships are known to have a DASA Telegon high-frequency direction-finding system but no details are available.

Manufacturer/Contractor
DASA, Ulm, Germany.

CS Défense DAGAIE Mk 2

Istiglal (Kuwait). Dagaie is a trainable mounting with 10 replaceable containers loaded with a mixture of 3/5 and 8/14 µm IR or I/J-band chaff projectiles produced by Etienne Lacroix Défense.

Loral Hycor Mk 36 Mod 1

'Doyan' 'Yildiz' (Turkey). The Mk 36 SRBOC Mod 1 (Super Rapid Bloom Offboard Countermeasures) decoy system has two Mk 137 launchers, each with six barrels. These are 160 × 43 × 86 cm mortar systems which fire a variety of 130 mm chaff and infra-red munitions from cartridges weighing 3.8-22.7 kg (8.4-50 lb) which create chaff clouds up to 2.5 n miles (4.5 km) from the ship.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

CelsiusTech 9LV 200 Mk 2

'Istiqlal' (Kuwait). The 9LV 200 Mk 2 is a radar-based weapon control system of mainframe architecture using the Philiips P800 mini-computer for the control of one medium and one light calibre gun mounting as well as surface-to-surface missiles. There is a tactical display system and two gun control displays, for ASuW and AAW operations.

Manufacturer/Contractor

Celsius Tech, Sweden.

Signaal WM25

'Lazaga' (Morocco). This has a mainframe architecture based upon the SMR mini-computer with a two-man display and control console. It can operate against two targets simultaneously using two guns or a surface-to-surface missile.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

Signaal WM28 ('Doğan')

'Doğan' (Turkey). The WM28 radar-based weapon control system has a mainframe architecture based upon the SMR mini-computer with a two-man display and control console. It can operate against two targets simultaneously using two guns or surface-to-surface missiles.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

Signaal Tacticos

'Yildiz' (Turkey). These vessels have a Signaal Tacticos command and weapon control system. This is a distributed architecture system based upon SUN-1S processors with five MOC (Multifunction Operator Consoles) workstations linked by a dual databus system.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

ELECTRO-OPTIC SENSORS

CS Défense Lynx director (Kuwait)

Specifications

Weight: 195 kg (430 lb)
Elevation: −15 to +75°
Sensors: Optical

CS Défense Panda director (Morocco)

Specifications

Weight: 480 kg (1,058 lb)
Elevation: −25 to +65°
Sensors: Optical

LIOD Mk 2 ('Yildiz' class)

Specifications

Weight: 200 kg (441 lb)
Elevation: n/k
Sensors: TV camera

RADARS

ISTIQLAL (KUWAIT)

Shafts: 4

('Yildiz' class)
System: Diesel
Main machinery: 4 MTU 16V 956 TB91 diesels; 11.1 MW (15,120 hp)
Shafts: 4

FURTHER INFORMATION

The FPB 57 design, with its steel, round-bilge hull and aluminium superstructure, was designed to meet a market need among Third World navies for a small warship with a multirole capability and the space to adapt for sensor/weapon upgrades. It has some 170 m² of living space and carries about 60 tonnes of fuel. The electricity systems generate 405 kW. They have a capacity for 300 rounds of 76 mm ammunition.

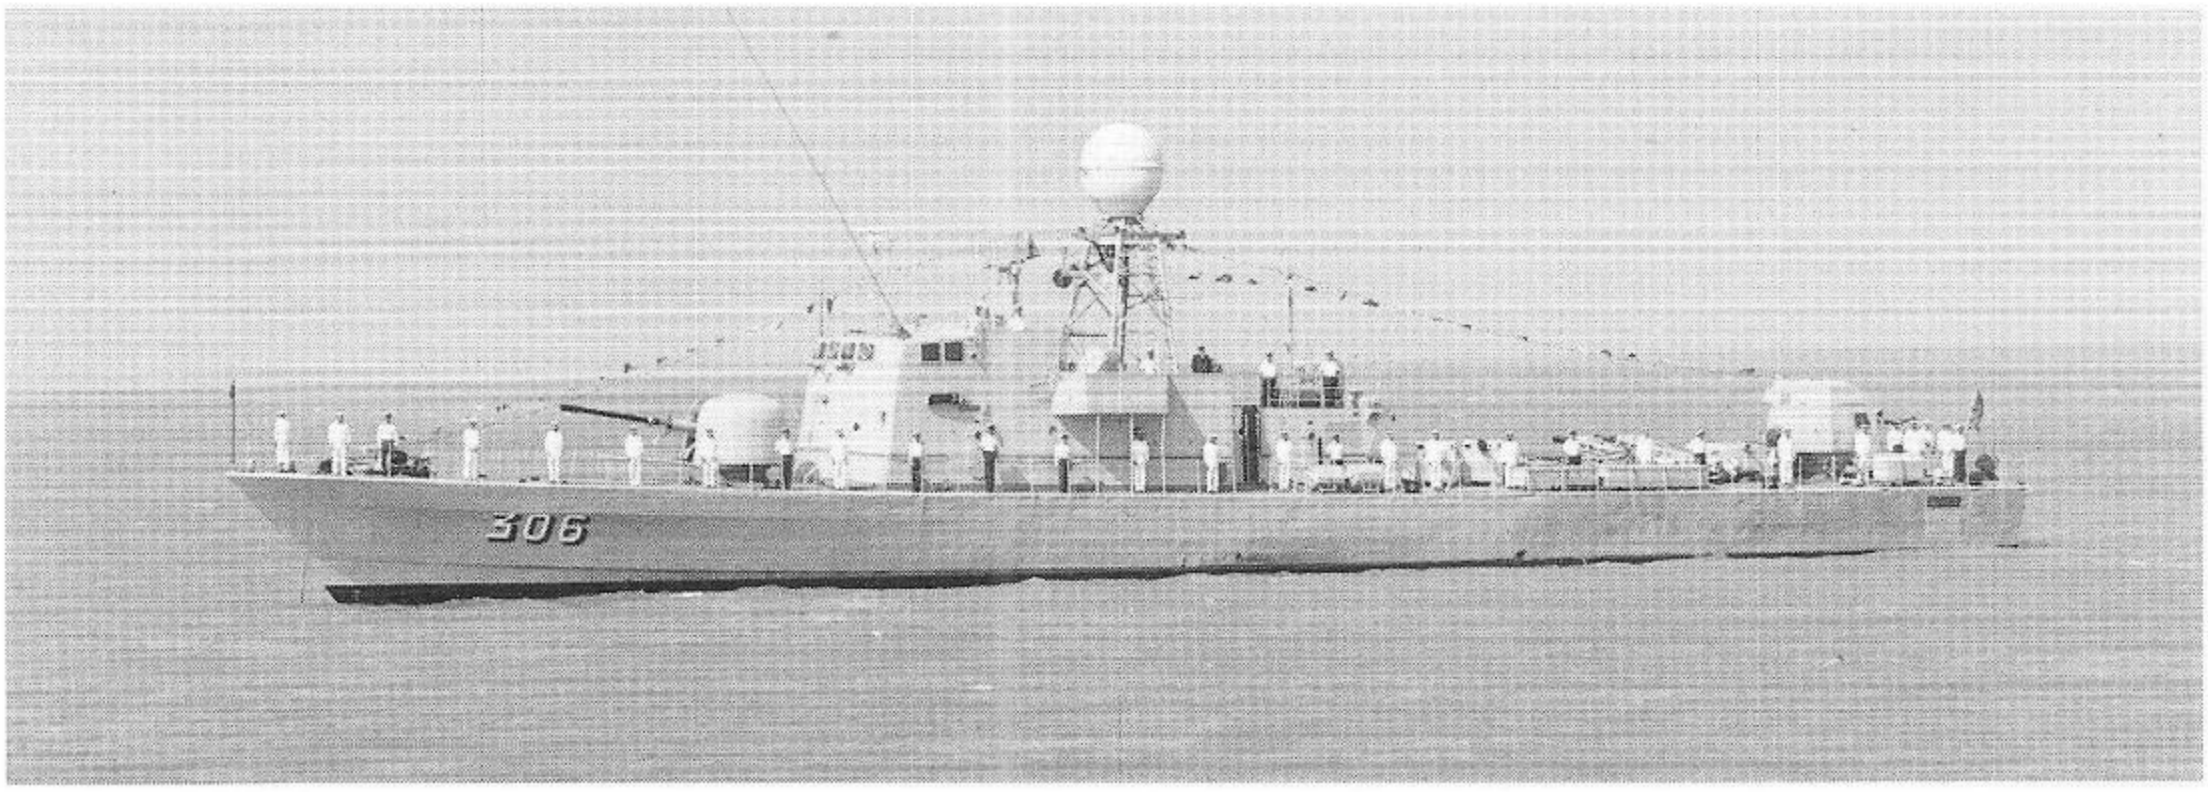
Two vessels were ordered from Lürssen by Kuwait in 1980 as leaders for the TNC 45s and were commissioned in 1982/1983. *Sabhan* was sunk in 1991 leaving *Istiqlal* which was refitted by CMN in 1995/1996.

The Moroccan vessels were ordered in 1977 and built by Bazan's San Fernando yard at Cadiz. Six more were built as the 'Lazaga' class for Spain in the mid-1970s (the first by Lürssen) but were stricken in 1993. They differed in having no missile armament.

The Turkish vessels ('Doğan' class) were ordered in 1973 with steel hulls and aluminium superstructures. The lead ship was built by Lürssen and commissioned in 1977 while the remainder were built by the Taskizak Yard, Istanbul and commissioned between 1978 and 1988.

The 'Yildiz' class is essentially a 'Doğan' hull with improved sensor and weapon systems, and a revised bridge. *Yildiz and Karayel* were ordered in 1991 from the Taskizak Yard and were commissioned in 1994 and 1996 respectively. Three more were authorised in 1993 with different radars, the first being built by Lürssen and the other two by Taskizak. They will be commissioned in 1997/1998.

In addition to these FACs Ghana has a gun-armed version while the Indonesian Navy's 'Singa' and 'Kakap' classes are patrol versions of this design. The Turkish *Girne* is an unsuccessful ASW version of the PB 57 design.



Commandant El Harty *(306) of the Moroccan Navy* (H & L van Ginderen Collection)

GEPARD (TYPE 143A)/ALBATROS (TYPE 143B)

WEAPONS SYSTEMS

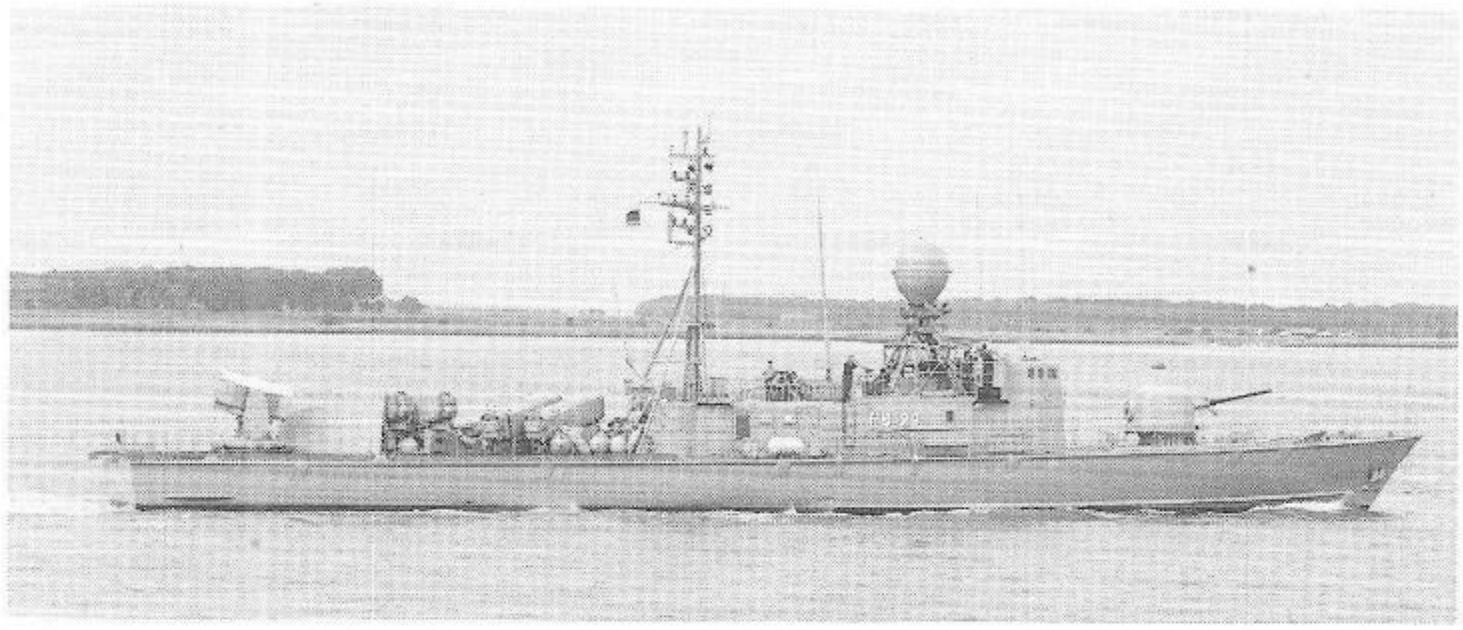
SURFACE-TO-SURFACE MISSILES (SSM)

Aerospatiale Exocet MM 38

Both classes have four forward-trained launchers for MM 38 anti-ship missiles aft of the superstructure, the forward pair pointing to port and the after pair to starboard.

Specifications
Length: 5.21 m (17.08 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 22.5 n miles (42 km)
Warhead: 165 kg (365 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles, France.



Wiesel *(P 6129), a Type 143A FAC of the Federal German Navy. Armament comprises a 76 mm/62 gun forward, four MM 38 Exocet launchers and the newly fitted (1994) RAM launcher. Note the protection plate fitted to deflect the RAM exhaust from the after Exocet* (H & L van Ginderen Collection)

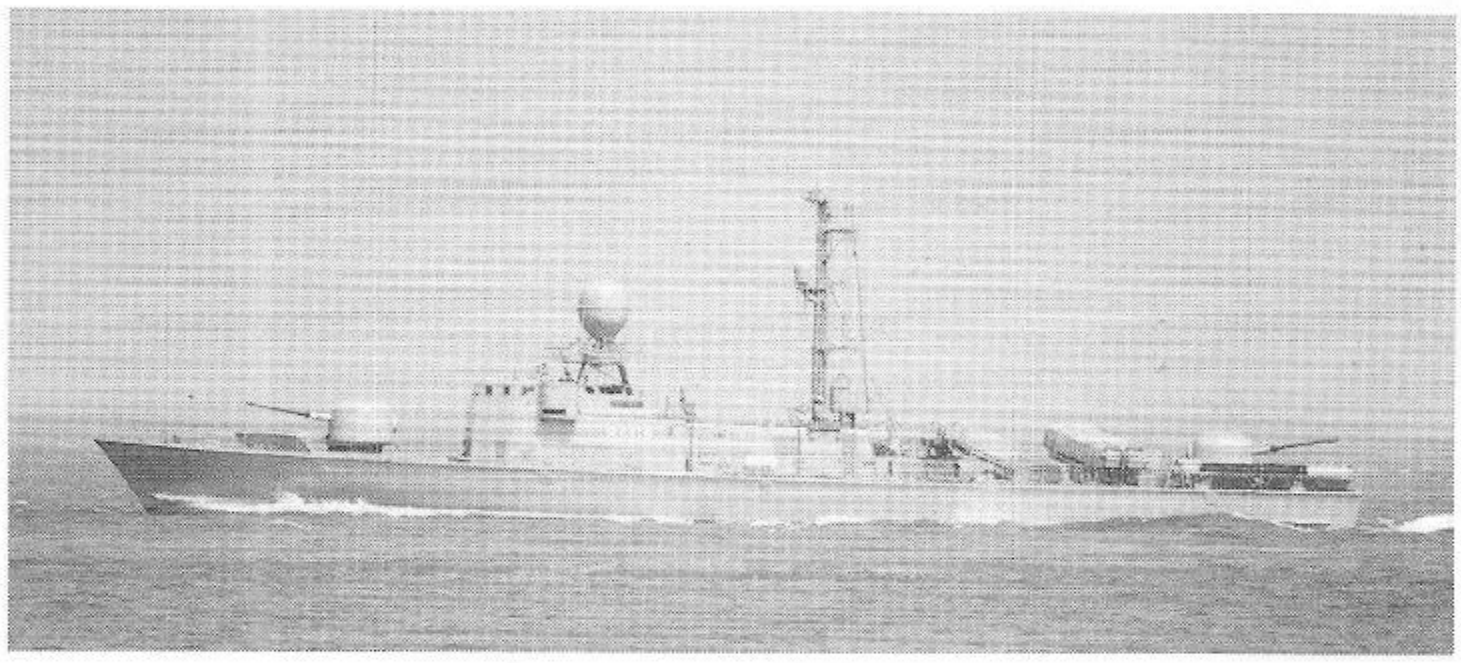
SURFACE-TO-AIR MISSILES (SAM)

RIM-116A Rolling Airframe Missile (RAM)

Since 1992 the 'Gepard' class has been receiving a standard, 19-cell launcher for the RIM-116A RAM (Rolling Airframe Missile) surface-to-air missile. This is installed on the stern; the installation includes a large, metal screen to protect the nearest Exocet launcher from the rocket efflux of the RAM missiles.

Specifications
Length: 2.79 m (9.15 ft)
Diameter: 12.7 cm (5 in)
Wing span: 43.4 cm (17 in)
Weight: 73.6 kg (162 lb)
Speed: Mach 2+
Range: 5 n miles (9.5 km)
Warhead: 9.09 kg (20 lb)
Guidance: Radar emitter and infra-red passive homing

Manufacturer/Contractor
Hughes Missile Systems, Tucson, Arizona, USA.



Greif *(P 6116) after conversion to a Type 143B. Note the two 76 mm/62 guns, which distinguish this group from the Type 143A* (H & L van Ginderen Collection)

TUBES

The 'Albatros' class has two 533 mm (21 in) torpedo tubes for STN Atlas Seal torpedoes.

TORPEDOES

STN Atlas Seal torpedo

Specifications
Length: 6.55 m (21.5 ft) (with guidance wire dispenser)
Diameter: 533 mm (21 in)
Weight: 1,370 kg (3,021 lb)
Propulsion: Electric
Speed: 33 kts
Range: 10.75 n miles (20 km)
Warhead: 260 kg (573 lb)
Guidance: Wire and active/passive sonar

Manufacturer/Contractor
STN Atlas, Bremen, Germany.

GUNS

OTOBREDA 76/62 Compact

'Gepard' class. The 'Gepard' class has one OTO-BREDA 76/62 Compact mounting forward.

'Albatros' class. The Albatros class has two 76 mm guns; one forward, the other aft.

Specifications
Gun
Calibre: 76 mm
Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 10-85 rds/min
Range: 8.5 n miles (16 km)

Mounting
Weight: 8.5 t (loaded)
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

12.7 mm machine gun

12.7 mm machine guns are fitted for operational deployments.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

DASA Telegon 6

All ships of both classes are fitted with the DASA Telegon 6 modular, high frequency, direction finding equipment.

Manufacturer/Contractor
DASA, Ulm, Germany.

ELECTRONIC COUNTERMEASURES (ECM)

DASA FL1800

'Gepard' class. These vessels have the DASA FL 1800 Stage II electronic warfare system, covering the H/J-bands and consisting of omnidirectional and planar direction-finding antennas, with elements covering five bands. The ECM element has a tracking processor which controls synchronous and asynchronous jamming. The Stage II system improves performance and adds a channelised and two fully integrated super-heterodyne receivers.

Manufacturer/Contractor
DASA, Ulm, Germany

DECOYS

Buck-Wegmann Hot Dog/Silver Dog

All ships, both 'Albatros' and 'Gepard' class have the Buck-Wegmann Hot Dog (infra-red) and Silver Dog (chaff) decoy launchers. These systems consist of 12 or 24 — 76 mm grenade launchers which weigh 115 kg (254 lb) or 220 kg (485 lb). Each group of three launcher tubes is 196 × 710 × 420 mm. The Hot Dog grenade weighs 0.74 kg (1.63 lb) while the Silver Dog one weighs 0.95 kg (2.1 lb), the chaff of the latter being deployed within 2 s of launching.

Manufacturer/Contractor

Buck-Wegmann, Germany

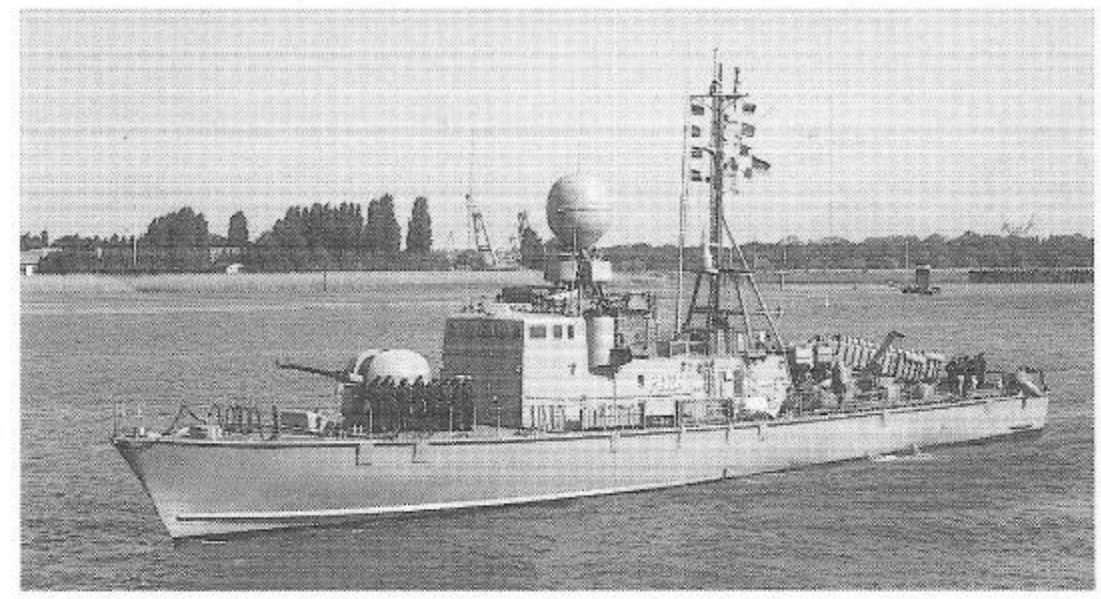
Racal-Thorn Octopus EW suite

'Albatros' class. This class is equipped with a Racal-Thorn Octopus electronic warfare suite based upon the Racal-Thorn Cutlass B1 ESM and Scorpion ECM systems with DASA threat library. The Cutlass uses the same antenna as RDL and provides bearings, CW bearing and frequency measurement over the E/J-band with instantaneous frequency measurement. The Scorpion is a wideband jammer covering the E/J-band. The dual-beam antenna can call upon 50 kW of radiated power and the system can deal with between five and eight targets.

Manufacturer/Contractor

Racal-Thorn, UK.

The RAM and Exocet launchers aboard Ozelot *(P 6128)* (H & L van Ginderen Collection)



Frettchen *(P 6126), showing the Signaal 'egg' containing the WM27 fire-control radar and the four receive antennas of the FL1800S ESM system* (H & L van Ginderen Collection)

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Both classes have a Signaal WM27 weapon control system with DASA AGIS tactical data system. The AGIS *(Automatisiertes Gefechts- und Informations-system für Schnellboote)* exchanges radar and communications data among FACs using two Univac 1830B mini-computers and a Link 11 datalink to feed data to the WM27 consoles. The WM27 radar-based weapon control system has a mainframe architecture based upon the SMR mini-computer with a two-man display and control console. It can operate against two targets simultaneously using one gun or a surface-to-surface missile.

RADARS

	WM27	3RM20
Maker	Signaal	SMA
Role	Weapon control	Search
Band	I	I
Beam	1.5, 7, 2.4°	0.8/2.0, 26°

Shafts: 4

'Albatros' class

Specifications

System: Diesel
Main machinery: 4 MTU MA 16V 956 TB92 diesels; 13 MW (17,700 hp)
Shafts: 4

FURTHER INFORMATION

The S.71 design, officially designated Type 143 by the Federal German Navy, has a round-bilge hull of three-layer, diagonal-bonded wooden outer skins with welded alloy frames, bulkheads and deck beams, and welded steel fabrications for longitudinals, crossbeams and machinery platforms. It has 125 m² of living space and carries 116 tonnes of fuel, while the electricity system generates 540 kW.

The 'Albatros' class was originally designated the Type 143, with ten being ordered in 1972, which was followed by an order for ten 'Gepard' class (Type 143A) in 1978. The prime contractor was AEG-Telefunken (now STN Atlas), but with actual construction being carried out by Lürssen (14 hulls) and Kröger (six hulls). In 1994-95 the electronic systems of the 'Albatros' class (Type 143) was upgraded, resulting in them being redesignated Type 143B.

SA'AR 4/MINISTER

Builder Sandock Austral, Durban, South Africa
Commissioned 4 Jul 1986

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

These FACs carry surface-to-surface missile launchers aft of the superstructure and forward of the after gun mounting. Israeli vessels have two launchers (twin or quad depending upon the mission) in crossover configuration immediately behind the superstructure facing port (forward launchers) and starboard (after set). Outboard angled, forward-facing launchers for Gabriel I (Chile), Gabriel II (Israel or South Africa, the latter as Skerpioen) are arranged in pairs either behind the Harpoons or (where only Gabriels are carried) behind the superstructure. Chilean vessels have four launchers, Israeli ones have four to six launchers while South African vessels carry up to eight.

Gabriel I

Specifications
Length: 3.35 m (11 ft)
Diameter: 34 cm (13.4 in)
Wing span: 1.35 m (4.4 ft)
Weight: 430 kg (950 lb)
Speed: Mach 0.7
Range: 10.75 n miles (20 km)
Warhead: 150 kg (330 lb)
Guidance: Semi-active radar and manual

Manufacturer/Contractor
Israel Aircraft Industries, Tel Aviv, Israel.

Gabriel II

Specifications
Length: 3.42 m (11.2 ft)
Diameter: 34 cm (13.4 in)
Wing span: 1.35 m (4.4 ft)
Weight: 522 kg (1,151 lb)
Speed: Mach 0.7
Range: 19 n miles (36 km)
Warhead: 150 kg (330 lb)
Guidance: Semi-active radar and manual

Manufacturer/Contractor
Israel Aircraft Industries, Tel Aviv, Israel.
Note: Licence-built in South Africa as Skerpioen.

Harpoon 1C

Specifications
Length: 4.63 m (15.18 ft) (with booster)
Diameter: 34 cm (13.4 in)
Wing span: 83 cm (32.67 in)
Weight: 681.9 kg (with booster)
Speed: Mach 0.85
Range: 67 n miles (124 km)
Warhead: 221.6 kg (500 lb)
Guidance: Inertial navigation and active radar

Manufacturer/Contractor
McDonnell Douglas Missile Systems Company, USA.

GUNS

The 'Sa'ar 4' and 'Minister' classes have two OTOBREDA 76/62 Compact mountings fore and aft, plus two US Navy Mk 10 single 20 mm Oerlikons. Some Israeli vessels replace the forward Compact mounting with a Phalanx close in weapon system.

OTOBREDA 76/62 Compact

Specifications
Gun
Calibre: 76 mm
Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 10-85 rds/min
Range: 8.5 n miles (16 km)

Mounting
Weight: 8.5 t (loaded)
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Hughes Mk 15 CIWS Phalanx

Specifications
Gun
Calibre: 20 mm
Length of barrel: 53 calibres
Muzzle velocity: 1,030 m/s (3,379 ft/s)
Rate of fire: 3,000 rds/min
Range: 0.75 n miles (1.47 km)

Mounting
Weight: 5.42 t
Traverse: 310°
Elevation: −25 to +85°

Manufacturer/Contractor
Hughes Missile Systems, Tucson, Arizona, USA.

US Navy Mk 10 20 mm Oerlikon

Specifications
Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Rate of fire: 450 rds/min
Range: 0.8 n miles (1.5 km)

Mounting
Weight: 499 kg (1,100 lb)
Traverse: 360°
Elevation: −15 to +90°

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Elta MN-53

'Casma' (Chile), 'Minister' (South Africa). The ESM system is the Elta MN-53 passive intercept system which measures features including band, PRF and pulsewidth with both manual and automatic direction-finding and analysis. In South African vessels the MN-53 is being replaced by a new system developed by South African company Grinaker Electronics, but no further details are available.

Manufacturer/Contractor
Elta, Israel.

Elisra NS9003

'Reshef' (Israel). The Elisra NS9003 is an automatic, computer-controlled ESM system covering the E/J-bands with monopulse direction-finding and instantaneous frequency measurement. There are omni-directional and multibeam static antennas with direction-finding accuracy of 1° in I/J-bands and 3° in E/H-bands.

ELECTRONIC COUNTERMEASURES (ECM)

Elisra NS 9005 ECM

'Reshef' (Israel). Integrated with it is the NS 9005 noise and deception jammer covering the same bands using steerable antennas, low-power exciter and high-power MultiBeam Array Transmitter (MBAT).

Manufacturer/Contractor
Elisra, Israel.

Rattler

'Casma (Chile), 'Minister' (South Africa). The Rafael Rattler jammer can engage three targets covering the E/J-bands simultaneously. It uses a high-powered, broad band amplifier wth low-power exciter.

DECOYS

Elbit ACDS

This is supported by four single-tube decoy launchers and the Elbit Automatic Countermeasures Dispensing System (ACDS) with six 24-tube launchers. The launchers use the Rafael Short-Range Chaff Rocket (SRCR) and the Long-Range Chaff Rocket (LRCR), the launchers weighing 22 kg (48.5 lb) and 12.5 kg (27.5 lb) respectively. The rockets weigh 3.2 kg (7.0 lb) (SRCR) and 9.4 kg (20.7 lb) (LRCR).

Decoy launchers

'Reshef' (Israel). Israeli vessels have one 45-tube, four or six 24-tube, and four single-tube decoy launchers; all are of unidentified, but presumably Israeli, manufacture.

COMMAND AND CONTROL SYSTEM

WEAPONS CONTROL

IAI fire control

'Reshef' class (Israel), 'Casma' class (Chile). These vessels have an IAI fire-control system with a one-man display control and processing console which interfaces with Gabriel (and later Harpoon) surface-to-surface missiles and the main gun. In Israeli ships this receives data from an IAI datalink system.

UEC SAIS

'Casma' class (South Africa). The 'Minister' class has received a UEC SAIS (Surface Action Information System) tactical data handling system with datalink input. This is a distributed architecture system with two workstations, one of which is used by the ship's commander and the other by the tactical compiler.

SONAR

Some Israeli vessels operating in the Red Sea carry an EDO 780 lightweight variable depth sonar. This operates at 13 kHz with a 7.3 tonne body and it has a range of some 8.5 n miles (16 km).

RADARS

'CASMA' CLASS (CHILE)

	Neptune	EL/M-2221
Maker	Thomson-CSF	Elta

PROPULSION

Specifications
System: Diesel
Main machinery: Chile: 4 MTU 16V 538 TB82; 8.74 MW (11,880 hp)
Israel, South Africa: 4 MTU 16V 956 TB91; 11.03 MW (15,000 hp)
Shafts: 4

FURTHER INFORMATION

These are larger steel-hulled versions of the earlier 'Sa'ar 3' class and were built by Israel Shipyards, Haifa between 1973 and 1980. The Israeli and South African vessels also carry two 12.7 mm machine guns. The Chilean vessels were transferred in 1979 and 1981, having served in the Israeli Navy since 1974 and 1973 respectively.

The first three South African vessels (*Jan Smuts, P W Botha* and *Frederic Cresswell*) were ordered in 1974 from the Haifa Shipyard and commissioned in 1977 and 1978. The remainder were built by the Sandrock Austral yard, Durban, South Africa and were commissioned between 1978 and 1986. Three improved vessels were ordered but later cancelled.

Between November 1986 and May 1989 *P W Botha, Kobie Coetsee* and *Oswald Pirow* were modernised with improved weapon control systems. Since 1991 a major upgrade has begun, involving improved command and weapon control system, new communications system, improved sensors and a new engine monitoring system, all of South African design and manufacture. *Frederic Cresswell* was the first to complete this programme in 1996 and will be followed by *Hendrik Mentz* and *Magnus Malan*.

South African Sa'ar 4 FAC-M Jan Smuts *(P 1561)* (H & L van Ginderen Collection)

WEAPONS SYSTEMS

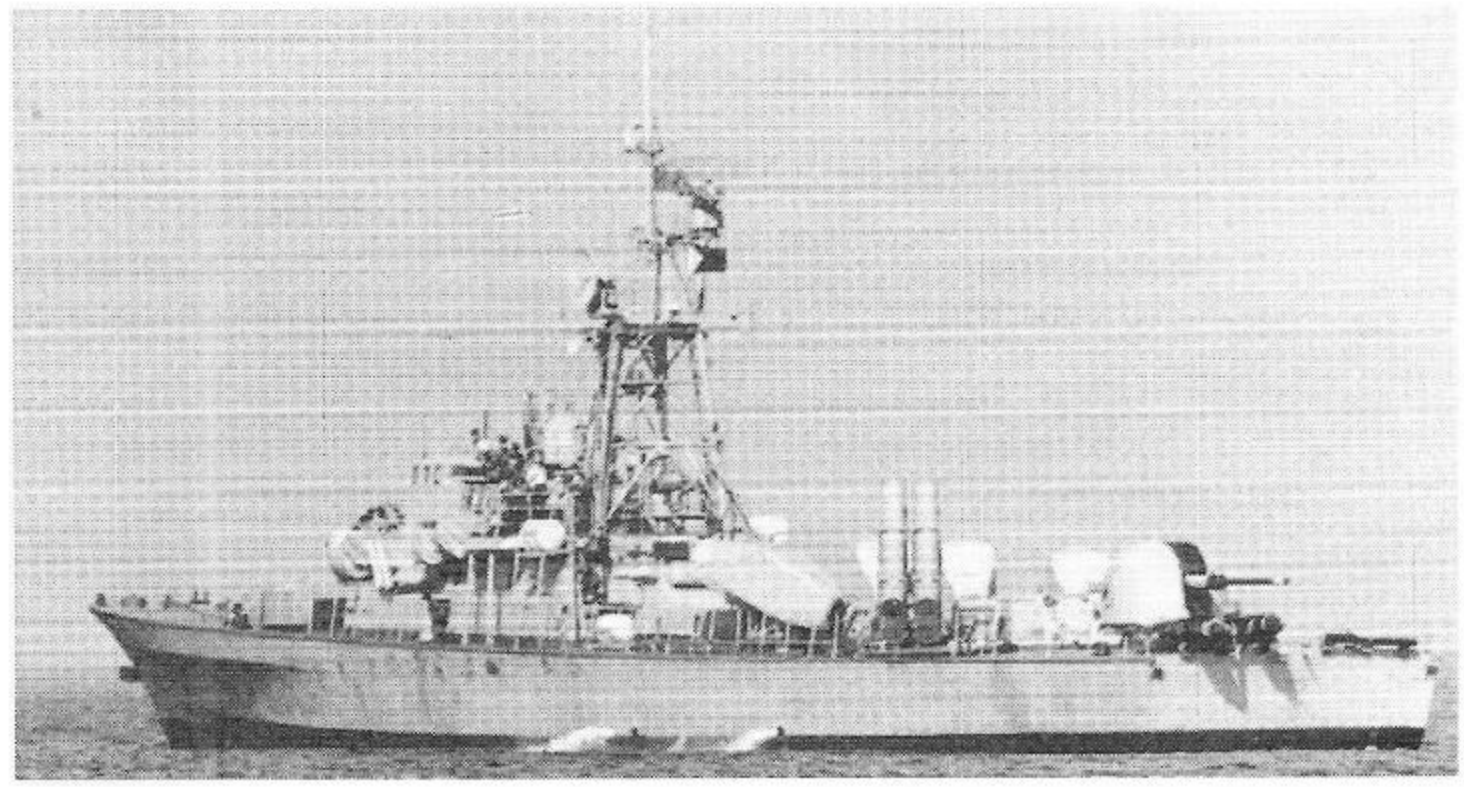
ANTI-SHIP MISSILES

The 'Sa'ar 4.5' class carries two kinds of anti-ship missile aft of the superstructure and forward of the after gun mounting. Immediately behind the superstructure are two twin launchers for the McDonnell Douglas Harpoon IC in crossover configuration with the forward pair facing port and the starboard pair facing starboard. Behind them are two ('Aliya') or three ('Hetz') pairs of outboard-angled, forward-facing, launchers for IAI Gabriel II.

Specifications
Harpoon 1C
Length: 4.63 m (15.18 ft) (with booster)
Diameter: 34 cm (13.38 in)
Wing span: 83 cm (32.67 in)
Weight: 681.9 kg (1,504 lb) (with booster)
Speed: Mach 0.85
Range: 67 n miles (124 km)
Warhead: 221.6 kg (500 lb)
Guidance: Inertial navigation and active radar

Manufacturer/Contractor
McDonnell Douglas Missile Systems Company, USA.

Specifications
Gabriel II
Length: 3.42 m (11.2 ft)



A 'Hetz' class FAC-Missile of the Israeli Navy. This rebuild of existing hulls, incorporating some new equipment, but including much old, refurbished equipment from older vessels, is a good bargain — reputedly costing less than US$10 million per vessel (IAI)

Diameter: 34 cm (13.4 in)
Wing span: 1.35 m (4.4 ft)
Weight: 522 kg (1,151 lb)
Speed: Mach 0.7
Range: 19 n miles (36 km)
Warhead: 150 kg (330 lb)
Guidance: Semi-active radar and manual

Manufacturer/Contractor
Israel Aircraft Industries. Tel Aviv, Israel.

SURFACE-TO-AIR MISSILES (SAM)

The modernised 'Hetz' class carries eight-cell silos of IAI Barak 1 point defence missiles. Between two and four such silos are carried.

Specifications
Barak 1
Length: 2.17 m (7.1 ft)
Diameter: 17 cm (6.7 in)
Wing span: 68.4 cm (27 in)
Weight: 97.9 kg (216 lb)
Speed: Mach 2
Range: 6.5 n miles (12 km)
Warhead: 22 kg (48.5 lb)
Guidance: Command to line of sight

Manufacturer/Contractor
Israel Aircraft Industries, Tel Aviv, Israel.

GUNS

'Hetz' class. The class carries a Mk 15 Phalanx close in weapon system forward of the bridge and two US Navy Mk 10 single 20 mm Oerlikons in the superstructure.

'Aliya' class. The 'Aliya' class also carries an OTO-BREDA 76/62 Compact mounting at the stern.

OTOBREDA 76 (3 in) 62 Compact

Specifications
Gun
Calibre: 76 mm
Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 10-85 rds/min
Range: 8.5 n miles (16 km)

Mounting
Weight: 8.5 t (loaded)
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Hughes Phalanx Mk 15 20 mm CIWS

Specifications
Gun
Calibre: 20 mm
Length of barrel: 53 calibres
Muzzle velocity: 1,030 m/s (3,379 ft/s)
Rate of fire: 3,000 rds/min
Range: 0.75 n miles (1.47 km)

Mounting
Weight: 5.42 t
Traverse: 310°
Elevation: −25 to +85°

Manufacturer/Contractor
Hughes Missile Systems, Tucson, Arizona, USA.

US Navy Mk 10 20 mm Oerlikon

Specifications
Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Rate of fire: 450 rds/min
Range: 0.8 n miles (1.5 km)

Mounting
Weight: 499 kg (1,100 lb)
Traverse: 360°
Elevation: −15 to +90°

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Elisra NS9003 ESM system

Both classes have the Elisra NS9003 ESM and Elisra NS9005 ECM systems. The NS9003 is an automatic, computer-controlled ESM system covering the E/J-bands with monopulse direction-finding and instantaneous frequency measurement. There are omnidirectional and multibeam static antennas with direction-finding accuracy of 1° in I/J-bands and 3° in E/H-bands.

Elisra NS9005 ECM system

Integrated with the NS9003 is the NS9005, a noise and deception jammer covering the same bands using steerable antennas, low-power exciter and high-power MultiBeam Array Transmitter (MBAT). This is supported by a 45-tube, four or six 24-tube and four single-tube decoy launchers of unidentified manufacture.

Manufacturer/Contractor
Elisra, Israel.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Elbit Naval Tactical Command and Control System (NTCCS)

The ships have an Elbit Naval Tactical Command and Control System (NTCCS) supported by an IAI datalink. The NTCCS is a distributed architecture system based upon Motorola 68020 and 68040 processors using two workstations. The system can handle about 100 targets simultaneously.

Manufacturer/Contractor
Elbit, Israel.

ELECTRO-OPTIC SENSORS

There are two directors, an Officine Galileo OG 20 on the superstructure and an Elop Multisensor Stabilised Integrated System (MSIS) in the mast.

Officine Galileo OG 20

Specifications
Weight: n/k
Elevation: n/k
Sensors: Optical

MSIS

Weight: 60 kg (132 lb)
Elevation: −15 to +85°
Sensors: Thermal imager, TV camera, laser rangefinder

RADARS

The class uses the Neptune search radar and, for weapon control, either two Elta EL/M-2221GM ('Hetz') or an Alenia Orion RTN-10 ('Aliya').

Type	Neptune	RTV-10X (Orion) (two)	EL/M-2221GM (two)
Maker	Thomson-CSF	Alenia	Elta
Role	Search	Weapon control	Weapon control
Frequency	H-band	I-band	I-band
Beam	2 22°	n/k	n/k
Peak power	250 kW	200 kW	n/k
Gain	38 dB	n/k	n/k
Pulsewidth	0,2, 0.5 0.7 µs	1.5 µs	n/k
PRF	n/k	450-550 pps	n/k
Scan rate	12, 24 rpm	n/k	n/k
Typical range	24 n miles (45 km)	n/k	n/k

AVIATION

HELICOPTERS

AIRCRAFT ('Aliya' class)

Eurocopter SA 366G Dauphin

Specifications
Role: Reconnaissance and over-the-horizon targeting
Rotor diameter: 11.93 m (39.14 ft)
Length: 11.44 m (37.5 ft)
Height: 4.07 m (13.35 ft)
Operating weight, empty: 2,300 kg (5,070 lb)
Max take-off weight: 4.050 kg (8,928 lb)
Max level speed: 140 kts (260 km/h)
Engine: 2 Avco Lycoming LTS101-750A-1 turboshafts each rated at 507 kW (680 shp)
Sensors: Unknown radar and MSIS electro-optical
Weapons: None

PROPULSION

Specifications
System: Diesel
Main machinery: 4 Bazan-built MTU 16V 956 TB91 diesels; 11.03 MW (15,000 hp)
Shafts: 4

FURTHER INFORMATION

PROGRAMME

This class has a complicated background. Originally there were four ships with a common hull, of which two were built as helicopter carriers ('Aliya' class — *Aliya* and *Geoula*) and two as FAC-Missiles ('Romat' class — *Romat* and *Keshet*). In addition, Israel shipbuilding then built a third 'Romat' class ship, named *Nirit*, using its own funds, which was eventually taken over in an unfinished state by the navy in 1989.

'ALIYAH' CLASS

The 'Aliya' class uses a lengthened Reshef (Sa'ar 4) hull and has a hangar and flight deck to enable it to operate a single Dauphin helicopter. This enables it to accommodate only two Harpoon launchers which are fitted between the hangar and the mast, and four Gabriel II missile launchers which are mounted on the foredeck, immediately in front of the bridge. The single Mk 15 Vulcan CIWS is mounted in the eyes of the ship. The helicopter is required to enable task groups of which the 'Aliya' class vessel will be the leader, to launch their Harpoon missiles at targets over the horizon, with the helicopter providing mid-course corrections.

HETZ CLASS

The two 'Romat' class ships have an identical hull to the 'Aliya' class, but without the helicopter facilities, which enables them to accommodate more weapons, including four Harpoon and six Gabriel II missiles, a 76 mm/62 gun and a Mk 15 CIWS. When *Nirit* was bought by the government, however, it was completed to a new standard, with Barak SAMs, improved electronics and a large tower mast, under the 'Nirit programme.' These improvements are now being incorporated into the original two ships in the class — *Romat* and *Keshet* — as well as into *Kidon* and *Tarshish*, which were originally built as Sa'ar 4 class vessels, being commissioned in 1973 and 1975, respectively. *Nirit's* name has been changed to *Hetz*, and all five vessels are now known as the 'Hetz' class.

It is anticipated that the remaining six vessels of the 'Reshet' (Sa'ar 4) class will be converted to Hetz class standards at a rate of one per year.

Hetz, *in harbour. Note the heavy armament and the characteristic bulky mast*

BREDA BMB 230

GENERAL SPECIFICATIONS

Country of origin: Italy
Operator: Thailand ('Ratcharit' class)
Type: FAC, Missile

Class: BREDA BMB 230

Built: 3
Active: 3

Displacement:
standard: 235 t
full load: 270 t

Dimensions
Length: 49.8 m (163.4 ft)
Beam: 7.5 m (24.6 ft)
Draught: 2.3 m (7.5 ft)

Speed: 37 kts (20 kts on two engines)
Range: 2,000 n miles (3,700 km) at 15 kts

Complement: 45 (7 officers)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Aerospatiale Exocet MM 38

There are four launchers for Aerospatiale Exocet MM 38 anti-ship missiles aft of the superstructure and forward of the rear gun mounting. They are forward-facing in crossover configuration with the forward pair facing port and the after pair facing starboard.

Specifications
Length: 5.21 m (17.08 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 22.5 n miles (42 km)
Warhead: 165 kg (365 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles.

GUNS

An OTOBREDA 76/62 Compact is installed forward of the bridge and a single OTOBREDA Bofors 40 mm L/70 at the stern.

OTOBREDA 76/62 Compact

Specifications
Gun
Calibre: 76 mm
Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 10-85 rds/min

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Racal-Thorn RDL-2

The 'Ratcharit' class has the Racal-Thorn RDL-2 ESM system, which covers the 1-18.5 GHz range. In addition to the automatic pulse analyser, it includes a frequency measurement capability.

Manufacturer/Contractor
Racal-Thorn, UK.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Signaal WM25

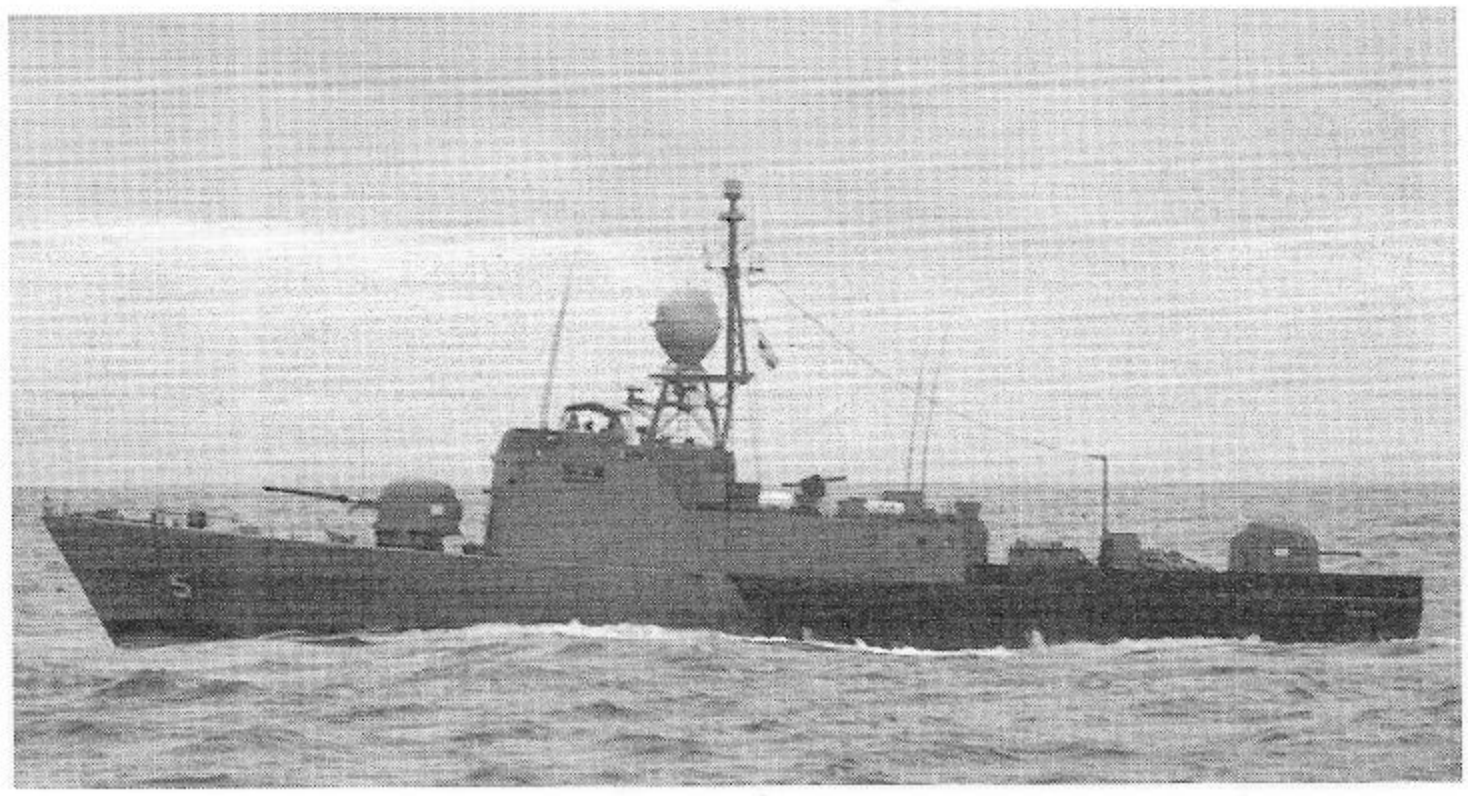
The 'Ratcharit' class has a Signaal WM25 radar-based weapon control system with a mainframe architecture, based upon the SMR mini-computer, and a two-man display and control console. It can operate against two targets simultaneously using one gun or a surface-to-surface missile.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

RADARS

Signaal WM25

Specifications
Role: Weapon control
Band: I



Witthayakhom *(322)* shown here with her old number (Royal Thai Navy)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

These have launchers for anti-ship missiles right aft and trained forward. Italian vessels carry two Matra/Alenia Otomat Mk 2 while Japanese vessels carry four Mitsubishi SSM-1B, a naval development of a land-based missile.

Otomat Mk 2

Specifications
Length: 4.46 m (14.62 ft)
Diameter: 46 cm (18 in)
Wing span: 1.36 m (4.46 ft)
Weight: 770 kg (1,697.8 lb) (with boosters)
Speed: Mach 0.9
Range: 35 n miles (65 km) (Longer ranges require helicopter support)
Warhead: 210 kg (465 lb)
Guidance: Inertial with active radar homing

Manufacturers/Contractors
Alenia Missile Systems/Matra BAe Dynamics.

Mitsubishi SSM-1B

Specifications
Length: 5.08 m (16.66 ft)
Diameter: 34 cm (13.38 in)
Wing span: n/k
Weight: 660 kg (1,455 lb)
Speed: Mach 0.9
Range: 80 n miles (150 km)
Warhead: 225 kg (496 lb)
Guidance: Inertial navigation with active radar homing

Manufacturer/Contractor
Mitsubishi Heavy Industries, Tokyo, Japan.

GUNS

Italian craft mount a single OTOBREDA 76/62 Compact gun forward, while Japanese craft have a single 20 mm Sea Vulcan 20.

OTOBREDA 76/62 Compact

Specifications
Gun
Calibre: 76 mm
Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 10-85 rds/min
Range: 8.5 n miles (16 km)

Mounting
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

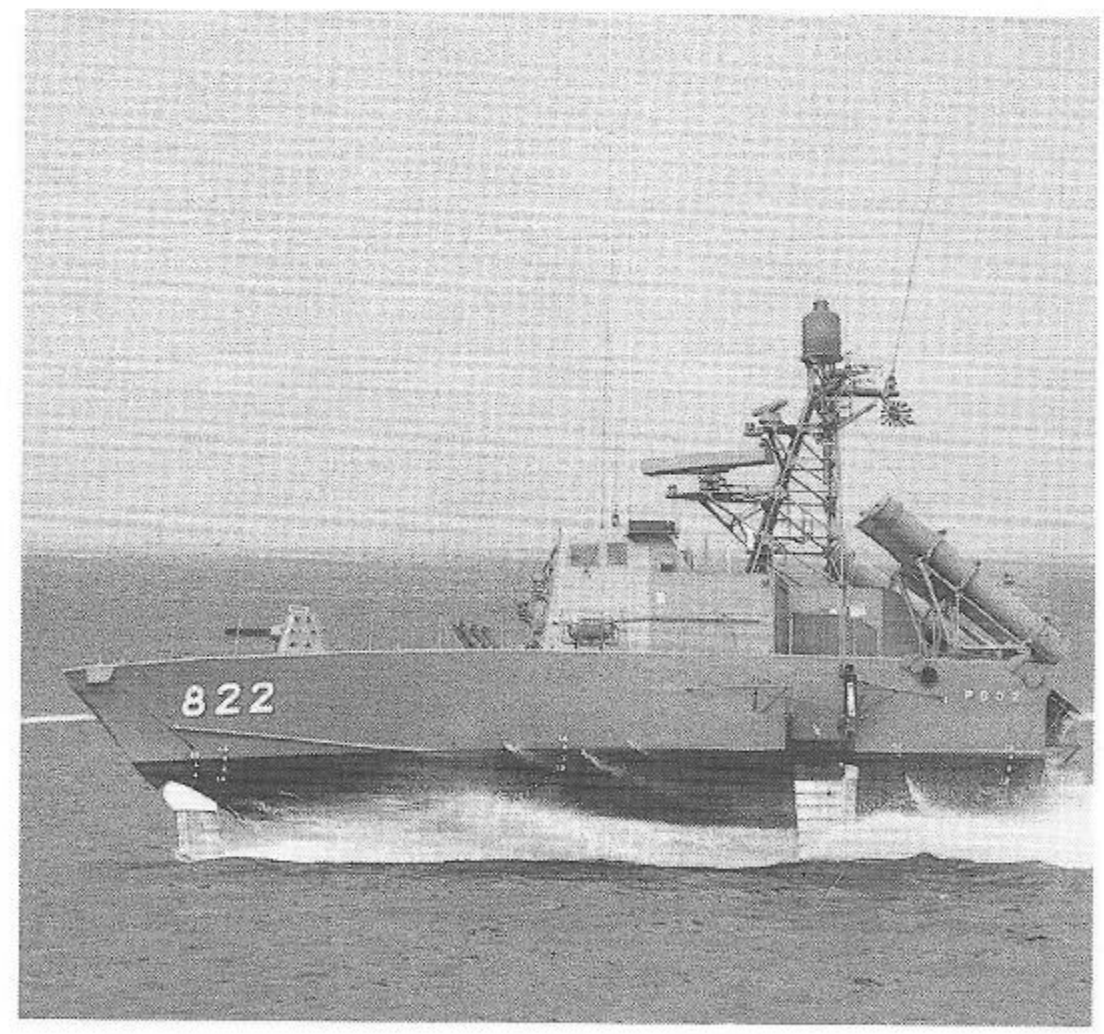
Lockheed Sea Vulcan 20

Specifications
Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,379 ft/s)
Rate of fire: 1,500 rds/min
Range: 1 n mile (2 km)

Mounting
Traverse: 360°
Elevation: −10 to +55°

Manufacturer/Contractor
Lockheed Martin, Armament Systems, USA.

Gheppio *(P 425). Note the folded hydrofoils, with the OTOBREDA 76 mm gun setting the scale for this small vessel* (Camil Busquets i Vilanova)



PG 02 *(822) of the JMSDF. Maximum speed is 48 knots and these vessels are intended for high-speed interceptions. Note the Sea Vulcan 3-barrel 20 mm on the foredeck; SRBOC chaff launchers immediately before the bridge; and the short mast with surface search and navigation radars and topped by an ESM array. Main weapons are four Mitsubishi SSM-1B mounted on the stern* (Hachiro Nakai)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Elettronica Farad ESM

Italian craft are fitted with the Elettronica Farad ESM system with warning display, direction-finding processor and pulse recognition processor.

Manufacturer/Contractor
Elettronica, Italy

DASA Telegon 4

They also have a DASA Telegon 4 high-frequency direction-finding system with egg-shaped ferrite antenna which limits it to intercepting ground waves.

Manufacturer/Contractor
DASA, Ulm, Germany.

Japan

Japanese craft have an unidentified ESM system.

COUNTERMEASURES

No information is available on Italian systems and while Japanese craft are known to carry an ECM system, no further details are available.

Loral Hycor Mk 36 SRBOC

The Japanese craft have a Mod 1 (Super Rapid Bloom Offboard Countermeasures) decoy system with two Mk 137 launchers, each with six barrels. These are 160 × 43 × 86 cm mortar systems which fire a variety of 130 mm chaff and infra-red munitions from cartridges weighing 3.8/22.7 kg (8.4/50 lb) which create chaff clouds up to 2.5 n miles (4.5 km) from the ship.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

The Italian craft have an Alenia NA 10 radar-based *weapon control system. This has an autonomous one-*man control and display console with a mini-computer and it can control up to three guns and a surface-to-surface missile. No equivalent system is believed to be in Japanese craft although they do have a Link 11 datalink.

RADARS

Italy

Type	MM/SPQ-701	Orion (RTN-10)
Maker	SMA	Alenia
Role	Search	Weapon control
Band	I	I
Beam	0.6°	n/k
Peak power	180 kW	200 kW
Gain	n/k	n/k
Pulsewidth	0.15, 1.5 µs	1.5 µs
PRF	450-550, 2,500-3,000 pps	450-550 pps
Scan rate	15 rpm	n/k

Note
In Italian Navy service the Orion RTN-10 is designated MM/SPG-70.

Japan
Japanese ships have an unidentified I-band search radar.

PROPULSION

Italy, Hullborne

Specifications
System: Diesel
Main machinery: 1 Isotta Fraschini ID 36 N6V; 213 kW (290 hp)
Shafts: 1 retractable

Foilborne

System: Gas turbine
Main machinery: 1 Rolls-Royce Proteus 15M560; 3.17 MW (4,250 hp)
Waterjet: 1

Japan, Hullborne

System: Diesel
Main machinery: 1 diesel of unknown type
Shafts: 1 retractable

Foilborne

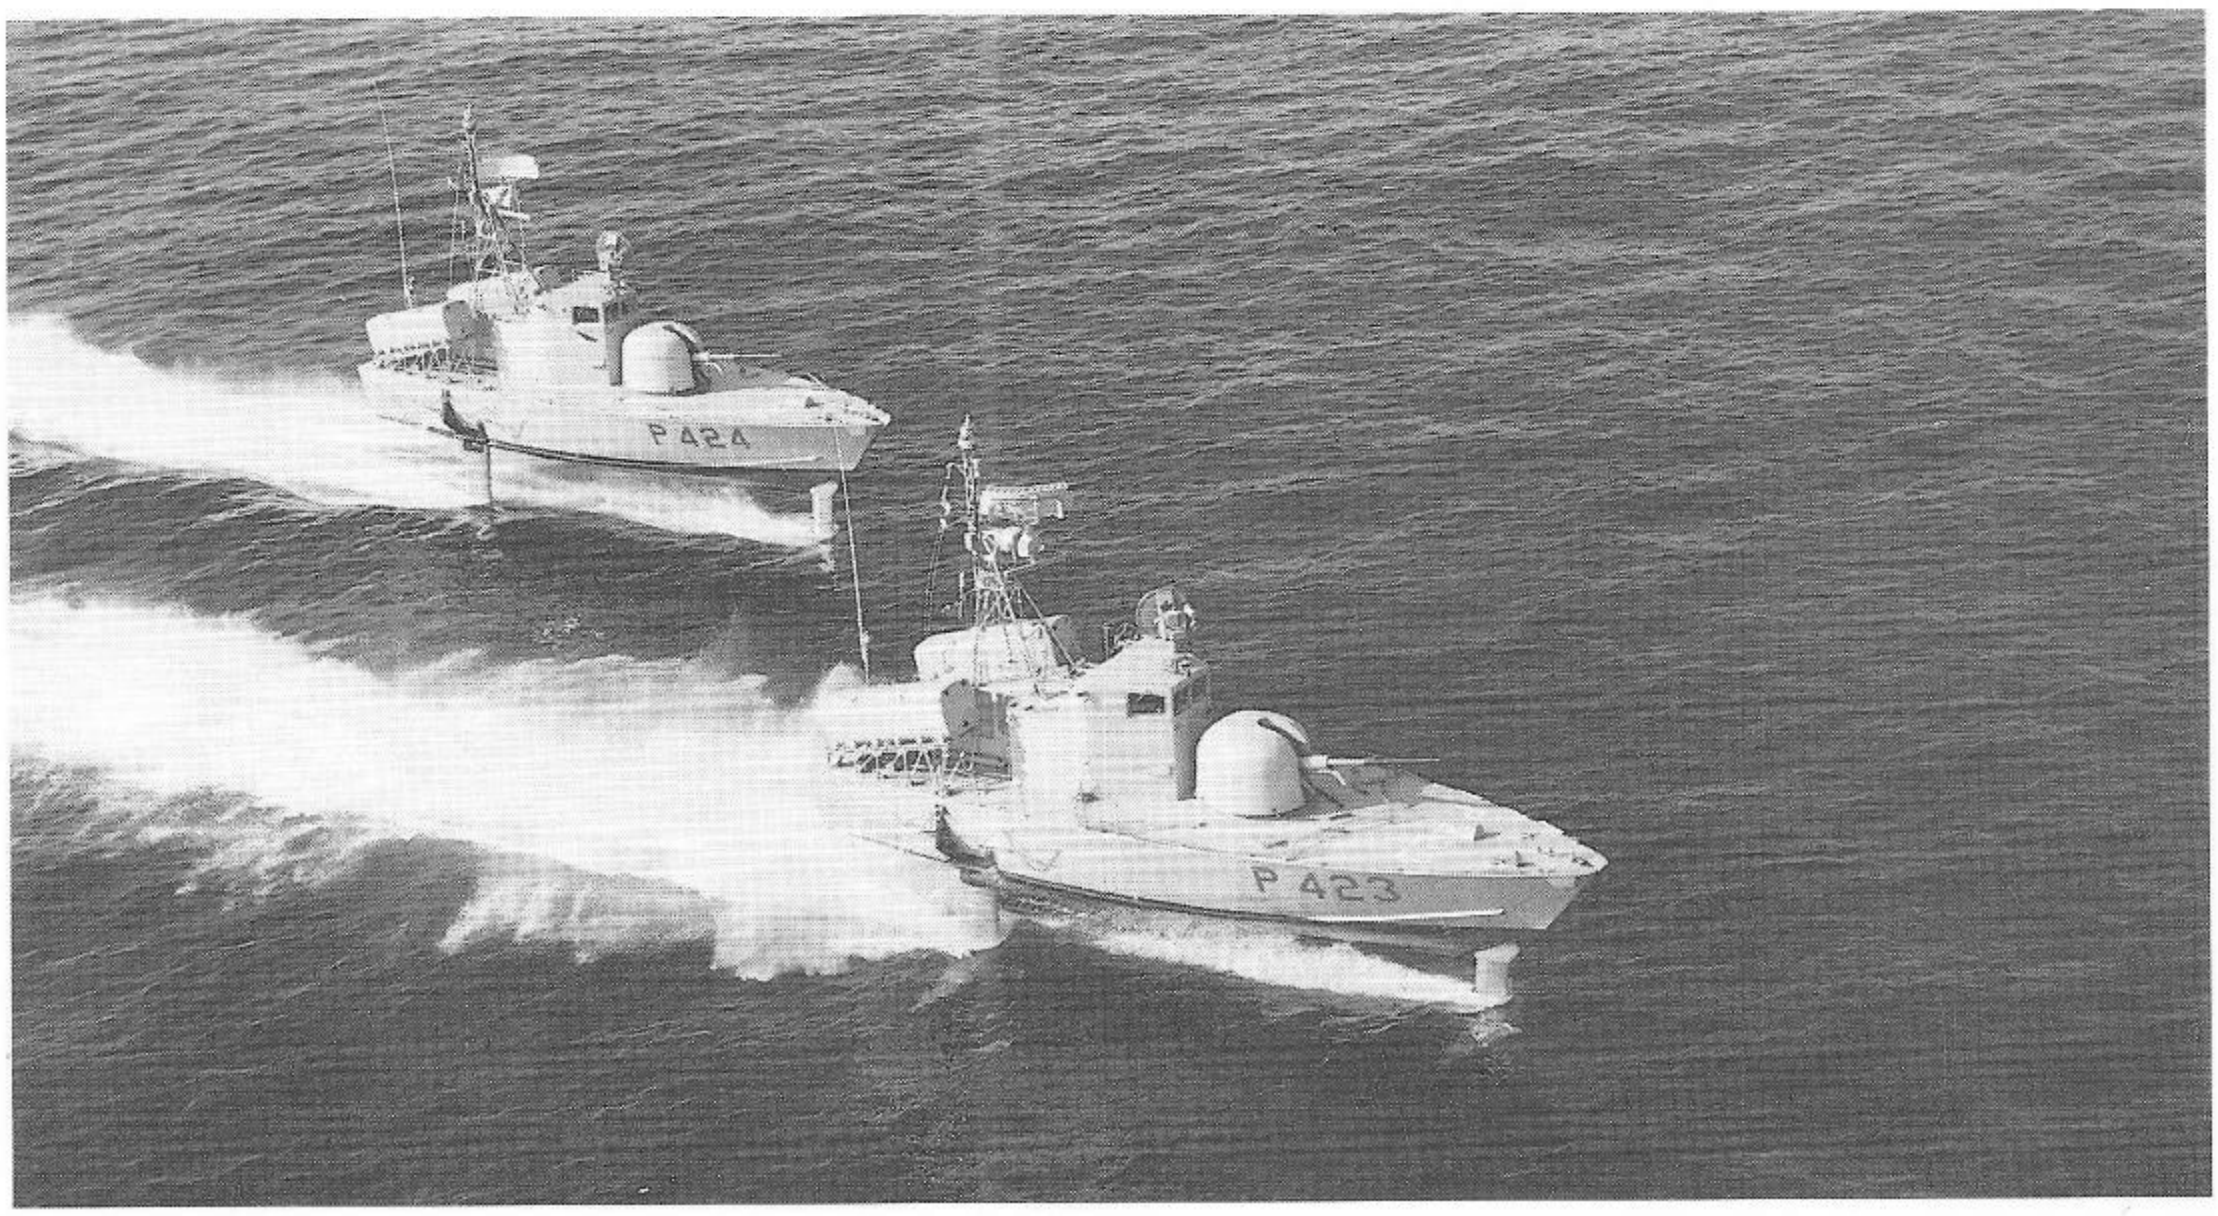
System: Gas turbine
Main machinery: 1 IHI-built GE LM 1500; 4.12 MW (5,522 hp)
Waterjet: 1

FURTHER INFORMATION

These vessels, reportedly based on the American Tucumari design, have aluminium hull and superstructure. The Italian vessels were ordered in 1977 from Fincantieri, Muggiano, Italy and commissioned between 1982 and 1984. They were originally powered by a General Motors 6V-53N diesel, but this was replaced circa 1992/1993 by the current Isotta-Fraschini engine. Plans exist to install a new gas turbine. The vessels carry 11 tonnes of fuel and have no accommodation, being designed for missions of short duration.

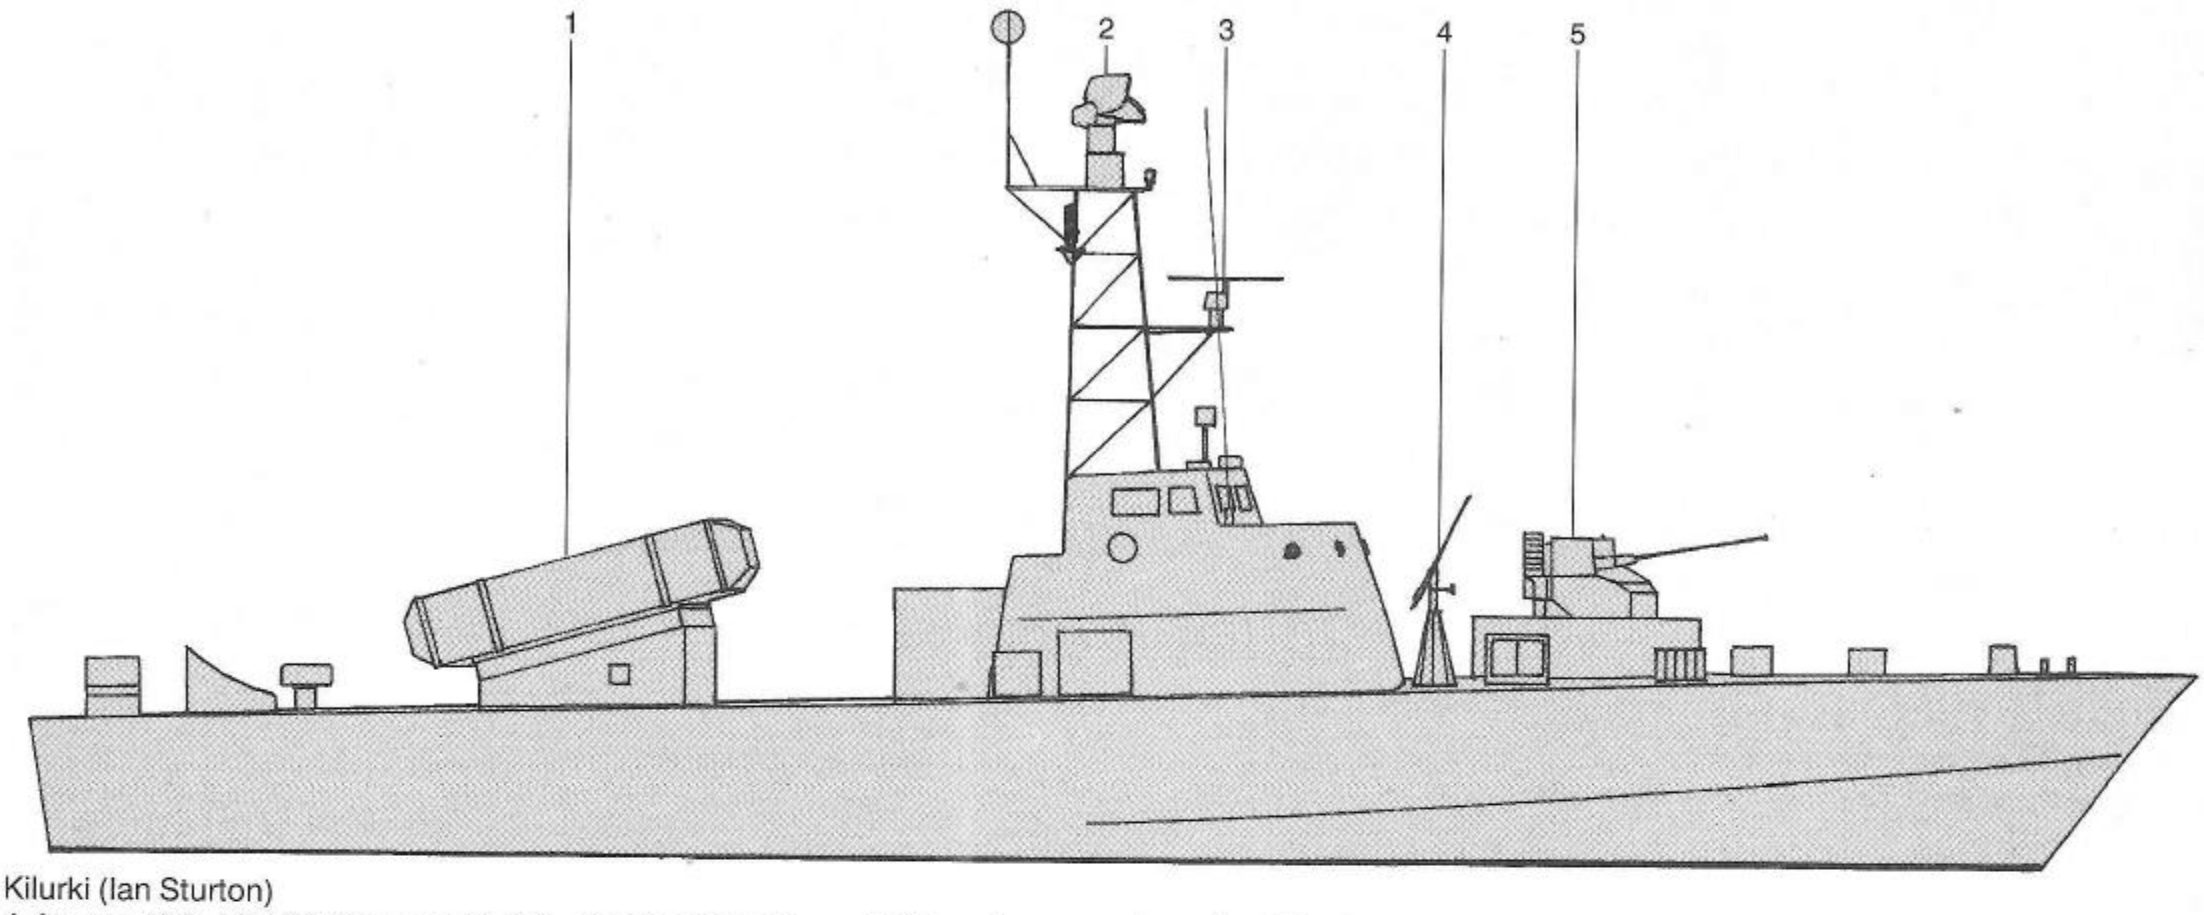
The Japanese versions, built under licence by Sumitomo of Uraga, Japan, were ordered in 1990 and commissioned between 1993 and 1995. Four were planned but only three authorised.

Hydrofoil boats are not as popular as in the early 1980s and it was somewhat surprising that the JMSDF selected the type.



Astore *and* Grifone *of the Italian Navy at speed* (Fincantieri)

KILURKI



Kilurki (Ian Sturton)
1 *Aerospatiale MM 38 Exocet anti-ship missiles* **2** *Raytheon 1645 surface search radar* **3** *Navigation radar; type unknown* **4** *M2HB 12.7 mm machine gun* **5** *USN/Bofors 40 mm/70*

GENERAL SPECIFICATIONS

Operator: Korea, Republic (South Korea)
Type: FAC, Missile

Class: KILURKI

Built: 2
Active: 2

Displacement:
standard: 120 t
full load: 140 t

Dimensions
Length: 33.9 m (108.9 ft)
Beam: 6.9 m (22.6 ft)
Draught: 2.4 m (7.9 ft)

Speed: 40 kts
Range: 800 n miles (1,480 km) at 17 kts

Complement: 29 (5 officers)

SHIPS

Completed 1972-73

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Exocet MM 38
These vessels carry two forward-pointing launchers for Aerospatiale Exocet MM 38 anti-ship missiles aft of the bridge and angled outboard.

Specifications
Length: 5.21 m (17.08 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 22.5 n miles (42 km)
Warhead: 165 kg (365 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles, Paris, France.

GUNS

Mk 3 Bofors 40 mm L/60
A single US Navy Mk 3 Bofors 40 mm L/60 is installed forward of the bridge.

Specifications
Gun
Calibre: 40 mm
Length of barrel: 56 calibres
Muzzle velocity: 881 m/s (2,890 ft/s)
Rate of fire: 60 rds/min
Range: 5.5 n miles (10 km)

Mounting
Weight: 2 t
Traverse: 360°
Elevation: −6 to +90°

M2HB 12.7 mm machine guns
Two M2HB machine guns are carried

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

The ships carry a UP-17 IFF system but nothing else is known of their electronic warfare equipment.

COMMAND AND CONTROL SYSTEMS

RADAR

Raytheon 1645

WEAPONS SYSTEMS

ANTI-SHIP MISSILES

Penguin Mk 2

These FACs have up to six forward-facing launchers for NFT Penguin Mk 2 anti-ship missiles on the after deck in outward angled pairs.

Specifications
Length: 3.0 m (9.84 ft)
Diameter: 28 cm (11.02 in)
Wing span: 1.42 m (4.65 ft)
Weight: 340 kg (750 lb)
Speed: Mach 0.8
Range: 14 n miles (27 km)
Warhead: 120 kg (264.6 lb)
Guidance: Inertial navigation with infra-red homing

Manufacturer/Contractor
NFT, Kongsberg, Norway.

SURFACE-TO-AIR MISSILES (SAM)

Mistral

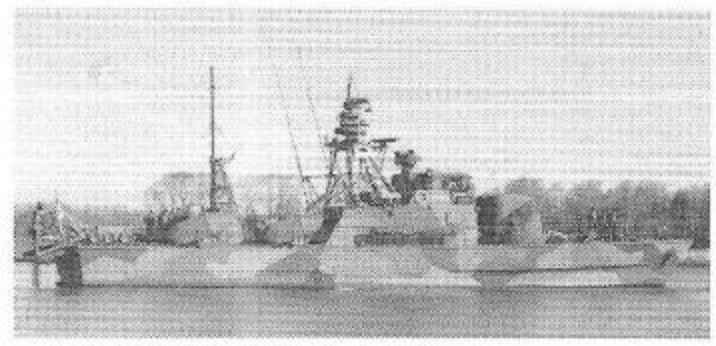
'Hauk' class (Norway) only. Since 1994 the Norwegian vessels have received the Sinbad launcher system with two Matra Mistral point defence missiles.

Specifications
Length: 1.81 m (5.9 ft)
Diameter: 9.2 cm (3.6 in)
Wing span: 11.1 cm (4.4 in)
Weight: 18.4 kg (40.5 lb)
Speed: Mach 2.6
Range: 2.7 n miles (5 km)
Warhead: 2.95 kg (6.5 lb)
Guidance: Infra-red passive homing

Manufacturer/Contractor
Matra BAe Dynamics.

TUBES

'Hauk' class (Norway) only. The Norwegian vessels have two 533 mm (21 in) torpedo tubes forward of the bridge and these fire Bofors Tp 617 torpedoes.



Snapphanen *(P 161). One of the modernised 'Kaparen' class, this has a VDS at the stern. Note also the depth charges and four Penguin anti-ship missiles* (Hartmet Ehlers)

TORPEDOES

Bofors Tp 617

Specifications
Length: 6.98 m (23.0 ft)
Diameter: 533 mm (21 in)
Weight: 1,860 kg (4,101 lb)
Propulsion: Hydrogen peroxide/alcohol
Speed: 45 kts
Range: 10.75 n miles (20 km)
Warhead: 240 kg (529 lb)
Guidance: Wire and active/passive sonar

Manufacturer/Contractor
Bofors, Sweden

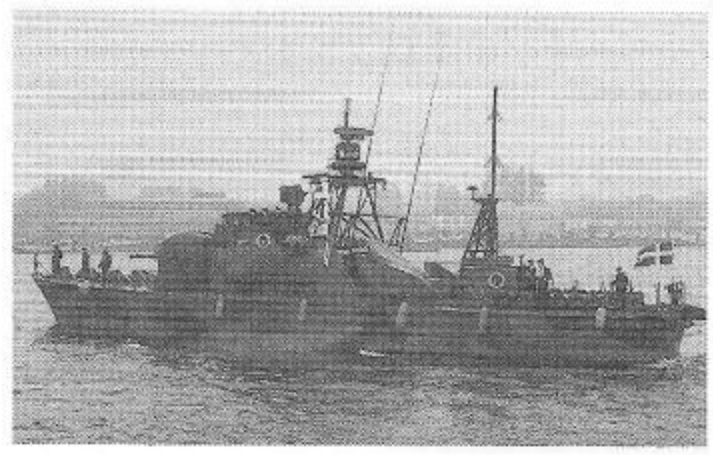
GUNS

'Hauk' class (Norway only. The Norwegian ships have a Bofors 40 mm SAK 40 L/70-350 gun forward of the bridge. They also had a Rheinmetall Rh-202 20 mm gun but this is now being replaced by the Mistral system.

'Hugin'/Kaparen' classes (Sweden) only. Swedish vessels have a Bofors single 57 mm SAK 57 Mk 1 forward of the bridge.

Bofors SAK 57 Mk 1

Specifications
Gun
Calibre: 57 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,020 m/s (3,346 ft/s)
Rate of fire: 200 rds/min
Range: 9 n miles (17 km)



Tordön *(P 165) with two Penguin launchers in the forward position and the remainder of the quarterdeck given over to mines, of which a maximum of 24 can be carried* (Dieter Wolf)

Mounting
Traverse: 360°
Elevation: −10 to +75°

Manufacturer/Contractor
Bofors Ordnance, Sweden.

Bofors SAK 40 L/70-350

Specifications
Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 300 rds/min
Range: 6.75 n miles (12.5 km)

Mounting
Traverse: 360°
Elevation: −9 to +85°

Manufacturer/Contractor
Bofors Ordnance, Sweden.

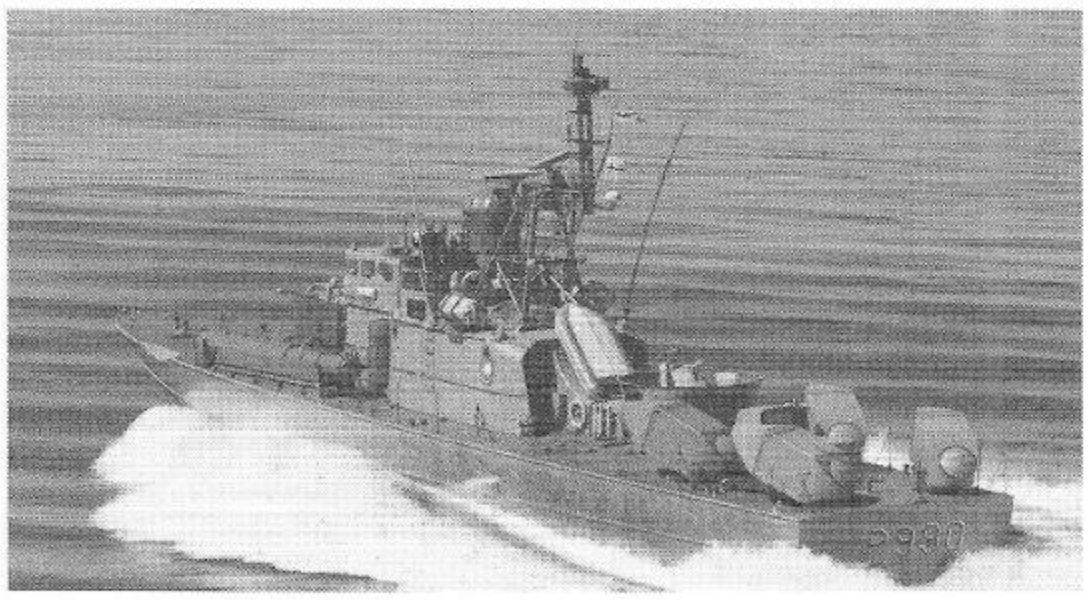
ASW WEAPONS

Saab Elma

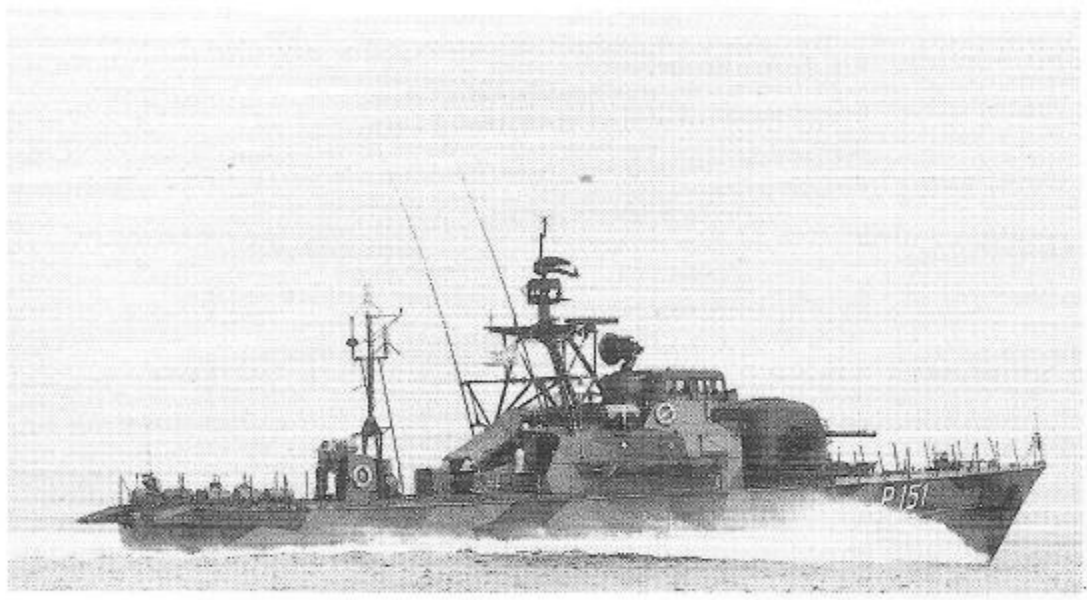
Hugin/Kaparen classes (Sweden) only. Swedish vessels have the Saab Elma ASW mortar system with four launchers.

Depth Charges

Hugin/Kaparen classes (Sweden) only. The Swedish vessels are fitted with two depth-charge racks.



Skarv *(P 990) one of 14 'Hauk' class FACs of the Royal Norwegian Navy. Note the 533 mm torpedo tube, Rheinmetall Rh-202 20 mm gun (abaft the upturned boat) and four Penguin Mk 2 anti-ship missile launchers* (Antonio Moreno)



Hugin *(P 151) one of the four unmodernised Swedish FACs. The hull is the same as the Norwegian 'Hauk' class, but the armament is different, as are the sensors. Note the depth charges being carried on the quarterdeck and the two chutes over the stern* (H & L van Ginderen Collection)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

ARGO AR-700A

'Hauk' class (Norway) only. Norwegian ships have the AR-700A receiver system which covers the C/J-bands. The wide open, monopulse, direction-finding and parallel instantaneous frequency receiver approach ensures there is no channelisation or band-stepping to degrade performance.

Manufacturer/Contractor
ARGOSystems, USA

Saab EWS-905

'Hugin/Kaparen' classes (Sweden) only. The EWS is designed to identify targets detected by the ship's radar with the antenna automatically turning in the appropriate direction. The system has surveillance, alert and decision modes with the display showing band, pulse interval/length and scan time. It automatically triggers the decoy launchers.

Manufacturer/Contractor
CelsiusTech, Sweden.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

NFT MSI-80S tactical system

'Hauk' class (Norway) only. For weapon control, Norwegian vessels have an NFT MSI-80S electro-optical weapon control system. This is a mainframe architecture system based upon the KS500 mini-computer with a console which has tactical situation (with radar input from the twin 1226 radars), electro-optical sensor and weapon control displays. The system also has a torpedo control panel.

Manufacturer/Contractor
NFT, Kongsberg, Norway.

CelsiusTech 9LV 200 Mk 2 (Sweden)

'Hugin/Kaparen' classes (Sweden) only. The 9LV 200 Mk 2 is a radar-based weapon control system of mainframe architecture using the Phillips P800 minicomputer for the control of one medium and one light calibre gun mounting as well as surface-to-surface missiles. There is a tactical display system and two gun control displays, for ASuW and AAW operations.

Manufacturer/Contractor
CelsiusTech, Sweden.

RADARS

Racal-Decca TM 1226 (two sets)

'Hauk' class (Norway) only.

Specifications
TM 1226 (2)
Role: Search
Frequency: I-band
Beam: 1.2°
Peak power: 25 kW
Pulse rate: 0.05, 0.25, 1.0 µs
PRF: 1,300 pps
Scan rate: 25 rpm
Typical range: 20 n miles (37 km)

Manufacturer/Contractor
Racal Decca.

Ørn (P 987). Note the twin 1226 radar antennas which are part of the MSI-80S tactical command system
(H & L van Ginderen Collection)

'Hugin/Kaparen' classes (Sweden) only.

Type	Skanter 16	9GR600
Maker	Terma	CelsiusTech
Role	Search	Weapon control
Frequency	I-band	I-band
Beam	1°	1.1, 7°
Peak power	20 kW	200 kW
Gain	n/k	35.5 dB
Pulsewidth	0.06, 0.6 µs	0.25, 1 µs
PRF	2,200, 4,400 pps	1,000, 3,000 pps
Scan rate	20-48 rpm	60 rpm
Typical range	n/k	n/k

SONARS

Simrad SQ-3D/SF

Norwegian vessels have a hull-mounted SQ-3D/SF sonar system, which operates at 24 kHz with a peak power of 4 kW and performs automatic search in azimuth of 360° and in elevation of 90° with a range of 1.5 n miles (2.5 km).

Simrad SA 950/ST 570 Toadfish

The Swedish 'Kaparen' class has a Simrad SA 950 hull-mounted and a Simrad ST 570 Toadfish variable depth sonar. The SA 950 is a mine detection/avoidance sonar operating at 95 kHz with beams covering 45° in azimuth, the antenna being trainable (±190°) and tiltable (−90 to +10°). The Toadfish is a lightweight active sonar operating at 57 kHz and creating 64 digitally formed beams with a range of 6.5 n miles (12 km).

ELECTRO-OPTIC SENSORS

Norway

The MSI-80S includes a director with low-light television, infra-red, optical, and a 5 MW Nd:YAG laser-rangefinder sensor collimated to the TV camera which has a 2.8° field of view.

Manufacturer/Contractor
NFT, Kongsberg, Norway.

PROPULSION

'Hauk' class (Norway).

Specifications
System: Diesel
Main machinery: 2 MTU 16V 538 TB92; 5 MW (6,820 hp)
Shafts: 2

'Hugin/Kaparen' class (Sweden).

Specifications
System: Diesel
Main machinery:
'Kaparen' class: 2 MTU 16V 396 TB94; 4.26 MW (5,800 hp)
'Hugin' class: 2 MTU 20V 672 TY90; 4.26 MW (5,800 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

Ordered for the Norwegian Navy in 1975, this class was built by Bergens Mek Verksteder (10 vessels) and Westamarin A/S, Alta (the former Westermoens Baatbyggeri).

In 1971, a prototype FAC similar to the 'Hauk' class was ordered from Bergens MV for Sweden as the Jägaren. Following extensive trials, a slightly modified version was ordered in 1975 as the 'Hugin' class, being built largely at Bergens MV (except for *Mode* and *Vidar*, which were built at Westamarin) and they were commissioned between 1978 and 1982.

DESIGN

The hull of the 'Hugin' class is made of welded steel, with GRP superstructure, and divided into nine watertight compartments. The engines were originally installed in the 'Plejad' class FACs (as Daimler Benz Type 518) but were reconditioned before installation in the new ships. Electrical power is provided by two Hitzinger 100 kVA generators.

The SAK 57 includes mounting rails for eight 103 mm illuminant rockets. Swedish vessels also have two racks of depth charges and mine rails for 24 mines, which may be installed instead of missile launchers.

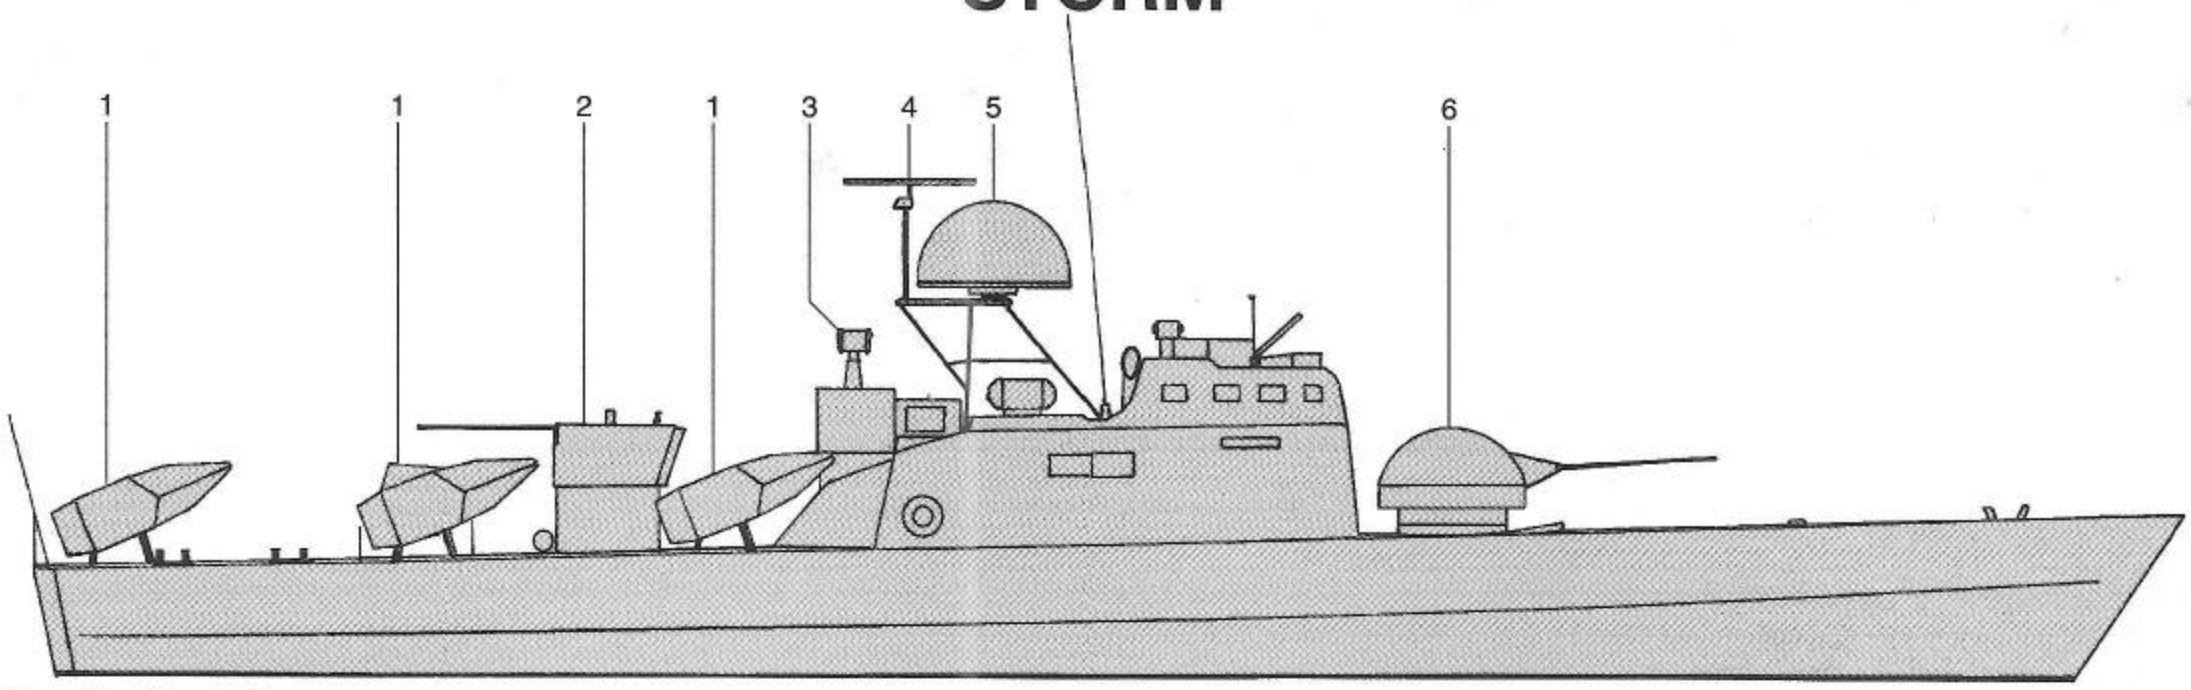
Orignially the Swedish craft were treated as one ('Hugin') class, but between 1991 and 1994 P159-P166 received half-life modernisation, which included new MTU 16V 396 TB94 engines, giving them improved loiter capacity, and the replacement of SQ-3D/SF sonars. As a result, these FACs are now known as the 'Kaparen' class.

RESERVE

Four of the Swedish boats were laid up in reserve in July 1994:

Magne (P 153)
Vale (P 155)
Mjölner (P 157)
Mysing (P 158)

STORM



Storm (Ian Sturton)
1 *Penguin Mk 1 anti-ship missile (total six)* **2** *Bofors SAK 40L/70-350 40 mm gun (in open mount)* **3** *Saab TVT-300 electro-optical tracker* **4** *Racal-Decca TM 1226 navigation radar* **5** *Nera SR-1A ESM* **6** *Bofors TAK 76 76 mm/50 automatic gun*

GENERAL SPECIFICATIONS

Operator: Norway
Type: FAC, Missile

Class: STORM

Built: 20
Active: 8

Displacement:
standard: 100 t
full load: 138 t

Dimensions
Length: 36.5 m (120 ft)
Beam: 6.2 m (20.3 ft)
Draught: 1.8 m (5.9 ft)

Speed: 32 kts
Range: 550 n miles (1,020 km) at 32 kts

Complement: 22 (6 officers)

SHIPS

BLINK (P 961)
Builder Bergens Mek Verksteder, Norway
Commissioned 18 Dec 1965

KJEKK (P 965)
Builder Bergens Mek Verksteder, Norway

Builder Bergens Mek Verksteder, Norway
Commissioned 1967

GNIST (P 979)
Builder Berkens Mek Verksteder, Norway
Commissioned 1968

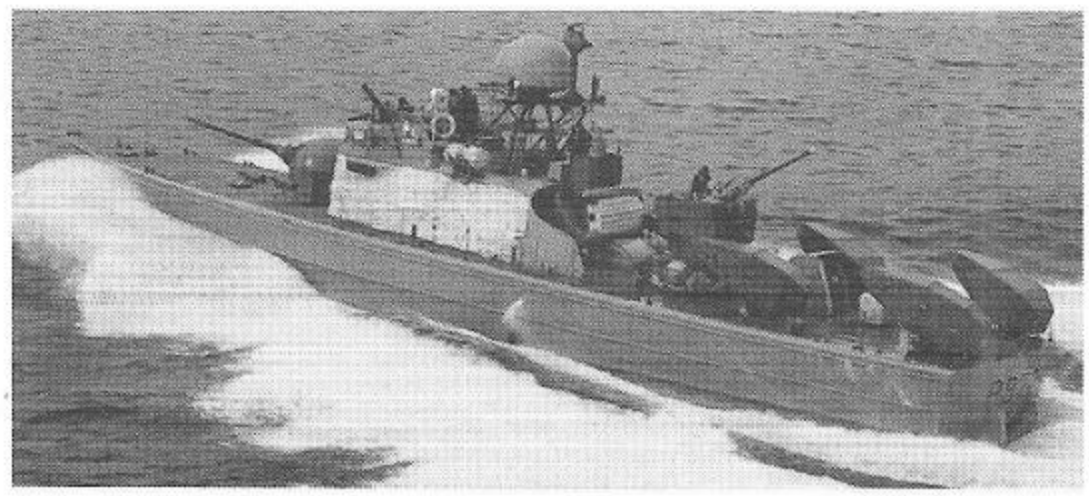
WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

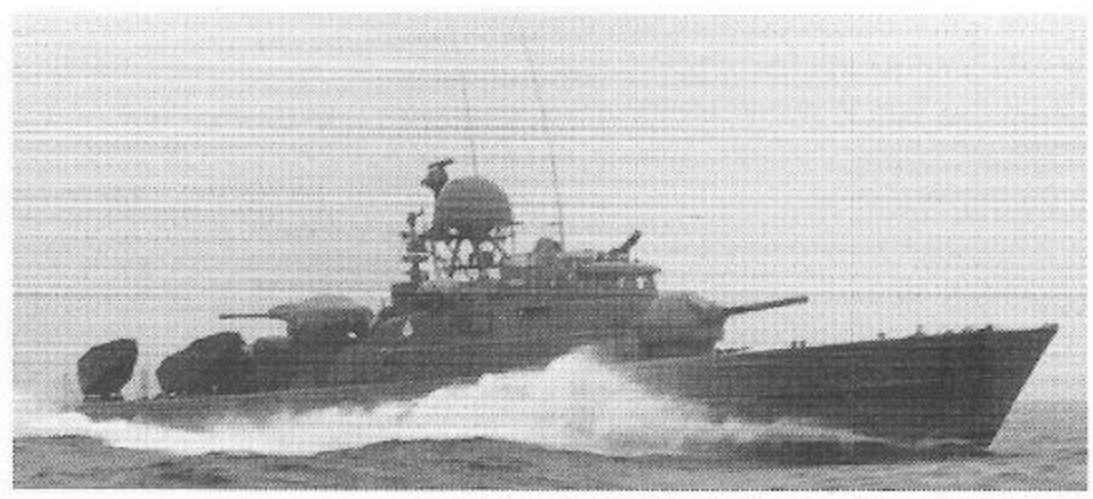
Penguin Mk 1

The 'Storm' class carries up to six NFT Penguin Mk 1 anti-ship missiles with the launchers facing forward, but angled outboard, in pairs on the afterdeck.

Specifications
Length: 3.0 m (9.84 ft)
Diameter: 28 cm (11.02 in)
Wing span: 1.42 m (4.65 ft)
Weight: 330 kg (727.6 lb)
Speed: Mach 0.7
Range: 10 n miles (18.5 km)
Warhead: 120 kg (264.6 lb)
Guidance: Inertial navigation with infra-red homing



Hvass *(P 972). Note the four Penguin anti-ship missiles on the afterdeck — a further two can be mounted abreast the gun.* (Jane's/David Miller)



Steil *(P 969) at speed. The Bofors TAK 76 on the foredeck has a maximum elevation of +30°, limiting it to anti-surface engagements.*

Manufacturer/Contractor
NFT, Kongsberg, Norway.

GUNS

A Bofors TAK 76 single 76 mm gun is installed forward of the bridge and a Bofors 40 mm SAK 40 L/70-350 aft of the superstructure. Note that since the maximum elevation of the TAK 76 is +30°, it has no air defence capability.

Bofors TAK 76

Specifications
Gun
Calibre: 76 mm
Length of barrel: 50 calibres
Muzzle velocity: 825 m/s (2,706 ft/s)
Rate of fire: 30 rds/min
Range: 6.8 n miles (12.5 km)

Mounting
Traverse: 350°
Elevation: −10 to +30°

Manufacturer/Contractor
Bofors Ordnance, Sweden.

Bofors SAK 40 L/70-350

Specifications
Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 300 rds/min
Range: 6.75 n miles (12.5 km)

Mounting
Traverse: 360°
Elevation: −9 to +85°

Manufacturer/Contractor
Bofors Ordnance, Sweden.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Nera SR-1A

These ships carry the Nera SR-1A radar-intercept receiver with rotating antenna (rotating at up to 5,000 rpm) and fixed octagonal horn array. The system covers the E/J-bands (2.5-18 GHz) with a bearing accuracy of 3.5° and 22.5° per antenna group. (Nera A/S no longer manufactures defence equipment).

COMMAND AND CONTROL SYSTEMS

Signaal WM26

The 'Storm' class has a Signaal WM26 radar-based weapon control system. This has a mainframe architecture based upon the SMR mini-computer with a two-man display and control console. It can operate against one target using either a gun or a surface-to-surface missile. It is the only one in the 'WM' series not to use the Signaal 'egg'.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

RADARS

Type	TM 1226	WM26
Maker	Racal-Decca	Signaal
Role	Search	Weapon control
Band	I	I
Beam	1.2°	1.5, 7, 2.4°
Peak power	25 kW	180 kW
Gain	n/k	33.5 dB
Pulsewidth	0.05, 0.25, 1.0 µs	0.22, 0.45 µs
PRF	1,300 pps	1,800,3,600 pps
Scan rate	25 rpm	60 rpm
Typical range	20 n miles (37 km)	15 n miles (28 km)

ELECTRO-OPTIC SENSORS

Saab Dynamics TVT-300

A Saab Dynamics TVT-300 electro-optical tracker is carried aft of the main mast.

Specifications
TVT-300
Weight: 160 kg (353 lb)
Elevation: −30 to +85°
Sensors: TV camera

Manufacturer/Contractor
CelsiusTech, Sweden.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU MB 16V 538 TB90; 4.41 MW (6,000 hp)
Shafts: 2

FURTHER INFORMATION

This class was originally designed as Motor Gun Boats, with the prototype, *Storm*, being completed in 1963. The remainder were built between 1965 and 1968 and received missile systems from 1970 onwards when they also received the TVT 300 and laser rangefinder electro-optical systems, while TM 1226 radar replaced the TM 909. In addition to the weapons mentioned above, two depth charge rails may be fitted in place of the after missile launchers. Three disarmed vessels were transferred to Estonia, Latvia and Lithuania as patrol boats in 1994.

KOMAR (PROJECT 183R)/SHANTOU/SOHUNG

GENERAL SPECIFICATIONS

Country of origin: Russia
Operators: North Korea ('Komar', 'Shantou', 'Sohung'), Syria ('Komar')

Type: FAC, Torpedo ('Shantou'); FAC, Missile ('Komar'/'Sohung')

Class: KOMAR (PROJECT 183R)/SHANTOU/SOHUNG

Built: 702 ('Shantou'), 152 ('Komar'), 6 ('Sohung')

SHIPS

North Korea: Hull numbers not known
Syria: 44, 45, 46

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Korean 'Komar'/'Sohung' class vessels have two launchers beside the rear of the superstructure and these have either Russian SS-N-2a 'Styx' or its Chinese derivative CSS-N-1.

SS-N-2a 'Styx'

Specifications
Length: 5.8 m (19 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.9 ft)
Weight: 2,870 kg (6,328 lb) (with booster)
Speed: Mach 0.9
Range: 24 n miles (45 km)
Warhead: 454 kg (1,001 lb)
Guidance: Autopilot with active radar

Manufacturer/Contractor
Raduga, Russia.

SY-1 (CSS-N-1 'Scrubbrush')

Specifications
Length: 5.8 m (19 ft)
Diameter: 76 cm (30 ins)
Wing span: 2.4 m (7.8 ft)
Weight: 2,300 kg (5,071 lb) excluding 570 kg (1,257 lb) boosters
Speed: Mach 0.9
Range: 21.5 n miles (40 km)
Warhead: 454 kg (1,001 lb)
Guidance: Autopilot and active radar

TUBES

The 'Shantou' class carries two 533 mm (21 in) torpedo tubes with torpedoes of unknown type.

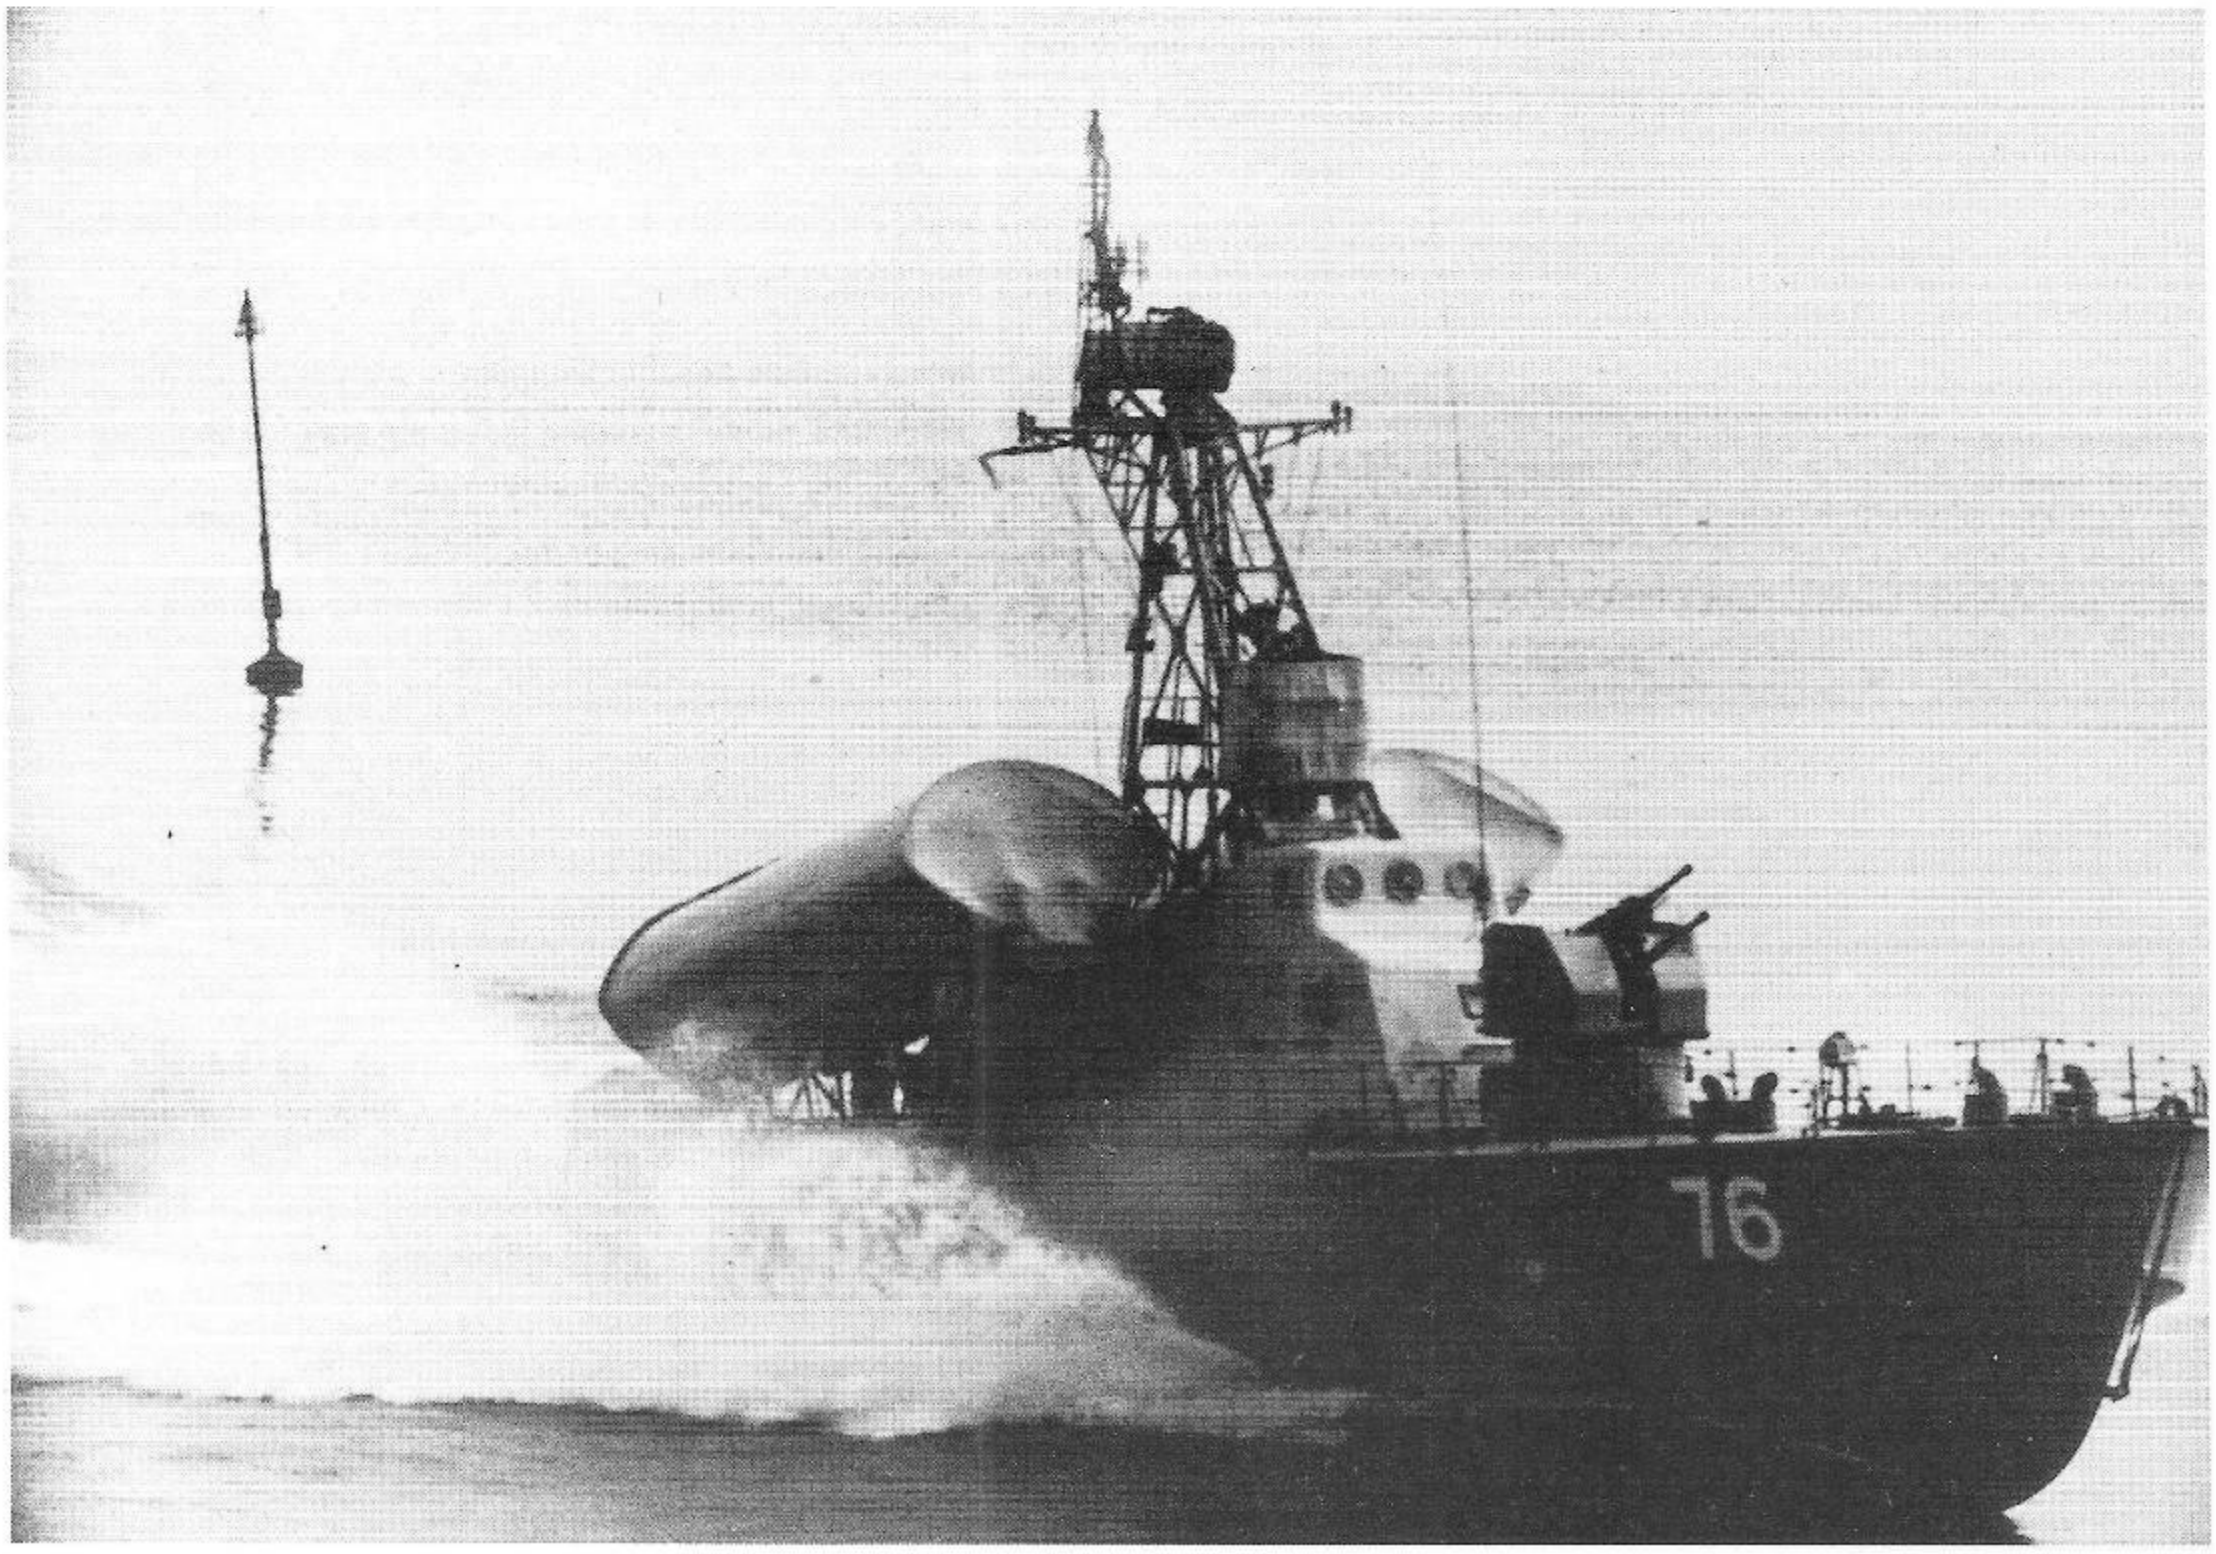
GUNS

The 'Shantou' class has gun mountings forward of the bridge and at the stern. These mountings consist of 2-M-3 twin 25 mm or 70K single 37 mm. The 'Komar'/'Sohung' class carries a 2-M-3 twin 25 mm gun mounted forward of the bridge.

70K

Specifications
Gun
Calibre: 37 mm
Length of barrel: 62.8 calibres
Muzzle velocity: 880 m/s (2,887 ft/s)
Rate of fire: 80 rds/min
Range: 2.2 n miles (4 km)

Mounting
Weight: 1.75 t
Traverse: 360°
Elevation: −10 to +85°



A Russian-built 'Komar' class FAC-M, with the relatively small boat totally dominated by the two launcher-containers for SS-N-2a Styx missiles (US Navy)

2-M-3

Gun
Calibre: 25 mm
Length of barrel: 60 calibres

Muzzle velocity: n/k
Rate of fire: 450 rds/min/barrel
Range:
anti-surface: 1.5 n miles (2.75 km)
anti-air: 2,800 m (9,180 ft)

Mounting
Weight: 1.7 t (loaded)
Traverse: 360°
Elevation: −10 to +85°

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Apart from the use of 'Square Head' IFF by the 'Komar'/'Sohung' classes nothing is known of the electronic warfare systems in these vessels.

COMMAND AND CONTROL SYSTEMS

RADARS

Skin Head — 'Shantou'

Specifications
Role: Surface search/fire control
Frequency: F-band
Beam: 17°

Peak power: 80 kW
Pulsewidth: 1 µs
PRF: 400 pps
Typical range: 17 n miles (31.5 km)

Note
This radar has the Russian designation Zarnista.

Square Tie — 'Komar'/'Sohung'

Specifications
Role: Search
Frequency: I-band
Peak power: 20 kW
PRF: 1,000, 2,000, 4,000 pps
Scan rate: 5, 15 rpm
Typical range: 25 n miles (46 km)

PROPULSION

Specifications
System: Diesel
Main machinery: 4 Type M 50; 3.3 MW (4,400 hp)
Shafts: 4

FURTHER INFORMATION

The steel-framed, wooden hard-chine hull, Project 183 Motor Torpedo Boat was designed by a design bureau run by the secret police (NKVD) and built between 1952 and 1960. They were known in the West as 'P6' (although some were also designated 'P8' and 'P10') and proved very successful, with some 190 (30 per cent) being transferred later by the Soviet Union to its (then) allies and friends. Some of the North Korean vessels have hydrofoils. The 'Shantou' (or 'Swatow') was a steel-hulled version built in China between 1956 and 1966, of which 20 were transferred to allies and friendly nations.

With the development of the P15 (SS-N-2A 'Styx') anti-ship missile and pending the introduction of the 'Osa' class (Project 205) the design was adapted for missiles as Project 183R. They were built from December 1959 and December 1965 and received the NATO designation 'Komar'. It is reported that 77 (68 per cent) were transferred to allied or friendly navies with the Korean 'Komars' transferred from the Soviet Union and later given steel hulls to replace their wooden ones. China built 40 'Komar' class then the 'Hegu' class. The 'Sohung' class is a copy of the 'Komar' class built from 1980/1981 although it is unclear whether or not they have wooden or steel hulls. The Syrian vessels were laid up between 1987 and 1990, but were then refitted and returned to service.

In addition to the FACs, 60 'MO-VI' (Project 199) patrol boats using the Project 183 hull were also produced.

Only some 37 remain in service, plus the Egyptian-developed '6 October' class; see separate entry.

An Egyptian 'Komar' class boat launched an SS-N-2a missile attack on 21 October 1967 from inside the breakwater of Port Said. Three of the missiles hit the Israeli destroyer *Elath* (ex-British *Zealous*) with heavy loss of life; the first time a ship-launched missile sank a major warship.

TABLE I: PARTICULARS

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

SS-N-2C

The 'Matka' class carries two forward-facing launchers for SS-N-2c/d 'Styx' anti-ship missiles on either side of the after superstructure. The Russian designation for SS-N-2c is P-21 Rubezh and for SS-N-2d it is P-22 Rubezh.

SS-N-2c 'Styx'

Specifications
Length: 6.55 m (21.5 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.9 ft)
Weight: 3,070 kg (6,769 lb) (with booster)
Speed: Mach 0.9
Range: 46 n miles (5/85 km)
Warhead: 454 kg (1,001 lb)
Guidance: Autopilot with active radar

Manufacturer/Contractor
Raduga, Russia.

SS-N-2d 'Styx'

Specifications
Length: 6.55 m (21.5 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.9 ft)
Weight: 3,170 kg (6,990 lb) (with booster)
Speed: Mach 0.9
Range: 54 n miles (100 km)
Warhead: 454 kg (1,001 lb)
Guidance: Autopilot with active radar

Manufacturer/Contractor
Raduga, Russia.

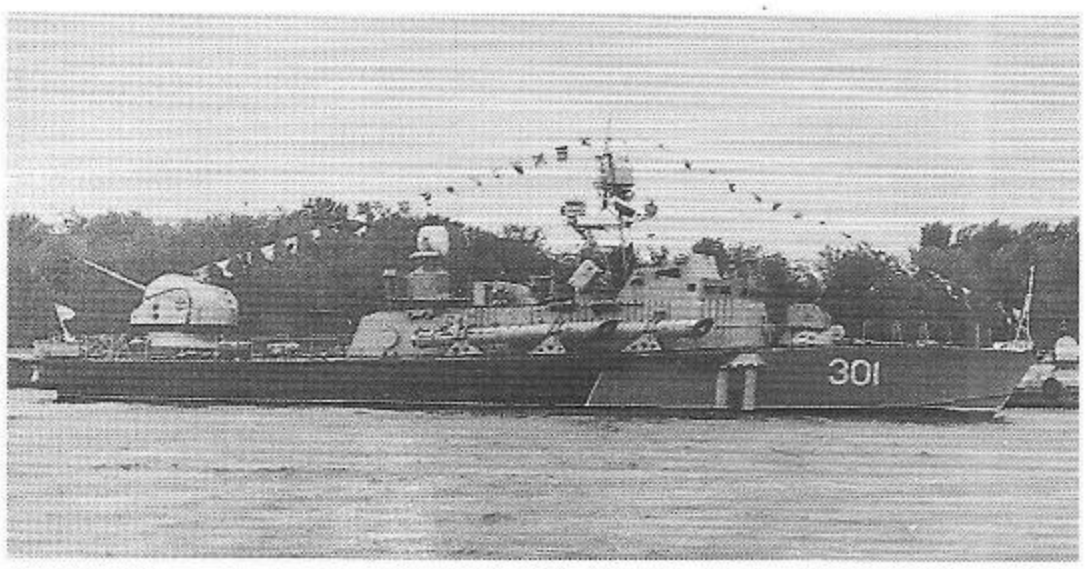
SURFACE-TO-AIR MISSILES (SAM)

SA-N-5

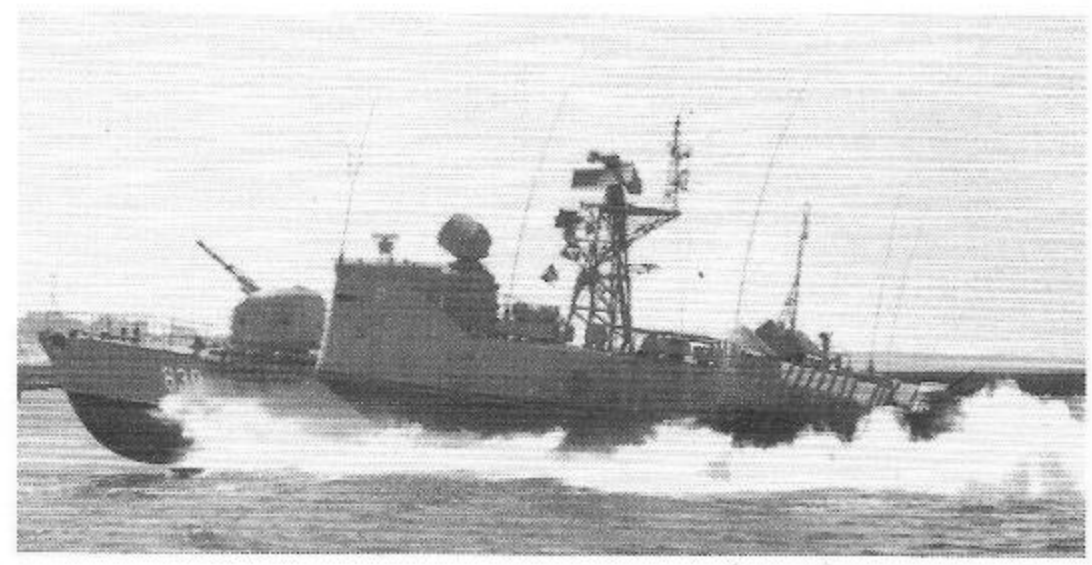
Vietnamese 'Shershen' class and some 'Matka' class vessels carry a quad launcher for SA-N-5 'Grail' point defence missiles. Cuban 'Turya' class ships carry man-portable SA-N-5 'Grail' surface-to-air missiles.

SA-N-5 'Grail' (Russian designation Strela 2)

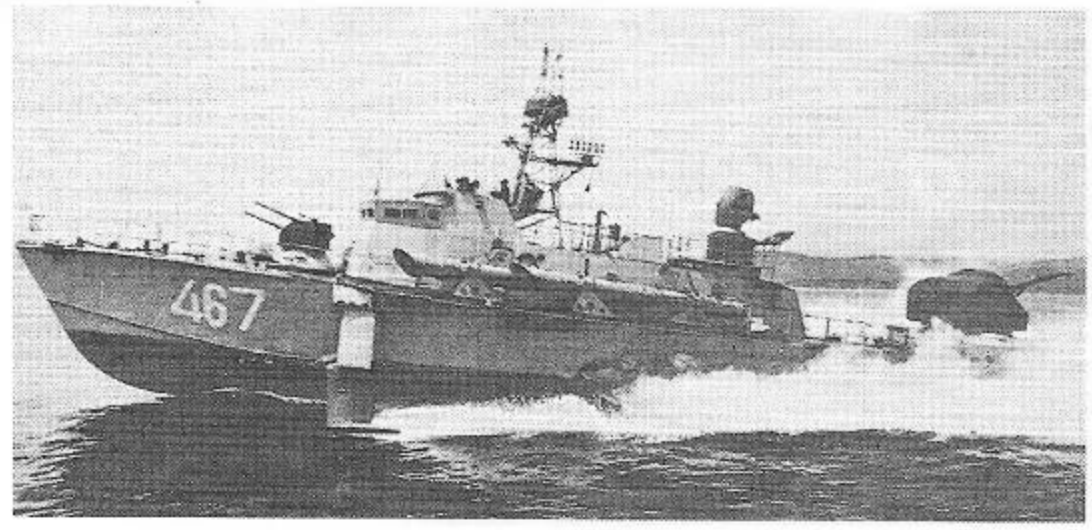
Specifications
Length: 1.45 m (3.2 ft)
Diameter: 7 cm (2.75 in)
Wing span: n/k
Weight: 9.97 kg (22 lb)
Speed: Mach 1.7
Range: 2.6 n miles (5.5 km)



'Turya' class. Note torpedo tubes and 57 mm gun aft (B Lemachko)



'Matka' missile launcher caps are open (Hartmut Ehlers)



'Turya' class (Type 206M) patrol boat. Note the use of hydrofoils (Almaz)

'Turya' class, without torpedo tubes

Warhead: 1.1 kg (2.4 lb)
Guidance: Infra-red passive homing

Manufacturer/Contractor
Fakel, Russia.

TUBES

'Shershen' class. Four 533 mm tubes for SAET-60 torpedoes.
'Turya' class. Some 'Turya' class for export (Cuba, Vietnam) carry four 533 mm (21 in) torpedo tubes with SAET-65E torpedoes while others have four 40 cm (16 in) torpedo tubes but the model of torpedo is unknown.

TORPEDOES

SAET-65E

Specifications
Length: 7.8 m (25.6 ft)
Diameter: 533 mm (21 in)
Weight: 1,700 kg (3,748.5 lb)
Propulsion: Electric
Speed: 35 kts
Range: 10.75 n miles (20 km)
Warhead: 372 kg (820 lb)
Guidance: Passive sonar

SAET-60

Specifications
Length: 7.8 m (25.6 ft)
Diameter: 533 mm (21 in)
Weight: 1,600 kg (3,528 lb)
Propulsion: Electric
Speed: 40 kts
Range: 8.1 n miles (15 km)
Warhead: 400 kg (882 lb)
Guidance: Passive sonar

GUNS

'Shershen' class. Two AK-230 twin 30 mm gun mountings: one is forward of the bridge, the other at the stern.

'Turya' class. One ZIF-72 twin 57 mm at the stern; one 2-M-3 twin 25 mm mounting forward of the bridge.
'Matka' class. One AK-176 single 76 mm gun forward of the bridge; one AK-630 close-in weapon system at the stern.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

'Shershen' class
This class has 'High Pole' and 'Square Head' IFF system but nothing is known of other electronic warfare systems.

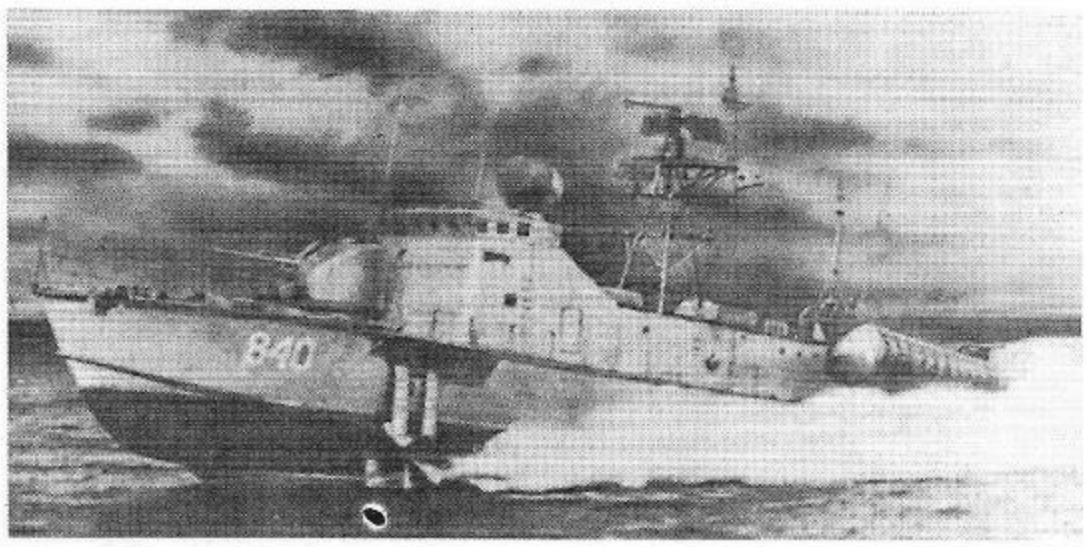
'Turya' class
These ships have 'Bell Nip' (Kursk) short-range J/K-band deception jammer with two radomes each with an omni-receiver which feeds a frequency memory loop which the antenna uses to transmit the deception signals. Russian vessels have 'Brick Plug' ESM systems while all carry 'High Pole B' and 'Square Head' IFF systems.

'Matka' class
This class has 'Clay Brick' ESM system, of which no details are available, and an IFF system which is 'High Pole B', 'Salt Pot B' or 'Square Head'.

ELECTRONIC COUNTERMEASURES (ECM)

'Shershen' and 'Turya' classes
Not known.

'Matka'
Two PK-16 decoy launchers are fitted.



Cuban 'Turya'

A 'Matka' class patrol hydrofoil (Almaz)

COMMAND AND CONTROL SYSTEMS

The 'Shershen' class has the OTA-53-206 torpedo fire-control system based upon radar, but no further details are available.

RADARS

'Shershen'

Type	'Pot Head'	'Drum Tilt'

Note
'Bass Tilt' has the Russian designation MR 123 Vympel, 'Drum Tilt' is MR 104 Rys, 'Plank Shave' is Garpun, 'Muff Cob' is MR 103 Bars, 'Pot Drum' is MR 102 Reya.
'Pot Drum' and 'Muff Cob' are used in Cambodian, Cuban, Russian and Vietnamese 'Turya' class ships.

SONAR

A 'Foal Tail' high-frequency, variable depth sonar is used in Russian 'Turya' class vessels and also in some Cuban and Vietnamese ones.

ELECTRO-OPTIC SENSORS

Two 'Hood Wink' electro-optical directors are fitted in the 'Matka' class.

PROPULSION

'Shershen'

Specifications
System: Diesel

Specifications
System: Diesel
Main machinery: 3 Type M 504 7.94 MW (10,800 hp)
Shafts: 3

FURTHER INFORMATION

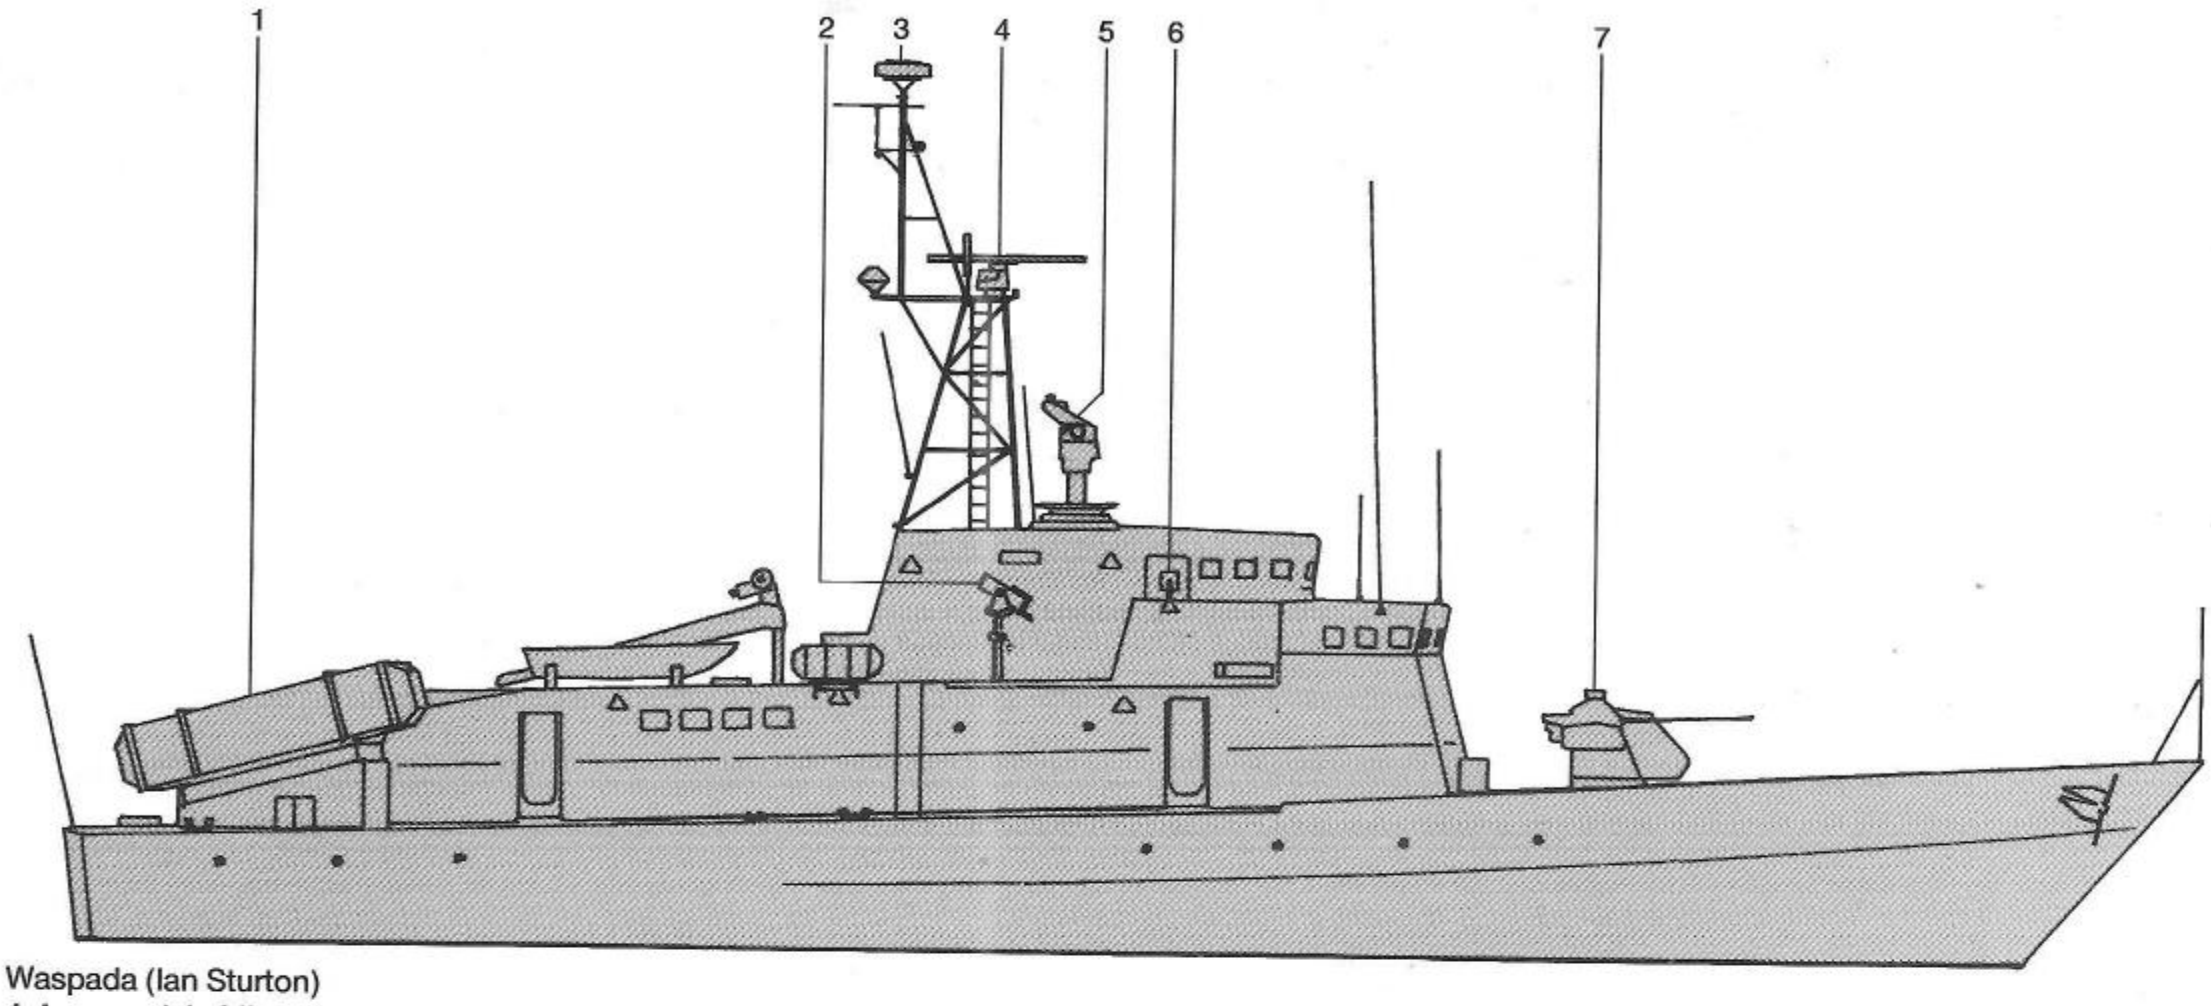
The Project 206 was designed as a round-bilge successor to the Project 183 ('P6') class and was intended to provide a common hull for a family of small combatants for a variety of roles. The lead boat was built by Zelenodolsk, Yaroslavl, Russia, with the remainder of the class being built between 1960 and 1971 at St Petersburg and Vladivostok; it was given the reporting name 'Shershen' by NATO. Some 75 vessels no longer required by the Soviet Navy were transferred to allies and friends, but there was also a specialised export version, designated Project 206E (NATO = 'Mol'), of which about a twelve were produced. A further 12 craft were built by the Tito Shipyard at Kraljevica in Yugoslavia between 1966 and 1971, and the Croatian 'Shershen' is the only known survivor of this group.

The hydrofoil version was produced as Project 206M and given the Russian class name 'Storm', although some later had their single forward foil removed. They were built between 1972 and 1987 by Leningrad's (now St Petersburg's) Kolpino and Petrovsky yards as well as by a yard in Vladivostok. In addition to the weapon systems noted above they also carry two racks of depth charges. Some 19 vessels were transferred to allies and friends while 18 export versions were built as Project 206ME. The Cambodian 'Turya' class was transferred between 1984 and 1985 without either torpedo tubes or sonars and this also applies to two of the Vietnamese vessels which were delivered in 1984 and 1986.

A missile-equipped version of the Project 206M was developed as Project 206MR and given the class name 'Vikhr'. They were built by the Kolpino Shipyard, Leningrad (now St Petersburg) between 1977 and 1983 and given the NATO designation 'Matka.' However, production was superseded by the 'Tarantul' class corvette. The vessels in the Baltic were scrapped, leaving only those in the Black Sea operational.

A patrol boat version was produced as Project 206EP by the Ulis yard in Vladivostok and exported to Guinea and Guinea-Bissau. With the Russian design designation 02065 Vikhr, it received the NATO designation 'Bogomol'. All are reported to be non-operational due to a lack of spares and poor maintenance.

WASPADA



Waspada (Ian Sturton)
1 *Aerospatiale MM 38 Exocet anti-ship missile (two)* **2** *2 in rocket launcher* **3** *Racal-Decca RDL radar warning* **4** *Racal-Decca TM 1629A surface search radar* **5** *BAe Sea Archer fire director* **6** *7.62 mm machine gun* **7** *Royal Ordance GCM-AO1 twin 30 mm Oerlikon*

GENERAL SPECIFICATIONS

Country of origin: Singapore
Operator: Brunei
Type: FAC, Missile

Class: WASPADA

Built: 3
Active: 3

Displacement:
standard: n/k
full load: 208 t

Dimensions
Length: 36.9 m (121 ft)
Beam: 7.2 m (23.5 ft)
Draught: 1.8 m (6 ft)

Speed: 32 kts
Range: 1,200 n miles (2,220 km) at 14 kts

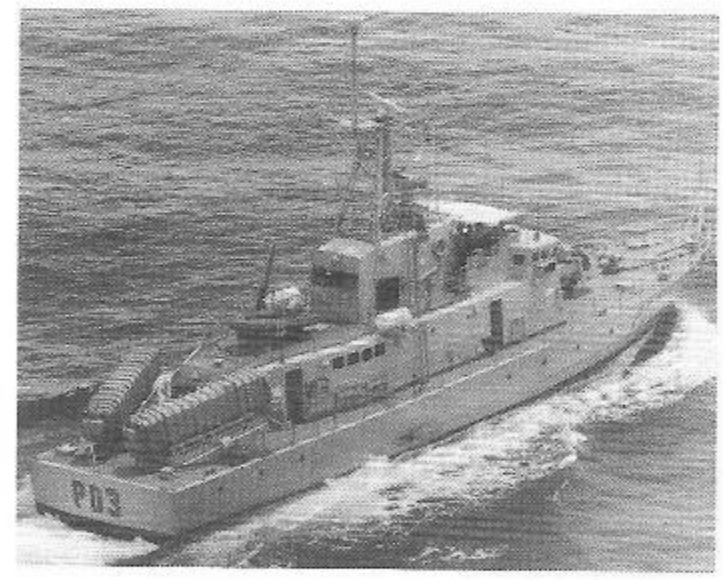
Complement: 24 (4 officers)

SHIPS

WASPADA (P 02)
Builder Vosper, Singpore
Launched Aug 1977
Commissioned 2 Aug 1978

PEJUANG (P 03)
Builder Vosper, Singapore
Launched Mar 1978
Commissioned 25 Mar 1979

SETERIA (P 04)
Builder Vosper, Singapore
Launched Jun 1978
Commissioned 22 Jun 1979



Pejuang *(P 03). Note the twin MM 38 Exocet launchers and the open upper bridge*
(H & L van Ginderen Collection)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Aerospatiale Exocet MM 38
This class carries two Exocet MM 38 anti-ship missile launchers facing forward and outboard at the rear of the superstructure.

Specifications
Length: 5.21 m (17.08 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)

Waspada *(P 02) in Penang harbour. Main armament consists of two MM 38 Exocet missiles and a twin Oerlikon 30 mm mount on the foredeck; a 7.62 mm machine gun can be seen on the bridge wing (below the nameboard). This vessel has an enclosed upper bridge to enable it to be used for training* (J Mortimer)

Speed: Mach 0.9
Range: 22.5 n miles (42 km)
Warhead: 165 kg (365 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles, France.

GUNS

Royal Ordnance GCM-AO1 twin 30 mm Oerlikon
A Royal Ordnance GCM-AO1 twin 30 mm Oerlikon mounting is installed on the foredeck.

Specifications
Gun
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Rate of fire: 650 rds/min/gun
Range:
anti-surface: 1.5 n miles (3 km)
anti-air: 3,500 m (11,500 ft)

Mounting
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
Royal Ordnance, UK.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

The ESM system is a Racal-Thorn RDL 1 whose antenna consists of two semicircular units which wrap around the mast. It covers 2-11.5 GHz and features the APA-1C automatic pulse analyser.

COMMAND AND CONTROL SYSTEMS

BAe Sea Archer 1
These ships have the British Aerospace Systems and Equipment Sea Archer 1 which is an electro-optical fire-control system of mainframe architecture with a single console. It can control one medium and one light calibre mounting simultaneously.

Manufacturer/Contractor
BAe, UK.

RADARS

Racal-Decca TM 1629AC

Specifications
Role: Surface search
Band: I-band
Beam: 1.2°
Peak power: 6 kW
Pulsewidth: 0.75 µs
PRF: 850 pps
Scan rate: 25 rpm
Typical range: 20 n miles (37 km)

Manufacturer/Contractor
Racal-Decca.

ELECTRO-OPTIC SENSORS

MSI Defence Systems OFD

The OFD (Optical Fire Director) is part of the Sea Archer system and is essentially a sighting device which can be controlled either manually or remotely.

Specifications
Weight: 485 kg (1,069 lb)
Elevation: −20 to +70°
Sensors: Optical

Manufacturer/Contractor
MSI Defence Systems, UK.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU 20V 538 TB91 diesels; 5.63 MW (7,680 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These three ships were built by Vosper (Singapore) for Brunei and were commissioned in 1978 and 1979. They were modernised starting in 1988, the work including improved fire-control systems and new ESM equipment. There are also plans to fit MM 40 Exocet in due course.

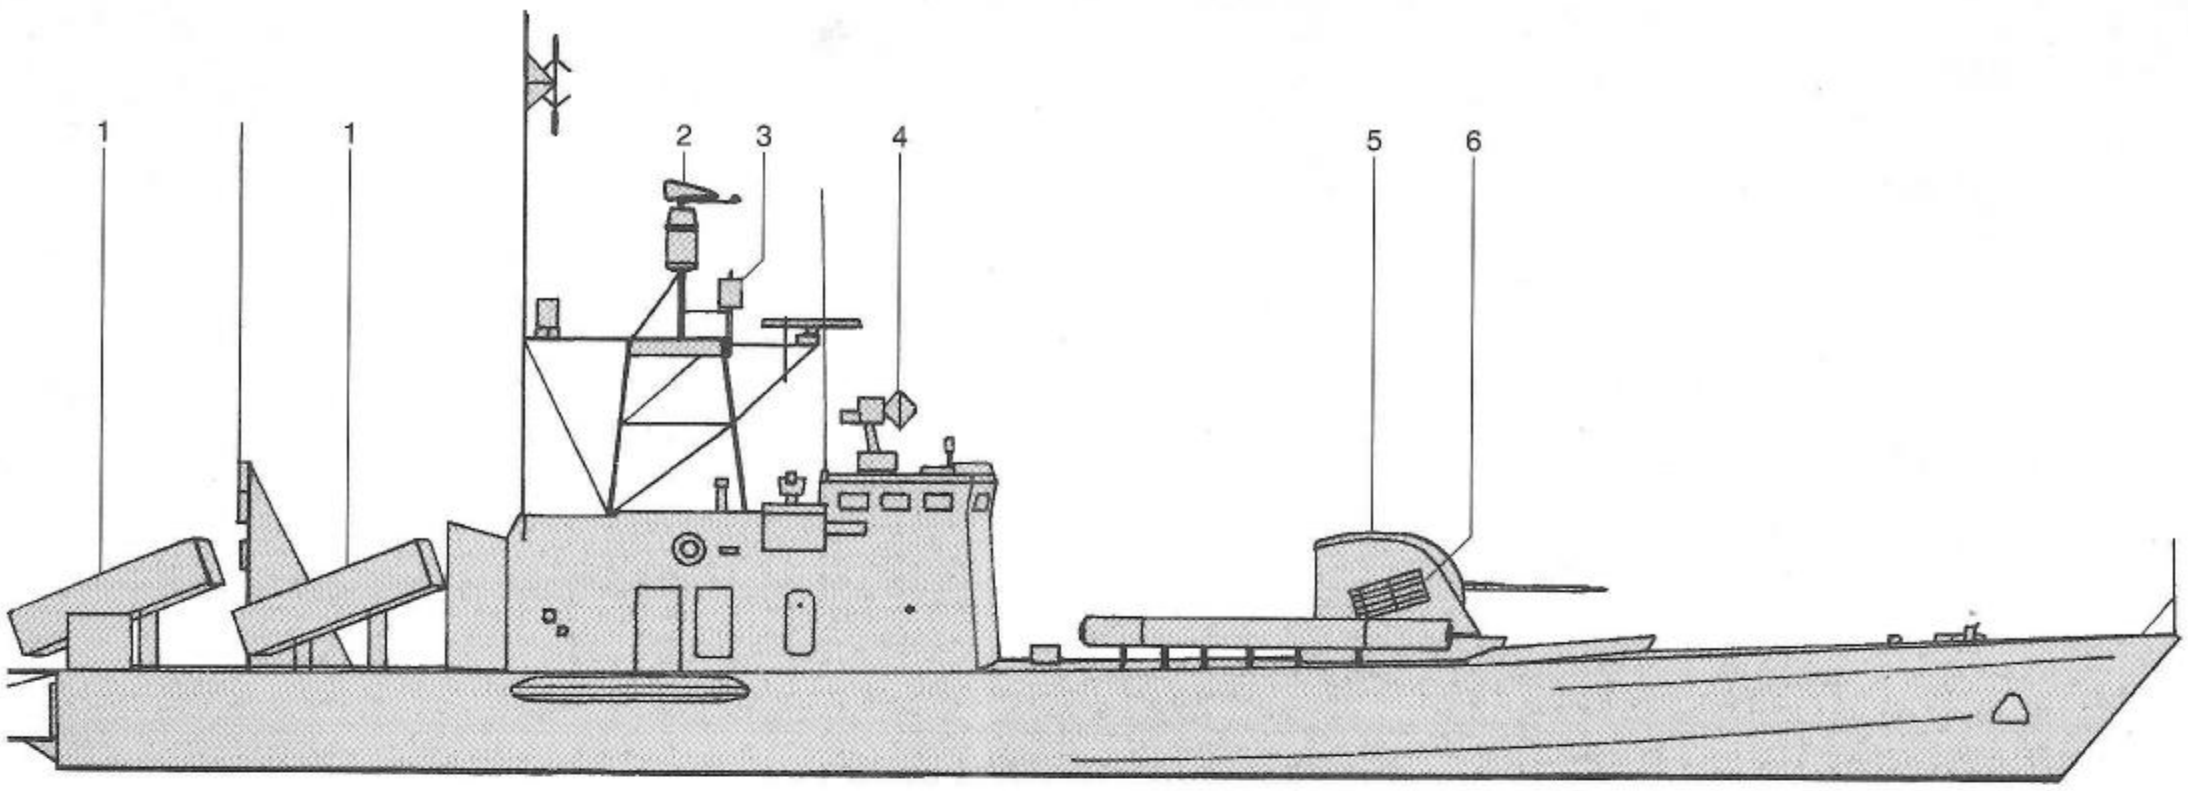
DESIGN

These vessels have welded steel hulls and aluminium alloy superstructure. The hulls have five watertight compartments and the ships carry 16 tonnes of fuel. There are two auxiliary diesel-generator sets providing a 440 V, three-phase, 60 Hz AC, and a single-phase, 60 Hz, 230 V AC electricity supply. *Pejuang* and *Seteria* have open upper bridges but *Waspada* has an enclosed one for training purposes.

These vessels also carry two 7.62 mm machine guns and two 50 mm MOD(N)2 illuminant launchers.

Seteria *(P 04)* (H & L van Ginderen Collection)

NORRKÖPPING (SPICA II)



Norrköpping (Ian Sturton)
1 *Saab RBS-15M anti-ship missiles (maximum eight)* **2** *CelsiusTech Sea Giraffe 50HC surface search radar* **3** *ARGOSystems AR700 ESM receiver* **4** *CelsiusTech 9GR600 weapon control radar* **5** *Bofors SAK 57 Mk 1 57 mm/70 automatic gun* **6** *103 mm flare launch racks*

GENERAL SPECIFICATIONS

Operator: Sweden
Type: FAC, Missile

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Saab RBS 15M

These vessels carry up to eight launchers for the Saab Dynamics' RBS-15M anti-ship missile on the afterdeck.

Specifications
Length: 4.35 m (14.26 ft)
Diameter: 50 cm (19.68 in)
Wing span: 1.4 m (4.6 ft)
Weight: 780 kg (1,720 lb) (with boosters)
Speed: Mach 0.8
Range: 38 n miles (70 km)
Warhead: 200 kg (440 lb)
Guidance: Inertial navigation with active radar homing

Manufacturer/Contractor
Saab Missiles AB, Sweden.

TORPEDOES

Six 533 mm (21 in) torpedo tubes can be fitted in place of missile launchers. Torpedoes are FFV Tp 613 anti-surface type, which use wire guidance for ranges up to 8.2 n miles (15 km).

GUNS

Bofors SAK 57 Mk 1

A single 57 mm Bofors SAK 57 Mk 1 is mounted forward of the bridge. There are 103 mm flare launchers on either side of the turret.

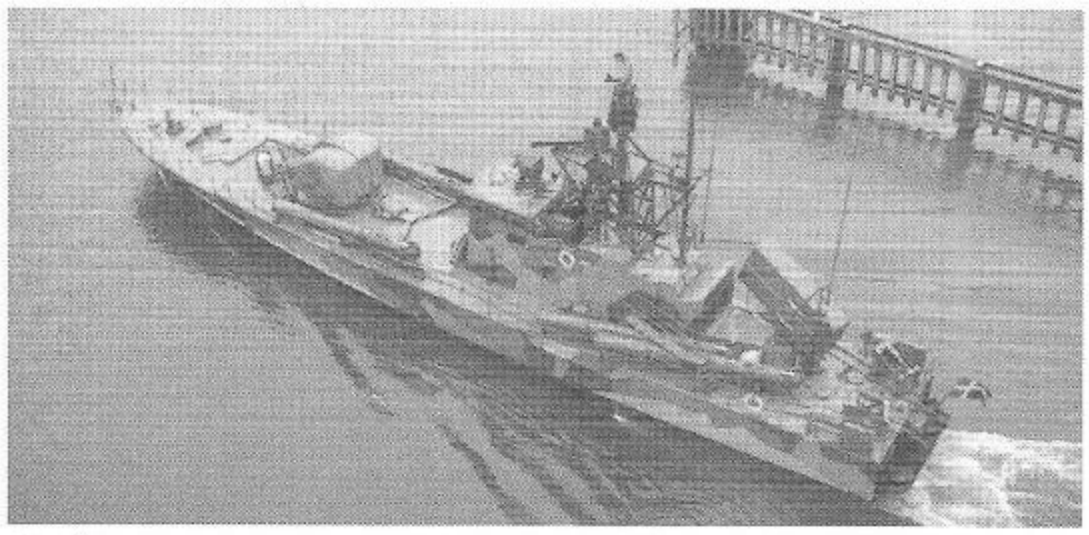
Specifications
Gun
Calibre: 57 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,020 m/s (3,346 ft/s)
Rate of fire: 200 rds/min
Range: 9 n miles (17 km)

Mounting
Traverse: 360°
Elevation: −10 to +75°

Manufacturer/Contractor
Bofors Ordnance, Sweden.

MINES

Minerails can be carried aft.



Umeå *(R 137). On this occasion it is armed with two Saab RBS-15M missiles to starboard and two torpedo tubes to port. Note also the mine racks at the stern*
(Antonio Moreno)

Varberg *(R 134). Note 57 mm gun on foredeck with flare launch rails on either side of the turret. Masthead radar is the CelsiusTech Sea Giraffe 50HC*
(Jane's/H M Steele)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

The class have either Argo AR700 or Racal-Thorn (formerly MEL) Susie-1 ESM systems.

ARGOSystems AR700

The AR700 radar receiver covers the 0.5-18 GHz frequency bands.

Manufacturer/Contractor
ARGOSystems, USA.

Racal-Thorn Susie ESM

Susie-1 is a solid-state system operating in the E/J-band range which automatically correlates band, pulsewidth and bearing then displays the data with an accuracy of 3.5° in fine mode. The system can automatically track up to seven signals.

Manufacturer/Contractor
Racal-Thorn, UK.

ELECTRONIC COUNTERMEASURES (ECM)

CelsiusTech Philax

The 'Norköpping' class has the CelsiusTech Philax decoy launcher system. This consists of trainable 875 × 720 × 950 mm (34 × 28 × 37 in) launchers weighing 180 kg (397 lb). Each has four magazines with 36 × 40 mm (1.41 × 1.5 in) chaff or infra-red payload grenades. The former fire at intervals of 0.1 second per magazine and within 1 second create a 1,000 m² (3,281 sq ft) decoy cloud while the infra-red ones cover both the 3-5 µm and 8-14 µm bands.

Manufacturer/Contractor
CelsiusTech, Sweden.

COMMAND AND CONTROL SYSTEMS

CelsiusTech 9LV200

The 'Norrköpping' class has a CelsiusTech 9LV200 weapon control system with CelsiusTech MARIL 800 tactical data system and datalink. The MARIL *(Marinen Eldlegnings)* is a tactical picture compilation system with a mainframe architecture based upon two Censor 932E mini-computers and a single display console. The 9LV200 Mk 2 is a radar-based weapon control system of mainframe architecture using the Philips P800 mini-computer for the control of one medium and one light calibre gun mounting as well as surface-to-surface missiles. There is a tactical display system and two gun control displays, for ASuW and AAW operations.

Manufacturer/Contractor
CelsiusTech, Sweden.

RADARS

Type	Sea Giraffe 50HC	9GR600
Maker	Ericsson	CelsiusTech

Typical range	54 n miles (100 km)	n/k

PROPULSION

Specifications
System: Gas turbine
Main machinery: 3 Rolls-Royce Proteus, 9.5 MW (12,750 hp)
Shafts: 3 with controllable pitch propellers

FURTHER INFORMATION

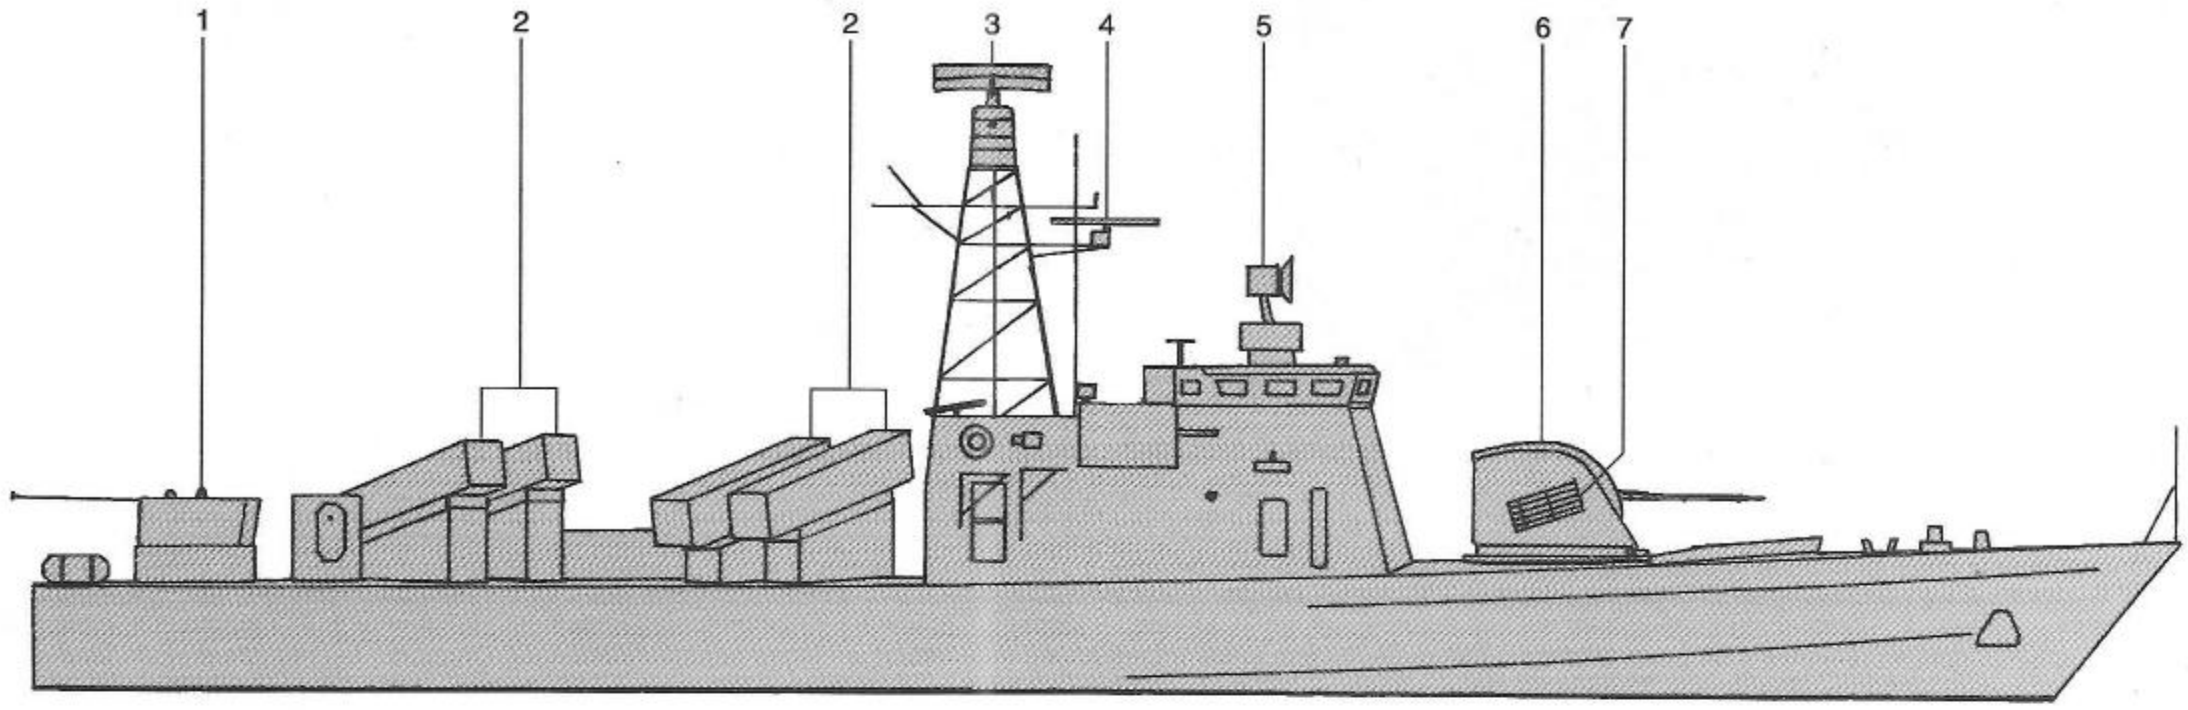
PROGRAMME

This class, also known as 'Spica II', was constructed between 1972 and 1975.

DESIGN

The 'Norrköpping' class has a steel, round-bilge hull with six watertight compartments and can float even if two adjacent compartments are flooded. Electricity is provided through three-phase alternators with a capacity of 200 kVA, 60 Hz (450 V). They were originally armed with six 533 mm (21 in) torpedo tubes but between 1980 and 1984 these were replaced by missile launchers, and concurrently the Skanter 009 radar was replaced by the Sea Giraffe. The Mk 2 version of 9LV200 replaced the Mk 1 version and Maril was incorporated. *Halmstad, Lulea, Norrköpping, Nynäshamn, Pitea* and *Ystad* are having their 9LV200 systems upgraded with new hardware and software to maintain them in operational service until 2010. *Ystad* was the first to be upgraded in December 1995.

SPICA I/KONCAR (TYPE 240)



'Handalan' class (Malaysia) (Ian Sturton)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

The 'Spica I' class has four forward-facing launchers in crossover configuration behind the superstructure. The forward pair face to port and the after pair face starboard. Malaysian vessels use Aerospatiale Exocet MM 38, the Croatian 'Koncar' class has Saab Dynamics RBS 15M anti-ship missiles while Yugoslav vessels have SS-N-2b 'Styx'.

Exocet MM 38

Specifications
Length: 5.21 m (17.08 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 2-22.5 n miles (4-42 km)
Warhead: 165 kg (365 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles, France.

RBS 15M

Specifications
Length: 4.35 m (14.26 ft)
Diameter: 50 cm (19.68 in)
Wing span: 1.4 m (4.6 ft)
Weight: 780 kg (1,720 lb) (with boosters)
Speed: Mach 0.8
Range: 38 n miles (70 km)
Warhead: 200 kg (440 lb)
Guidance: Inertial navigation with active radar homing

Manufacturer/Contractor
Saab Missiles AB, Sweden.

SS-N-2b 'Styx'

Specifications
Length: 5.8 m (19 ft)
Diameter: 76 cm (30 in)
Wing span: 2.4 m (7.9 ft)
Weight: 2,870 kg (6,328 lb) (with booster)
Speed: Mach 0.9
Range: 43 n miles (80 km)
Warhead: 454 kg (1,001 lb)
Guidance: Autopilot with active radar

Manufacturer/Contractor
Raduga, Russia.

GUNS

'Handalan' class (Malaysia). The Malaysian vessels have a single 57 mm Bofors SAK 57 Mk 1 forward and a Bofors 40 mm SAK 40 L/70-350 aft of the missile launchers.

'Koncar' class (Yugoslavia/Croatia). There are two gun mountings in the 'Koncar' class; either two Bofors SAK 57 Mk 2 or one SAK 57 and an AK-630.

Bofors SAK 57 Mk 1

Specifications
Gun
Calibre: 57 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,020 m/s (3,346 ft/s)
Rate of fire: 200 rds/min
Range: 9 n miles (17 km)

Mounting
Traverse: 360°
Elevation: −10 to +75°

Manufacturer/Contractor
Bofors Ordnance, Sweden.

Bofors SAK 57 Mk 2

Specifications
Gun
Calibre: 57 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,020 m/s (3,346 ft/s)
Rate of fire: 220 rds/min
Range: 9 n miles (17 km)

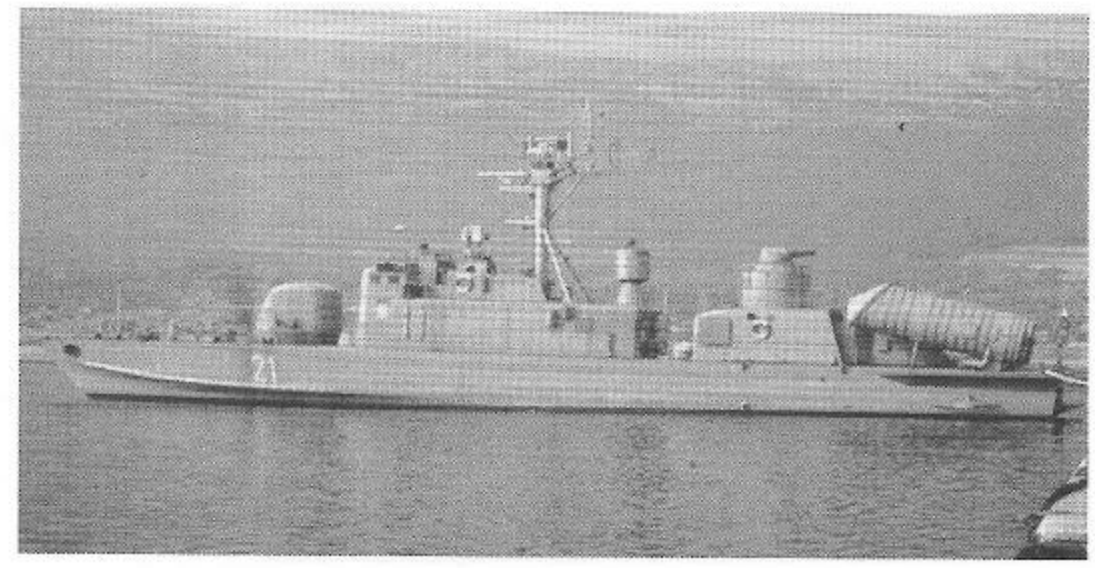
Mounting
Traverse: 360°
Elevation: −10 to +77°

Manufacturer/Contractor
Bofors Ordnance, Sweden.

Bofors SAK 40 L/70-350

Specifications
Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 300 rds/min
Range: 6.75 n miles (12.5 km)

Pendekar *(3513) one of four 'Spica-M' class FACs built for the Royal Malaysian Navy. The bridge was moved forward in these vessels to enable four Exocet launchers to be mounted* (John Mortimer)



Sibenic *(21) of the Croatian Navy was originally one of six vessels built for the Yugoslav Navy and based on the Swedish Spica design. The bridge is further forward as in the Malaysian Spica-M, but the Yugoslav Navy selected SS-N-2 Styx in preference to Exocet. The Croatians have now replaced SS-N-2 by Saab RBS-15* (L Poggiali)

Mounting
Traverse: 360°
Elevation: −9 to +85°

Manufacturer/Contractor
Bofors Ordnance, Sweden.

AK-630

Specifications
Gun
Calibre: 30 mm
Length of barrel: 65 calibres
Muzzle velocity: 890 m/s (2,920 ft/s)
Rate of fire: 5,000 rds/min
Range: 2.5 n miles (5 km)

Mounting
Traverse: 360°
Elevation: −12 to +88°

Manufacturer/Contractor
Tula Machine Works, Russia.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Racal-Thorn Susie-1 system
'Handalan' class (Malaysia) only. Susie-1 is a solid-state system operating in the E/J-band range which automatically correlates band, pulsewidth and bearing then displays the data with an accuracy of 3.5° in fine mode. The system can automatically track up to seven signals.

ELECTRONIC COUNTERMEASURES (ECM)

ML Aviation Barricade
'Koncar' class (Yugoslavia, Croatia). This lightweight chaff launcher system uses spin-stabilised 57 mm rockets whose launcher consists of frames which point in various directions at different angles of elevation. They fire short-range rockets which create chaff clouds up to 60 m (197 ft) from the ship and long-range rockets whose clouds are deployed between 400 and 2,000 m (1,312 and 6,562 ft) of the ship. The short-range Pallisade rockets weigh 2.1 kg (4.6 lb) while the longer-ranged Stockade rockets (which are also available with infra-red payloads) weigh 1.77/1.88 kg (3.9/4.1 lb).

COMMAND AND CONTROL SYSTEM

CelsiusTech 9LV Mk 2
Both classes of 'Spica I' have CelsiusTech 9LV Mk 2 radar-based weapon control systems. These have a mainframe architecture using the Philiips P800 minicomputer for the control of one medium and one light calibre gun mounting as well as surface-to-surface missiles. There is a tactical display system and two gun control displays, for ASuW and AAW operations.

Manufacturer/Contractor
CelsiusTech, Sweden.

Shafts: 4

FURTHER INFORMATION

PROGRAMME

Six boats of the 'Spica I' class, with steel hull and aluminium alloy superstructure, were built for the Swedish Navy in the mid-1960s and have since been deleted. A modified design ('Spica M') for Malaysia was ordered from Karlskronavarvet in 1976 and was commissioned in one large group on 26 October 1979.

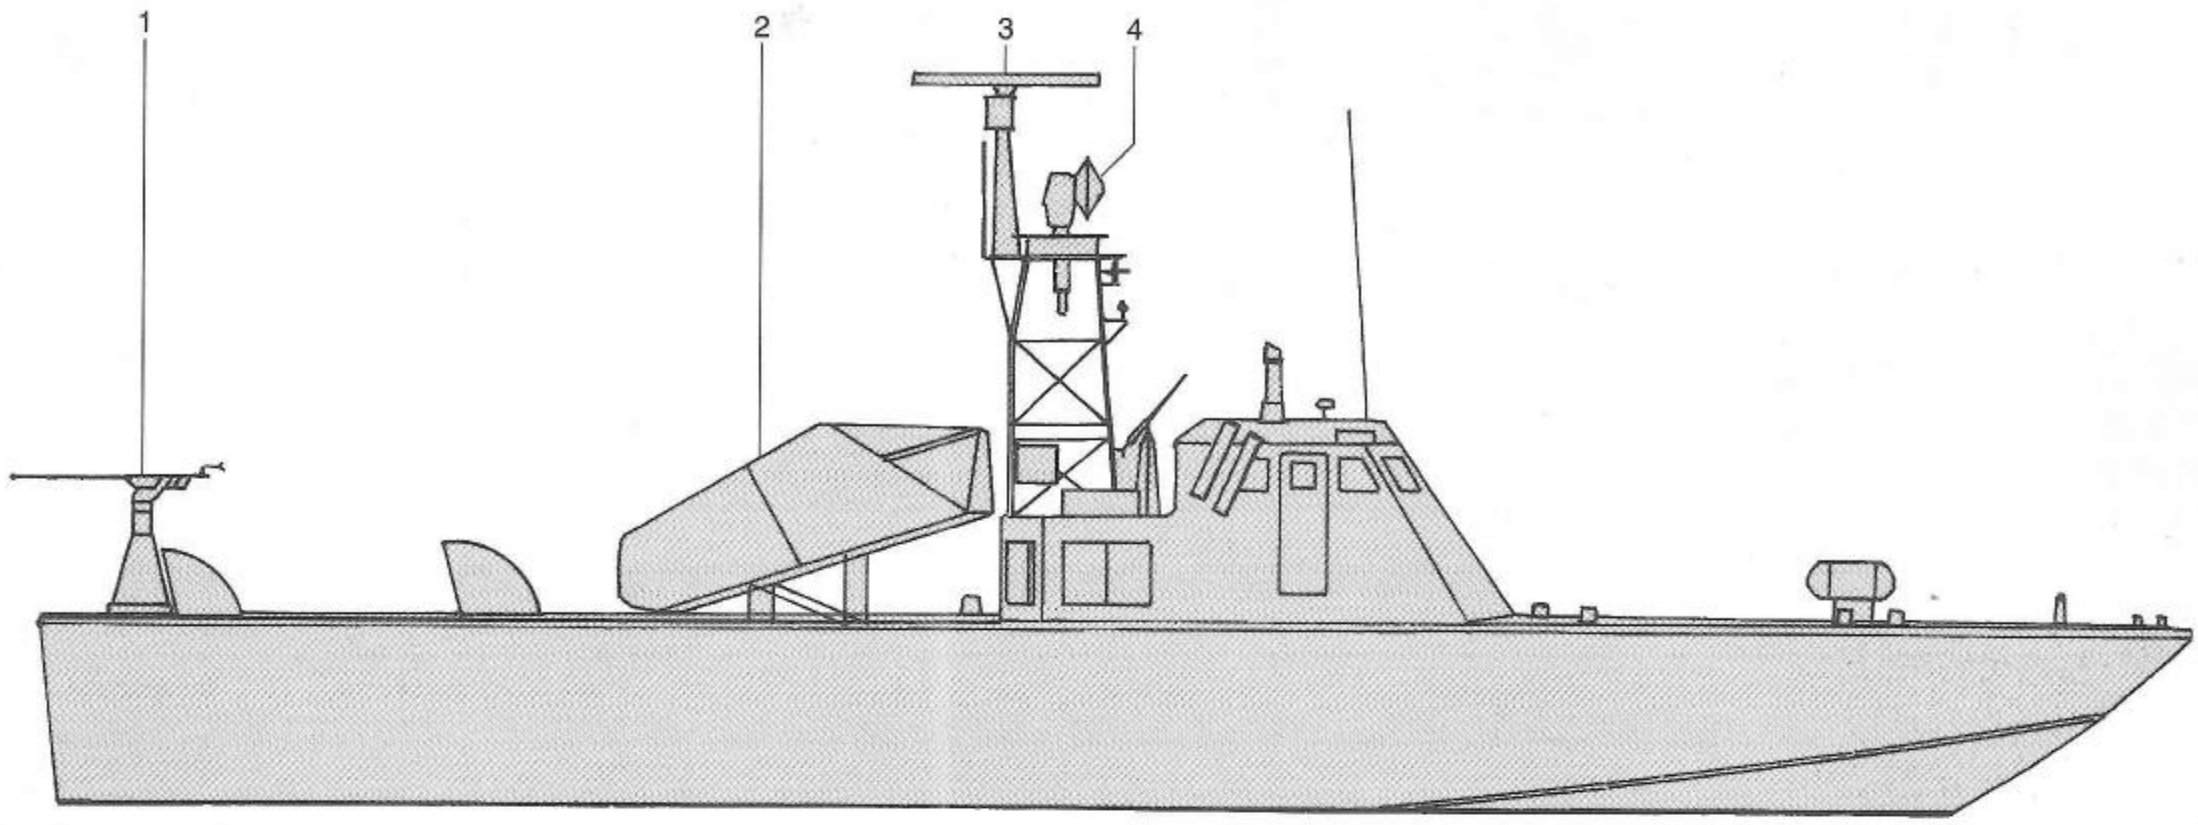
The 'Koncar' or Type 240 class was designed by the Naval Shipping Institute in Zagreb based upon the 'Spica' class as built for Malaysia with bridge amidships.

DESIGN

In this version the bridge was moved forward to enable MM 38 Exocet launchers to be accommodated aft, and the vessels had Simrad SU hull-mounted sonar, although this was later removed when an ASW upgrade plan was abandoned. These vessels carry 80 tonnes of fuel and have an electricity generating system producing 400 kW.

Originally the Yugoslav ships had 'Styx' anti-ship missiles and two SAK 57, but the aft one has been replaced by an AK-630. They also have a 128 mm rocket launcher for illuminants. Their electricity generation systems produce 300 kW.

HAI OU



Hai Ou (Ian Sturton)
1 *20 mm Type 75 cannon* **2** *Hsiung Feng I anti-ship missile (two)* **3** *Canadian Marconi LN 66* **4** *RCA R76 C5 fire-control radar*

GENERAL SPECIFICATIONS

Country of origin: Israel
Operator: Taiwan, Republic of China
Type: FAC, Missile

Class: HAI OU

Built: 49
Active: 49

Displacement:
full load: 47 t

Dimensions
Length: 21.6 m (70.8 ft)
Beam: 5.5 m (18 ft)
Draught: 1 m (3.3 ft)

Speed: 36 kts
Range: 700 n miles (1,300 km) at 32 kts

Complement: 10

SHIPS

FABG 5/12
FABG 14/21
FABG 23/30
FABG 32/39
FABG 41/57

(FABG 5, 6 built by Israeli Aircraft Industries (RAMTA) in Israel. Remainder built by China Ship Building, Kaohsiung, Taiwan.)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Hsiung Feng I

Two forward-facing, outboard angled, launchers for Hsiung Feng I anti-ship missiles are behind the superstructure.

Specifications
Length: 3.9 m (12.8 ft)
Diameter: 34 cm (13.4 in)
Wing span: 1.35 m (4.4 ft)
Weight: 540 kg (1,190 lb)
Speed: Mach 0.9
Range: 19 n miles (36 km)
Warhead: 150 kg (330 lb)
Guidance: Semi-active radar and manual

SURFACE-TO-AIR MISSILES (SAM)

FIM-92 Stinger

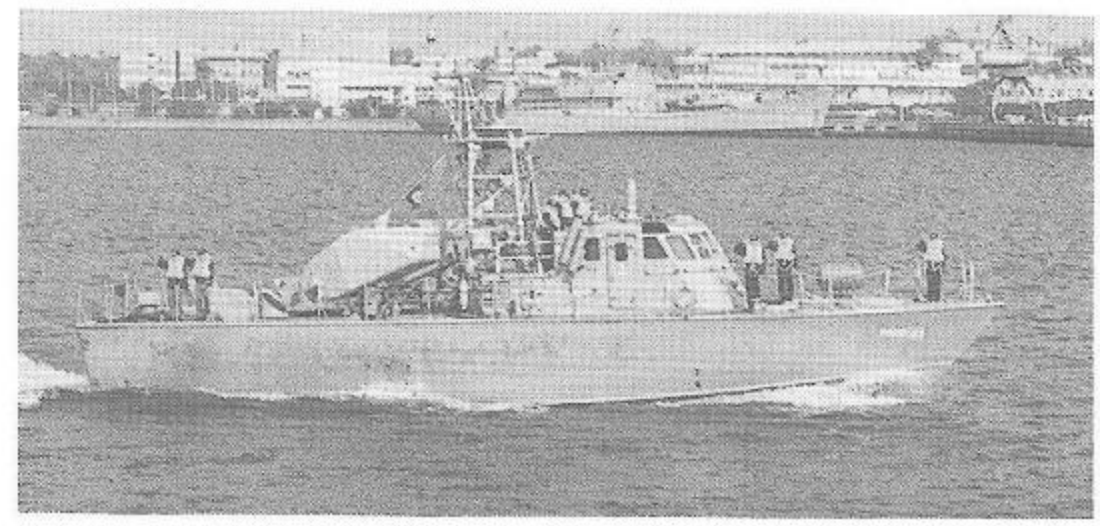
These vessels often carry a FIM-92 Stinger man-portable point defence missile launcher.

Specifications
Length: 1.52 m (4.99 ft)
Diameter: 70 cm (27.5 ft)
Wing span: n/k
Weight: 10.1 kg (22.3 lb)
Speed: Mach 2.2
Range: 2 n miles (3.8 km)
Warhead: 3 kg (6.6 lb)
Guidance: Infra-red passive homing

Manufacturer/Contractor
Hughes Missile Systems.
Raytheon Company's Missile Systems Division.

GUNS

There is a 20 mm Type 75 gun at the stern. No details are available on this weapon. Some also mount two 12.7 mm machine guns at the stern; type unknown.



FABG 41, a 'Hai Ou' class FAC-missile of the RoC Navy (L J Lamb)

Israeli 'Dvora' class FAC-gun from which the Taiwanese 'Hai Ou' class FAC-missile was developed

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

WD-2A ESM
The domestically produced WD-2A threat-warning receiver is carried to provide early warning of E/J-band threats.

ELECTRONIC COUNTERMEASURES (ECM)

AV-2
The decoy launcher carried in these vessels is the domestically produced AV-2 chaff rocket launcher. Two pairs of launchers are installed to create an 80 m² cloud using Rafael-designed rockets.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

These vessels have a combined surface-to-surface missile and gun weapon control system similar to that used in Israeli 'Sa'ar 3' and 'Sa'ar 4' classes but produced domestically.

ELECTRO-OPTIC SENSORS

Kollmorgen Mk 35
There is a Kollmorgen Mk 35 optical periscope for missile control.

RADARS

Type	LN66	R76C5
Maker	Canadian Marconi	Lockheed Martin
Role	Search	Weapon control
Frequency	I-band	I-band
Beam	2.5 × 22°	2.7°
Peak power	75 kW	250 kW
Gain	30 dB	32 dB
Pulsewidth	0.1, 1 µs	0.25, 0.5 µs
PRF	500, 2,000 pps	1,000-3,000 pps
Scan rate	22 rpm	n/k
Typical range	24 n miles (44.5 km)	21.5 n miles (40 km)

FABG 17 (Chien Chung)

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU 12V 331 TC82 diesels; 1.92 MW (2,605 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

There has been close co-operation on weapons and technical matters between israel and Taiwan for some years. Two Israeli 'Dvora' class FACs were exported to Taiwan and are now the first two craft (FABF 5, FABG 6) in this class. The design was then deployed by the Sun Yat Sen Scientific Research Institute and built by the China Shipbuilding Corporation at the Tsoying Shipyard.

DESIGN

There are two versions; the first with pole mast whose missile launchers are nearer the stern and the second with a lattice mast whose missile launchers are further forward.

DEPLOYMENT

In addition to the armament mentioned above some carry two 12.7 mm machine guns.

In addition to patrol work they are used to provide high-speed targets in shallow waters.

JIN CHIANG

GENERAL SPECIFICATIONS

Operator: Taiwan, Republic of China
Type: FAC, Missile

Class: JIN CHIANG

Built: 1
Active: 1

Displacement:
full load: 580 t

Dimensions
Length: 61.4 m (201.4 ft)
Beam: 9.5 m (31.2 ft)
Draught: 2.9 m (9.5 ft)

Speed: 25 kts
Range: 4,150 n miles (7,685 km) at 20 kts

Complement: 50 (7 officers)

SHIPS

JIN CHIANG (603)
Builder Lien Ho, Kaohsiung, Taiwan

Launched 27 Jun 1994
Commissioned 1 Dec 1994

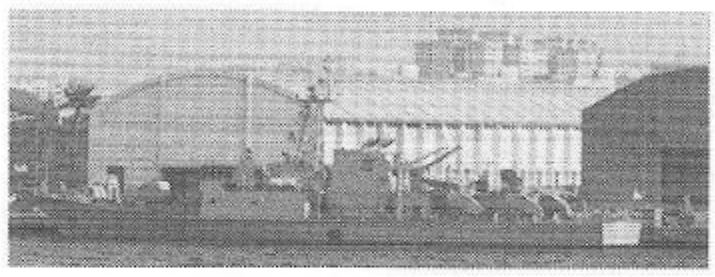
WEAPONS SYSTEMS

ANTI-SHIP MISSILES

Hsiung Feng I

Four launchers for the Hsiung Feng I anti-ship missile are installed aft of the superstructure.

Specification
Length: 3.9 m (12.8 ft)
Diameter: 34 cm (13.4 in)
Wing span: 1.35 m (4.4 ft)



Jin Chiang *(603), the prototype of a new class of FAC-M for the RoC Navy* (L J Lamb)

Weight: 540 kg (1,190 lb)
Speed: Mach 0.9
Range: 19 n miles (36 km)
Warhead: 150 kg (330 lb)
Guidance: Semi-active radar and manual

GUNS

OTOBREDA 40 mm L/70

An OTOBREDA-Bofors 40 mm L/70 is carried forward of the bridge while a Type 75 20 mm gun is installed in the superstructure.

Specifications
Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 300 rds/min
Range: 6.75 n miles (12.5 km)
Traverse: 360°
Elevation: n/k

Manufacturer/Contractor
OTOBREDA.

DEPTH CHARGES

There are two depth charge racks.

MINES

Two rails for the US Navy Mk 6 anchored mine.

COMMAND AND CONTROL SYSTEMS

Hughes H930 Mod 2

This class has a Hughes Naval and Marine Systems H930 Mod 2 command and weapon control system with mainframe architecture based upon the AN/UYK-19 mini-computer. The Mod 2 system, with five UYK-19 Model 1664 computers as well as a pair of display and control consoles, can control up to four guns as well as surface-to-surface missiles.

RADARS

Type	LN66	R76C5
Maker	Canadian Marconi	Lockheed Martin
Role	Search	Weapon control
Frequency	I-Band	I-Band
Beam	2.5 × 22°	2.7°
Peak power	75 kW	250 kW
Gain	30 dB	32 dB
Pulsewidth	0.1, 1 µs	0.25, 0.5 µs
PRF	500, 2,000 pps	1,000-3,000 pps
Scan rate	22 rpm	n/k
Typical range	24 n miles (44.5 km)	21.5 n miles (40 km)

SONAR

Simrad sonar

A Simrad sonar is installed for ASW operations but its identity has not been established.

ELECTRO-OPTIC SENSORS

Rafael Sea Eye

A Rafael Sea Eye electro-optical sensor is installed. No further details are available on this system.

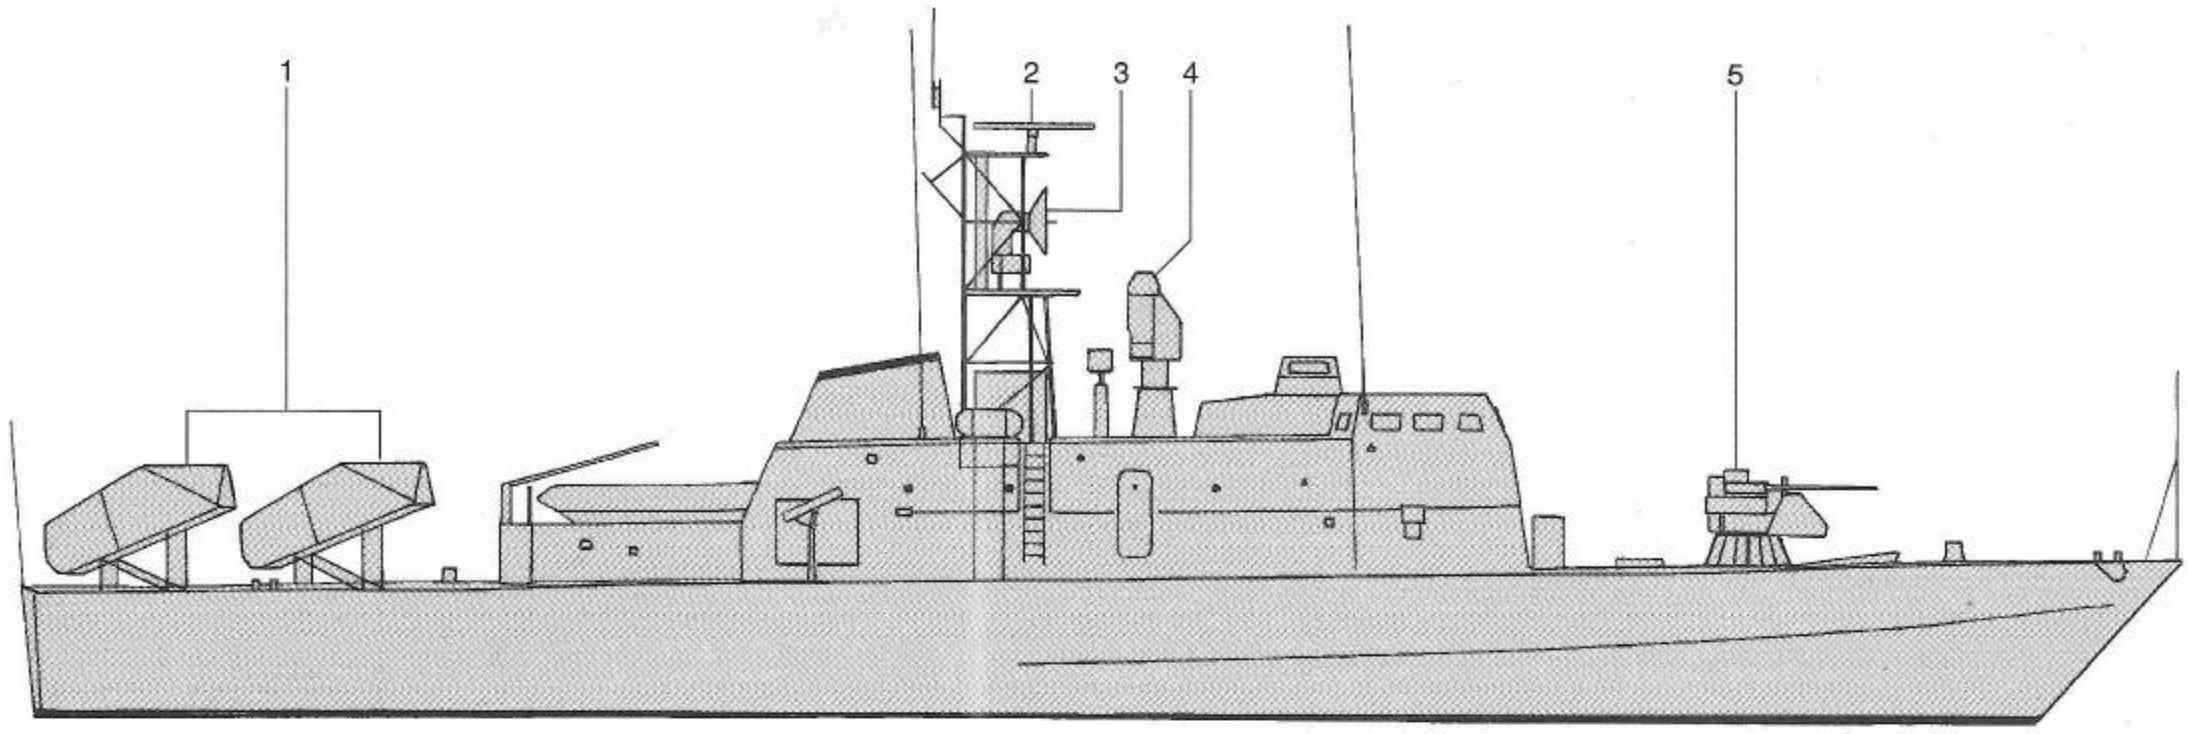
PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU 20V 1163 TB93; 14.79 MW (20,128 hp)
Shafts: 2

FURTHER INFORMATION

Designed by the United Ship Design Center as the Kwang Hua Project III this new class resembles an enlarged 'Lung Chiang' (itself based upon PSMM Mk 5). *Jin Chiang* was laid down in August 1993, launched on 27 June 1994 and commissioned in December 1994. A similar design, modified as the result of sea trials, has been authorised with plans for 12 and options on another 12.

BROOKE MARINE 32.5 m (MADARAKA)



Brooke Maine 32.5m (Ian Sturton)
1 *IAI Gabriel II anti-ship missiles (four)* **2** *Racal Decca AC 1226 navigation radar* **3** *Alenia Orion RTN-10X fire-control radar* **4** *El-Op electro-optic director for Gabriel II system* **5** *Royal Ordance twin 30 mm GCM-AO2*

GENERAL SPECIFICATIONS

Operator: Kenya ('Madaraka')
Type: FAC, Missile

Class: BROOKE MARINE 32.5 m

Built: 3
Active: 3

Displacement:
standard: 120 t
full load: 145 t

Dimensions
Length: 32.6 m (107 ft)
Beam: 6.1 m (20 ft)
Draught: 1.7 m (5.6 ft)

Speed: 25.5 kts
Range: 2,500 n miles (4,630 km) at 12 kts

Complement: 21 (3 officers)

SHIPS

MADARAKA (P 3121)
Builder Brooke Marine, Lowestoft, UK
Launched 28 Jan 1975
Commissioned 16 Jun 1975

JAMHURI (P 3122)
Builder Brooke Marine, Lowestoft, UK
Launched 24 Mar 1975
Commissioned 16 Jun 1975

HARAMBEE (P 3123)
Builder Brooke Marine, Lowestoft, UK
Launched 2 May 1975
Commissioned 22 Aug 1975

The three 'Madaraka' class FACs in their original state in 1975, with two single Bofors 40 mm guns and no Gabriel missiles (Brooke Marine)

WEAPONS SYSTEMS

ANTI-SHIP MISSILES

Gabriel II

These vessels have two pairs of forward-facing, outboard angled, launchers for IAI Gabriel II anti-ship missiles on the afterdeck.

Specifications
Length: 3.42 m (11.2 ft)
Diameter: 34 cm (13.4 in)
Wing span: 1.35 m (4.4 ft)
Weight: 522 kg (1,151 lb)
Speed: Mach 0.7
Range: 19 n miles (36 km)
Warhead: 150 kg (330 lb)
Guidance: Semi-active radar and manual

Manufacturer/Contractor
Israel Aircraft Industries, Tel Aviv, Israel.

GUNS

Royal Ordnance GCM-AO2

A Royal Ordnance twin 30 mm GCM-AO2 is mounted forward of the bridge.

Specifications
Gun
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Rate of fire: 650 rds/min/gun
Range: 1.5 n miles (3 km)

Mounting
Weight: 2.26 t
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
Royal Ordnance.

COMMAND AND CONTROL SYSTEMS

These vessels have an IAI fire-control system with a one-man display control and processing console which interfaces with the Gabriel surface-to-surface missiles and the main gun.

ELECTRO-OPTIC SENSORS

El-Op electro-optical director

An electro-optical director is carried by these vessels, as part of the Gabriel II system. It appears identical to similar devices aboard Israeli Sa'ar class FACs.

RADARS

Type	AC 1226	Orion

PRF	1,300 pps	450-550 pps
Scan rate	25 rpm	—
Typical range	20 n miles (37 km)	n/k

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Paxman Valenta 16CM
Power output: 4.96 MW (6,650 hp)
Shafts: 2

FURTHER INFORMATION

These steel-hulled ships were ordered as patrol boats from Brooke Marine, Lowestoft in 1973 and commissioned in 1975. In 1982 they were upgraded with Gabriel II missiles, the associated electro-optical director and the twin 30 mm gun, which replaced two 40 mm guns.

MAMBA (BROOKE MARINE) 37.5 m

GENERAL SPECIFICATIONS

Operator: Kenya ('Mamba')
Type: FAC, Missile

Class: BROOKE MARINE 37.5 m

Built: 1
Active: 1

Displacement:
standard: 125 t
full load: 160 t

Dimensions
Length: 37.5 m (123 ft)
Beam: 6.9 m (22.6 ft)
Draught: 1.6 m (5.2 ft)

Speed: 25 kts
Range: 3,300 n miles (6,110 km) at 13 kts

Complement: 25 (3 officers)

SHIPS

MAMBA (P 3100)
Builder Brooke Marine, Lowestoft, UK
Laid down 17 Feb 1972
Launched 6 Nov 1973
Commissioned 7 Feb 1974

WEAPONS SYSTEMS

ANTI-SHIP MISSILES

Gabriel II
This ship has two pairs of forward-facing, outboard angled, launchers for Gabriel II anti-ship missiles on the afterdeck.

Specifications
Length: 3.42 m (11.2 ft)
Diameter: 34 cm (13.4 in)
Wing span: 1.35 m (4.4 ft)
Weight: 522 kg (1,151 lb)
Speed: Mach 0.7
Range: 19 n miles (36 km)
Warhead: 150 kg (330 lb)
Guidance: Semi-active radar and manual

Manufacturer/Contractor
Israel Aircraft Industries, Tel Aviv, Israel.

GUNS

Royal Ordnance GCM-AO2
The Kenya ship has a Royal Ordnance GCM-AO2 twin 30 mm gun forward of the bridge.

Specifications
Gun
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Rate of fire: 650 rds/min/gun
Range: 1.5 n miles (3 km)

Mounting
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
Royal Ordnance, UK.

COMMAND AND CONTROL SYSTEMS

These vessels have an IAI fire-control system with a one-man display control and processing console which interfaces with Gabriel surface-to-surface missiles and the main gun.

ELECTRO-OPTIC SENSORS

Mamba has an Israeli Kollmorgen 35 periscope.

PROPULSION

Specification
System: Diesel
Main machinery: 2 Paxman 16YJCM diesels; 2.98 MW (4,000 hp)
Shafts: 2

FURTHER INFORMATION

The steel-hulled Kenyan vessel was laid down as a patrol boat but upgraded in 1982 with the new weapons replacing two 40 mm guns.

Brooke Marine 37.5 m patrol boats or gun-armed versions are also in service with the following navies:

- Algeria. 'Kebir' class. Nine in service, plus three building.
- Barbados. 'Trident' class. One vessel.
- Oman. 'Al Waafi' class. Four delivered, but only two remain in service.

This vessel was modernised in 1982, when the Gabriel II missiles, new gunnery equipment and an optronic director were fitted. It then underwent a major refit between May 1989 and November 1990 at Vosper Thornycroft in the UK.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

These vessels have two sets of launchers facing forward and outboard on the main deck aft of the superstructure. The forward launchers face port while the after ones face starboard. The Kenyan vessels have two twin launchers for Otomat Mk 2 while Omani vessels have two quad launchers (two triple in *Dhofar*) for Aerospatiale MM 38 Exocet.

Otomat Mk 2

Specifications
Length: 4.46 m (14.62 ft)
Diameter: 46 cm (18 in)
Wing span: 1.36 m (4.46 ft)
Weight: 770 kg (1,698 lb) (with boosters)
Speed: Mach 0.9
Range: 35 n miles (65 km) (Longer ranges require helicopter support)
Warhead: 210 kg (465 lb)
Guidance: Inertial with active radar homing

Manufacturers/Contractors
Alenia Missile Systems.
Matra BAe Dynamics.

Exocet MM 38

Specifications
Length: 5.21 m (17.08 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 22.5 n miles (42 km)
Warhead: 165 kg (365 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles, France.

GUNS

Both classes have an OTOBREDA 76/62 Compact forward of the bridge, but the secondary armament differs. Kenyan vessels have a Royal Ordnance twin 30 mm GCM-AO2 on the aft superstructure and two 20 mm Royal Ordnance A41 in the superstructure. Omani vessels have only an OTOBREDA twin 40 mm Compact on the stern.

OTOBREDA 76/62 Compact

Specifications
Gun
Calibre: 76 mm (3 in)
Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 10/85 rds/min
Range: 8.5 n miles (16 km)

Mounting
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
OTOBREDA.

OTOBREDA twin 40 mm L/70 Compact

Specifications
Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 600 rds/min
Range: 3.25 n miles (12.5 km)

Mounting
Traverse: 360°
Elevation: −13 to +85°

Manufacturer/Contractor
OTOBREDA.

Royal Ordnance GCM-AO2
Gun
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Rate of fire: 650 rds/min/gun
Range: 1.5 n miles (3 km)

Mounting
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
Royal Ordnance, UK.

Royal Ordnance A41

Specifications
Gun
Calibre: 20 mm
Length of barrel: 80 calibres
Muzzle velocity: 850 m/s (2, 789 ft/s)
Rate of fire: 750/800 rds/min
Range: 1.3 n miles (2.4 km) and 2,000 m

Mounting
Traverse: 360°
Elevation: −10 to +50°

Manufacturer/Contractor
Royal Ordnance, UK.

Umoja *(P 3127). The Kenyan ships carry four Otomat Mk 2 missiles (not fitted in this picture). Note also the AWS 4 radar on the lower mast platform, Cygnus jammer (spherical radome) and Cutlass radar warner (masthead)* (Vosper Thornycroft)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Racal Thorn Cutlass ESM
All these vessels have the Racal-Thorn Cutlass ESM system which uses the same antenna as RDL and provides bearings, CW bearing and frequency measurement over the E/J-band with instantaneous frequency measurement. The system can incorporate a responsive noise jammer as well as providing spot or barrage noise. It may also be integrated with decoy launchers.

ELECTRONIC COUNTERMEASURES (ECM)

Racal Thorn Cygnus ECM
Kenyan ships have Racal Thorn Cygnus ECM system and ML Aviation Barricade decoy launchers. Cygnus is a narrowband tracking jammer covering the D/J bands and designed to operate with Cutlass for spot or barrage jamming. With one transmitter and two antennas it can jam two targets simultaneously, the 300 kW jammer being tuned by instantaneous frequency measurement.

Racal Thorn Scorpion
Omani ships have the Racal Thorn Scorpion wideband jammer which covers the E/J bands. The dual-beam antenna can call upon 50 kW of radiated power and the system can deal with between five and eight targets.

DECOYS

ML Aviation Barricade
All ships have the ML Aviation Barricade lightweight chaff launcher system which uses spin-stabilised 57 mm rockets. The launcher consists of frames which point in various directions at different angles of elevation. Barricade fires short-range rockets which create chaff clouds up to 60 m (197 ft) from the ship and long-range rockets whose clouds are deployed between 400 and 2,000 m (1,312 and 6,562 ft) from the ship. The short-range Pallisade rockets weigh 2.1 kg (4.6 lb) while the longer-ranged Stockade rockets (which are also available with infra-red payloads) weigh 1.77/1.88 kg (3.9 lb/4.1 lb).

Nyayo *(P 3126). The Kenyan ships have a similar profile to the Omani ships but can be instantly recognised by the spherical radome at the masthead for the Cygnus jammer* (H & L van Ginderen Collection)

Al Sharqiyah *(B 11) of the RNO. Sensors include: CelsiusTech 9GR 600 (on bridge roof); Plessey AWS-4 surface search radar (on lower mast platform); Racal-Decca 1226 navigation radar and Plessey AWS-6 air search radar (masthead platform) and Racal Thorn Cutlass ESM array (masthead)* (Vosper Thornycraft)

COMMAND AND CONTROL SYSTEMS

GEC-Marconi CAAIS 450

Kenyan ships only. This former Ferranti command and weapon control system is a federated architecture system based upon the FM1600E mini-computer and F100L microprocessors. There are two consoles for display and weapon control and the system can track up to 120 targets simultaneously.

Manufacturer/Contractor
GEC-Marconi, UK.

CelsiusTech 9LV200 Mk 2

Omani ships but not *Dhofar* The 9LV 200 Mk 2 is a radar-based weapon control system of mainframe architecture using the Philips P800 mini-computer for the control of one medium and one light calibre gun mounting as well as surface-to-surface missiles. There is a tactical display system and two gun control displays, for ASuW and AAW operations.

Manufacturer/Contractor
CelsiusTech, Sweden.

British Aerospace Systems and Equipment Sea Archer 1A Mod 0

Omani ships only. This is an electro-optical fire-control system of mainframe architecture with a single fire-control console. It can control one medium and one light calibre mounting simultaneously.

Manufacturer/Contractor
BAe, UK.

ELECTRO-OPTIC SENSORS

MSI Defence Systems Optical Fire Director (OFD)

The OFD is part of the Sea Archer system and is either manually or remotely operated.

Specifications
Weight: 485 kg (1,069 lb)
Elevation: −20 to +70°
Sensors: Optical and thermal imager

PROPULSION

Specifications
System: Diesel
Main machinery: 4 Paxman Valenta 18CM diesels; 12.2 MW (15,000 hp)
Shafts: 4

FURTHER INFORMATION

The first two Omani vessels (Dhofar) were ordered in 1980 from Vosper Thornycroft as modified versions of the 'Ramadan' class for Egypt; they were commissioned in 1982. *Al Sharqiyah* and *Al Bat'nah* were ordered from the same yard in 1981 with new command and sensor systems as well as larger offensive load. All have steel hulls with aluminium superstructure and carry 45 tonnes of fuel while the electricity generation system produces 420 kW. They have two 100 hp electric motors for manoeuvring. They were commissioned in 1983/1984 while the last ship was ordered in 1986 and commissioned in 1989. In addition to the weapon systems mentioned above they have two 12.7 mm machine guns.

The Kenyan vessels were ordered from Vosper Thornycroft in 1984 and commissioned in 1987.

WEAPONS SYSTEMS

ANTI-SHIP MISSILES

Exocet MM 40 Block 2

The 'Barzan' class carries two quad launchers of Exocet MM 40 Block 2 anti-ship missiles in crossover configuration aft of the superstructures. The forward set face to port and the starboard set face starboard.

Specifications
Length: 5.80 m (19.02 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.13 m (3.7 ft)
Weight: 870 kg (1,918 lb)
Speed: Mach 0.9
Range: 40.5 n miles (75 km)
Warhead: 155 kg (340 lb)
Guidance: Inertial navigation and active radar homing

Manufacturer/Contractor
Aerospatiale Missiles, France.

SURFACE-TO-AIR MISSILES (SAM)

Mistral

A six-round Sadral launcher for the Matra Mistral point defence missile is installed amidships.

Barzan *(Q 04). Armament comprises: 76 mm gun (foredeck); Sadral Mistral SAM launcher (aft of mast); eight MM 40 Exocet (abaft Sadral); Goalkeeper CIWS* (Vosper Thornycroft)

Specifications
Length: 1.81 m (5.9 ft)
Diameter: 9.2 cm (3.6 in)
Wing span: 11.1 cm (4.4 in)
Weight: 18.4 kg (40.5 lb)
Speed: Mach 2.6
Range: 2.7 n miles (5 km)
Warhead: 2.95 kg (6.5 lb)
Guidance: Infra-red passive homing

Manufacturer/Contractor
Matra BAe Dynamics.

GUNS

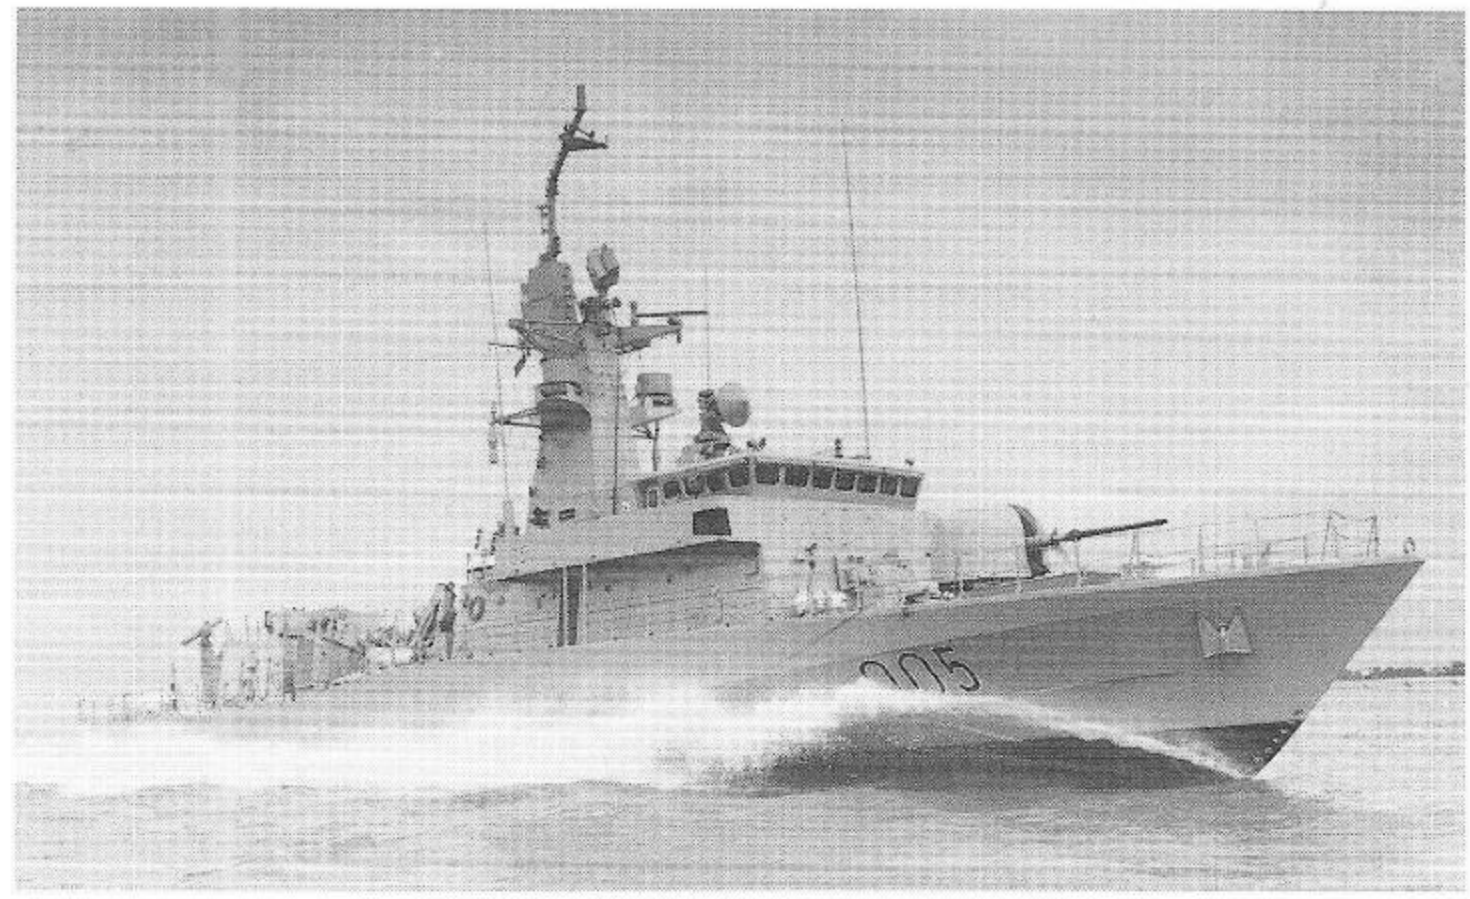
An OTOBREDA 76/62 Super Rapid is installed forward of the bridge while a Signaal Goalkeeper close in weapon system is at the stern.

OTOBREDA 76/62 Super Rapid

Specifications
Gun
Calibre: 76 mm (3 in)
Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 120 rds/min
Range: 8.5 n miles (16 km)

Mounting
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.



Hwar *(Q 05) at speed. With a top speed of 35 knots and a heavy armament, the squadron of six of these FACs for the Qatar Emiri Navy will exert a substantial influence on naval operations in the Gulf* (Vosper Thornycroft)

Goalkeeper

Specifications
Gun
Calibre: 30 mm
Length of barrel: 78 calibres
Muzzle velocity: 1,020-1,150 m/s (3,346-3,773 ft/s)
Rate of fire: 4,200 rds/min
Range: 1.6 n miles (3 km)

Mounting
Traverse: 360°
Elevation: −25 to +85°

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

There is a Thomson-CSF DR 3000S ESM system with CS Défense Sidewind electronic warfare co-ordination software. The DR 3000S is a lightweight ESM system covering D/K-bands with higher sensitivity (due to a low-noise amplifier in the antenna) and an instantaneous direction-finding accuracy of 6°. There are six direction-finding antennas under one radome.

Manufacturer/Contractor
Thomson-CSF, Paris, France.

ELECTRONIC COUNTERMEASURES (ECM)

Dassault Salamandre

For ECM activity the ships have a Dassault Salamandre ECM system. The Salamandre has up to three phased array, travelling-wave tube, transmitters in cylindrical radomes on the mast.

Manufacturer/Contractor
Dassault, France.

DECOYS

Dagaie

Dagaie is a trainable mounting with 10 replaceable containers loaded with a mixture of 3/5 and 8/14 µm IR or I/J-band chaff projectiles produced by Etienne Lacroix Défense.

Manufacturer/Contractor
CS Défense, France.

COMMAND AND CONTROL SYSTEMS

Signaal TACTICOS

The 'Barzan' class has a Signaal Tacticos command and weapon control system. This is a distributed architecture system based upon SUN-1S processors with five MOC (Multifunction Operator Consoles) workstations linked by a dual-databus system. In addition to data from on-board sensors the system receives radar data from off-board platforms via a Signaal Link Y datalink.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

ELECTRO-OPTIC SENSORS

Signaal IRSCAN

A Signaal IRSCAN electro-optical tracker is installed and the STING has electro-optical elements. There are also TDS directors.

IRSCAN

Specifications
Weight: 75 kg (165 lb)
Elevation: n/k
Sensors: Thermal imager

RADARS

Type	**MRR***	**1007**	**STING**
Maker	Thomson-CSF	Kelvin Hughes	Signaal

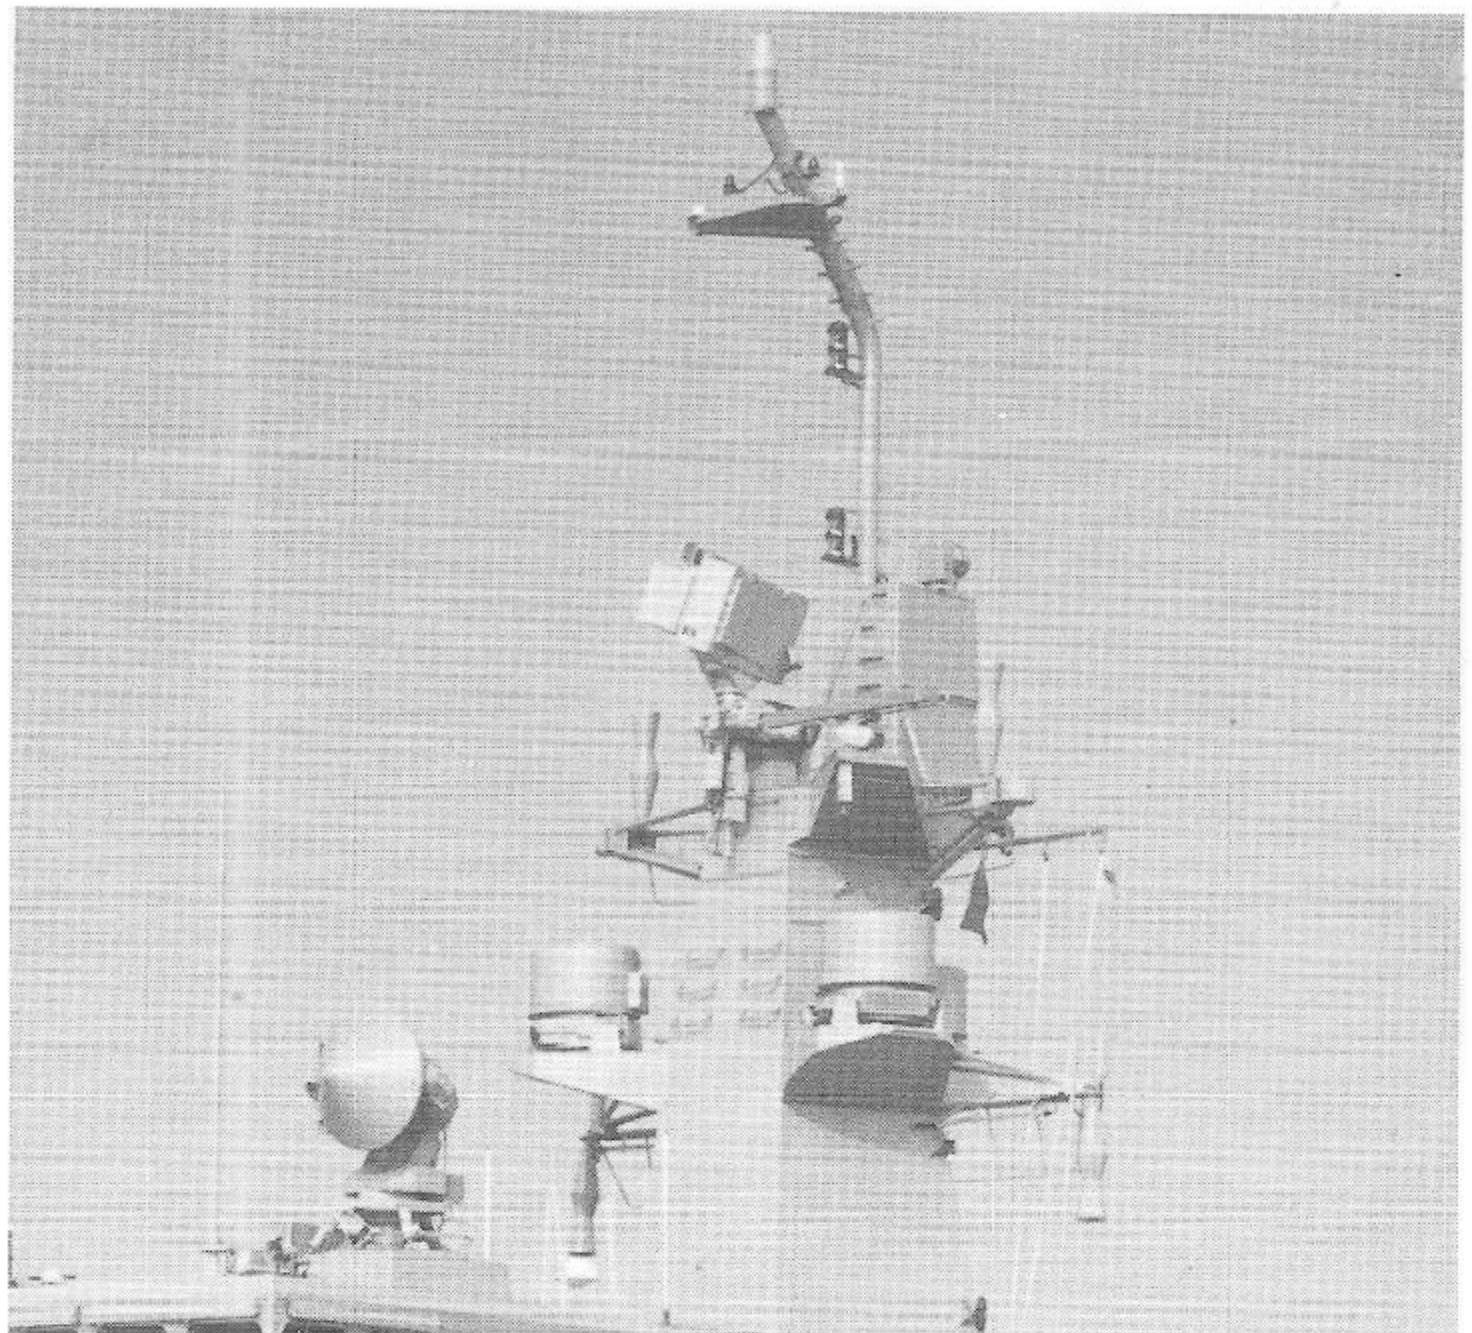
* MRR = MultiRole Radar

TDS

Specifications
Weight: 77 kg (170 lb)
Elevation: −15 to +85°
Sensors: Optical



The mainmast of a 'Barzan' class FAC. On the bridge roof is the Signaal STING fire director. Behind the STING are two of the three radomes of the Dassault Salamandre (ARBB-33) jamming system, while above the port jammer is the horizontal slotted waveguide of the Kelvin Hughes Type 1007 navigation radar. Above the 1007 is the Thomson-CSF MRR (MultiRole Radar) and at the head of the 'swan-neck' topmast is the Thomson-CSF DR 3000S radar intercept array

PROPULSION

Specifications
System: Diesel
Main machinery: 4 MTU 20V 538 TB93; 13.8 MW (18,740 hp)
Shafts: 4
Ships services: 3 Deutz 260 kW diesel generators; 1—135 kW emergency generators

FURTHER INFORMATION

PROGRAMME

Four of these Vita-based designs were ordered in 1992 from Vosper Thornycroft and the first two commissioned in October 1996 with *Al Udeid* and *Adeebel* scheduled to be commissioned in 1997.

DESIGN

The main propulsion, electrical generation and auxiliary systems are operated from a one-man console while the bridge can also monitor all compartments for damage control purposes. The sideplating of the hull forward has a pronounced 'knuckle' to reduce spray. In addition to the weapons mentioned above these ships carry two 12.7 mm machine guns.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Otomat Mk 2 TG1

Federación, Libertad, Victoria only. These three vessels have two launchers for Otomat Mk 2 TG1 anti-ship missiles at the stern.

Specifications
Length: 4.46 m (14.62 ft)
Diameter: 46 cm (18 in)
Wing span: 1.36 m (4.46 ft)
Weight: 770 kg (1,698 lb) (with boosters)
Speed: Mach 0.9
Range: 35 n miles (65 km) (Longer ranges require helicopter support)
Warhead: 210 kg (465 lb)
Guidance: Inertial with active radar homing

Manufacturers/Contractors
Alenia Missile Systems.
Matra BAe Dynamics.

Federación *(PC 12), also as built, with a Bofors 40 mm/70 in an open mount forward and two OTOBREDA Otomat Mk 2 launchers aft* (Vosper Thornycroft)

GUNS

OTOBREDA Single Compact 30 mm

Constitución, Independencia, Patria only. An OTOBREDA Single Compact 30 mm mounting is installed forward of the bridge.

Specifications

Gun
Calibre: 30 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,040-1,220 m/s (3,412-4,002 ft/s)
Rate of fire: 800 rds/min
Range: 1.6 n miles (3 km)

Mounting
Weight: 1.33 t
Traverse: 360°
Elevation: −13 to +85°

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

OTOBREDA 76 mm (3 in)/62 Compact

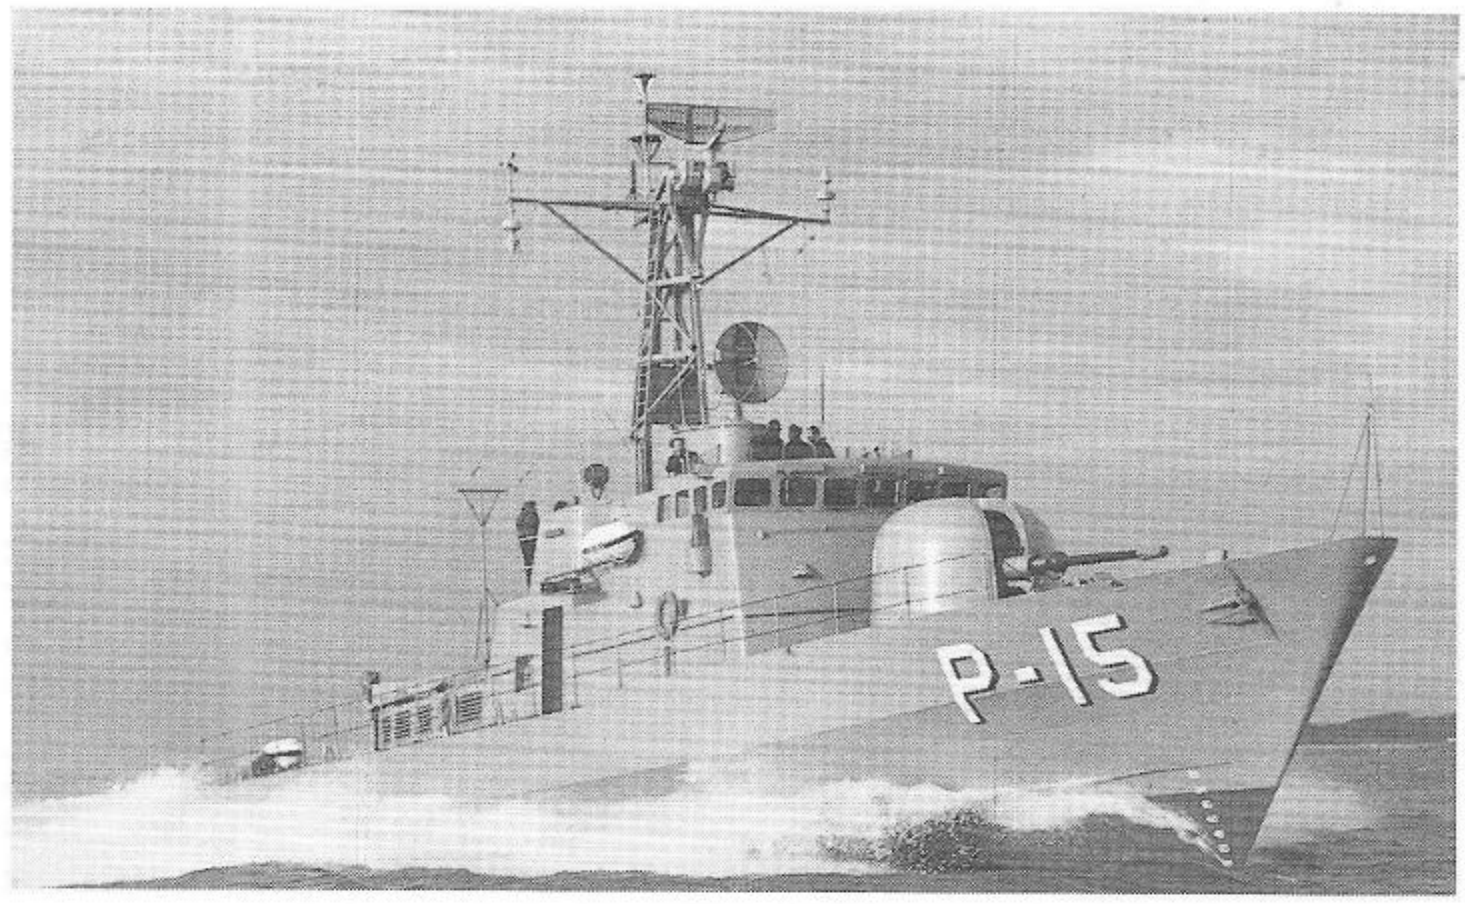
There are two gun mountings; an OTOBREDA 76/62 Compact forward of the bridge and an OTOBREDA twin 40 mm Compact at the stern.

Specifications

Gun
Calibre: 76 mm
Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 85 rds/min
Range: 8.5 n miles (16 km)

Mounting
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.



Patria *(PC 15) as built. This is the gun version with an OTOBREDA 76 mm/62 gun in 'A' position* (Vosper Thornycroft)

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU MD 16V 538 TB90 diesels; 4.4 MW (6,000 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

Ordered from Vosper Thornycroft in 1972 for the coastguard, these vessels were transferred to the navy in 1983. All six have the same hull, but three were completed as missile ships and three as gun ships.

These were the first ships to be built by Vosper Thornycroft to metric (as opposed to Imperial) standards.

The order was obtained at the last minute from a Scandinavian yard at a time when the Venezuelan Navy had already purchased the weapons systems from various Italian companies.

DESIGN

They have steel hulls, subdivided into seven watertight compartments with aluminium bulkheads, and aluminium superstructure. Electrical power is from two GM 6-71 (M) diesels and two Delco-Remy three phase, 60 Hz, 450 V (125 kW) generators.

Plans were made to replace the Otomat missiles with Harpoon in the FAC-missiles and to be added to the FAC-Guns but these plans were cancelled for financial reasons. However, in 1989 the OTOBREDA Bofors 40 mm L/70 was replaced by the 30 mm mounting. These vessels have Vosper Thornycroft roll dampers.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

Otomat Mk 1

There are four launchers for Otomat Mk 1 anti-ship missiles between the superstructures, the forward two are trained to port and the after two are trained to starboard, with all angled towards the bow.

Specifications

Length: 4.66 m (15.28 ft)
Diameter: 46 cm (18 in)
Wing span: 1.36 m (4.46 ft)
Weight: 770 kg (1,698 lb) (with boosters)
Speed: Mach 0.9
Range: 35 n miles (65 km) (Longer ranges require helicopter support)
Warhead: 210 kg (465 lb)
Guidance: Inertial with active radar homing

Manufacturers/Contractors

Alenia Missile Systems.
Matra BAe Dynamics.

SURFACE-TO-AIR MISSILES (SAM)

Man-portable SA-N-5 'Grail' missiles are carried by these vessels.

Specifications

Length: 1.45 m (3.2 ft)
Diameter: 7 cm (2.75 in)
Wing span: n/k
Weight: 9.97 kg (22 lb)
Speed: Mach 1.7
Range: 2.6 n miles (5.5 km)
Warhead: 1.1 kg (2.4 lb)
Guidance: Infra-red passive homing

Manufacturer/Contractor

Fakel, Moscow, Russia.

GUNS

There are two gun mountings; an OTOBREDA 76/62 Compact forward of the bridge and an OTOBREDA twin 40 mm Compact at the stern.

OTOBREDA 76/62 Compact

Specifications

Gun
Calibre: 76 mm
Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 85 rds/min
Range: 8.5 n miles (16 km)

Mounting
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy.

OTOBREDA twin 40 mm L/70 Compact

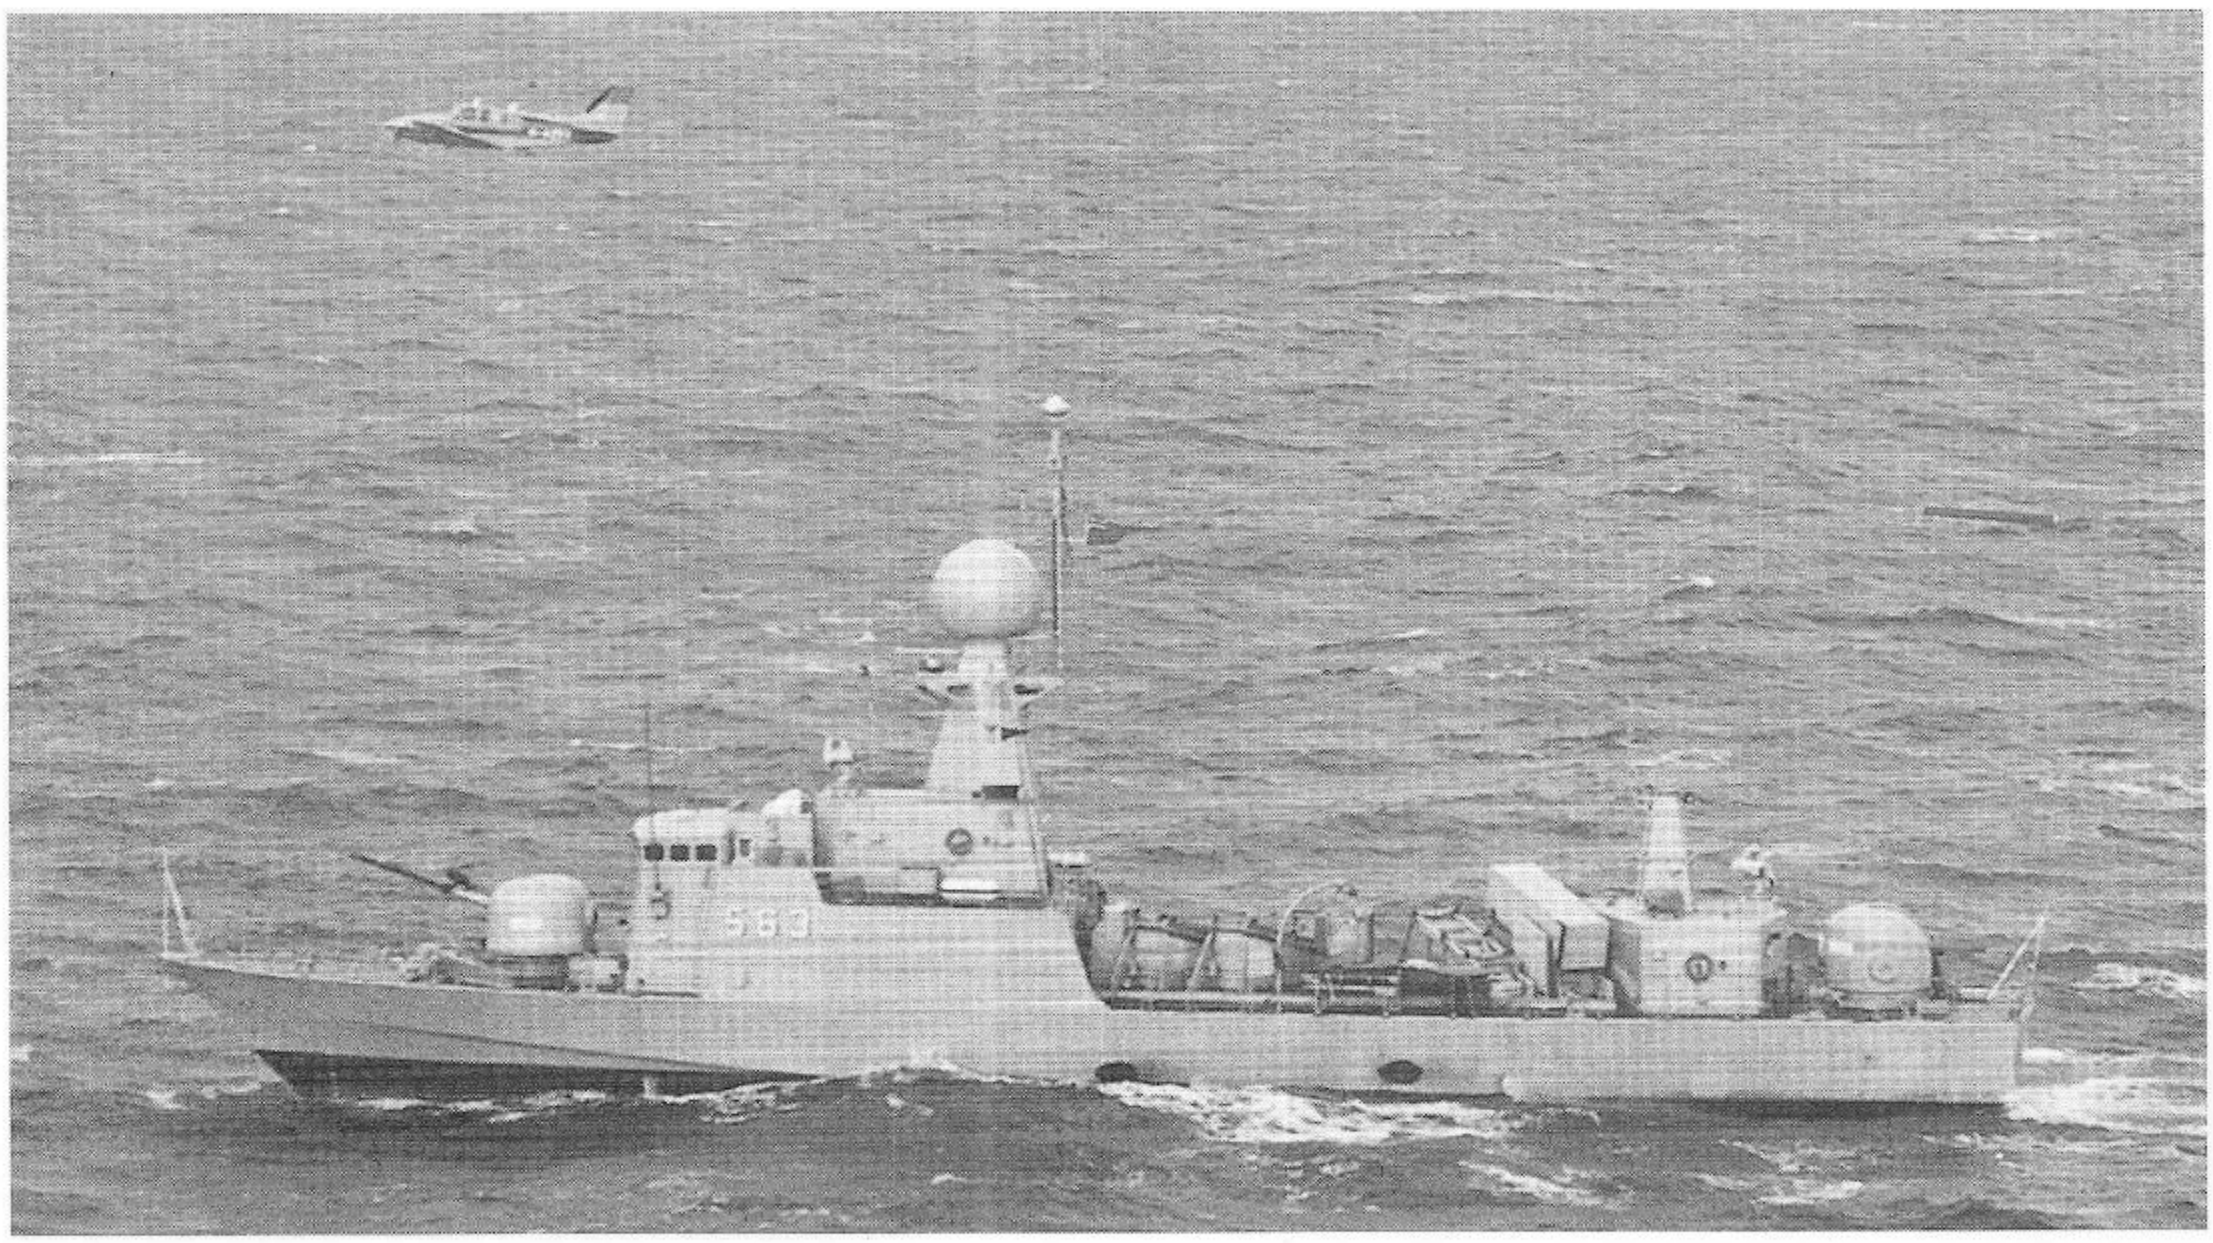
Specifications

Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 600 rds/min
Range: 3.25 n miles (12.5 km)

Mounting
Traverse: 360°
Elevation: −13 to +85°

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy.



A 'Ramadan' class FAC; one of six built for the Egyptian Navy by Vosper Thornycroft. In this picture only one Otomat launcher/container is fitted and the Cygnus jammer has not been installed (Vosper Thornycroft)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Racal-Thorn Cutlass

Cutlass uses the same antenna as RDL and provides bearings, CW bearing and frequency measurement over the E/J-band with instantaneous frequency measurement.

Manufacturer/Contractor

Racal-Thorn, UK.

ELECTRONIC COUNTERMEASURES (ECM)

Racal-Thorn Cygnus

Cygnus is a narrowband tracking jammer covering the D/J-bands and designed to operate with Cutlass for spot or barrage jamming. With one transmitter and two antennas it can jam two targets simultaneously, the 300 kW jammer being tuned by instantaneous frequency measurement.

Manufacturer/Contractor

Racal-Thorn, UK.

Racal-Thorn Protean decoy launcher

Protean consists of two fixed launchers. Each has four magazines with 36 × 40 mm chaff or infra-red payload grenades. The former fire at intervals of 0.1 second per magazine and within 1 second create a 1,000 m^2 decoy cloud while the infra-red ones cover both the 3-5 µm and 8-14 µm bands.

Manufacturer/Contractor

Racal-Thorn, UK.

COMMAND AND CONTROL SYSTEM

GEC-Marconi CAAIS

These ships have the GEC-Marconi CAAIS 450 tactical data handling system and two British Aerospace Systems and Equipment Sapphire weapon control systems. CAAIS is a former Ferranti system with a federated architecture system based upon the FM1600E mini-computer and F100L microprocessors. There is a two-man tactical picture compilation console and the system can track up to 120 targets simultaneously. Sapphire is a radar and electro-optical weapon control system for guns based upon the Sea Archer 1 predictor. The system is operated from a single console.

Manufacturer/Contractor

GEC-Marconi, UK.

PROPULSION

Specifications

System: Diesel
Main machinery: 4 MTU 20V 538 TB91; 11.29 MW (15,360 hp)
Shafts: 4 (three-bladed propellers)

FURTHER INFORMATION

These ships were ordered from Vosper Thornycroft in 1977, laid down from 1978 onwards and commissioned in 1981/1982 using the Vosper Thornycroft 52 m design which was based upon that of the Royal Navy's 'Tenacity' class fast patrol boats. They have steel hulls but, to save weight, extensive use was made of aluminium in the decks, main bulkheads and superstructure. They carry 43 tonnes of fuel oil, while their electricity generator systems produce 420 kW. There are plans to replace the existing Otomat launchers with lightweight ones which will double the payload. New electronic warfare equipment was installed between 1995 and 1996.

Ramadan *(670) on trials, wearing temporary pennant number. Sensor fit includes; two ST802 fire-control directors (one on bridge roof, one on deckhouse roof, aft) S820 air/surface search (atop foremast) and S810 navigation radar (ahead of S820). All are by GEC-Marconi. EW equipment includes DASA Telegon 4 HF/DF (foremast head), Racal Decca Cutlass (below Telegon 4) and Cygnus jammer (small radome atop mainmast)* (Vosper Thornycroft)

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

McDonnell Douglas Harpoon 1C

There are two twin launchers for McDonnell Douglas Harpoon 1C anti-ship missiles in crossover configuration on the afterdeck. The forward pair face starboard and the after pair face port.

Specifications
Length: 4.63 m (15.18 ft) (with booster)
Diameter: 34 cm (13.38 in)
Wing span: 83 cm (32.67 in)
Weight: 681.9 kg (1,503 lb) (with booster)
Speed: Mach 0.85
Range: 67 n miles (124 km)
Warhead: 221.6 kg (500 lb)
Guidance: Inertial navigation and active radar

Tariq *(523)* (H & L van Ginderen Collection)

Al Siddiq *(511), first of nine missile-armed FACs for the Royal Saudi Navy. Armament is heavy for the hull size and includes a 76 mm gun, Vulcan Phalanx CIWS and four Harpoon missiles* (Guy Toremans)

Manufacturer/Contractor
McDonnell Douglas Missile Systems Company, USA.

GUNS

United Defense Mk 75 76 mm/62

A United Defense Mk 75 76 mm gun is mounted forward of the bridge and a Hughes Phalanx close in weapon system at the stern. Amidships there are two US Navy Mk 2 or Mk 4 20 mm Oerlikon mountings.

Mk 75

Specifications
Gun
Calibre: 76 mm
Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 85 rds/min
Range: 8.5 n miles (16 km)

Mounting
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
United Defense, USA.

Hughes Mk 15 CIWS Phalanx

Specifications
Gun
Calibre: 20 mm
Length of barrel: 53 calibres
Muzzle velocity: 1,030 m/s (3,379 ft/s)
Rate of fire: 3,000 rds/min
Range: 0.75 n miles (1.47 km)

Mounting
Traverse: 310°
Elevation: −25 to +85°

Manufacturer/Contractor
Hughes Missile Systems, Tucson, Arizona, USA.

US Navy Mk 20 mm Oerlikon Mk 2/4

Specifications
Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Rate of fire: 450 rds/min
Range: 0.8 n miles (1.5 km)

Mounting
Traverse: 360°
Elevation: −15 to +90°

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

E-Systems AN/SLQ-32(V)1

These vessels use the E-Systems' AN/SLQ-32(V)1 ESM system which is designed to detect missile seekers in the H, I and J-bands. There are two antenna assemblies with two direction-finding receiver arrays each covering 90° supported by a semi-omni-antenna covering 180°.

ELECTRONIC COUNTERMEASURES (ECM)

Loral Hycor Mk 36 SRBOC

The ships have a Lockheed Martin Hycor Mk 36 SRBOC Mod 1 (Super Rapid Bloom Offboard Countermeasures) decoy system with two Mk 137 launchers each with six barrels. These are 160 × 43 × 86 cm (63 × 17 × 39 in) mortar systems which fire a variety of 130 mm chaff and infra-red munitions from cartridges weighing 3.8/22.7 kg (8.4/50 lb) which create chaff clouds up to 2.5 n miles (4.5 km) from the ship.

Manufacturer/Contractor
Loral Hycor, USA.

COMMAND AND CONTROL SYTEMS

Lockheed Martin Mk 92 Mod 5

A Lockheed Martin Mk 92 Mod 5 radar-based weapon control system has a mainframe architecture based upon the AN/UYK-7 mini-computer with two display and control consoles as well as a supervisory console. It can operate against two targets simultaneously using one gun or a surface-to-surface missile.

Manufacturer/Contractor
Lockheed Martin, USA.

RADARS

Type	AN/SPS-55	Mk 92
Maker	Cardion	Lockheed Martin
Role	Search	Weapon control
Frequency	I-band	I-band
Beam	1.5 × 20°	1.5 × 7° 2.4°
Peak power	130 kW	200 kW
Gain	31 dB	33.5 dB

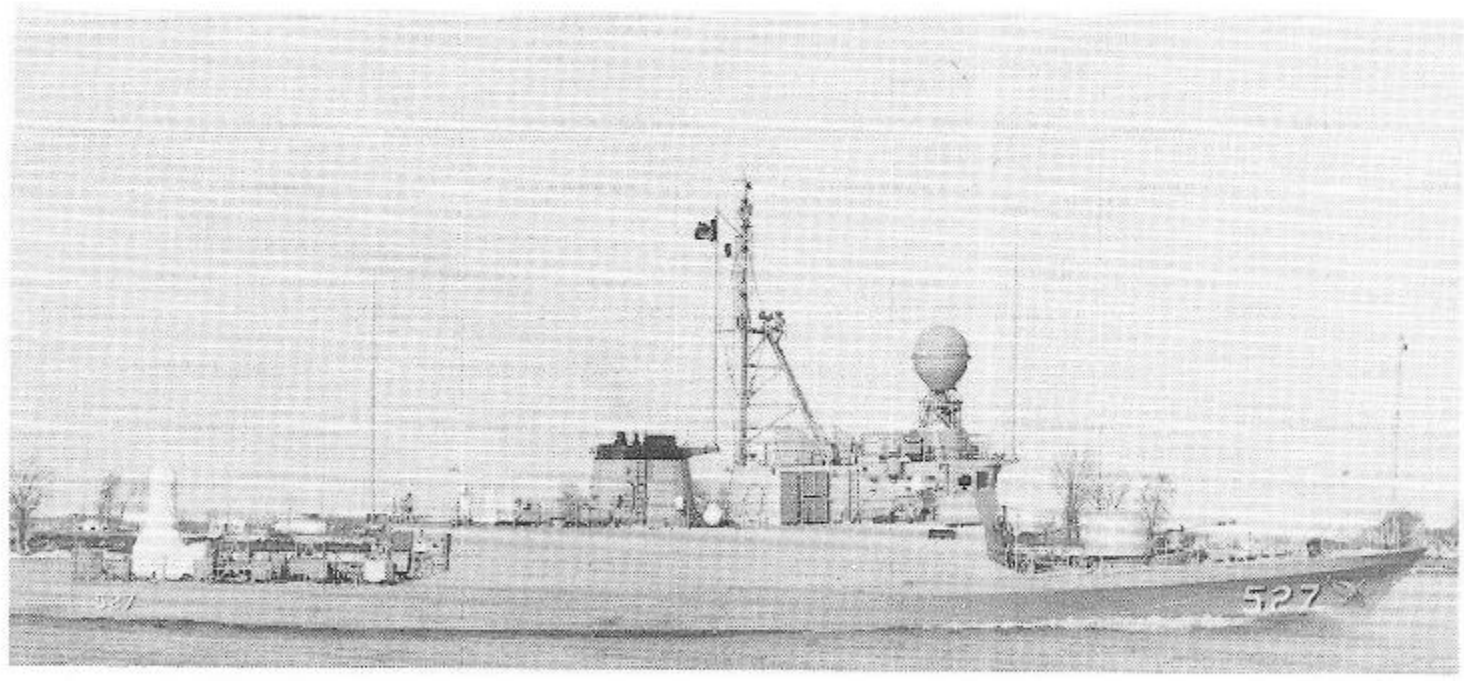
PRF	750, 2,250 pps	1,800, 3,600 pps
Scan rate	16 rpm	60 rpm
Typical range	n/k	16 n miles (30 km)



Abu Obaidah *(527). The prominent 'egg' on the bridge roof houses the Lockheed Martin Mk 92 fire-control radar, a licence-produced version of the Signaal system* (H & L van Ginderen Collection)

PROPULSION

Specifications
System: Combined diesel or gas turbine (CODOG)
Main machinery: 2 MTU 12V 652 TB91 diesels; 2.55 MW (3,470 hp); 1 General Electric LM-2500 gas turbine; 17.2 MW (23,000 hp)
Shafts: 2 with controllable pitch propellers

FURTHER INFORMATION

PROGRAMME

Ordered on 16 February 1972 from the Peterson yard, these vessels were commissioned between 1980 and 1982. They were scheduled for modernisation from the early 1990s but this was postponed for financial reasons in the wake of the Gulf War. In adddition to the armament mentioned above they are also equipped with two 81mm mortars and two Mk 19 40 mm grenade launchers.

DESIGN

They are generally similar in design to the larger 'Badr' class, with an identical propulsion system and alsmost the same weapons systems, except for half the number of Harpoon missiles.

ASHEVILLE

OVERVIEW

The 'Asheville' class has its origins in the mid-1960s, when the emphasis in United States military planning was on small wars, infiltration and 'special forces'. There was also a perceived requirement for small, very fast vessels to play a part in US operations against Cuba. As the design was being prepared gas turbines were coming into use in naval warships and it was decided to give the 'Asheville' class a CODOG propulsion system, with a single General Electric LM-1500 gas turbine and two Cummins diesels.

A total of 17 'Asheville' class vessels was built by Tacoma Boatbuilding and Peterson Brothers and they were employed by the US Navy in a variety of roles. They saw service in the Vietnam War, where they were particularly valued in riverine operations, and they also simulated attacking Soviet missile boats in US and NATO exercises. Some were also employed in trailing Soviet ships in the Mediterranean, for which they were armed with a naval version of the Standard air-to-ground anti-radiation missile (ARM).

Their careers in the US Navy were short. Having been commissioned between 1967 and 1970, the first transfers took place in 1973. They were then either transferred or stricken until the last two, which had been retained to train Saudi Arabian crews, were transferred to Colombia in 1983 to combat drug smuggling.

The Asheville class suffered from a bad reputation for a variety of reasons. First, they suffered from propeller cavitation at high speeds and never reached their design maximum, although this might have been overcome by new propellers. Secondly, they were uncomfortable in a seaway. Thirdly, they were mechanically unreliable and have caused problems to some of the foreign navies who received them after their US Navy service was completed.

TABLE I. ASHEVILLE CLASS

Name	Pennant number	Builder	Completed	US Navy Fate	Current Status	Remarks

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

These ships have two missile launchers. Greek vessels use SS 12M while Korean ones use Standard Anti-Radiation Missiles.

Aerospatiale SS 12M

Length: 1.86 m (6.1 ft)
Diameter: 21 cm (8.26 in)
Wing span: 65 cm (25.6 in)
Weight: 76 kg (167.5 lb)
Speed: Mach 0.6
Range: 3 n miles (5.5 km)
Warhead: 28.38 kg (62.5 lb)
Guidance: Wire command to line of sight

Manufacturer/Contractor

Aerospatiale Missiles.

RGM-66D Standard ARM

The Standard ARM was developed for use by aircraft (AGM-78) as an air-to-ground anti-radar missile. The RoK Navy uses the Standard ARM in several types of ship, the only known naval application of this variant of the widely used Standard SAM. (See 'Further Information').

Specifications

Length: 4.48 m (14.7 ft)
Diameter: 34 cm (13.4 in)
Wing span: 91.5 cm (36 in)
Weight: 617 kg (1,358 lb)
Speed: Mach 2.5
Range: 70 n miles (130 km)
Warhead: 100 kg (222 lb) blast fragmentation
Guidance: Inertial navigation with emitter homing

Manufacturer/Contractor
Standard Missile Company, USA.

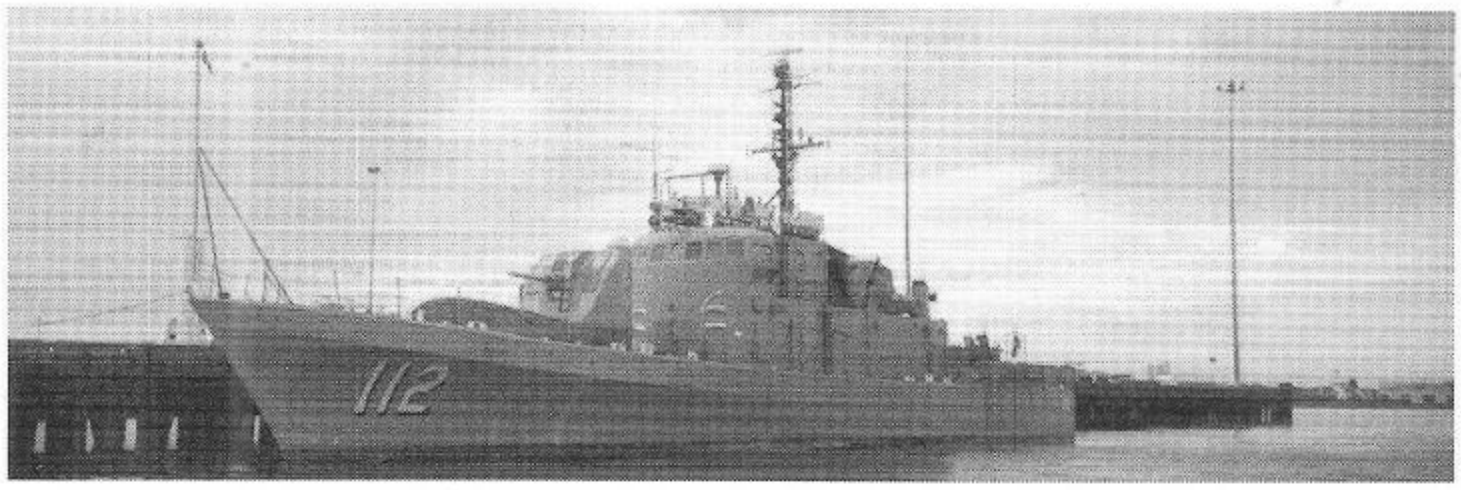
GUNS

One United Defense Mk 34 76 mm is forward of the bridge and one Navy Mk 3 Bofors 40 mm L/60 mounting is at the stern.

United Defense Mk 34 76 mm/62

Specifications
Gun
Calibre: 76.2 mm
Length of barrel: 50 calibres
Muzzle velocity: 823 m/s (2,700 ft/s)
Rate of fire: 50 rds/min
Range: 7 n miles (13 km)

Mounting
Traverse: 355°
Elevation: −15 to +85°



Quita Sueno *(PM 112), a former US Navy 'Asheville' class patrol combatant is now used by the Colombian coastguard on anti-smuggling duties* (Paul Campbell)

Manufacturer/Contractor
United Defense, USA.

US Navy Mk 3 Bofors 40 mm L/60

Specifications
Gun
Calibre: 40 mm
Length of barrel: 56 calibres
Muzzle velocity: 881 m/s (2,890 ft/s)
Rate of fire: 60 rds/min
Range: 5.5 n miles (10 km)

Mounting
Traverse: 360°
Elevation: −6 to +90°

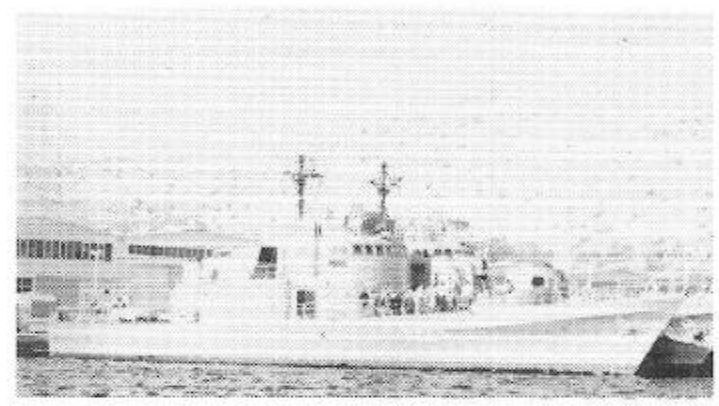
COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

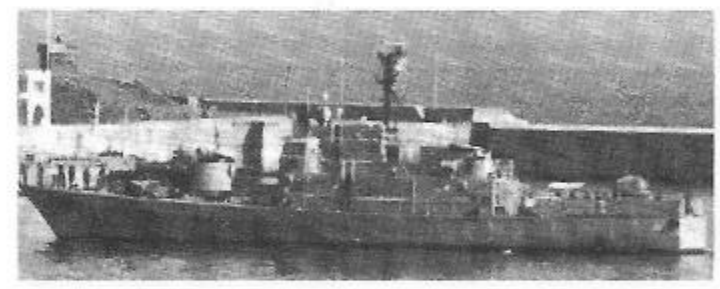
Mk 63 Gun Fire Control System (GFCS)
A Mk 63 radar-based weapon control system is used for the 76 mm gun. The SPG-50 radar is augmented by a manned Mk 29 optical sight. This is essentially a Second World War system.

RADARS

Type	1645	AN/SPG-50
Maker	Raytheon	Western Electric
Role	Search	Weapon control
Frequency	I-band	I-band
Beam	4 × 25°	2.5°
Peak power	4 kW	50 kW
Gain	n/k	36 dB
Pulsewidth	0.08, 0.5, 0.25 µs	0.3 µs
PRF	750, 1,500 2,250 pps	1,800 pps
Scan rate	24 rpm	n/k
Typical range	32 n miles (59 km)	29 n miles (55 km)



Tolmi *(P 229) one of two ex-'Asheville' class boats of the US Navy transferred to Greece in 1991. The last to be released, they had been retained to train Saudi Arabian crews. The gas turbine was removed before transfer and top speed is now 16 knots* (Hellenic Navy)



Pae Ku 51 *is the only surviving 'Asheville' class boat still to be armed with the Standard ARM*

PROPULSION

Colombia, Greece

Specifications
System: Diesel
Main machinery: 2 Cummins VT12-875M diesels; 1.08 MW (1,450 hp)
Shafts: 2 (with controllable pitch propellers)

South Korea, Turkey

Specifications
System: Combined diesel and gas turbine (CODOG)
Main machinery: 2 Cummins VT12-875M diesels; 1.08 MW (1,450 hp); 1 General Electric LM 1500 gas turbine; 9.92 MW (13,300 hp)
Shafts: 2 (with controllable pitch propellers)

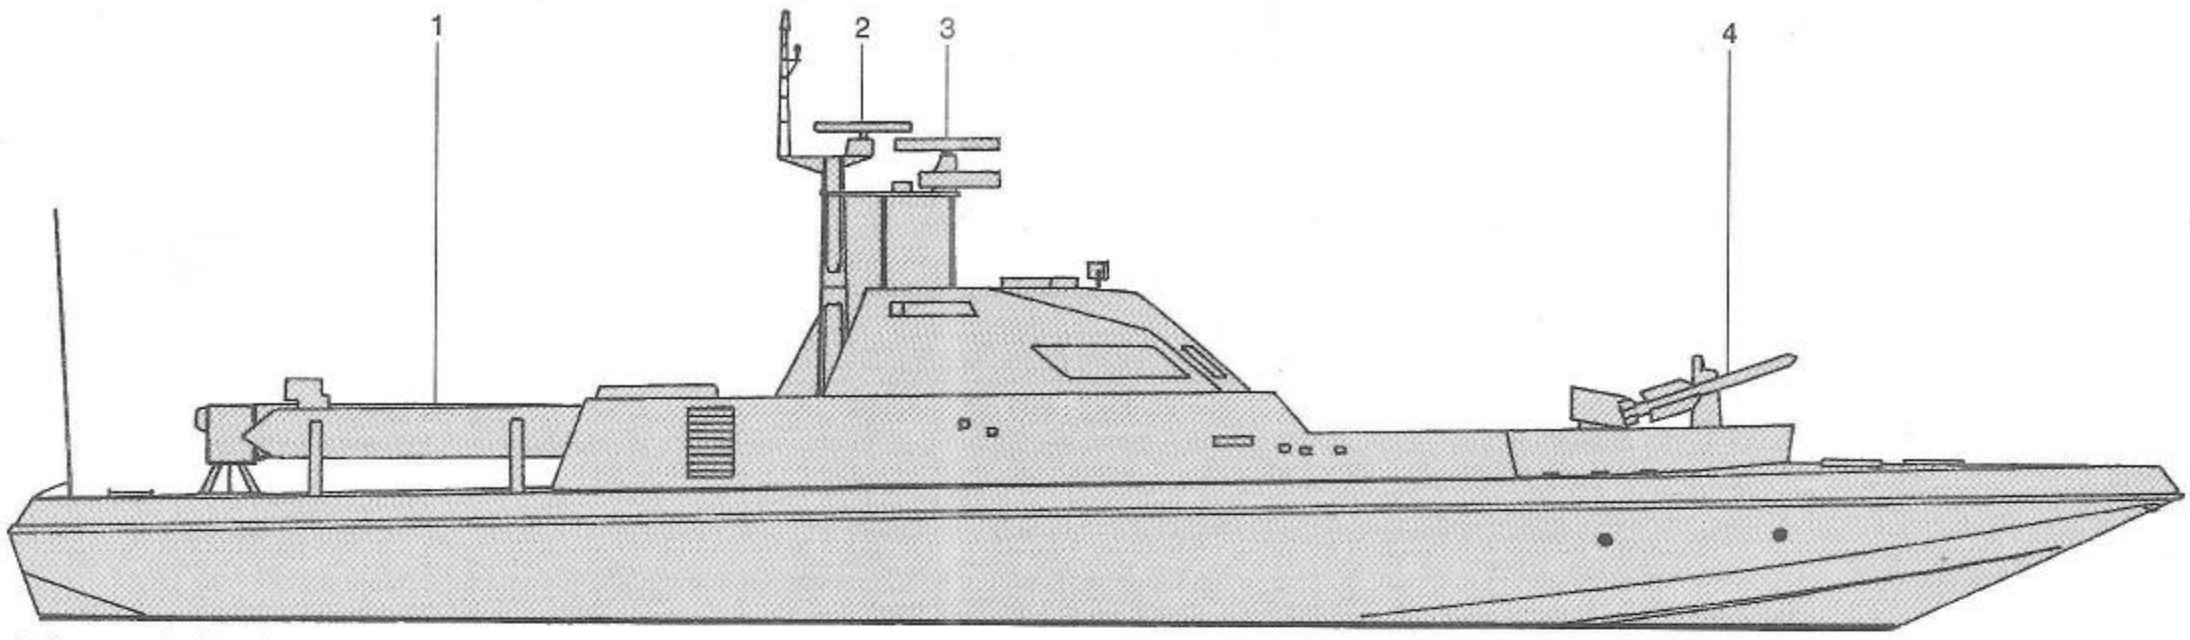
FURTHER INFORMATION

The 'Asheville' class was built by Peterson Shipbuilding and Tacoma Boatbuilding as CODOG Motor Gun Boats and were commissioned in the US Navy between 1966 and 1969. They were transferred or leased to foreign navies from 1971 to 1983, many of them removing the gas turbines.

The South Korean vessel was acquired in 1971 (with its gas turbine) and received missiles in 1975. Greece acquired its two vessels in 1989 (without the gas turbine) and equipped them with missiles upon arrival in 1990.

In addition to the missiles and guns the ships have four 12.7 mm machine guns.

'ISLA CORONADO' CLASS



Isla Coronado (Ian Sturton)
1 *Rigid-hull inflatable boat (RHIB)* **2** *Raytheon AN/SPS-69(V) navigation radar* **3** *Thomson-CSF Agrion weapon control radar* **4** *Twin-arm launcher for Aerospatiale MM 15 anti-ship missile*

WEAPONS SYSTEMS

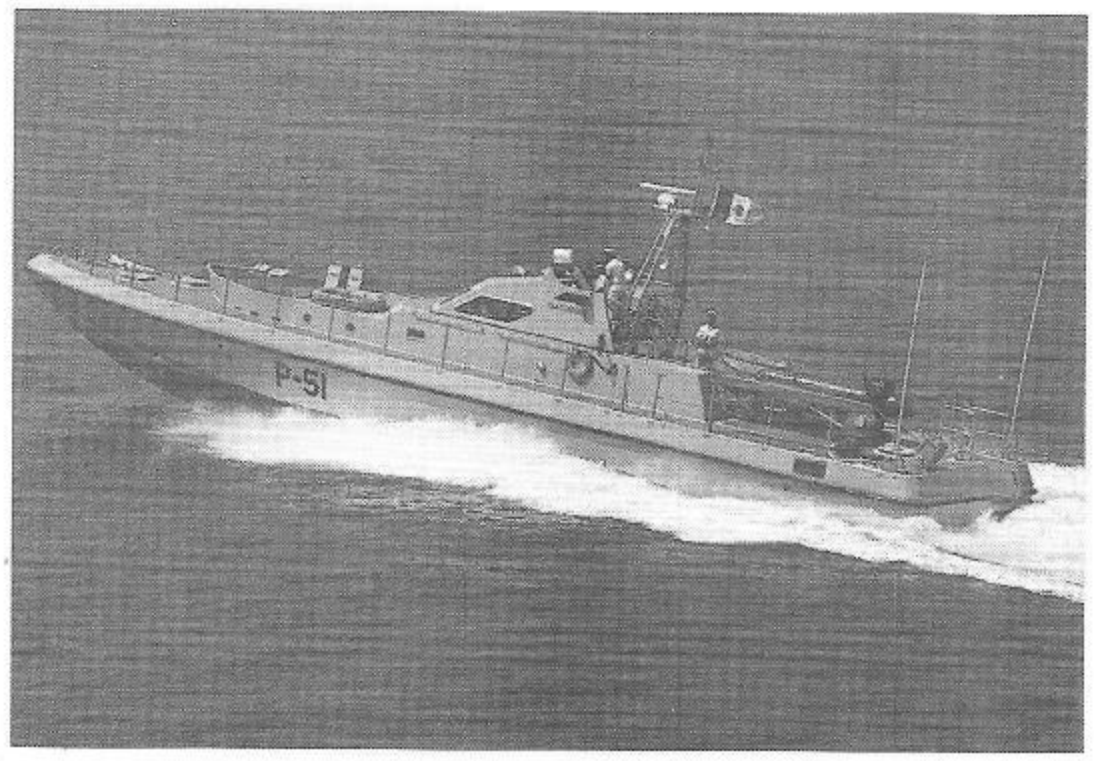
SURFACE-TO-SURFACE MISSILES (SSM)

Aerospatiale MM 15 short-range anti-ship missile

The Mexican Navy is one of the first users of the MM 15 (MM = *Mer-Mer)* system, which is designed to provide small ships with a capability between that of a gun and a long-range missile. The warhead is derived from that used in AS 12M and features a delayed impact fuze. The sensor is the Thomson-CSF Agrion 15 search and fire-control radar, an 8-10 GHz (I/J-band) system with a roll-stablised, disc-like main antenna for panoramic search and tracking, and a second antenna to gather the missile. Agrion produces a very narrow beam which can be used for 360° panoramic sweep or for sector sweep, and may be used in surveillance, surface search and over-the-horizon (OTH) targeting modes.

On detecting the target, the operator switches to automatic tracking, selects the missile and operates the firing button to launch the missile. Given the parameters of the radar altimeter's performance, the missile climbs after launch to a height of no more than 50 m (164 ft). A second missile may be fired against the same target almost immediately afterwards, although against targets at the periphery of the radar's range an interval of 1 minute must elapse. The missile is gathered by the auxiliary antenna and brought into the main radar beam. The target and the missile are tracked simultaneously and automatically with the missile's radar responder providing a highly amplified echo which assists tracking by reducing the effects of sea clutter and ECM activity.

Using differential tracking of both missile and target, the ship's fire-control system computes the necessary



Isla Coronado *(P 51)* (Mexican Navy)

Isla Cozumel *(P 54). Note the revised launcher for two MM 15 anti-ship missiles*

azimuth guidance commands which are automatically transmitted to the missile in coded form through the radar transmission. The commands are decoded in the missile and translated into steering commands. The radar altimeter keeps the missile at a height of up to 15 m (50 ft) above the sea until the terminal phase, 300 m (980 ft) from the target, when it approaches at a height of about 2 m (6.6 ft).

Specifications
Length: 2.3 m (7.55 ft)
Diameter: 18.5 cm (7.3 in)
Wing span: 56.4 cm (22.2 in)
Launch weight: 103 kg (227 lb)
Maximum range: 8.2 n miles (15 km)
Speed: Mach 0.9
Guidance: Radar command

Manufacturer/Contractor
Aerospatiale Missiles, Paris, France.

FURTHER INFORMATION

This Extra Fast Patrol Boat (XFPB) design of fibre-reinforced plastic and Kevlar was built by the Trinity Group's Halter Marine Equitable Shipyard, New Orleans, and commissioned in 1993 and 1994. In addition to missiles they carry a 12.7 mm and two 7.62 mm machine guns. The US Navy uses similar vessels for Special Operations as the 'Pegasus' class.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SSM)

'Dagger' class (Indonesia)
Indonesian ships may embark up to four launchers for Aerospatiale Exocet MM 38 anti-ship missiles on the afterdeck with the forward two facing to starboard and the after two facing to port.

'Pae Ku' class (South Korea)
Korean ships have two forward-facing launchers with Standard Anti-Radiation Missiles (Pae Ku 52, Pae Ku 53, Pae Ku 55) on the stern or two twin launchers for the McDonnell Douglas Harpoon 1C are carried in cross-over configuration aft of the superstructure with the forward set facing to port and the after ones facing starboard.

'Lung Chiang' class (Taiwan)
Taiwanese vessels have two pairs of forward-facing launchers for Hsiung Feng I, two at the rear of the superstructure and two immediately aft of it.

Harpoon 1C (Korea)

Specifications

Diameter: 34 cm (13.38 in)
Wing span: 83 cm (32.67 in)
Weight: 681.9 kg (1,503.6 lb) (with booster)
Speed: Mach 0.85
Range: 67 n miles (124 km)
Warhead: 221.6 kg (500 lb)
Guidance: Inertial navigation and active radar

Manufacturer/Contractor
McDonnell Douglas Missile Systems Company.

RGM-66D Standard ARM (Korea)

Specifications
Length: 4.48 m (14.7 ft)
Diameter: 34 cm (13.4 in)
Wing span: 91.5 cm (36 in)
Weight: 617 kg (1,358 lb)
Speed: Mach 2.5
Guidance: Inertial navigation with emitter homing

Manufacturer/Contractor
Standard Missile Company, USA.

Exocet MM 38 (Indonesia)

Specifications
Length: 5.21 m (17.08 ft)
Diameter: 35 cm (13.77 in)
Wing span: 1.00 m (3.28 ft)
Weight: 735 kg (1,620 lb)
Speed: Mach 0.9
Range: 22.5 n miles (42 km)
Warhead: 165 kg (365 lb)
Guidance: Inertial navigation and active radar homing

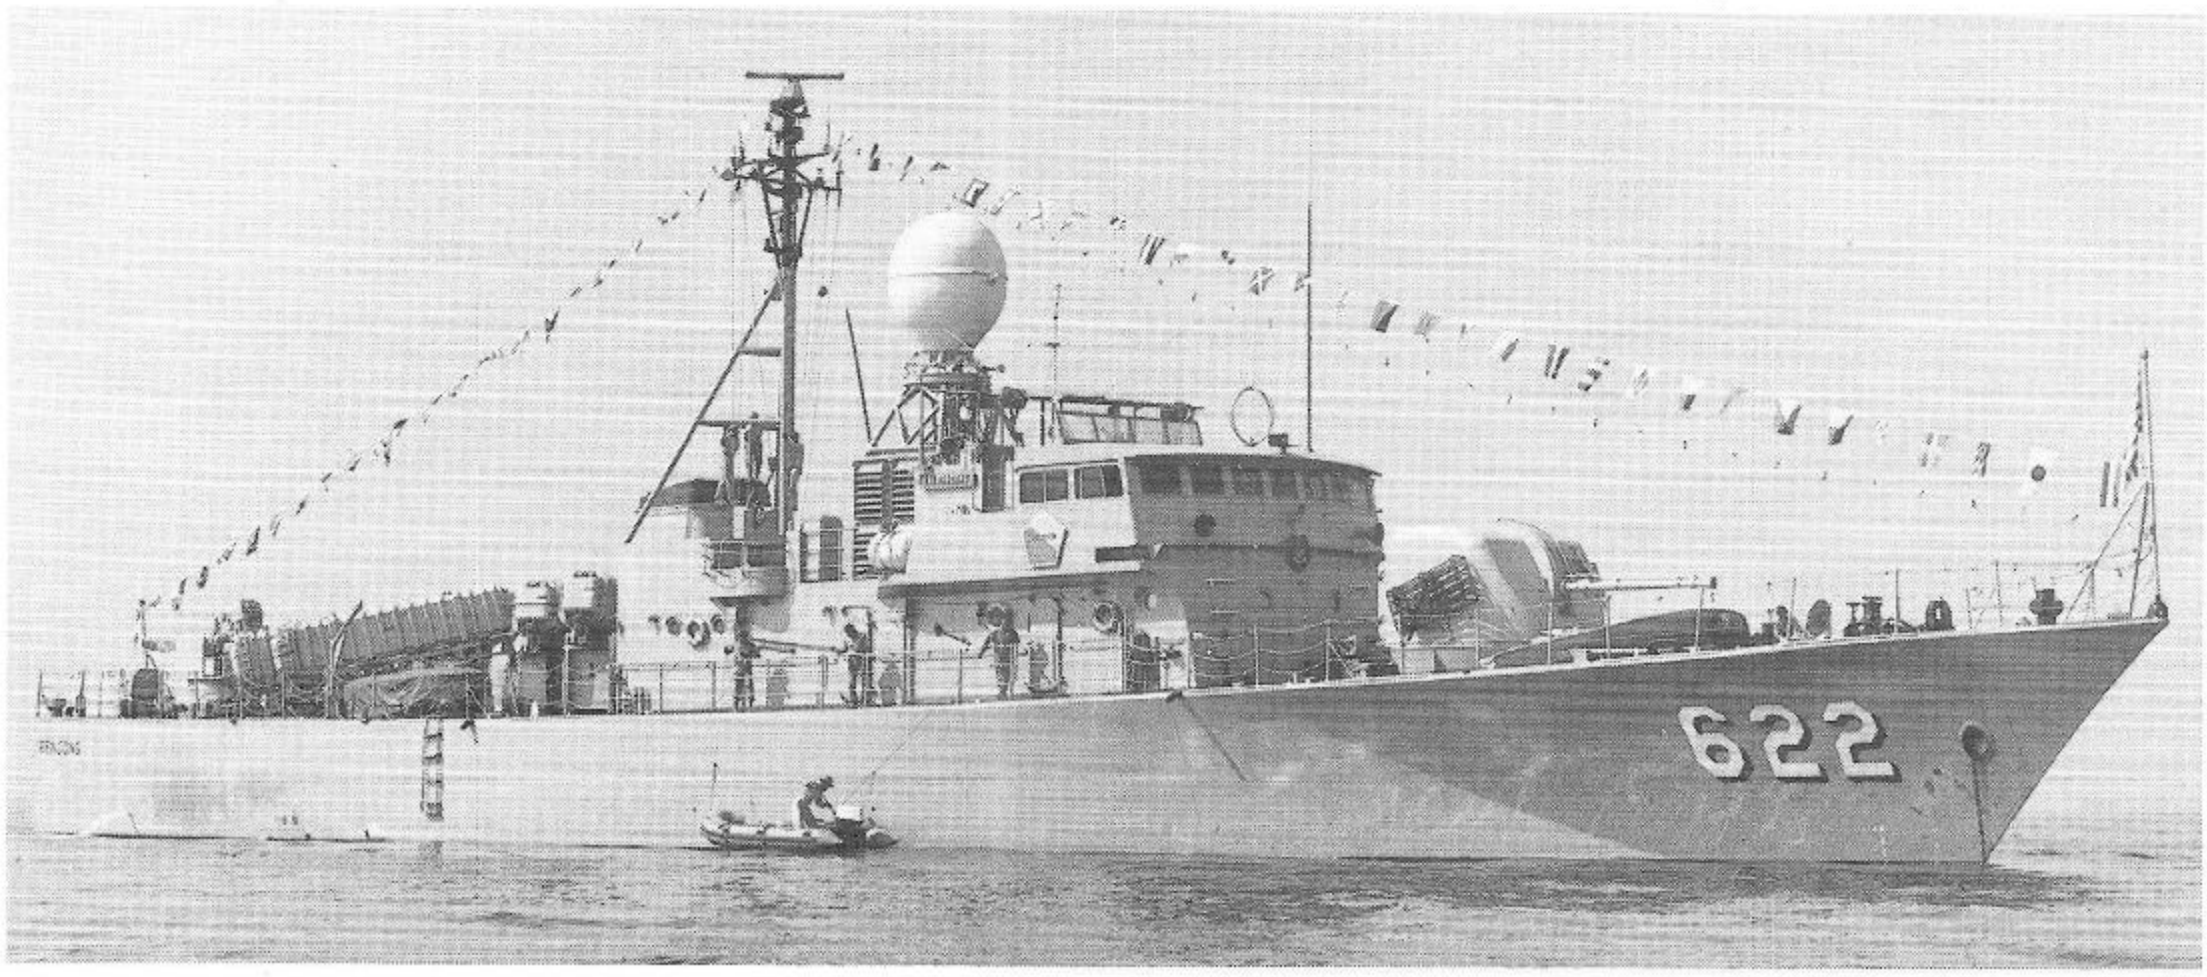
Manufacturer/Contractor
Aerospatiale Missiles, France.

Hsiung Feng I (Taiwan)

Specifications
Length: 3.9 m (12.8 ft)
Diameter: 34 cm (13.4 in)
Wing span: 1.35 m (4.4 ft)
Weight: 540 kg (1,190 lb)
Speed: Mach 0.9
Range: 19 n miles (36 km)
Warhead: 150 kg (330 lb)
Guidance: Semi-active radar and manual

GUNS

'Pae Ku' class (South Korea), 'Lung Chiang' class (Taiwan)



Rencong *(622) of the Indonesian Navy. Weapons include Bofors 57 mm Mk 1 on foredeck (with flare launchers on turret sides), four MM 38 Exocet anti-ship missiles and a Bofors 40 mm/70 at the stern in a gun mount* (John Mortimer)

The Korean ships have either a United Defense Mk 34 (Pae Ku 52, Pae Ku 53, Pae Ku 55) or an OTOBREDA 76/62 Compact forward of the bridge and an Esco (formerly Emerlec) 30 twin 30 mm gun at the stern, this latter armament also being carried by Taiwanese vessels.

'Dagger' class (Indonesia)
The Indonesian ships carry a Bofors SAK 57 Mk 1 gun forward and a Bofors SAK 40 L/70-520 at the stern.

United Defense Mk 34 76 mm/50

Specifications
Gun
Calibre: 76.2 mm
Length of barrel: 50 calibres
Muzzle velocity: 823 m/s (2,700 ft/s)
Rate of fire: 50 rds/min
Range: 7 n miles (13 km)

Mounting
Traverse: 355°
Elevation: −15 to +85°

Manufacturer/Contractor
United Defense.

OTOBREDA 76 mm/62 Compact

Specifications
Gun
Calibre: 76 mm
Length of barrel: 62 calibres
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 85 rds/min
Range: 8.5 n miles (16 km)

Mounting
Traverse: 360°
Elevation: −15 to +85°

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Bofors SAK 57 Mk 1

Specifications
Gun
Calibre: 57 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,020 m/s (3,346 ft/s)
Rate of fire: 200 rds/min
Range: 9 n miles (17 km)

Mounting
Traverse: 360°
Elevation: −10 to +75°

Manufacturer/Contractor
Bofors Ordnance, Sweden.

Bofors SAK 40 L/70-520

Specifications
Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Rate of fire: 300 rds/min
Range: 6.75 n miles (12.5 km)

Mounting
Traverse: 360°
Elevation: −9 to +85°

Manufacturer/Contractor
Bofors Ordnance, Sweden.

Esco 30

Specifications
Gun
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Rate of fire: 600 rds/min/barrel
Range: 3.25 n miles (6 km)

Mounting
Weight: 3.88 t
Traverse: 360°
Elevation: −15 to +80°

Manufacturer/Contractor
Esco, USA.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

'Pae Ku' class (South Korea), 'Dagger' class (Indonesia)
ESM systems are installed in all Korean vessels and the 'Dagger' class ships *Badik* and *Keris*, but they have not been identified.

WD-2
'Lung Chiang' class (Taiwan) only. The domestically produced WD-2A threat-warning receiver is carried to provide early warning of E/J-band threats.

DECOYS

Lockheed Martin Hycor Mk 33 RBOC
'Pae Ku' class (South Korea) only. The Mk 33 RBOC (Rapid Bloom Offboard Countermeasures) decoy launcher system has four launchers each with six mortar barrels at different angles of elevation. These are 112 and 203 mm tubes firing a variety of chaff and infrared cartridges weighing between 4.1 and 18.2 kg (9.0 and 40 lb) which can deploy munitions up to 2 n miles (4 km) from the ship.

AV2
'Lung Chiang' class (Taiwan) only. Taiwanese vessels have four domestically produced AV2 decoy launchers. Each launcher has two tubes firing Rafael-designed chaff rockets which produce an 80 m² cloud.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Mk 63 Gun Fire Control System (GFCS)
Pae Ku 52, Pae Ku 53, Pae Ku 55 (South Korea). The Mk 63 radar-based weapon control system is used for the 76 mm gun and the SPG-50 radar is augmented by a manned Mk 29 optical sight.

Hughes H-930 weapon control system
Pae Ku 56, -57, -58, -59, -61 (South Korea); Sui Chiang (Taiwan). The H-930 is a command and weapon control system with mainframe architecture based upon the AN/UYK-19 mini-computer. The Mod 0 system, with UYK-19 Model 1602 computer, has radar display and weapon control consoles and can control two guns as well as a surface-to-surface missile system. The Mod 2 system, with five UYK-19 Model 1664 computers as well as a pair of display and control consoles, can control up to four guns as well as missiles.

Signaal WM28
'Dagger' class (Indonesia). Indonesian ships have a Signaal WM28 radar-based weapon control system with a mainframe architecture based upon the SMR mini-computer as well as a two-man display and control console. It can operate against two targets simultaneously using two guns or surface-to-surface missiles.

Alenia NA 10
Lung Chiang (Taiwan). *Lung Chiang* has an Alenia NA 10 radar-based weapon control system. This has an autonomous one-man control and display console with a mini-computer and it can control up to three guns and a surface-to-surface missile.

Note
Lung Chiang does not have HR76C

PROPULSION

'Dagger' class (Indonesia)

Specifications
System: Combined diesel or gas turbine (CODOG)
Main machinery: 2 MTU 12V 331 TC81; 1.65 MW (2,240 hp); 1 GE LM 2500; 17.16 MW
Shafts: 2 with controllable pitch propellors

'Pae Ku' class (South Korea)

Specifications
System: Gas turbine (COGAG)
Main machinery: 6 Avco Lycoming TF 35; 12.53 MW (16,800 hp)
Shafts: 2

'Lung Chiang' class (Taiwan)

Specifications
System: Combined diesel and gas turbine (CODAG)
Main machinery: 3 Detroit Diesel 12V-149TI; 2.04 MW (2,736 hp); 3 Avco Lycoming TF-40A gas turbines; 8.95 MW (12,000 hp)
Shafts: 3 with controllable pitch propellers

FURTHER INFORMATION

PROGRAMME

The Patrol Ship, Multi-Mission, 5 (PSMM 5) design was prepared by Tacoma Boatbuilding and was based upon the Asheville design. Three (*Pae Ku* 52, *Pae Ku* 53, *Pae Ku* 55) were built for Korea by Tacoma and commissioned between 1975 and 1976. The remainder were built by Korea Tacoma Marine and commissioned in 1977 and 1978.

The Indonesian vessels were ordered from Korea Tacoma, Masan in 1975 and commissioned between 1979 and 1980. They are smaller derivatives of the PSMM Mk 5. The Taiwanese vessels are similar, *Lung Chiang* being built by Tacoma and *Sui Chiang* by China Shipbuilding (due to the HR 76 she has a large lattice mast). It was planned to build six of this class with Harpoon missiles but Washington's refusal to sell the missiles, poor sea-keeping qualities (despite the provision of roll dampers) and fires due to overheating of the gas turbine gearboxes led to the abandonment of this plan.

Patrol versions of the PSMM 5 are used by Thailand.

DESIGN

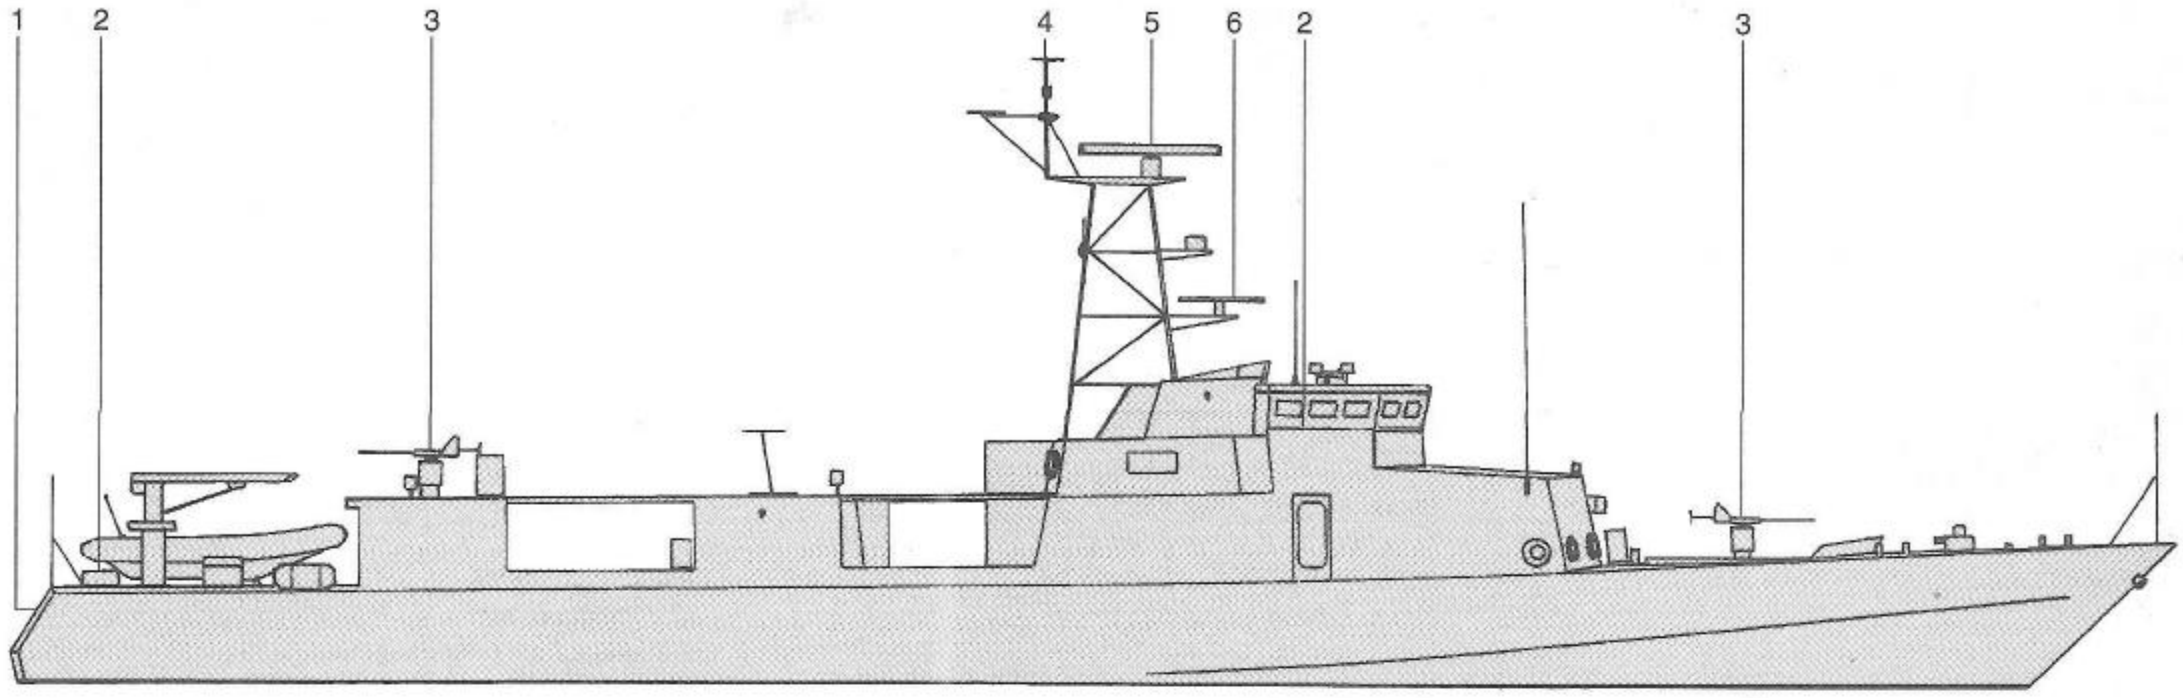
The design is based on that of the 'Asheville' class, with the Indonesian and Taiwanese boats being the same size as the original, while those for Korea were slightly longer. The hull is constructed of aluminium and while the superstructure of the Indonesian boats resembles the original Asheville, that of the Korean and Taiwanese boats is quite different.

The propulsion arrangements differ significantly, with the Korean boats having no less than six gas tubines, of which between one and three per shaft can be connected, with a variety of power settings. The Indonesian boats have a CODOG system with one gas turbine and two diesels, while the Taiwanese boats have CODOG with three gas turbines and three diesels.

They carry 65 tonnes of fuel and their electricity generation systems produce 400 kW.

All carry, in addition to the armament mentioned above, two 12.7 mm machine guns.

CYCLONE CLASS



Cyclone (Ian Sturton)
1 *Platform for launching/recovering SEALs* **2** *Weapon mounts (either 12.7 mm machine guns, or 7.62 mm MGs, or 40 mm grenade launcher) (four total)* **3** *Sea Snake Mk 38 Mod 0 25 mm automatic cannon* **4** *AN/APR-39(V)1 radar warning* **5** *Sperry RASCAR surface search radar* **6** *Raytheon AN/SPS-64(V)9 navigation radar*

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES (SAM)

FIM-92C STINGER-RMP

'Cyclone' class vessels carry a Stinger launcher, with six missiles. The system consists of the M46A2 launcher, the sighting system, M41 missile in its launcher-container, and the battery coolant unit (BCU). The rocket motor's first stage drives the missile out of the launch tube and the aerodynamic surfaces deploy; then, after 1.6 seconds and with the missile 6 to 7 m (19.7 to 23 ft) clear of the launcher, the sustainer ignites, the warhead is armed, and the seeker starts to operate.

Stinger-RMP (FIM-92C) uses a rosette-pattern image scanning technique with IR and UV (Ultra-Violet) detectors, and has two microprocessors integrated into the signal processor. The IR data is processed to determine the relative angle between the missile and the target and an intercept point is then predicted using a proportional navigation guidance technique.

On receiving the alert, the operator shoulders the system, acquires the target through the optical sight and operates the IFF interrogator which responds with an audio signal in 0.7 seconds. First pressure on the trigger energises the cooling unit and, when the missile seeker has acquired the target, an audio signal tells the

operator to depress the trigger fully and the missile is launched. The total time elapsed between initiation of the firing sequence and motor ignition is 1.7 seconds. The weapon can be assembled for another engagement in 15 seconds.

Specifications
FIM-92C
Length: 1.52 m (5.0 ft)
Diameter: 70 cm (27.5 in)
Weight: 10.1 kg (22 lb)
Speed: Mach 2.2
Range: 8,000 m (26,246 ft)
Altitude: 3,500-3,800 m (11,483-12,467 ft)
Guidance: IR/UV passive homing

Manufacturers/Contractors
Hughes Missile Systems.
Raytheon Company, Missile Systems Division (second source).

GUNS

25 mm Mk 38 Mod 0 automatic cannon (Sea Snake)
There are two Mk 38 Mod 0 25 mm cannon (Sea Snake) on Mk 88 mountings: one is on the foredeck, the other on a raised platform, aft. This weapon is designed to engage surface and shore targets in low- and mid-intensity operational environments at ranges up to 1.33 n miles (2.5 km), and consists of a single barrel, externally powered weapon incorporating a rotating bolt mechanism driven by a chain. The barrel recoils separately from the receiver, reducing the available travel as the bolt also has to move, the travelling distance being 12.7 mm. The Mark 38 can fire single shots or 175 rds/min and features twin shoulder braces and an optical Aimpoint sight. The peak recoil force is 4,536 kg (10,000 lb) in the naval version but with a McDonnell Douglas muzzle brake modification and recoil damper this can be reduced to 2,721.5 kg (6,000 lb). The barrel life is in excess of 13,000 rounds while the demonstrated reliability of the weapon is 22,000 rounds between stoppages.

Specifications
Calibre: 25 mm
Length of barrel: 81 calibres
Muzzle velocity: 1,100 m/s (3,609 ft/s)
Traverse: 300°
Elevation: −20 to +55°
Weight: 596.5 kg (1,315 lb) (loaded)
Crew: 1 (often supported by a spotter)
Range: 1.33 n miles (2.47 km)
Rate of fire: 175 rds/min (max)
Ammunition: 184 g HEI-T

Interchangeable mountings
There are four weapons positions which are designed to accommodate either 12.7 mm machine guns, 7.62 mm machine guns, or Mk 19 40 mm grenade launchers. These positions are located, two on the port bridge wing; one on the starboard bridge wing; and one on the stern, on the starboard side.

Mk 26 Mod 17 12.7 mm machine guns
Two Mk 26 Mod 17 machine guns are carried. This is a selective fire, short recoil, automatic weapon with a 1,143 mm (45 in) long barrel. Muzzle energy is 1,867 mkp and the weapon uses 110-round belts.

Specifications
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)
Gun weight: 38.1 kg (84 lb)

M60 7.62 mm MGs
Two M60 machine guns are carried. These are the standard weapons used throughout the US armed forces.

Specifications
Weight: 10.51 kg (23 lb)
Muzzle velocity: 855 m/s (2,805 ft/s)
Rate of fire: 550 rds/min (cyclical); 200 rds/min (practical)

Mk 19 40 mm grenade launchers in Mk 64 mountings
Two grenade launchers are carried.

Specifications
Grenade Launcher Mk 19
Ammunition: M-406/M-463 High Explosive, M-407 Target Practice and M-430 High Explosive Dual Purpose (HEDP)
Fuzes: Impact detonating fuzes
Performance: M-430 penetrates 50 mm of rolled homogeneous armour at 2.2 km. In anti-personnel role will kill or seriously injure everyone within a 15 m (49 ft) radius of detonation
Muzzle velocity: 241 m/s (791 ft/s) (nominal)
Range: 2.21 km
Rate of fire: 475 rds/min (practical 325-375 rds/min)
Weight: 227 kg (500 lb)

Mark 64
Weight (unloaded): 422 kg (930 lb) (521 kg (1,148 lb) with shield)
Elevation: −15 to +65°
Traverse: 180°

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

E-Systems AN/APR-39(V)1 radar warning
The AN/APR-39 radar warning receiver (RWR) was initially designed for use in helicopters and light aircraft, but has been adapted for use in FACs. It covers the F to I frequency bands and gives both visual and audio warnings of hostile radar transmissions.

DECOYS

Mk 52 chaff launchers
There are two Mk 52 six-tube chaff launchers.

COMMAND AND CONTROL SYSTEMS

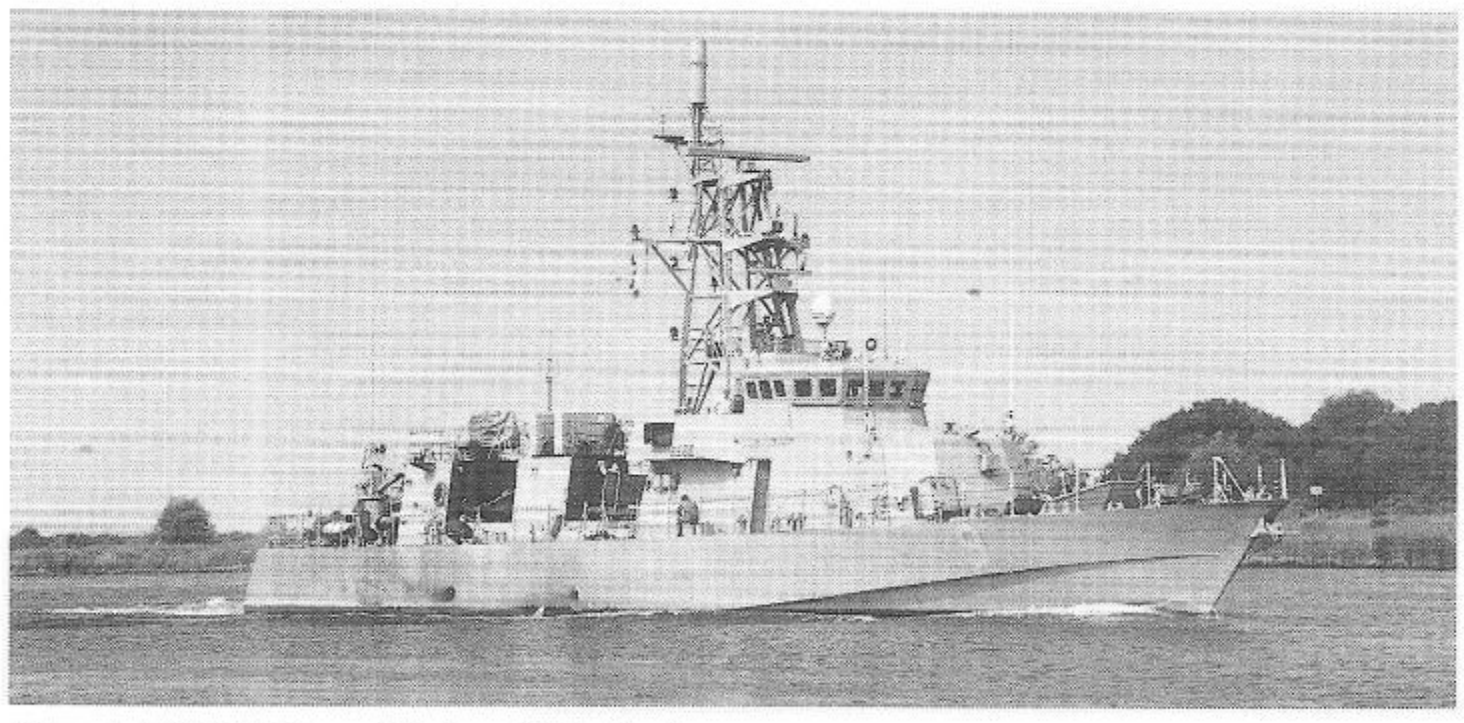
WEAPONS CONTROL

GEC-Marconi/McLennan VISTAR IM 405 electro-optic surveillance system
The VISTAR surveillance system is used at night and in poor visibility and consists of a servo-controlled sensor tracker head with second-generation image intensifier and a thermal imager, together with a display system. The tracker head features two-axis gyrostabilisation and may be slaved to a search radar and has a glass fibre hood for environmental protection. The McLennan Marine image intensifier amplifies light up to 80,000 times and is coupled by a fibre optic link to a VISTAR camera. The GEC-Marconi thermal imager operates in the 8-12 µm waveband and uses cadmium mercury telluride detectors.

Specifications
Maximum range: up to 8 n miles
Effective range: 2-8 n miles
Sensor head
- **weight:** 50 kg (110 lb)
- **height:** 42 cm (16.5 in)
- **width:** 63 cm (24.8 in)
- **length:** 60 cm (23.6 in)

Slew rate: 30°/s
Azimuth coverage: 340°
Elevation coverage: ±30°
Field of view
- **image intensifier:** 16 × 12°
- **thermal imager:** 9.6 × 5.6° (×2); 4.0 × 2.3° (×5)

Manufacturers/Contractors
GEC-Marconi Radar and Control, UK.
McLennan Marine Ltd, USA.



Chinook *(PC 9)* (H & L van Ginderen Collection)

RADAR

Sperry RASCAR
The Sperry RASCAR is an E/F/I/J band surface search radar.

Raytheon AN/SPS-64(V)9

Specifications
Role: Navigation
Frequency: I-band
Beam: 1.9 × 22°
Peak power: 20 kW
Gain: 20 dB
Pulsewidth: 0.06/0.5/1.0 µs
PRF: 3,600/1,800/900 pps
Scan rate: 33 rpm

Manufacturer/Contractor
Raytheon.

SONAR

Wesmar sonar
The 'Cyclone' class is fitted with a Wesmar hull-mounted, active, high-frequency, side-scanning sonar.

PROPULSION

Specifications
System: Diesel
Main machinery: 4 Paxman Valenta 16RP200CM diesels, 10 MW (13,400 hp) sustained
Shafts: 4

FURTHER INFORMATION

PROGRAMME

The US Navy had been seeking for some time to find a new craft to replace some elderly patrol boats, whose prime mission was to transport SEAL teams. Sixteen vessels were planned, but the first contract for eight was awarded in August 1990 followed by a second for five more in July 1991, and the last three will not now be ordered. The vessels are being built by Bollinger Shipyard, at Lockwood, Louisiana, a shipyard which had previously built 49 'Island' class patrol boats for the US Coast Guard to a modified Vosper Thornycroft design.

DESIGN

The design is based on the Vosper Thornycroft 'Ramadan' class, which was built for the Egyptian, Kenyan and Omani navies, but was modified to meet the US Navy's operational requirements. These modifications included a lighter armament than other versions of the 'Ramadan' class, 25.4 mm (1 in) Kevlar armour on the superstructure, shoulder-launched Stinger SAM, a slow speed loiter capability, and a swimmer platform in the transom.

They are fitted with the Vosper roll damping system.

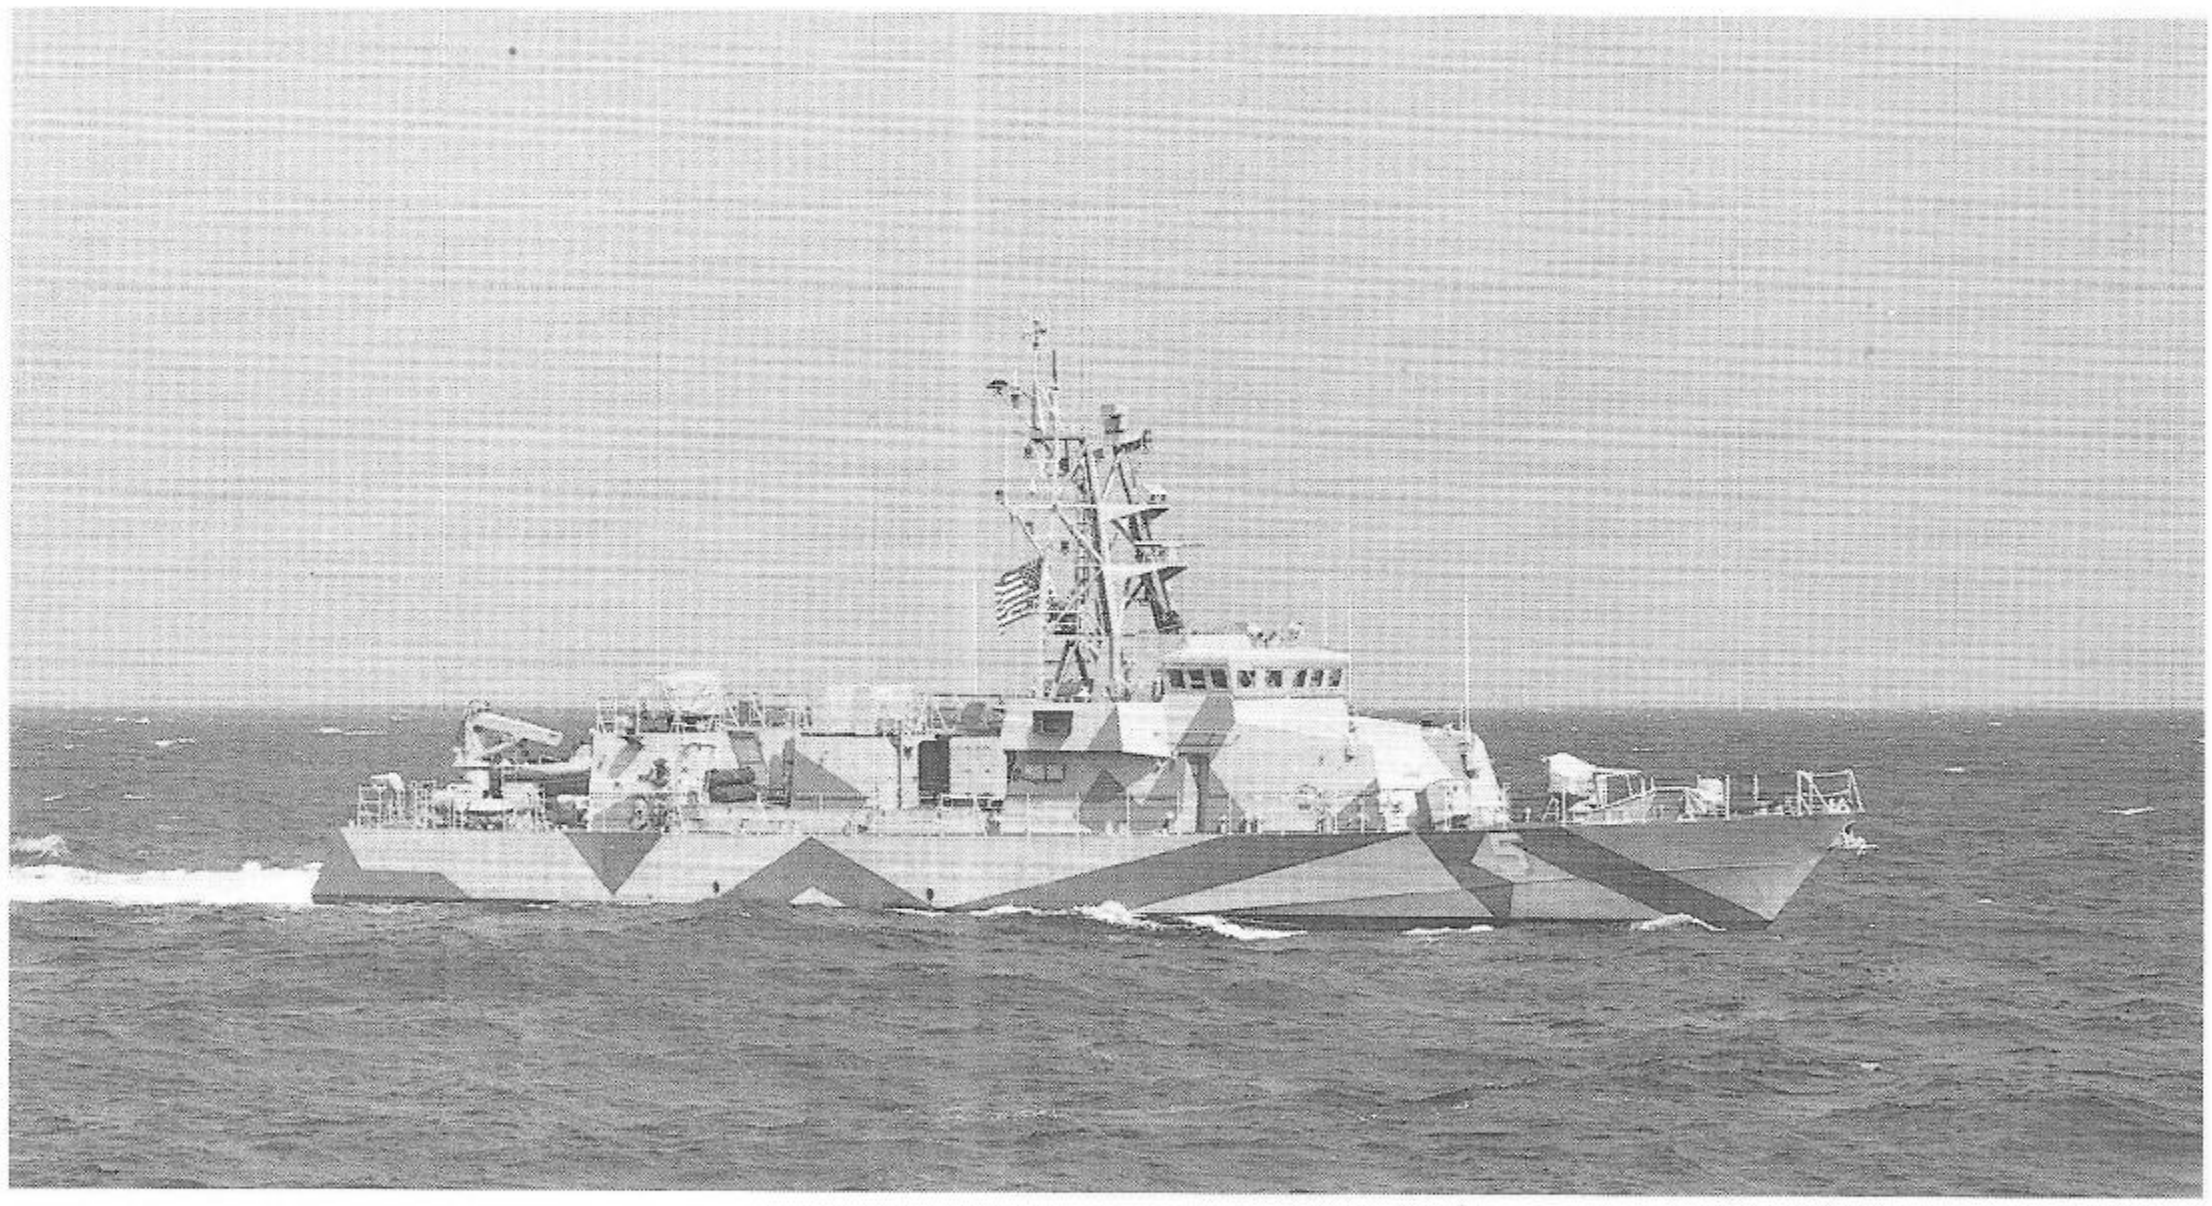
OPERATIONAL

The vessels are based at Norfolk, Virginia and San Diego, California, and operate in pairs supported by a 12-man maintenance team in two trucks ashore.

They carry up to eight SEALs, plus two SEAL raiding craft and one RIB. Swimmers are launched and recovered from a platform in the transom, which has a door providing direct access into the hull.

THE FUTURE

A stabilised weapons platform system is being developed for Stinger or Hellfire and a combat system is being developed to integrate the navigation, ship control and weapons control systems.



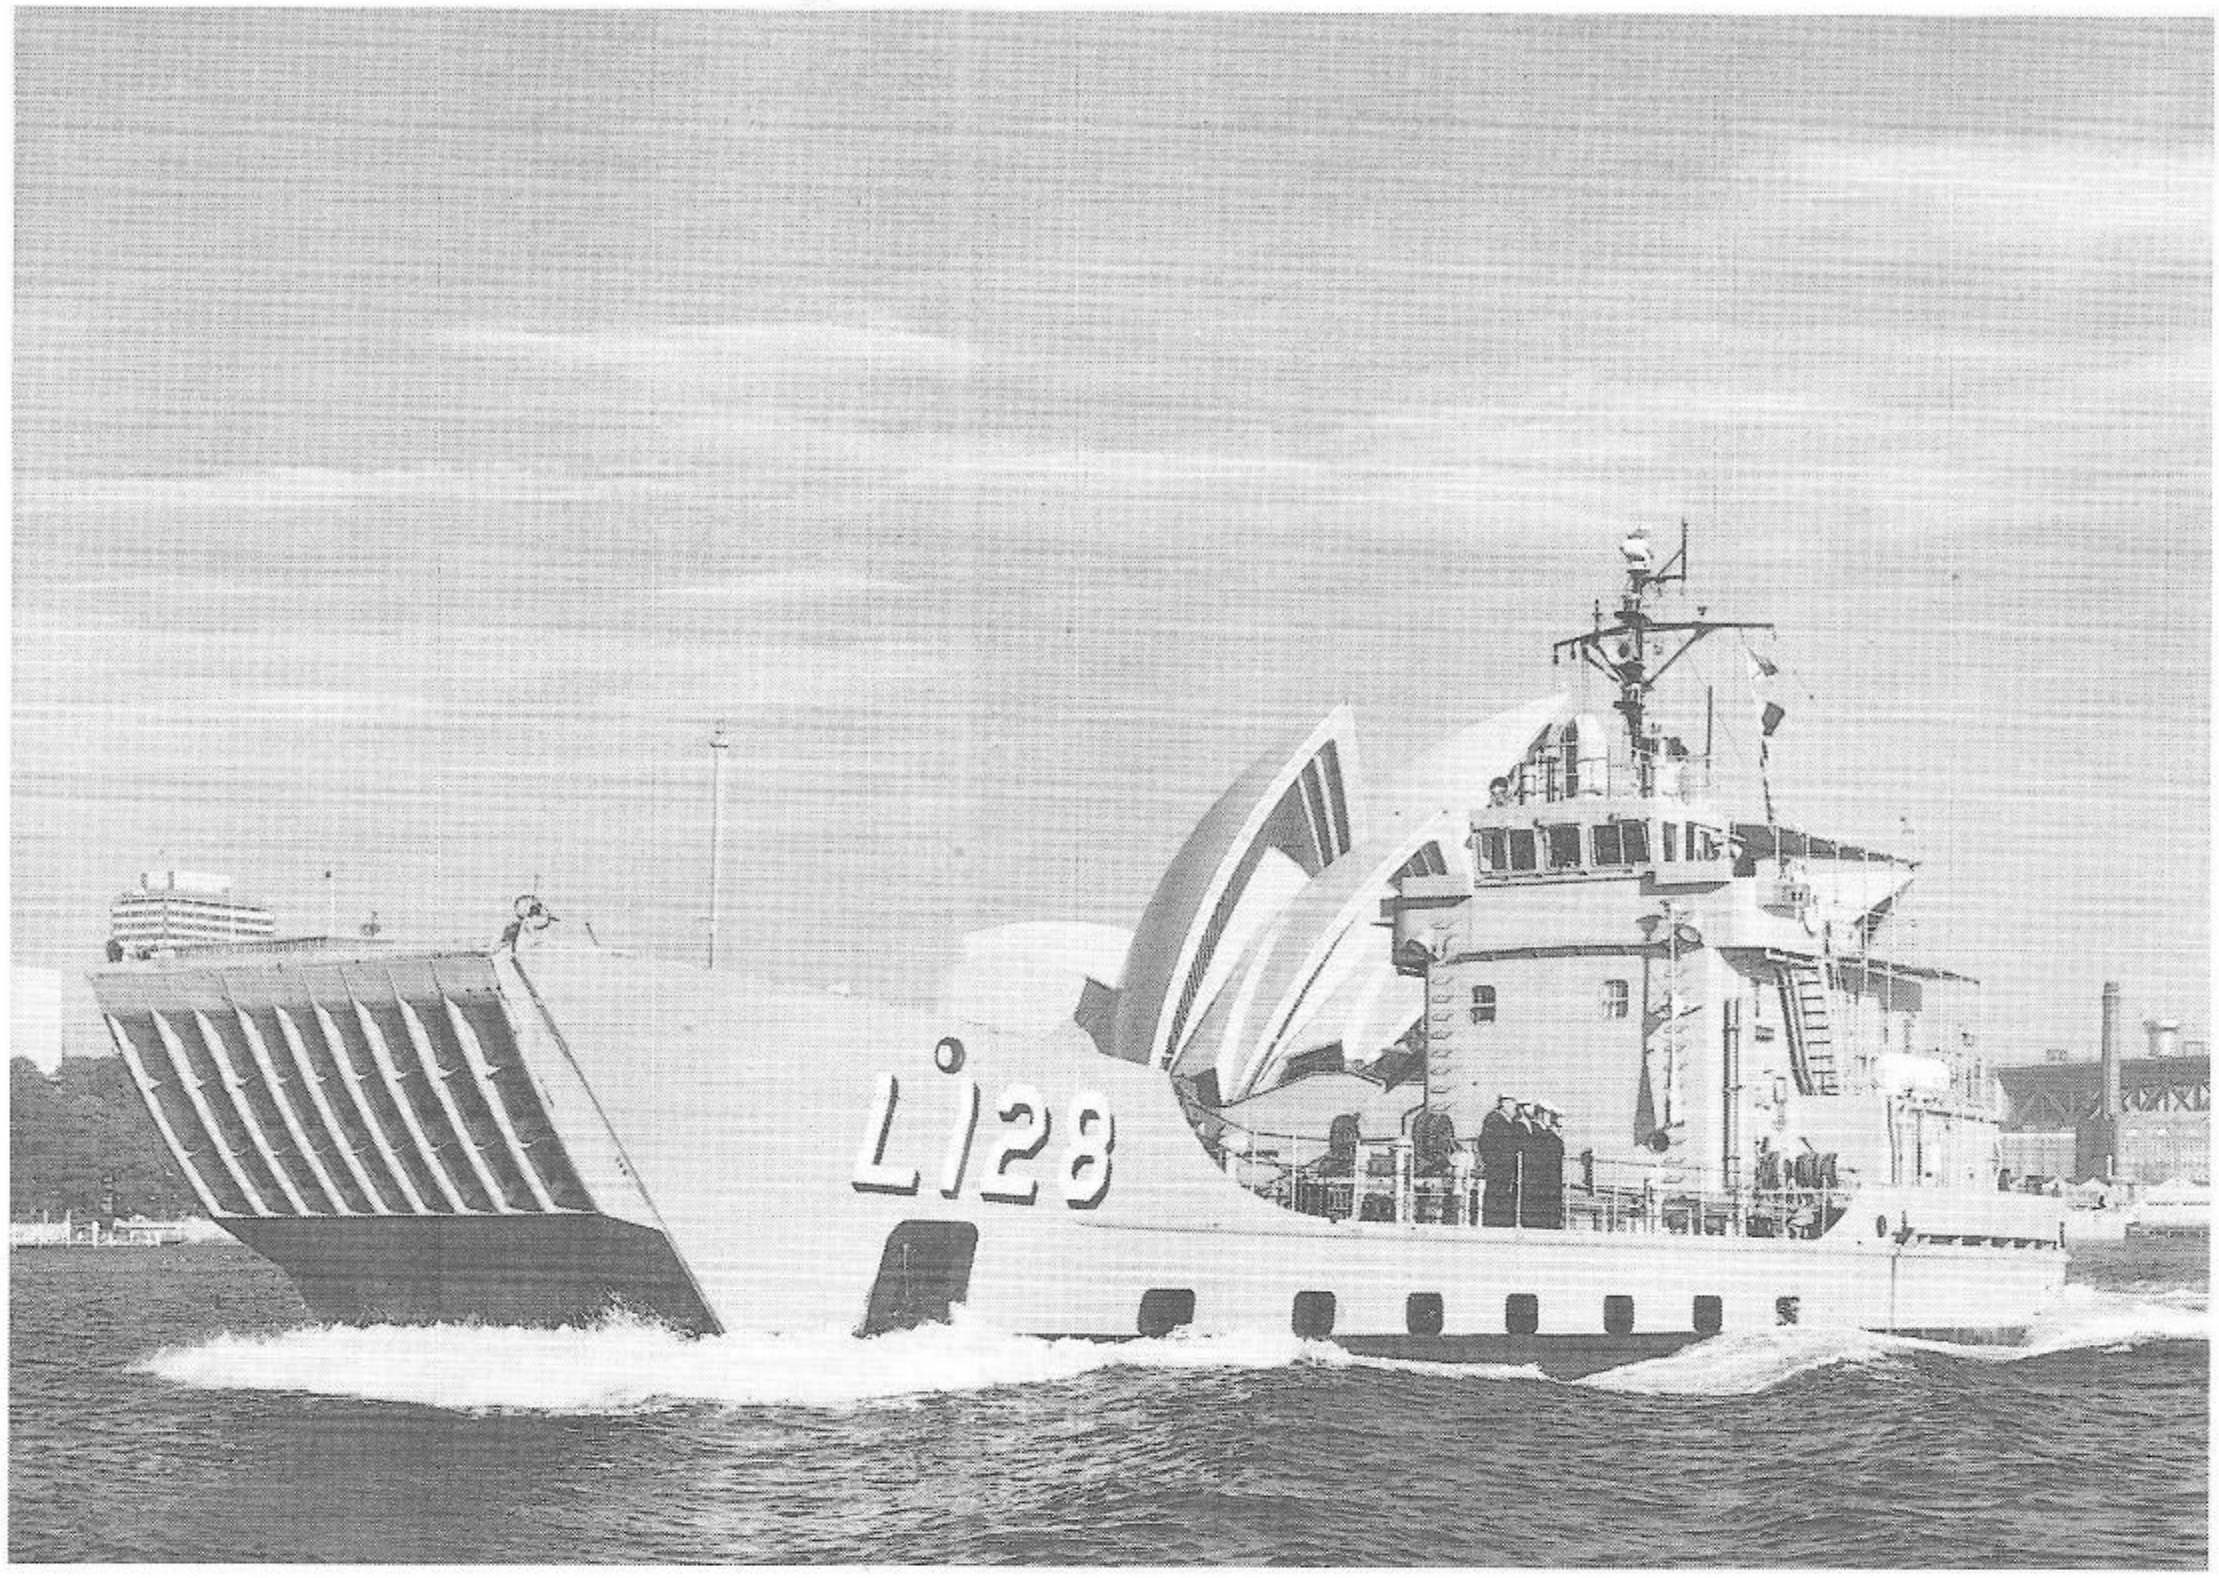
Typhoon *(PC 5) in the latest disruptive camouflage scheme* (H & L van Ginderen Collection)

Cyclone *(PC 1). Note the platform on the stern which enables SEALs and divers to enter and leave the water* (Bollinger)

The 'Cyclone' class was developed from the US Coast Guards' 'Island' class which were also built by Bollinger, Lockport, Louisiana to a Vosper Thornycroft design (Vosper Thornycroft)

AMPHIBIOUS WARFARE SHIPS

BALIKPAPAN



Labuan *(L 128). The design is typical of most landing craft, with a flat, horizontally hinged bow ramp; a long, rectangular tank deck, and superstructure and machinery aft* (DoD/PR, Australia)

- Three medium battle tanks (MBT) or equivalent
- 150 tonnes cargo

AMPHIBIOUS FACILITIES

- Horizontally hinged flat bow ramp
- Kedge anchor

WEAPONS SYSTEMS

GUNS

Two 7.62 mm machine guns

The 7.62 mm machine gun normally carried by Australian vessels is the M60 with the heavy barrel option. The M60 is a gas-operated weapon with a 560 mm barrel and the majority of these weapons are fitted into simple single-pintle mountings, although some are installed on ring mountings attached to the ship's rail. Twin mountings are also found.

Specifications
(M60 7.62 mm machine gun)
Calibre: 7.62 mm
Length of barrel: 73.5 calibres
Gun weight: 10.51 kg (23.17 lb)
Muzzle velocity: 855 m/s (2,805 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 200 rds/min
Effective range: 0.97 n miles (1.8 km)

RADAR

Racal Decca RM 916

One Type 916 navigation radar is carried. This is one of the Transar series of radars from UK manufacturer Racal-Decca and is also used on the Australian heavy lift ship Tobruk. The radar features PPI Plan Position Indicator displays, and operates in the I-band.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors 6-71 diesels; 260 kW (348 hp) sustained.
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These small landing ships (or heavy landing craft) were originally designed and built for the Australian Army to carry three of the (then) new Leopard main battle tanks. Only the first of the series, *Balikpapan* (L 126), ever saw army service, however, and was transferred to the Royal Australian Navy (RAN) in September 1974 and commissioned on 27 September 1974, by which time the other seven were in naval service. Two of the class of eight were transferred almost immediately to the Papua New Guinea Defence Force, where they are officially classed as auxiliaries.

DESIGN

These are built to the traditional tank-landing craft (LCT) design, with a flat bow ramp providing direct access to a long tank deck. All machinery and superstructure are aft. There is a large kedge anchor.

DEPLOYMENT

Brunei (L 127) and *Betano* (L 133) act as diving tenders at Cairns. *Labuan* (L 128) is operational at Cairns and *Balikpapan* (L 126) at Darwin. *Wewak* (L 130) is laid up at Cairns. *Tarakan* (L 129) operates from Cairns in a survey ship role and for general duties, All are available for amphibious duties. The two other craft in the class were transferred to Papua New Guinea and are listed below.

Balikpapan *(L 126) is one of six heavy landing craft operated by the RAN, although most are involved in other duties when not on amphibious operations* (John Mortimer)

SALAMAUA (BALIKPAPAN)

GENERAL SPECIFICATIONS

Country of Origin: Australia
Operator: Papua New Guinea

Class: BALIKPAPAN

Acquired: 2
Active: 2

Displacement:
standard: 314 t
full load: 511 t

Dimensions
Length: 44.5 m (146 ft)
Beam: 10.1 m (33 ft)
Draught: 2 m (6.5 ft)

Speed: 10 kts
Range: 3,000 n miles at 10 kts

Complement: 15 including two officers

SHIPS

SALAMAUA (31)
Builder Walkers Ltd, Maryborough, Queensland, Australia
Commissioned (RAN) 19 Oct 1973 (L 131)
Transferred (PNG Defence Force) Nov 1974

BUNA (32)
Builder Walkers Ltd, Maryborough, Queensland, Australia
Commissioned (RAN) 7 Dec 1973 (L 132)
Transferred (PNG Defence Force) Nov 1974

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Three medium battle tanks or equivalent
- 150 tonnes cargo

AMPHIBIOUS FACILITIES

- Horizontally hinged flat bow ramp

WEAPONS SYSTEMS

GUNS

M2HB 12.7 mm machine guns
The M2HB is a selective short recoil automatic operation weapon with a 1,143 mm (45 in) long barrel and eight right-hand grooves turning once every 381 mm (15 in). Muzzle energy is 1,867 mkp and the weapon uses 110-round belts.

Specifications
(M2HB)
Calibre: 12.7 mm (0.5 in)
Length of barrel: 90 calibres
Gun weight: 38.1 kg (84.0 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

COMMAND AND CONTROL SYSTEMS

RADARS

Racal Decca RM 916
The Type 916 navigation radar is one of the Transar series of radars from UK manufacturer Racal-Decca and is used on the Australian craft of this class. The radar features PPI Plan Position Indicator displays and operates in the I-band.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors 6-71 diesels, 260 kW (348 hp) sustained.
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These two ships are operated by the Papua New Guinea Defence Force Maritime Element, which is the equivalent of a navy. The vessels are officially classed as auxiliaries.

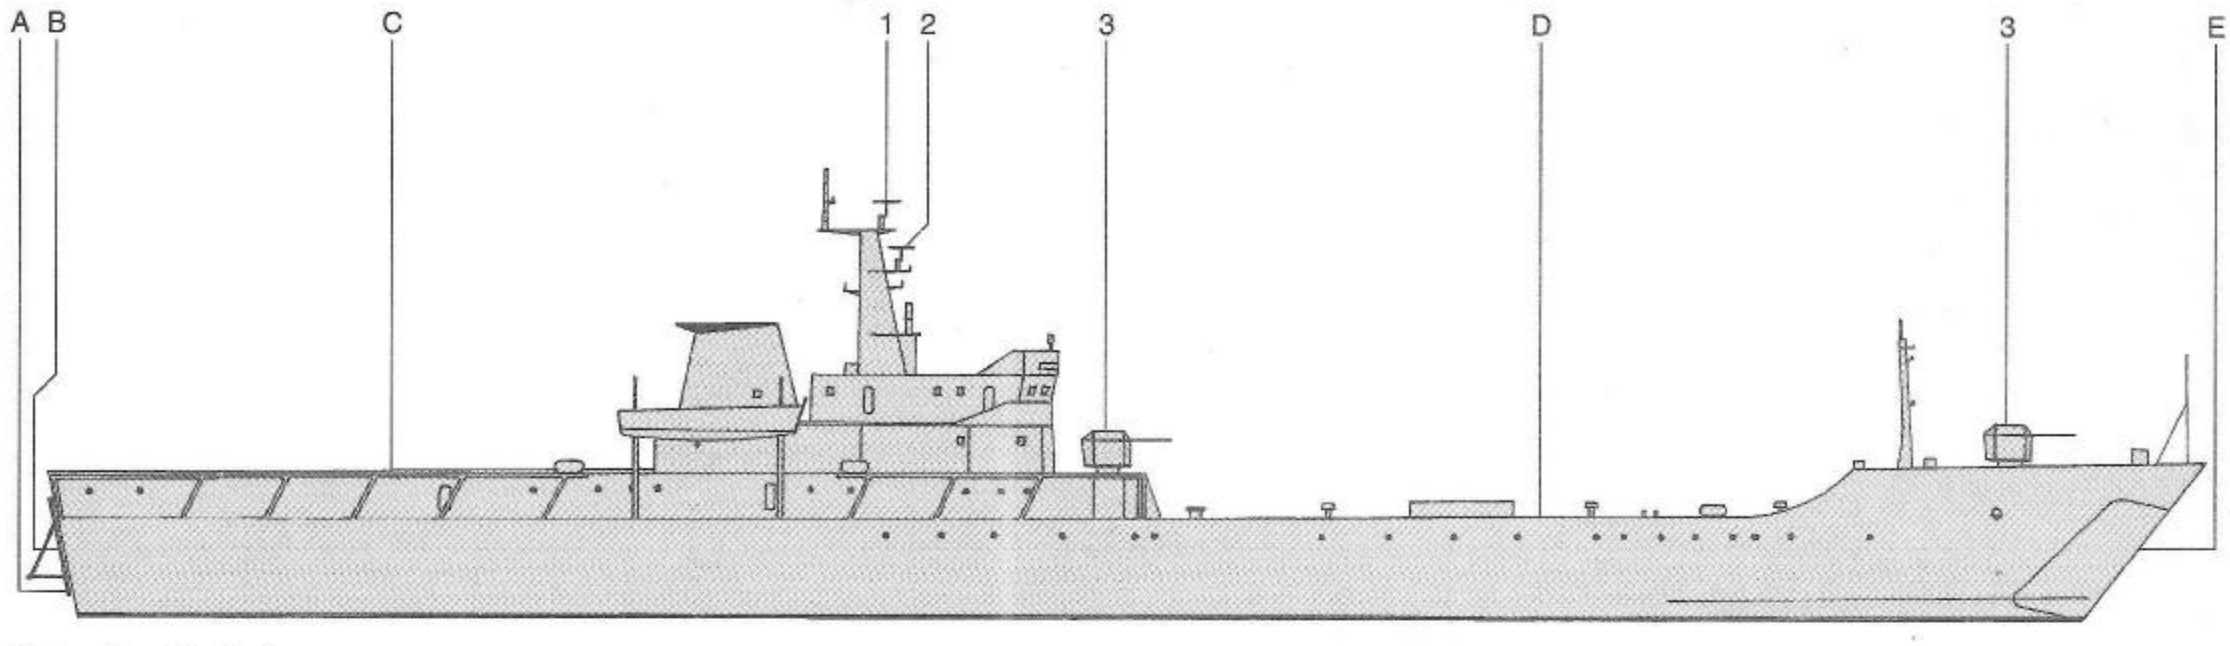
MODERNISATION

Both were given extensive refits in 1985/86.

DEPLOYMENT

They are based at Port Moresby.

YUTING



Yuting (Ian Sturton)
Amphibious A *Kedge anchor* **B** *Stern door* **C** *Flight deck* **D** *Tank deck* **E** *Bow doors with internal ramp*

General 1 *Surface search radar* **2** *Navigation radar* **3** *Chinese 37 mm/63 twin cannon (three mounts)*

GENERAL SPECIFICATIONS

Operator: China

Class: YUTING (LST)

Built: 3
Active: 3
Building: 2

Displacement:
standard: 3,770 t
full load: 4,800 t

Dimensions
Length: 130 m (426.5 ft)
Beam: 16 m (52.5 ft)
Draught: 3.2 m (10.5 ft)

Speed: 17 kts
Range: 3,000 n miles at 14 kts

Complement: 120

SHIPS

YUTING 991
YUTING 934
YUTING 935

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- 200 troops
- 10 medium battle tanks
- Cargo: 500 tonnes

SHIP-SHORE LIFT

- Two LCVPs are carried on the foredeck

AVIATION FACILITIES

Specifications
Flight deck: There is a large flight deck measuring approximately 28 × 16 m (93 × 53 ft)
Hangar: There does not appear to be a hangar, but it can be assumed that there are refuelling and rearming facilities.
Helicopters: No helicopters have been seen aboard these ships, so far, but the flight deck would be capable of operating up to and including Zhi-8 (Super Frelon)

WEAPONS SYSTEMS

GUNS

Chinese 37 mm/63 cannon
There are six China 37 mm/63 guns in three twin mountings. A Russian-derived weapon manufactured in China, the 37 mm/63, has become a standard light air defence gun in a variety of ships. In the twin mounting, the barrels are enclosed in separate water jackets with exposed spring recuperators. In addition to the Russian-originated mounting, the Chinese introduced the Type 76 turret mounting in the 1980s and use it for this gun as well as for the 57 mm.

Specifications
Calibre: 37 mm
Length of barrel: 62.8 calibres
Muzzle velocity: 886 m/s (2,907 ft/s)
Traverse: 360° at 17°/s (25°/s in Type 76)
Elevation: −10 to 85° at 13°/s
Crew: 3
Range:
anti-surface: 2.2 n mile (4 km)
anti-air: 3,000 m (9,842 ft)
Ammunition: 0.732 kg (1.6 lb)

COMMAND AND CONTROL SYSTEMS

RADARS

Unidentified radars
Two radars are carried, presumably working in the I-band. These have not yet been identified. It is assessed that one will be used for surface search, the other for navigation.

PROPULSION

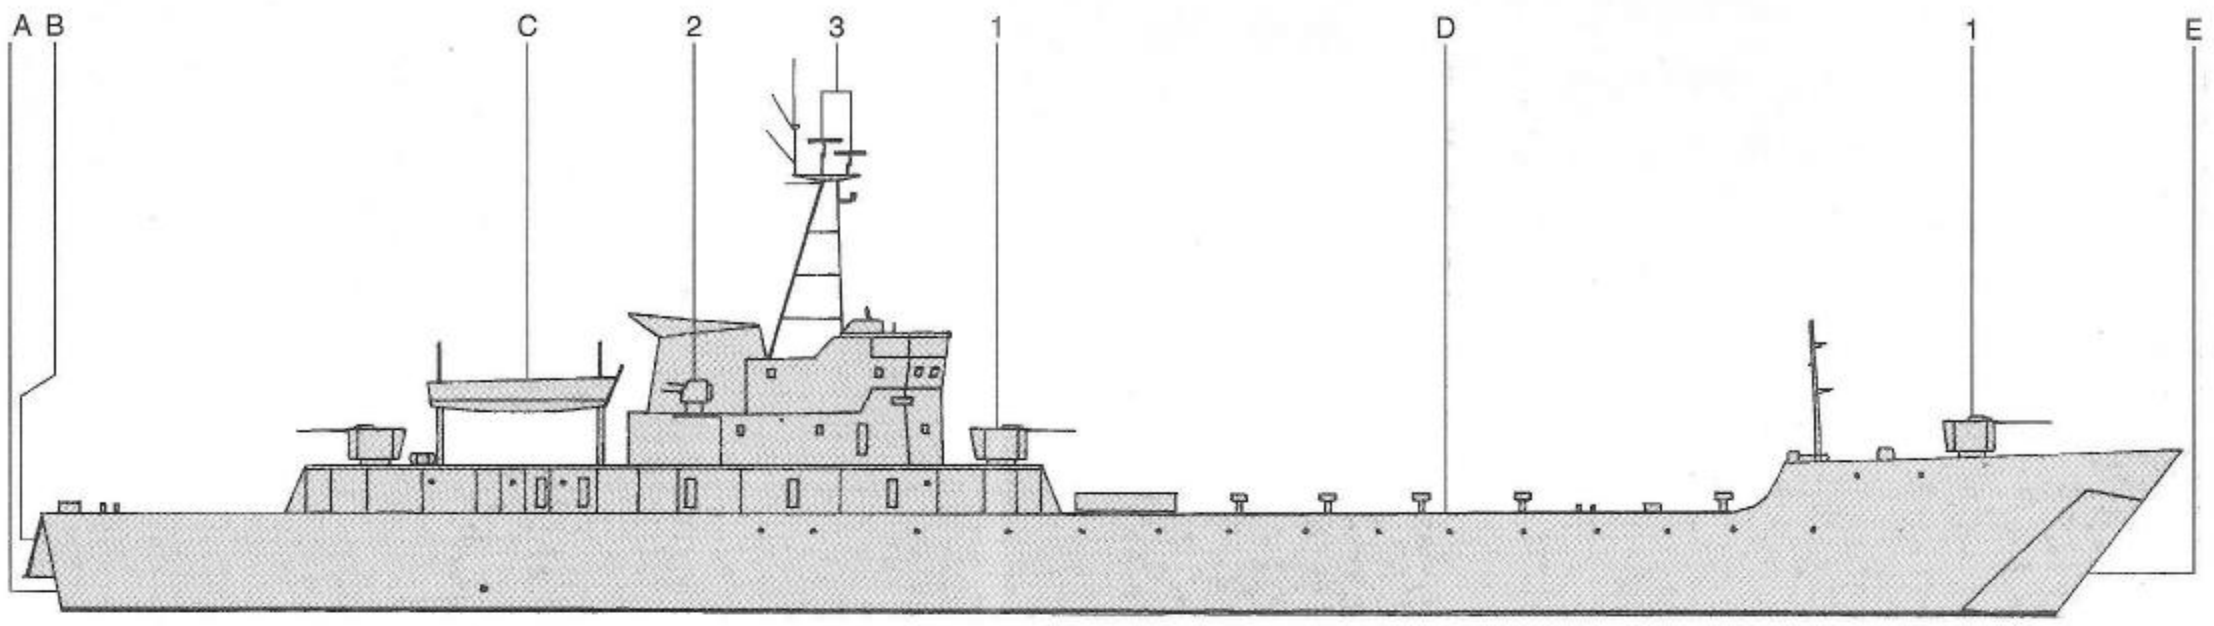
Specifications
System: Diesel
Main machinery: 2 (unknown type)
Shafts: 2

FURTHER INFORMATION

This appears to be a marginally larger version of the 'Yukan' class, providing helicopter facilities and a large helicopter deck. The first example of the class was seen fitting out at Shanghai in 1992. The quoted gun armament seems light by Chinese standards and may be augmented. Two more ships of this class are reported to be in build.

The 'Yuting' class LSTs appear to be some 10 m (32.8 ft) longer than the 'Yukan' class, but otherwise the two types are generally similar
(Henry Dodds)

YUKAN



'Yukan' class
Amphibious A *Stern ramp* **B** *Kedge anchor* **C** LCVP (two) **D** *Covered tank deck* **E** *Clamshell doors*

General 1 *Twin Chinese 57 mm/50 mounts (total four mounts)* **2** *Twin Chinese 25 mm cannon* **3** *Chinese Type 573 navigation radar (two)*

GENERAL SPECIFICATIONS

Operator: China

Class: YUKAN TYPE 072 (LST)

Built: 7
Active: 7

Displacement:
standard: 3,159 t
full load: 4,236 t

Dimensions
Length: 120 m (393.6 ft)
Beam: 15.3 m (50 ft)
Draught: 2.9 m (9.5 ft)

Speed: 18 kts
Range: 3,000 n miles at 14 kts

Complement: 109

SHIPS

YUKAN 927, YUKAN 928, YUKAN 929, YUKAN 930, YUKAN 931, YUKAN 932, YUKAN 933

AMPHIBIOUS CHARACTERISTICS

MILITARY LIFT

- 200 troops
- 10 tanks
- Cargo
- Total lift = 508 tonnes

SHIP-SHORE LIFT

- 2 LCVP are mounted abreast the stack.

AMPHIBIOUS FACILITIES

- Two clamshell bow doors with internal ramp; maximum load 51 tonnes.
- There is a comparatively small stern ramp; capacity 20.3 tonnes.

WEAPONS SYSTEMS

GUNS

Chinese 57 mm/66 cannon

Armament appears to be either two or four twin 57 mm mountings. The Chinese 57 mm guns are derived from the Russian ZIF-31B, which was manufactured in China as the Type 66. The gun is an air-cooled conventional weapon with a 4.39 m (14.4 ft) barrel. The twin-barrel mounting weighs 14.5 tonnes and is 3 m (9.84 ft) high, 3.6 m (11.8 ft) long (excluding barrels) and 3.6 m (11.4 ft) wide.

Specifications
Calibre: 57 mm
Length of barrel: 77 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Traverse: 360° at 30°/s
Elevation: −10 to 85° at 25°/s
Crew: 5
Range:
anti-surface: 4.52 n miles (8.4 km)
anti-air: 4,500 m (14,764 ft) (max)
Ammunition: 2.81 kg (6.19 lb)

37 mm 163 cannon

Four 37 mm (two twin). The 37 mm gun is another Russian-derived weapon manufactured in China and has become a standard light air defence gun in a variety of ships. It is a 62.8 calibre gun with a 2.32 m (7.6 ft) long barrel. In the twin mounting, the barrels are enclosed in separate water jackets with exposed spring recuperators.

Specifications
Calibre: 37 mm
Length of barrel: 62.8 calibres
Muzzle velocity: 886 m/s (2,907 ft/s)
Traverse: 360° at 17°/s
Elevation: −10 to 85° at 13°/s
Crew: 3
Range:
anti-surface: 2.2 n mile (4 km)
anti-air: 3,000 m (9,842 ft)
Ammunition: 0.732 kg (26 oz)

25 mm/60 machine guns in Type 61 mount

Standard fit is four 25 mm/60 machine guns in two twin mountings, but some of class have a further two twin mountings amidships above the tank deck. The Chinese manufacture the gun, (which is of Russian origin) and developed their own mounting, the Type 61, which is used by the navies of 10 countries. There are two guns installed one above the other in separate cradles and turned on their sides so that they can be fed from the side. The guns have 1.5 m (4.92 ft) long air-cooled barrels. The ammunition is either in five-round clips or 65-round belts. There are two on-mount operators and five loader-carriers.

Specifications
Calibre: 25 mm
Length of barrel: 60 calibres
Elevation: −10 to 85°
Traverse speed (manual): 25°/s
Traverse speed (hydraulic): 70°/s
Elevation speed (manual): 15°/s
Elevation speed (hydraulic): 40°/s
Rates of fire: 450 rds/min/barrel
Projectile: 0.28 kg (0.61 lb) HEI-T
Range: anti-surface: 1.5 n mile (2.75 km)

COMMAND AND CONTROL SYSTEMS

RADARS

Type 753
Two Chinese Type 753 navigation radars; I-band

IFF
May have High Pole A IFF fitted.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Type 12E 390 diesels; 10.6 MW (14,400 hp (m)) sustained.
Shafts: 2

FURTHER INFORMATION

PROGRAMME

The first of class was completed in 1980 and the seventh and (apparently) last in 1995. The type is now superseded by the 'Yuting' class, which has a helicopter deck, which this class lacks.

DESIGN

These are large LSTs with a respectable capacity. It is a conventional LST design, with vertically hinged clamshell doors, although the superstructure is rather extensive.

DEPLOYMENT

These ships are currently the PLAN's most capable amphibious warfare ships and several have been observed around the disputed Spratly Islands.

'Yukan' class LST 930. The 'Yukan' class represents the first attempt by the PLAN to design a successor to the numerous ex-US Navy LSTs. The design appears very sound and incorporates a stern door to give a ro-ro capability (Paul Beaver)

'Yukan' class LST 927 shows its beaching ability. The guns to the forecastle are twin 57 mm/50

YUDENG

GENERAL SPECIFICATIONS

Operator: China

Class: YUDENG

Built: 1 (see 'Further Information')
Active: 1

Displacement:
full load: 1,850 t

Dimensions
Length: 87 m (285.4 ft)
Beam: 13 m (42.7 ft)
Draught: 3.8 m (12.5 ft)

Speed: 14 kts

SHIP

YUDENG 990

Launched	1990
Commissioned	1994

WEAPON SYSTEMS

GUNS

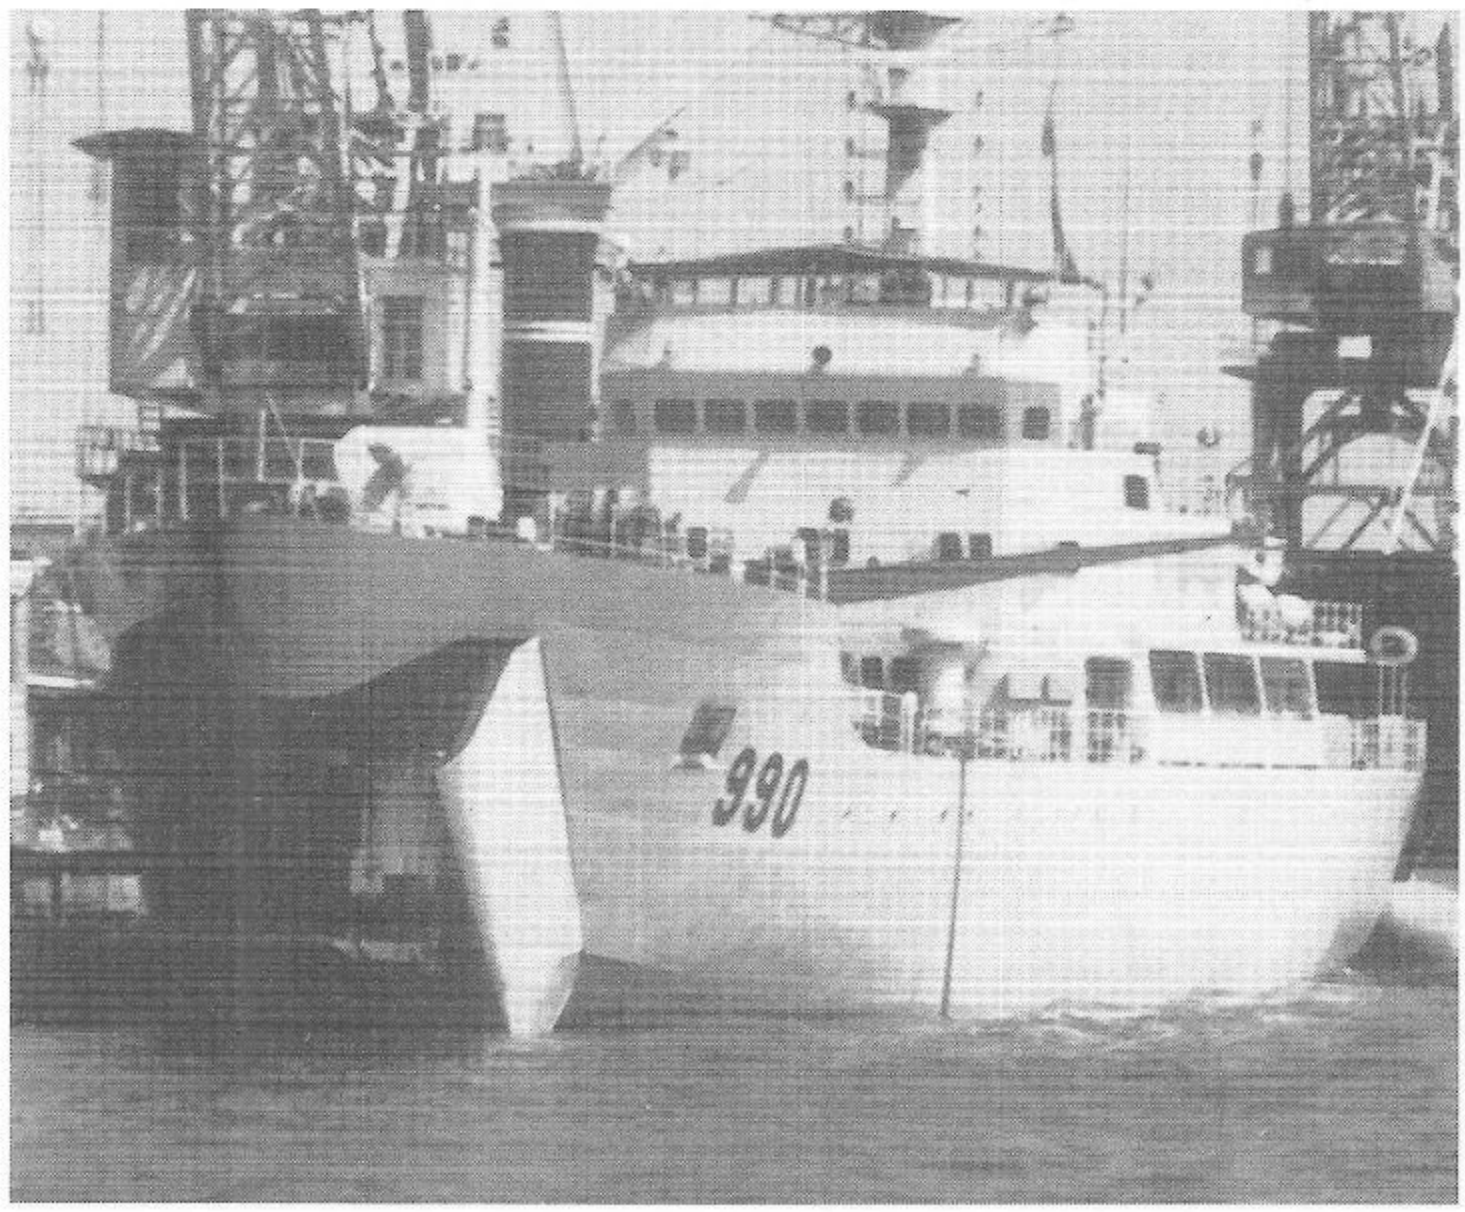
An unidentified gun, possibly 57 mm, is mounted on the forecastle.

PROPULSION

Specifications
System: Diesel
Main machinery: 2
Shafts: 2

FURTHER INFORMATION

One ship, Yudeng (990) has been observed and photographed at a port in China. A possible second ship in the class, No 994, has not been confirmed.



Yudeng *(990). This is the only known Western picture of this ship, which appears to be somewhat smaller than the 'Yukan' class . Note the bow doors and the shrouded gun on the forecastle* (Paul Beaver)

YULIANG

GENERAL SPECIFICATIONS

Operator: China
Type: 079

Class: YULIANG

Built: 31
Active: 31

Displacement:
full load: 1,117 t

Dimensions
Length: 63 m (206.7 ft)
Beam: 10 m (32.8 ft)
Draught: 2.4 m (7.9 ft)

Speed: 14 kts

Complement: 60

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Personnel
- Three main battle tanks
- Cargo = 150 tonnes (estimate)

AMPHIBIOUS FACILITIES

- There is a rectangular, flat, bottom-hinged, bow ramp.
- There is a kedge anchor at the stern.

WEAPONS SYSTEMS

GUNS

25 mm/60 machine guns in Type 61 mount

Standard fit is four 25 mm/60 machine guns in two twin mountings, located either side of the tank deck and about one-third of its length from the bows. The Chinese manufacture the gun, (which is of Russian origin) and developed their own mounting, the Type 61, which is used by the navies of 10 countries. There are two guns installed one above the other in separate cradles and turned on their sides so that they can be fed from the side. The guns have 1.5 m (4.92 ft) long air-cooled barrels. The ammunition is either in five-round clips or 65-round belts. There are two on-mount operators and five loader-carriers.

Specifications
Calibre: 25 mm
Length of barrel: 60 calibres
Elevation: −10 to 85°
Traverse speed (manual): 25°/s
Traverse speed (hydraulic): 70°/s
Elevation speed (manual): 15°/s
Elevation speed (hydraulic): 40°/s
Rates of fire: 450 rds/min/barrel
Projectile: 0.28 kg (0.61 lb) HEI-T
Range: anti-surface: 1.5 n mile (2.75 km)

BM-21 multiple rocket launcher

Two BM-21 multiple rocket launchers. Navalised BM-21 mountings were used first on the Russian Navy's 'Alligator' class LSTs and have since been sold to the former East Germany as well as to China. Naval BM-21s are used during the run-in to the beach and consist of two 20-tube clusters on either side of an electrically operated pedestal which holds training and elevation gears. They are reloaded automatically from a below-deck magazine. The mounting can traverse 360° and elevate from 0 to +55° . The standard missile for these weapons is the M-21-OF spin- and fin-stabilised rocket which comes in 3.226 m (10.6 ft) and 2.87 m (7.5 ft) lengths and can carry high-explosive fragmentation, smoke, incendiary or chemical warheads.

Specifications
Rocket M-21-OF (9M22U)
Diameter: 122 mm (4.8 in)
Length: 3.226 m (10.6 ft)
Weight: 77.5 kg (170.8 lb)
Range: 500-20,380 m (1,640-66,846 ft)
Warhead weight: 19.3-19.4 kg (42.5-42.7 lb)
Max velocity: 690 m/s (2,863 ft/s)

Rocket M-21-OF (9M22M)
Diameter: 122 mm (4.8 in)
Length: 2.87 m (9.4 ft)
Weight: 66 kg (145.5 lb)
Range: 500-20,000 m (1,640-6,560 ft)
Warhead weight: 18.4 kg (40.5 lb)
Max velocity: 700 m/s (2,296 ft/s)

COMMAND AND CONTROL SYSTEMS

RADARS

Fin Curve

The navigation radar is Fin Curve, an I-band equipment.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 diesel engines
Shafts: 2

FURTHER INFORMATION

PROGRAMME

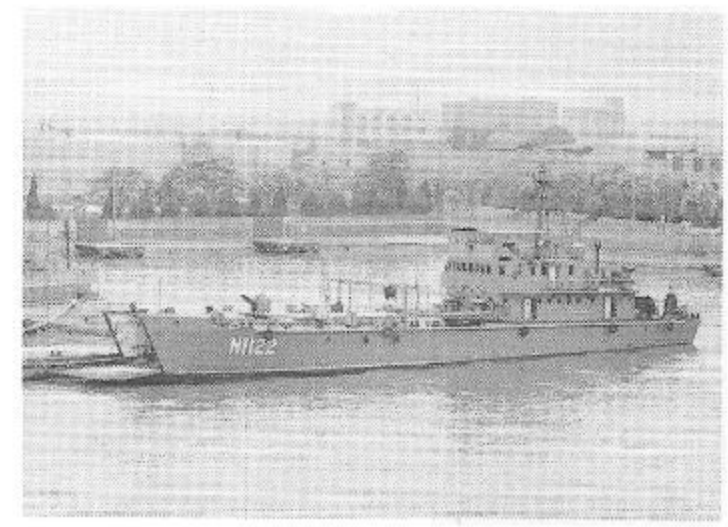
Series production started 1980 in three or four smaller yards, including Shantou. Production has since ended in favour of newer classes of LSL, although this remains the principle type of LCT. The exact numbers produced remain uncertain and Western estimates have recently been adjusted downwards.

DESIGN

It would appear that simplicity was a significant factor in this design.

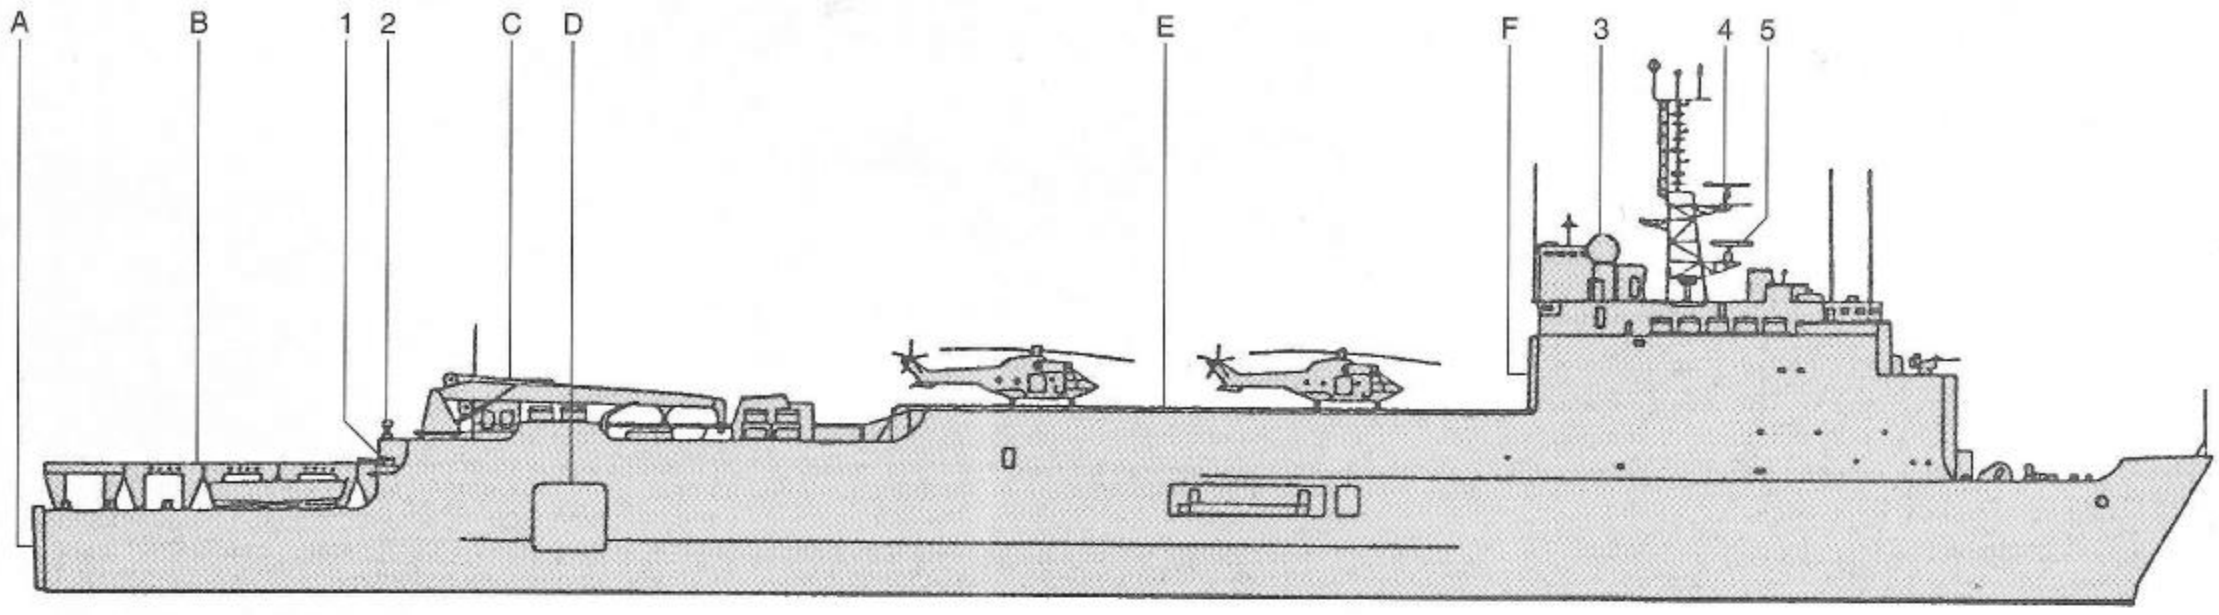
DEPLOYMENT

Most are based in South Sea fleet.



Yuliang (*N1122)* (Henry Dodds)

FOUDRE



Foudre (Ian Sturton)
Amphibious A *Stern door to docking well* **B** *Aft flight deck (26 × 9.5 m)* **C** *Crane (37 t capacity)* **D** *Loading/unloading door* **E** *Main flight deck (62 × 23 m)* **F** *Hangar*

General 1 *Breda-Mouser 30 mm/70 gun (three)* **2** Racal-Decca 1229 helicopter control radar **3** *Syracuse II Satcom* **4** *Racal-Decca 2459 surface search radar* **5** *Racal-Decca 1229 navigation radar*

Speed: 21 kts
Range: 11,000 n miles at 15 kts

Complement: 226 (13 officers)

SHIPS

FOUDRE (L 9011)	
Builder	Naval Dockyard, Brest, France
Laid down	26 Mar 1986
Launched	19 Nov 1988
Commissioned	8 Dec 1990

SIROCO (L 9012)	
Builder	Naval Dockyard, Brest, France
Laid down	11 Apr 1994
Launched	Dec 1996
Commissioned	Apr 1998

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- 467 troops (normal), maximum 1,600 troops (emergency)
- 1,810 tonnes cargo
- Can carry one P400 patrol craft.
- Endurance of 30 days with 693 people (467 troops plus 226 crew).

SHIP-SHORE LIFT

- Two CDIC or 10 CTM

AVIATION FACILITIES

Specifications
Main flight deck: 62 × 23.5 m (203.4 × 77.1 ft) with Samahé haul-down system
Second flight deck: 26.25 × 9.5 m (86 × 931 ft)
Hangar capacity: 2 Super Frelon or four Super Puma Can operate up to seven Super Pumas.

RAMPS, DECKS

- Well dock 122 × 14.2 × 7.7 m (400 × 47 × 25 ft).
- 52 tonnes capacity elevator at forward end of well dock.
- 37 tonne crane (starboard side).

HOSPITAL

- 2 Operating theatres
- 47 beds

TYPICAL LOADS

- 1 CDIC, 4 CTM, 10 AMX-10RC armoured cars, and 50 vehicles, or a total of 180-200 vehicles (without landing craft).
  or
- 1 mechanised armoured regiment of the French rapid deployment force.

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

Matra Simbad

Two Matra Simbad twin launchers for Mistral are mounted at the base of the mainmast. Simbad *(Système Integre de Mistral Bitube d'Auto-Defense)* is manually operated with two missile launcher containers, a missile selector and a prelaunch electronics box. Replaceable battery/coolant units are used to provide up to 45 s of prelaunch power to the missile and to cool the seeker detector cells for lock on.

There is a x3 optical sight which can be deployed from −5 to +55° in elevation.

When the target is designated, the operator tracks it, designates a missile and activates the battery/coolant unit. This cools the seeker and warms up the missile as the prelaunch electronics use the seeker to determine whether the target is in range. If it is, the seeker locks on and the operator receives an audio signal to launch the missile. If for some reason the firing has to be postponed the missile system automatically compensates minor aiming errors and remains ready for launch.

Specifications
Length: 1.81 m (5.9 ft)
Diameter: 9.2 cm (3.6 in)
Wing span: 1.9 cm (0.75 in)
Weight: 18.4 kg (40.6 lb)
Speed: Mach 2.6
Range: 700-5,000 m (2,296-16,400 ft)

Manufacturer/Contractor
Matra Défense, Paris, France.

French Landing-Ship Dock (LCD) Foudre *(L 9011) tests its NBCD wash-down facilities.* Foudre *and second ship* Siroco *(to be completed in 1998) are designed to carry, land and support a mechanised armoured regiment of the* Force Action Rapide *(FAR), with secondary roles of logistic support and humanitarian missions* (DCN/Jean Biaugeaud)

GUNS

Breda/Mauser 30 mm/70

Three Breda/Mauser 30 mm/70 on single compact mountings have been fitted in Siroco during construction and have been retrofitted in Foudre in 1996 (replacing a single 40 mm Bofors L/60). The MK30 Model F is a fully gas-operated weapon using pistons which not only operate the bolt but, autonomously, the ammunition feed system. It is a twin-feed weapon with two boxes each of 80 rounds attached to the trunnion supports and linked to the feed mechanism by a flexible chute.

Specifications

Calibre: 30 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,040-1,220 m/s (3,412-4,003 ft/s) (HEI/APDS)
Traverse: Unlimited
Elevation: −13 to +85°
Rate of fire: 800 rds/min/barrel
Ammunition: 1.05 kg (2.3 lb) (TP, HEI, HEI-SD, API, APDS)
Training speed: 140°/s
Elevation speed: 80°/s
Mounting weight, with ammunition: 1,480 kg (3,263 lb)
Crew: 0

Manufacturer/Contractor

OTOBREDA. La Spezia, Italy.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT/ COUNTERMEASURES (ESM/ECM)

ESM/ECM fit has not yet been specified.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Command support system

OPSMER is installed.

Syracuse

Syracuse (French national system). Satcom domes are on pedestals on the after outboard end of superstructure.

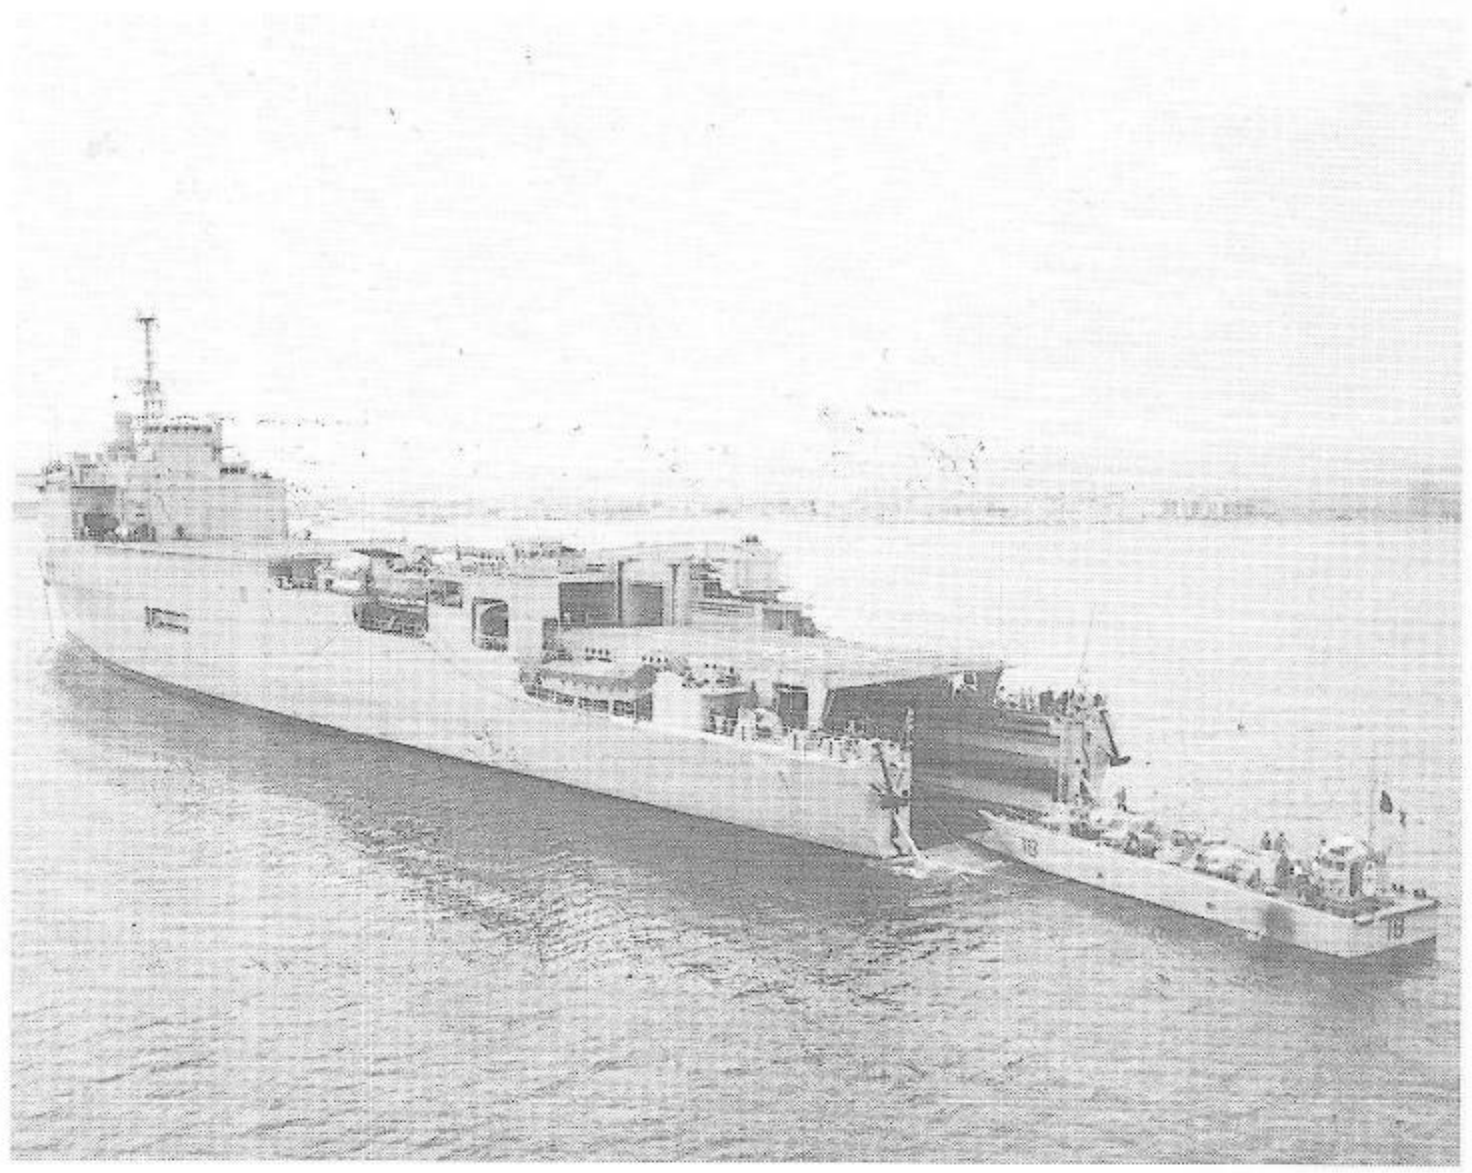
WEAPONS CONTROL

Sagem VIGY-105 optronic system

VIGY-105 is being fitted in *Foudre* during 1996/97 for 30 mm guns. This is an electro-optical fire-control system for guns or short-range missiles and possesses a similar rotating sensor head on the same three-axis gimbal as the earlier VAMPIR MB. The fixed sensor module is repackaged but has similar servo and electronics modules, although the VIGY-105 electronics include a video tracker and fire-control computer as well as a TMS C40 processor. Some of the electronics are incorporated in a CS Defense Calisto workstation.

Foudre. *Among the features visible are the two Syracuse 2 satellite antennas and at the port side after end of the flight deck the Racal-Decca 1229 radar, which is used for helicopter control* (DCN/ Jean Biaugeaud)

Foudre *from astern. Note the large stem door giving access to the docking well, the secondary flight deck (with access to the vehicle hangar) and the primary flight deck with the aircraft hangar at the forward end* (DCN/Jean Biaugeaud)



CTM-18 (CTM = Chalands de Transport de Materiel*) delivers two VAB* (Vehicule de l'Avant Blindé) *to* Foudre. *Two CTMs can be carried in the docking well* (DCN/Jean Biaugeaud)

The sensors consist of a high-resolution TV camera, an IRCCD camera and an eye-safe laser rangefinder which are all harmonised to less than 50 µrad.

Specification
(VIGY-105)
Director dimensions: 600 × 6,500 × 1,500 m (1,968 × 21,320 × 4,920 ft)
Director weight: 150 kg (330.75 lb)
Elevation: −25 to +65°
Fields of view: 9 × 12°, 3 × 4° (TV camera); 9 × 11.5°, 3 × 3.8° (IRCCD camera)

Manufacturer/Contractor
SAGEM, Navigation and Defence Division, France.

RADARS

Thomson-CSF DRBV 21A Mars
The air/surface search set is the Thomson-CSF DRBV 21A. The antenna is mounted on a small platform on the complex mainmast. Mars is a member of the D-band TRS 3011 Jupiter/TRS 3015 Mars/Astral family of naval surveillance radars. It is intended for ocean-capable patrol vessels and operates with a simplified transmitter assembled with the receiver in a single electronics cabinet. Rotation speed is 12 rpm. Instrumented ranges are 110 km for the air channel and 80 km for the optional surface channel. The transmitter is solid state with frequency agility, burst-to-burst with Doppler processing, or pulse-to-pulse.

Manufacturer/Contractor
Thomson-CSF, Systemes Navals de Combat, Bagneux, France.

Racal-Decca 2459
The Racal-Decca 2459 is an I-Band set used for surface search. It is fitted with a combined F/I-band antenna and utilises a variety of transceiver and display units.

Racal-Decca 1229
Two Racal-Decca 1229, I-Band, solid-state sets are installed. One is used for navigation, the other for helicopter control.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 SEMT-Pielstick 16 PC2.5 V 400 diesels, 15.3 MW (20,800 hp) sustained
Shafts: 2
Propellers: Controllable pitch
Thruster: 1 bow thruster, 735 kW (1,000 hp)

FURTHER INFORMATION

PROGRAMME

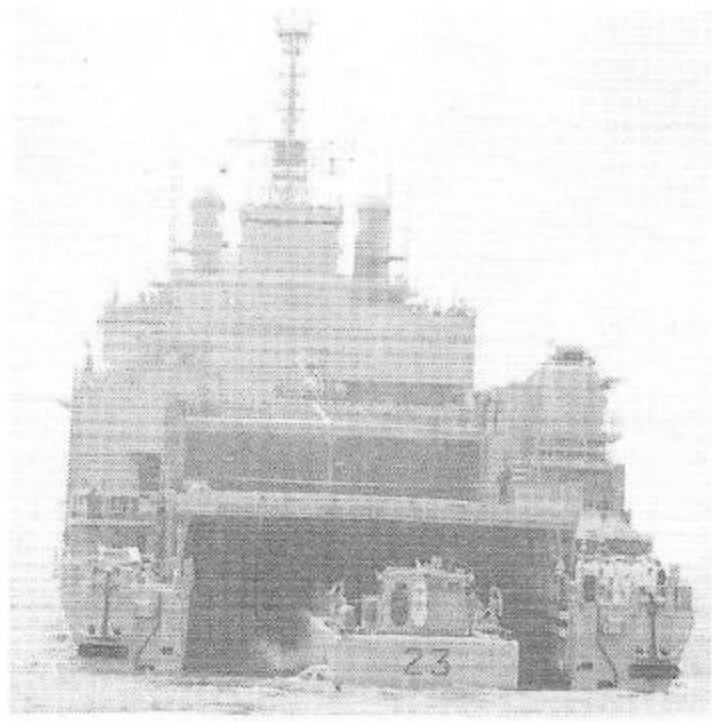
Foudre, first ship of this class, was ordered in November 1984 and the second, *Siroco,* not until nine years later. The long gap is indicative of the debate that has been going on in France as elsewhere about the future of amphibious forces, and is the reason the ageing 'Ouragan' class ships have had their service lives extended into the 21st century.

Foudre is categorised as a TCD *(Transport de Chalands de Debarquement),* indicating that the landing craft are seen as the primary method of assault. Its capability for supporting helicopters is, in contrast, limited. The second of the class, *Siroco*, alters the balance between landing craft and helicopters a little, with a longer flight deck giving a small increase in the aviation capability.

The probability is that if there are to be more ships of this type, and drastic cuts in defence spending since the election of President Chirac make that less likely in the short term, then the design may be more radically updated the next time around, with even greater emphasis on the deployment of helicopters.

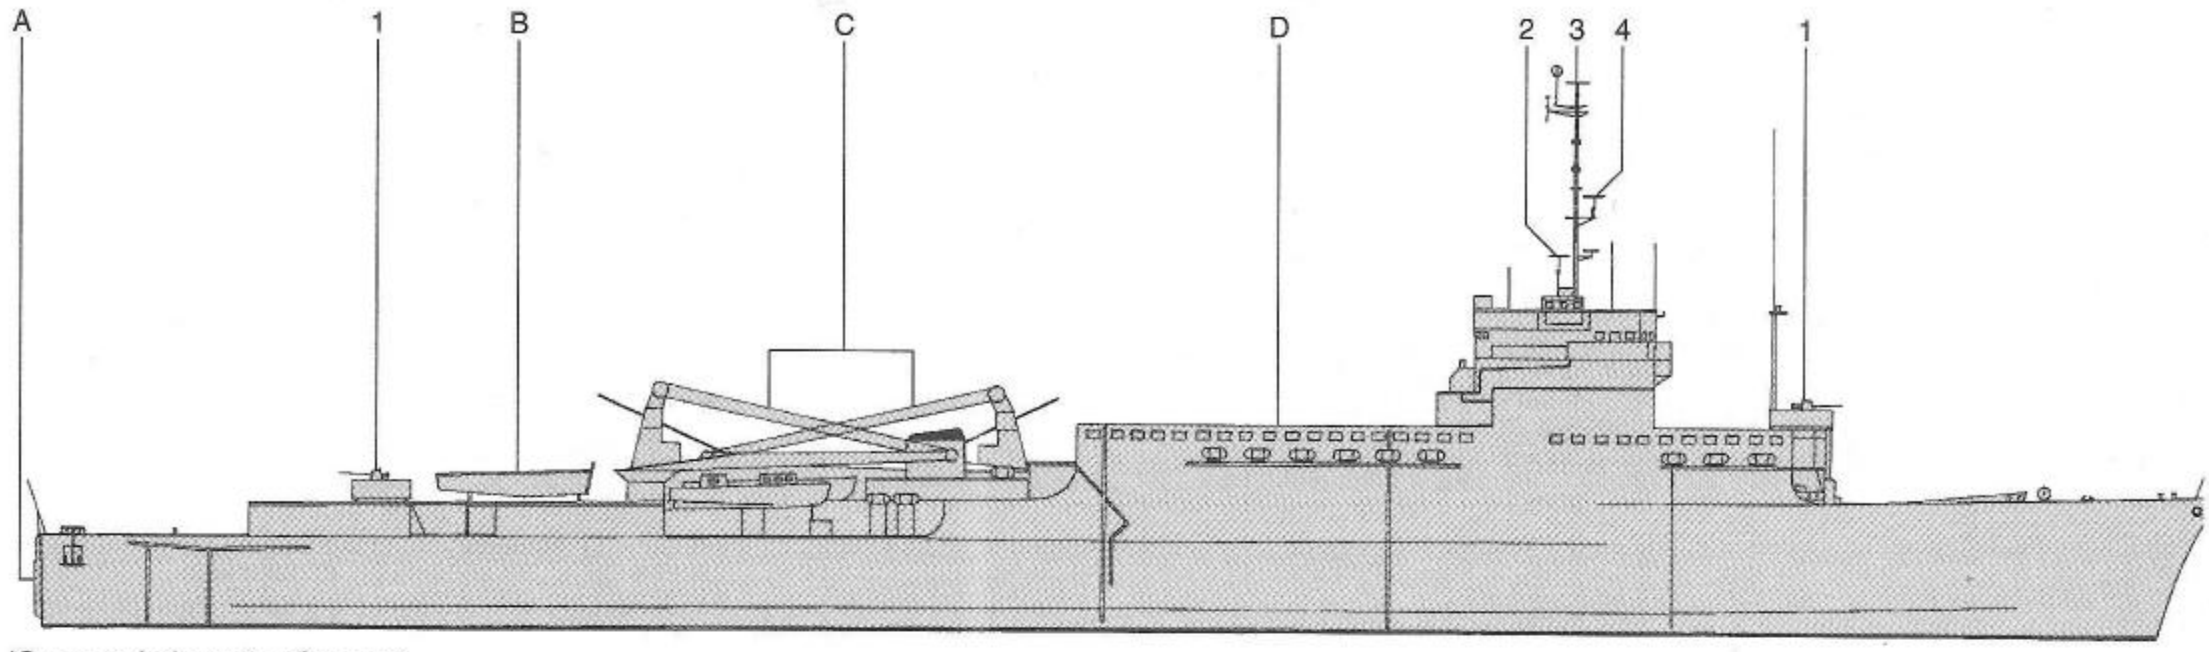
DEPLOYMENT

Foudre is assigned to *Force d'Action Navale* at Toulon. It is designed to embark a mechanised regiment of the Rapid Action Force (FAR) and to act as a logistic support ship. There are extensive command facilities for an amphibious operation.



CTM 23 enters the docking well, with Foudre *ballasted down* (DCN)

OURAGAN



'Ouragan' class (Ian Sturton)
Amphibious A *Stern door to docking well* **B** *LCVP* **C** *Cranes, 35 t capacity* **D** *Flight deck*

General 1 *Bofors 40 mm/60* **2** *Racal-Decca 1226 helicopter control radar* **3** *Thomson-CSF DRBV-51A air/surface search radar* **4** *Racal-Decca 1226 navigation radar*

GENERAL SPECIFICATIONS

Operator: France

Class: OURAGAN (TCD/LSD)

National designation: *Transports de Chalands de Debarquement* (TCD)

Built: 2
Active: 2

Displacement:
standard: 5,893 t
full load: 8,636 t
fully docked down: 15,238 t

Dimensions
Length: 149 m (488.9 ft)
Beam: 23 m (75.4 ft)
Draught: 5.4 m (17.7 ft)

Speed: 17 kts
Range: 9,000 n miles at 15 kts

Complement: 213 including 10 officers

SHIPS

OURAGAN (L 9021)	
Builder	Naval Dockyard, Brest, France
Laid down	Jun 1962
Launched	9 Nov 1963
Commissioned	1 Jun 1965

ORAGE (L 9022)	
Builder	Naval Dockyard, Brest, France
Laid down	Jun 1966
Launched	22 Apr 1967
Commissioned	1 Apr 1968

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops
  normal: 343
  hard-lying: 472
- Light tanks: 22 or
- Cargo: 1,500 t

SHIP-SHORE LIFT

- 2 EDIC LCTs
- 3 LCVPs
- 8 loaded CTMs

AMPHIBIOUS FACILITIES

- 2 cranes, each of 35 tonne capacity
- For logistics operations, two temporary deck sections, one 90 m (295 ft) long, the other 36 m (118 ft) long, can be used to accommodate extra vehicles.
- Docking well 120 × 14 m (394 × 46 ft)
- Stern gate 14 × 5.5 m (46 × 18 ft)

AVIATION FACILITIES

Specifications
Flight deck
Hangar
Helicopters: 4 SA 321G Super Frelon or four Super Pumas or 10 SA 319B Alouette IIIs.

The normal helicopter platform can operate three Super Frelon or 10 Alouette III helicopters, while a second portable platform can be installed over the docking well enabling the ship to operate a further single Super Frelon or three Alouette IIIs.

TYPICAL LOADS

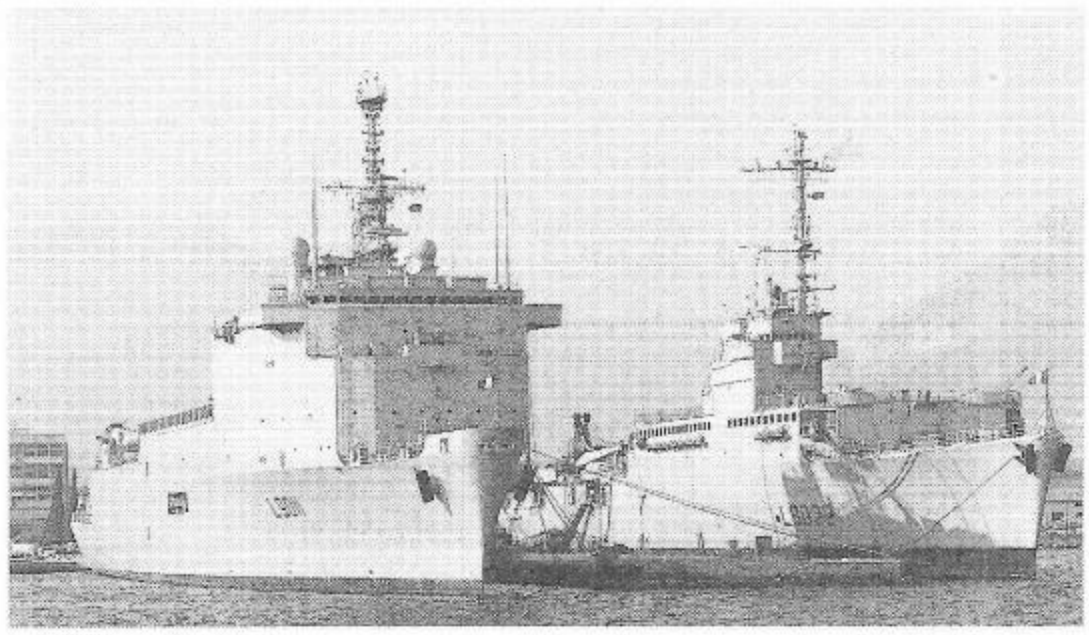
- 1 CDIC, four CTM, 10 AMX 10 RC armoured cars and 21 vehicles
- or a total of 150-170 vehicles without landing craft.
- or 18 Super Frelon or 80 Alouette III helicopters.
- or 120 AMX 13 tanks.
- or 84 DUKWs.
- or 340 Jeeps.
- or 12 50-tonne barges.

WEAPONS SYSTEMS

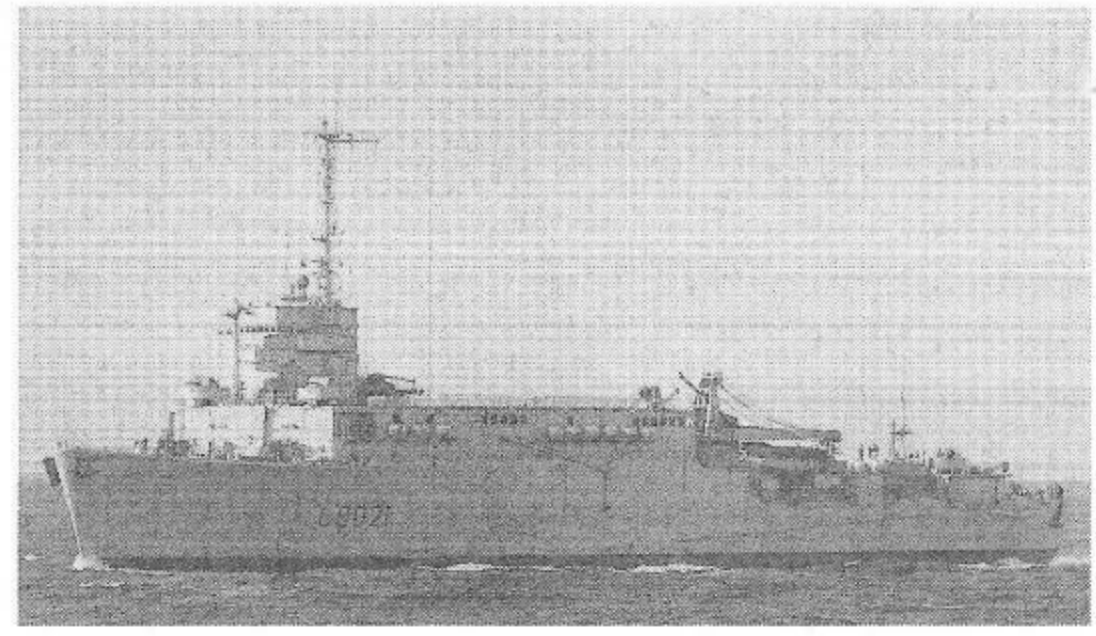
SURFACE-TO-AIR MISSILES (SAM)

Matra Simbad
Two Matra Simbad twin launchers for Mistral were fitted in 1993. Simbad (Système Integre de Mistral Bitube d'Auto-Defense) is a manually operated system which has two missile launcher-containers and a loaded weight of 250 kg (551 lb). When the target is designated, the operator tracks it, designates a missile and activates the battery/coolant unit. This cools the seeker and warms up the missile as the prelaunch electronics use the seeker to determine whether the target is in range. If it is, the seeker locks on and the operator receives an audio signal to launch the missile. If for some reason the firing has to be postponed the missile system automatically compensates minor aiming errors and remains ready for launch.

Specifications
Length: 1.81 m (5.9 ft)
Diameter: 9.2 cm (3.6 in)
Wing span: 1.9 cm (0.75 in)
Weight: 18.4 kg (40.6 lb)



Ouragan *(L 9021) (right) with* Foudre *(L 9011) (left). Delays in the second 'Foudre' class ship have caused the two 'Ouragan' class ships to be extended into the next century* (H & L van Ginderen Collection)



Ouragan *(L 9021), France's first purpose-built amphibious warfare ship. Note that the bridge superstructure is on the starboard side as in an aircraft carrier* (Albert Campanera i Rovira)

Speed: Mach 2.6
Range: 700-5,000 m (2,296-16,400 ft)

Manufacturer/Contractor
Matra Defense, France.

GUNS

OTOBREDA/Mauser 30 mm/70
Two OTOBREDA/Mauser 30 mm/70 cannon on single compact mountings were fitted in 1996/97 to replace the four 40 mm Bofors L/60s. The MK30 Model F is 3.35 m (10.99 ft) long, weighs 132.5 kg (292.2 lb) and uses the 30 mm × 173 GAU 8/A round. It is a fully gas-operated weapon using pistons which not only operate the bolt but, autonomously, the ammunition feed system. The Single Compact mounting is on an 80 cm diameter base. It is a twin-feed weapon with two boxes each of 80 rounds attached to the trunnion supports and linked to the feed mechanism by a flexible chute. The mounting weighs 1.33 tonne when loaded. The mounting is 3.57 m (11.71 ft) long, 1.6 m (5.2 ft) high and 1.8 m (5.9 ft) in width, with a swept radius of 2.72 m (8.9 ft).

Specifications
Calibre: 30 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,040-1,220 m/s (3,412-4,002 ft/s) (HEI/APDS)
Traverse: 360° at 140°/s
Elevation: −13 to +85° at 80°/s
Rate of fire: 800 rds/min/barrel
Ammunition: 1.05 kg (2.3 lb) (TP, HEI, HEI-SD, API, APDS)
Mounting weight, with ammunition: 1,480 kg (3,263 lb) (SC)
Crew: 0

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Sagem VIGY-105 optronic system
VIGY-105 was fitted in 1996/97 for the 30 mm guns. This is an electro-optical fire-control system for guns or short-range missiles and possesses a similar rotating sensor head on the same three-axis gimbal as the earlier VAMPIR MB. The fixed sensor module is repackaged but has similar servo and electronics modules, although the VIGY-105 electronics include a video tracker and fire-control computer as well as a TMS C40 processor. Some of the electronics are incorporated in a CS Defense Calisto workstation. The sensors consist of a high-resolution TV camera, an IRCCD camera and an eye-safe laser rangefinder which are all harmonised to less than 50 µrad.

Specifications
(VIGY-105)
Director dimensions: 600 × 6,500 × 1,500 m (1,968 × 21,320 × 4,920 ft)
Director weight: 150 kg (330.75 lb)
Elevation: −25 to +65°
Fields of view: 9 × 12°, 3 × 4° (TV camera); 9 × 11.5°, 3 × 3.8° (IRCCD camera)

Manufacturer/Contractor
SAGEM, Navigation and Defence Division.

RADARS

Thomson-CSF DRBV 51A
The Thomson-CSF DRBV 51A, G-Band radar is used for air/surface search. This was the most frequently used French naval radar a few years ago, but is now being replaced in some ships by more up-to-date systems.

Racal-Decca 1226
The Type 1226, I-band radar is used for navigation. It has a 30 cm PPI Plan Position Indicator display, a 20 kW output and a 1.83 m antenna.

SONAR

EDO AN/SQS-17
Ouragan only. Ouragan is fitted with an AN/SQS-17, a 1950s-vintage sonar, which was designed by EDO and built under licence in France. It is a hull-mounted, active search set, working at 12, 13 and 14 kHz, using a 24 stave 50 cm diameter array. While the sonar may give warning of a submarine, Ouragan actually carries no ASW weapons to deal with it.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 SEMT-Pielstick diesels, delivering 6.32 MW (8,600 hp)
Shafts: 2
Propellers: Controllable pitch

FURTHER INFORMATION

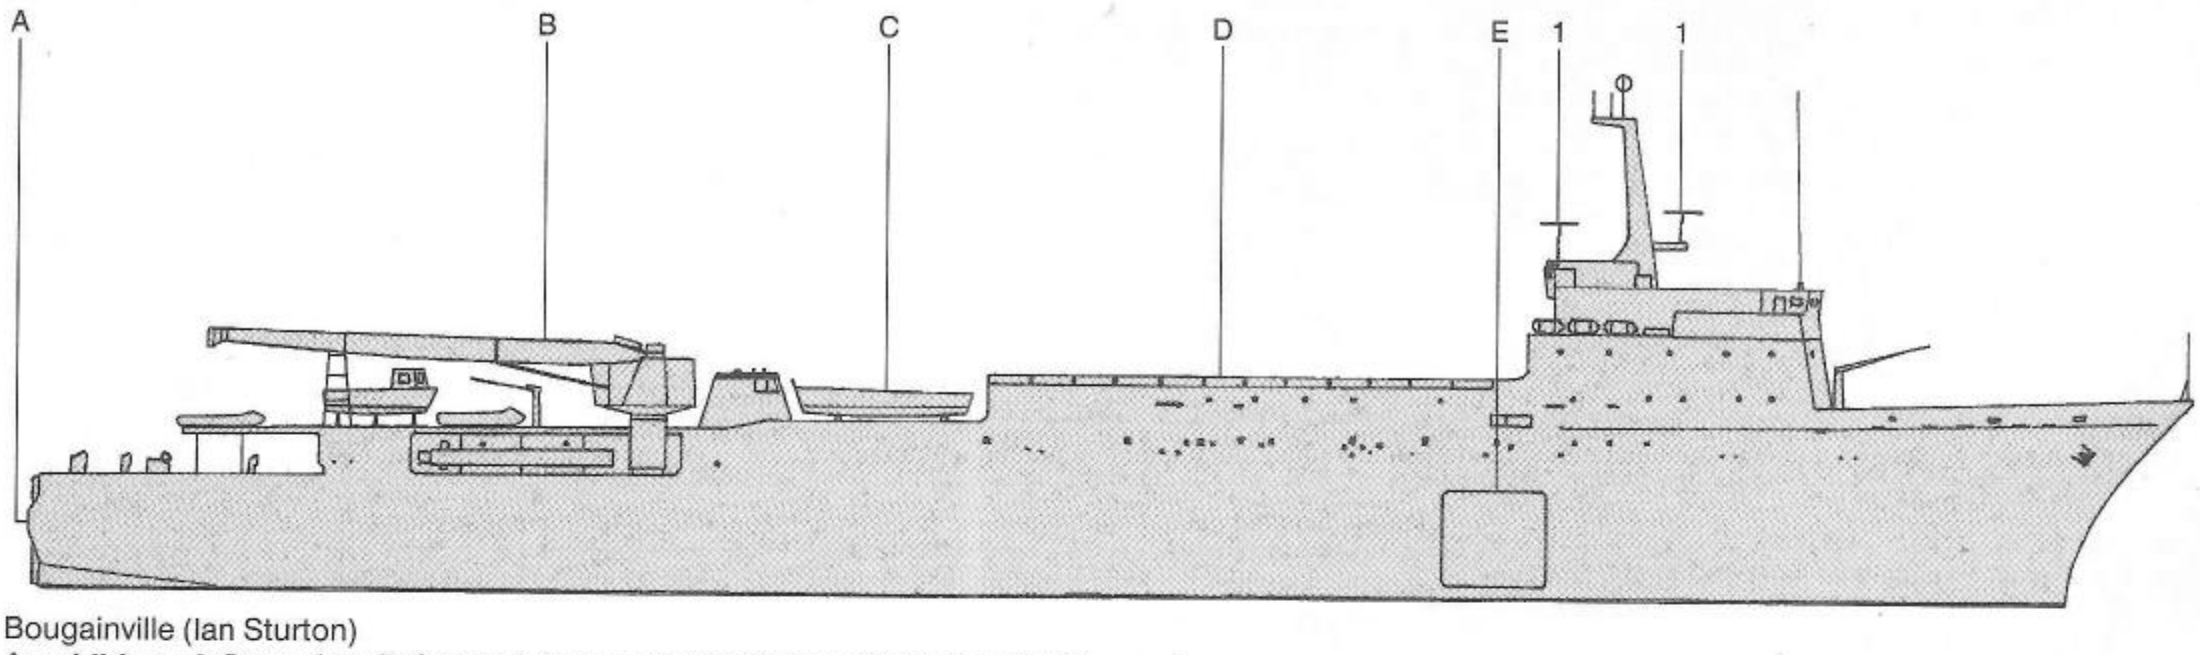
PROGRAMME

In the early post-war years the French Navy operated a number of ex-US Navy landing ships and one landing platform, dock (LPD). The two ships of the 'Ouragan' class were the first French-designed and -built amphibious warfare ships and have proved very successful. They were completed in 1965 and 1968, and were due to be replaced by two 'Foudre' class TCDs in the early 1990s. Due to delays in that programme, however, the lives of these two ships have been extended into the next century. Thus, as with the British Royal Navy and its two 'Fearless' class LPDs, the French Navy is being forced into retaining the two 'Ouragan' class ships well beyond the point where they should have retired, while it awaits decisions on future LPDs. In practice, the French position is a little ahead of the British since one LPD, *Foudre,* has been in service now for some years, and a second, *Siroco,* is due to be commissioned in 1998. Further, the cessation of nuclear testing in the Pacific may free the relatively modern *Bougainville* multipurpose amphibious ship for a more conventional naval role. Meanwhile, the 'Ouragan' class ships are being updated in terms of weaponry and control systems.

DEPLOYMENT

Both ships are assigned to the FAN (Force d'Action Navale) at Toulon. They have command facilities for directing amphibious and helicopter operations.

BOUGAINVILLE



Bougainville (Ian Sturton)
Amphibious A *Stern door* **B** *Crane; 37 t capacity* **C** *LCVP* **D** *Flight deck* **E** *Entry port*

General 1 *Racal-Decca 1226 navigation*

GENERAL SPECIFICATIONS

Operator: France

Class: BOUGAINVILLE

National designation: *Batiment de Transport et de Soutien* (BTS) (transport and logistic support ship).

Built: 1
Active: 1

Displacement:
standard: 4,954 t
full load: 5,181 t

Dimensions
Length: 113.5 m (372.3 ft)
Beam: 17 m (55.8 ft)
Draught: 4.3 m (14.1 ft)

Speed: 15 kts
Range: 6,000 n miles at 12 kts

Complement: 53 (including five officers) plus 10 staff

SHIP

BOUGAINVILLE (L 9077)

Builder	Chantier Dubigeon, Nantes, France	**Laid down**	28 Jan 1986
Completed by	Chantiers de l'Atlantique, St Nazaire, France	**Launched**	3 Oct 1986
		Commissioned	5 Jun 1988

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- 500 troops for eight days
- 1,180 tonnes of cargo

SHIP-SHORE LIFT

- Amphibious role: 10 LCP plus two LCM
- Logistic support role: two LCU

AVIATION FACILITIES

Specifications
Flight deck: Aft of forward superstructure.
Helicopters: 2 Aerospatiale 332B Super Pumas.

AMPHIBIOUS FACILITIES

- Well deck 78 × 10.2 m (255.84 × 33.45 ft).
- Can receive tugs and one BSR support vessel or two CTM (Chalands de Transport de Materiel) LCM-type vessels, a supply tender of the 'Chamois' class, containers and mixed bulk cargo.
- Can dock a 400 tonne ship.
- There is a 37 tonne crane aft of the flight deck.

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

Two Matra Simbad twin launchers
Simbad *(Système Integre de Mistral Bitube d'Auto-Defense)* is a manually operated system for firing Mistral missiles which has two missile launcher-containers and a loaded weight of 250 kg (551.25 lb). Simbad is 2.3 m (7.54 ft) high with an operating radius of 1.5 m (4.92 ft) and it can be installed on any 20 mm gun mounting. It has a ×3 optical sight and can be deployed from −5 to +55° in elevation.

Specifications
Missile
Length: 1.81 m (5.93 ft)
Diameter: 9.2 cm (33.32 in)
Wing span: 1.9 cm (0.74 in)
Weight: 18.4 kg (40.57 lb)
Speed: Mach 2.6
Range: 700-5,000 m (2,296-16,400 ft)

Manufacturer/Contractor
Matra Defense, Paris, France

GUNS

M2HB 12.7 mm machine guns
Two M2HB are carried. The M2 automatic was designed as an anti-tank weapon in 1919 but was used during the Second World War for both air defence and surface fire support. The common air-cooled version is the M2HB (Heavy Barrel) which has a 1,143 mm long barrel. There are numerous mountings available.

Specifications
(M2HB)
Calibre: 12.7 mm
Length of barrel: 90 calibres
Gun weight: 38.1 kg (84.0 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

COMMAND AND CONTROL SYSTEMS

RADAR

Racal-Decca Type 1226
The Racal Decca Type 1226 is an I-band equipment: one set is used for navigation, the other for helicopter control. The Type 1226 uses a 30 cm PPI (Plan Position Indicator) display, operates in the I-band, has 20 kW outputs and is equipped with a 1.83 m antenna.

Manufacturer/Contractor
Racal-Decca, UK.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 SACM AGO 195 V12 RVR diesels, 3.24 MW (4,410 HP) sustained.
Shafts: 2
Propellers: Controllable pitch
Thruster: 1 bow thruster, 294 kW (400 hp).

FURTHER INFORMATION

PROGRAMME

Bougainville was ordered in November 1984 for the *Direction du Centre d'Experimentations Nucleaires* (DIRCEN) and is based in the Pacific Squadron for use at the nuclear test base at Muroroa. It is a one-off vessel built to support the nuclear test site in the South Pacific but has extensive amphibious capabilities as well. Its future role is uncertain because of French defence cuts and the end of nuclear testing in the Pacific, though it is well-equipped for a more conventional amphibious role or for service as a command vessel. *Bougainville* was built and launched at Chantiers Dubigeon at Nantes, but the yard closed down after her launch and it was fitted out at Alsthom's Chantiers de l'Atlantique.

DESIGN

The ship has a dual designation as an LPD amphibious craft and a BTS *(Batiment de Transport et de Soutien)* which relates to her role as support vessel in the South Pacific. There are large-scale repair workshops and repair facilities for helicopters, and the ship can act as a mobile crew accommodation. There are extensive facilities for medical treatment, and large storerooms for spare parts, food and ammunition.

Bougainville *(L 9077). The smallest operational LPD in any navy, this ship was built specifically for use in the Pacific on France's nuclear testing range and the hull was built to civil standards* (Alsthom)

EDIC/EDIC 700/CDIC

OVERVIEW

The original series of EDIC *(Engins de Debarquement d'Infanterie et de Chars)* was built by CN Franco-Belge and the Toulon naval dockyard in the late 1950s. These were essentially updated versions of the British Landing Craft Tank (LCT) Mk 4, of which a number had been supplied to the French Navy both during and after the Second World War. The EDIC design led to a long-running series of LCTs, which have been built in France and other countries over a period of some 20 years.

Two batches of EDICs were built for the French Navy:

L 9091, L 9093, L 9094, L 9096. These were launched in 1958. All were stricken between 1988 and 1991, but L 9096 has subsequently been restored to the register.

L 9070, L 9072, L 9073, L 9074. These were launched in 1967-69 and L 9074 alone remains in service.

Besides being built in France, the EDIC has also been built in Portugal, Spain and Turkey.

A modified version, designated EDIC 700 (or EDIC III), was also produced. It originated with an order for two vessels (L 9051, L 9052) for use at the French nuclear testing site in the Pacific, which were financed out of the nuclear budget, rather than paid for by the navy, although they have naval crews. A third EDIC 700 was built for Senegal, and another two for Lebanon.

A further variation on the design, the CDIC, was developed specifically to operate with the 'Foudre' class LPDs. Two were built for the French Navy.

TABLE I: EDIC/EDIC 700 PRODUCTION

Type	Country	Number built	Launched	In service 1 Jan 1997	Remarks
EDIC	France	8	4 - 1958 4 - 1967-69	1 1	
	Ethiopia	2	1977	—	Ethiopian Navy has ceased to exist (see note)
	Madagascar	1	1964	1	One BATRAM-type built in Madagascar is very similar to EDIC
	Morocco	1	1963	1	
	Portugal	3	1969-1985	3	Built in Portugal
	Senegal	1	1986	1	Also has one EDIC 700 (below)
	Spain	3	1966	3	Built by Bazan, La Caracca
	Turkey	12	1966-1973	7	Built at Golcuk
EDIC 700	France	2	1987	2	
	Lebanon	2	1985	2	
	Senegal	1		1	
CDIC	France	2	1988	2	For use with 'Foudre' class LPDs
TOTALS		**38**		**25**	

Note: The Ethiopian Navy received two EDIC vessels from France, of which one remained in late 1996. With the loss of Ethiopia's coastline, however, all ships of the former Ethiopian Navy were being offered for sale in late 1996.

- Eight armoured personnel carriers
- 250 tonnes

AMPHIBIOUS FACILITIES

- Flat, bottom-hinged bow door
- Tank deck 28.5 × 8 m (93.5 × 26.25 ft)
- Kedge anchor at stern

WEAPONS SYSTEMS

GUNS

Oerlikon 20 mm cannon

Specifications
Calibre: 20 mm
Length of barrel: 90 calibres
Muzzle velocity: 1,050-1,250 m/s (3,445-4,101 ft/s)
Traverse: 325°
Elevation: −15 to +80°
Mounting weight, loaded: 470 kg (1,036 lb)
Crew: 2
Range: 3.5-5.5 n miles (6.75-10 km)

Giat 20F2 20 mm

Specifications
(M693/F2 A)
Calibre: 20 mm
Length of barrel: 90 calibres
Muzzle velocity: 1,050-1,250 m/s (3,445-4,101 ft/s)

Traverse: 325°
Elevation: −15 to +80°
Mounting weight, loaded: 470 kg (1,036 lb)
Crew: 2
Range: 3.5-5.5 n miles (6.75-10 km)

M2HB 12.7 mm machine gun

Specifications
Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

81 mm mortar

These ships carry one 81 mm mortar for use in the run in to amphibious landings. Typical range for such a weapon is 1.94 n miles (3.6 km), firing a 4.05-4.15 kg (8.9-9.1 lb) bomb at a rate of approximately 10 rds/min.

FURTHER INFORMATION

France
L 9074 has been based in French Guiana since February 1995. L 9096 was paid off in 1990 but is now active again as a special harbour craft at Brest.

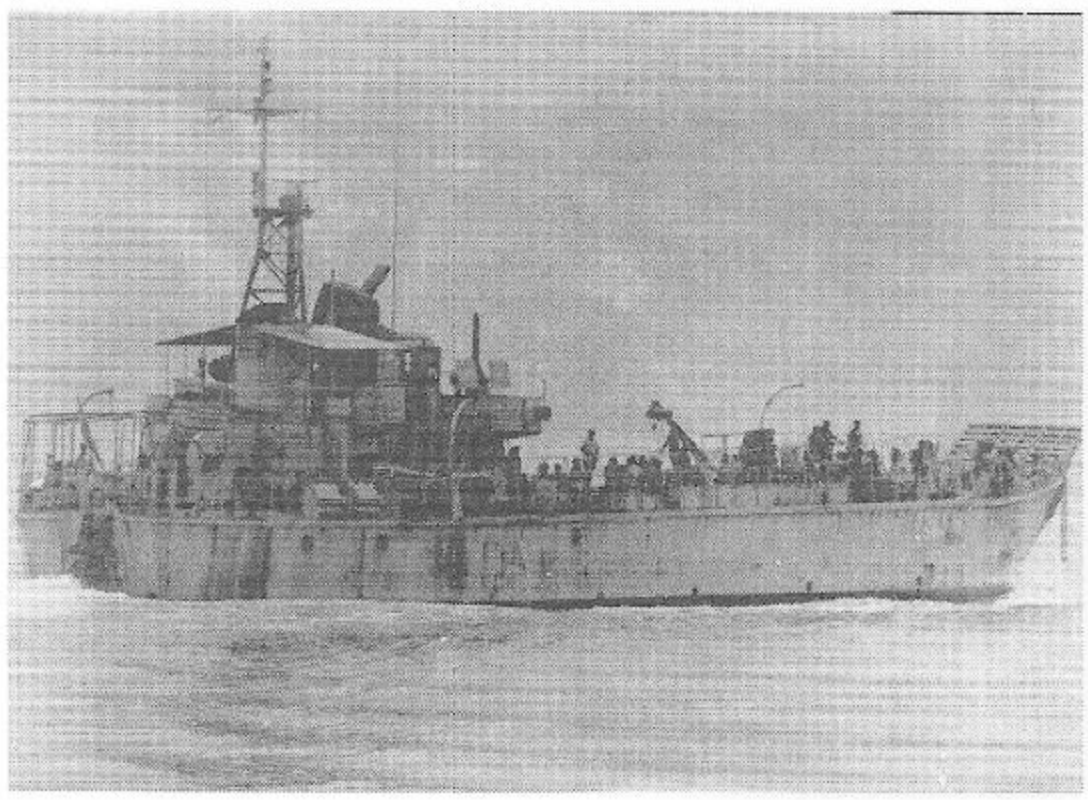
Madagascar
The Madagascar vessel served in the French Navy from 1964 to 1981, spending most of that time in the Pacific. It was laid up at Tahiti in 1981 but was sold to Madagascar in 1985.

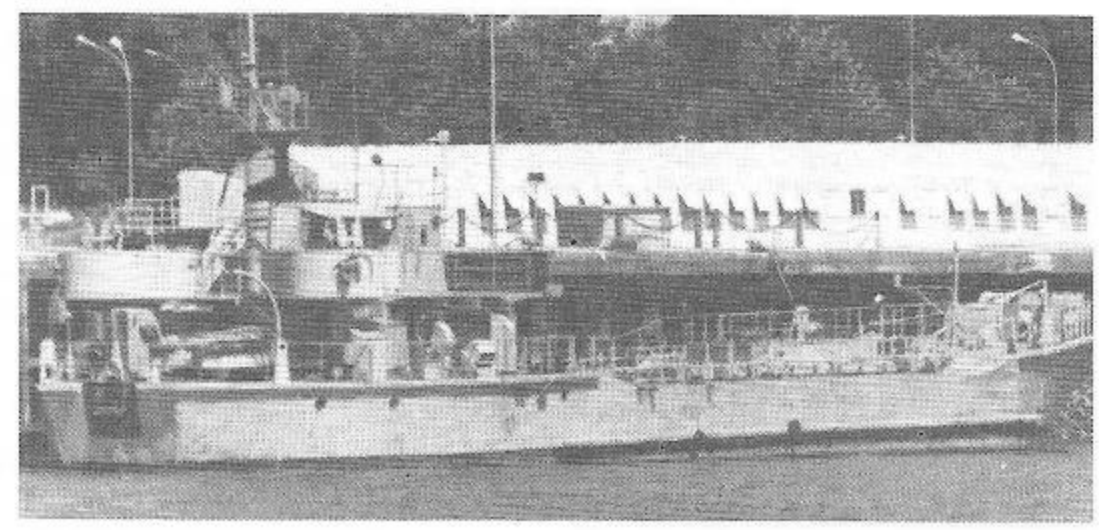
Morocco
This vessel was built in France and delivered to Morocco in 1965.

Portugal
The design of these Portuguese-built landing craft was based on that of the French EDIC. It should be noted that *Bacamarte,* the third of class, was built a full 15 years after the second vessel.

Spain
Spanish-built, but the design was based on that of the French EDIC class. They were redesignated logistics support craft in 1986, but still carry armament.

Turkey
Twelve landing craft were built in Turkey between 1966 and 1973, of which four were scrapped in 1991 and one in 1993. The Turkish version has three engines and three propellers.

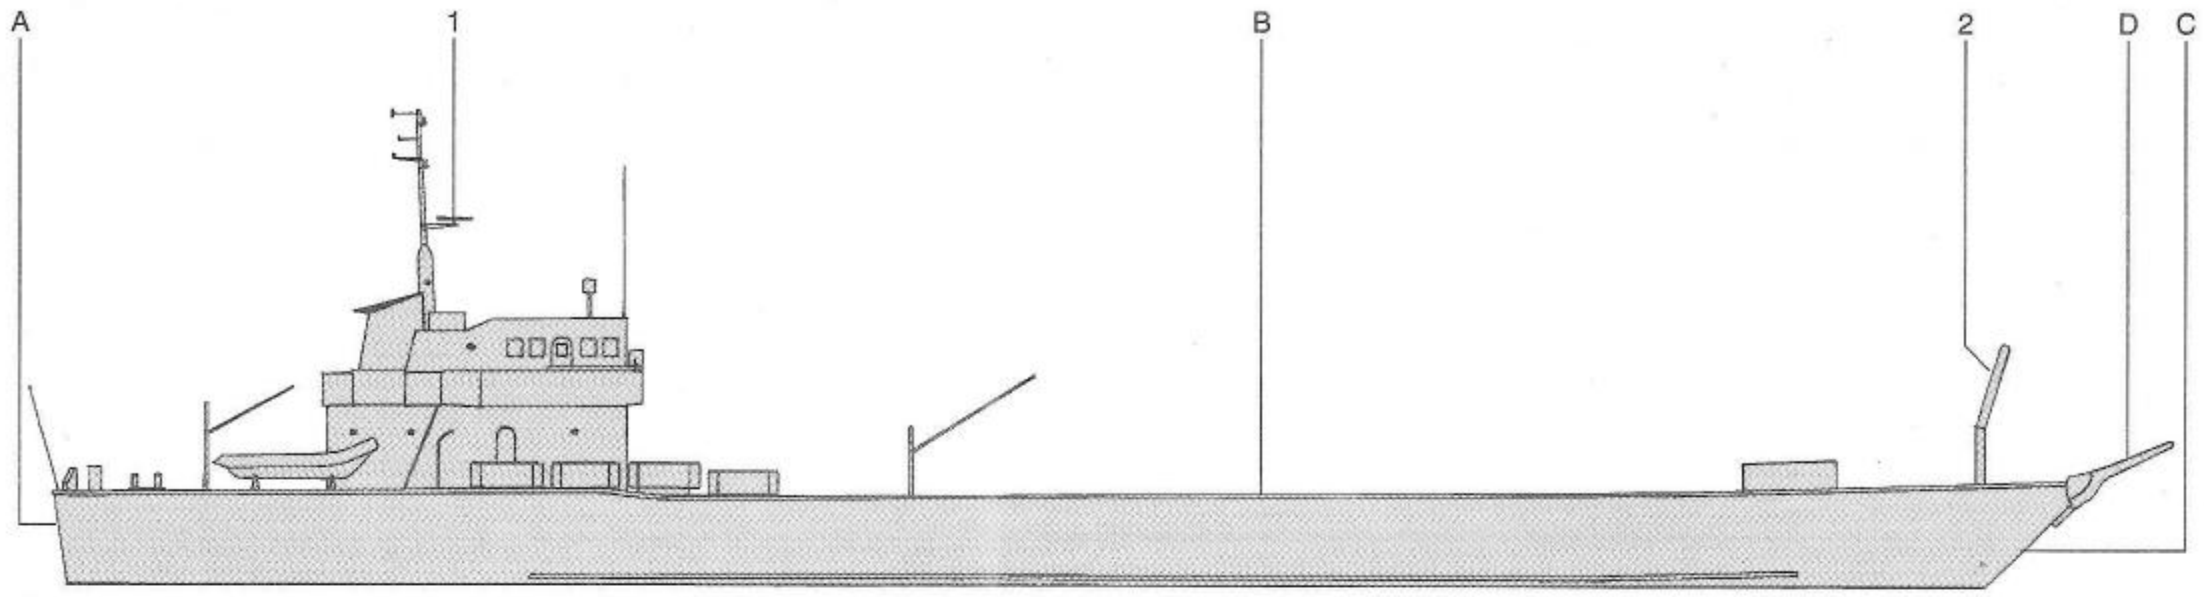




EDIC of the Madagascar Navy (J Y Robert)

A French-built 'EDIC' class landing craft in service with the Ethiopian Navy. This vessel was probably included in the sell-off of the former Ethiopian Navy in late 1996 but its fate is unknown (Ethiopian Navy)

EDIC 700



EDIC 700 class L 9052 (Ian Sturton)

RAMPS, DECK

- Tank deck 28.5 × 8 m (93.5 × 26.25 ft)
- Flat-fronted bow door, bottom-hinged

WEAPONS SYSTEMS

GUNS

Giat 20F2 20 mm

French ships only. Two Giat 20F2 20 mm cannon in a swivel fork-type mount revolving on a fixed ferrule. The mounting, which is unpowered, is largely made up of light alloys and stainless steel to reduce weight.

Specifications
(M693/F2 A)
Calibre: 20 mm
Length of barrel: 90 calibres
Muzzle velocity: 1,050-1,250 m/s (3,445-4,101 ft/s)
Traverse: 325°
Elevation: −15 to +80°
Mounting weight, loaded: 470 kg (1,036 lb)
Crew: 2
Range: 3.5-5.5 n miles (6.75-10 km)

Two 12.7 mm machine guns

There are two 12.7 mm machine guns. The M2HB is a selective short recoil automatic operation air-cooled weapon using 110-round belts. Giat has developed a single pintle mounting in the P.127A weighing 125 kg (276 lb) loaded and an elevation arc of −15 to +50°.

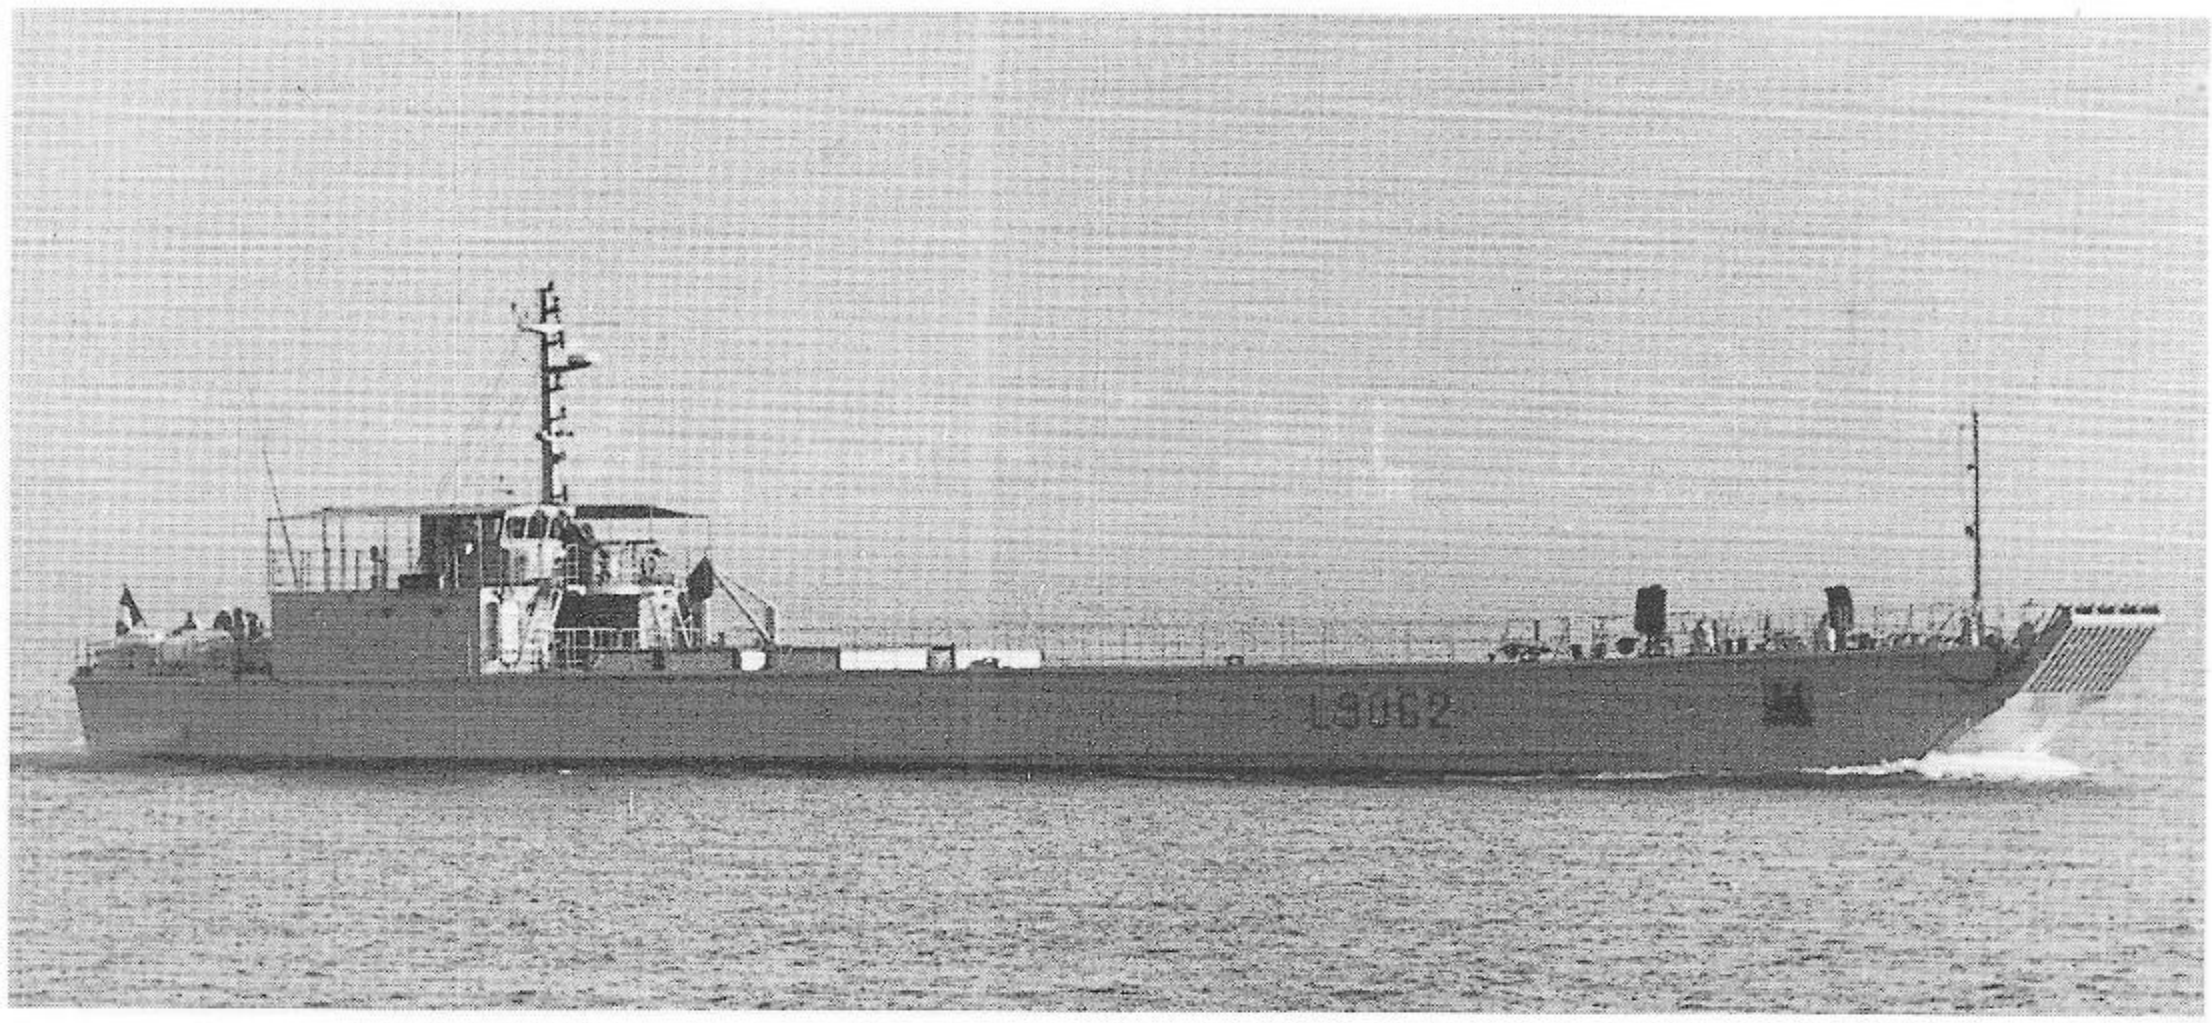
Specifications
Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

Two Oerlikon 20 mm in a twin US Mk 24 mounting

Lebanese and Senegalese vessels only. There is one Mk 24 mounting, with two Oerlikon 20 mm cannon, although the weapons are only normally fitted in the Lebanese vessels. The barrel has an approximate life of 9,000 EFC.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 1.5 km
anti-air: 1,150 m (3,773 ft)
Rate of fire: 450 rds/min/barrel
Round weight: 241 g
Projectile: 122 g

US Mk 24 mounting
Elevation: −15 to +90°
Weight: 481-649 kg (1,060-1,431 lb) (unloaded)



EDIC 700, L 9052, of the French Navy. This is an improved version of the original EDIC 700 (H & L van Ginderen Collection)

81 mm mortar

Lebanese ships only. These ships carry one 81 mm mortar for use in the run in to amphibious landings. Typical range for such a weapon is 1.94 n miles (3.6 km), firing a 4.05-4.15 kg (8.9-9.1 lb) bomb at a rate of approximately 10 rds/min.

Two 12.7 mm machine guns

French and Lebanese vessels only. These ships have standard 12.7 mm machine guns in a French Giat mounting.

Specifications
Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 898 m/s (2,946 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

One 7.62 mm machine gun

There is one rifle calibre (7.62 mm) machine gun for self-protection duties against both air and sea threats.

Specifications
Gun weight: 10.55 kg (23.25 lb)
Muzzle velocity: 840 m/s (2,756 ft/s)
Cyclic rate of fire: 700 rds/min
Practical rate of fire: 300 rds/min
Effective range: 0.66 n miles (1.2 km)

COMMAND AND CONTROL SYSTEMS

RADAR

Racal-Decca

Lebanon only. An I-band set is used; model unknown.

Racal-Decca 1226

Senegal only. One I-band Racal-Decca 1226 navigation set. The Type 1226 is part of the Solid State series and uses a 30 cm (12 in) PPI (Plan Position Indicator) display. It operates in the I-band, has 20 kW output and is equipped with a 1.83 m (6.0 ft) antenna.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 SACM Uni-Diesel UD 30 V12 M1 diesels, delivering 882 kW (1,200 hp) sustained
Shafts: 2

Lebanon, Senegal
System: Diesel
Main machinery: 2 SACM MGO 175 V 12 M1 diesels, delivering 882 kW (1,200 hp)
Shafts: 2

FURTHER INFORMATION

France
L 9051 is based at the Pacific Nuclear Test Centre at Mururoa, and L 9052 at Djibouti.

Lebanon
Lebanon borrowed an EDIC (L 9096) from the French Navy from November 1983 to January 1985, pending the delivery of these two new-build vessels. Both were damaged in early 1990, but were repaired the following year.

Senegal
A French EDIC was lent to Senegal from January 1974 to 23 June 1986, when it was replaced by the newly built *Karakene,* an EDIC 700 type. A second ex-French Navy vessel, ex-L 9070, one of the Batch 2 EDICs, was transferred in 1995.

RADAR

Racal-Decca 1229
The Type 1229 is an I-band, navigation radar in Racal-Decca's Solid State series and uses a 30 cm PPI (Plan Position Indicator) display.

Specifications
(AC 1229)
Role: Navigation
Frequency: I/J-band
Beam: 1.2°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25.1.0 µs
PRF: 1,300/650 pps
Scan rate: 25 rpm
Typical range: 48 n miles

Manufacturer/Contractor
Racal-Decca, UK.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 SACM Uni-Diesel UD 30 V12 M1 diesels, 882 kW (1,200 hp) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME
This is a modern design of tank landing craft, developed from the EDIC 700, and specifically built to work with the 'Foudre' class dock landing ships (LPD), although they can also work with the 'Ouragan' class ships. At one time it was proposed to order a further three, but this was postponed, although the fact that there are only two of these landing craft — and four large ships that they can work with, plus perhaps others in the pipeline — will need to be faced soon.

DESIGN

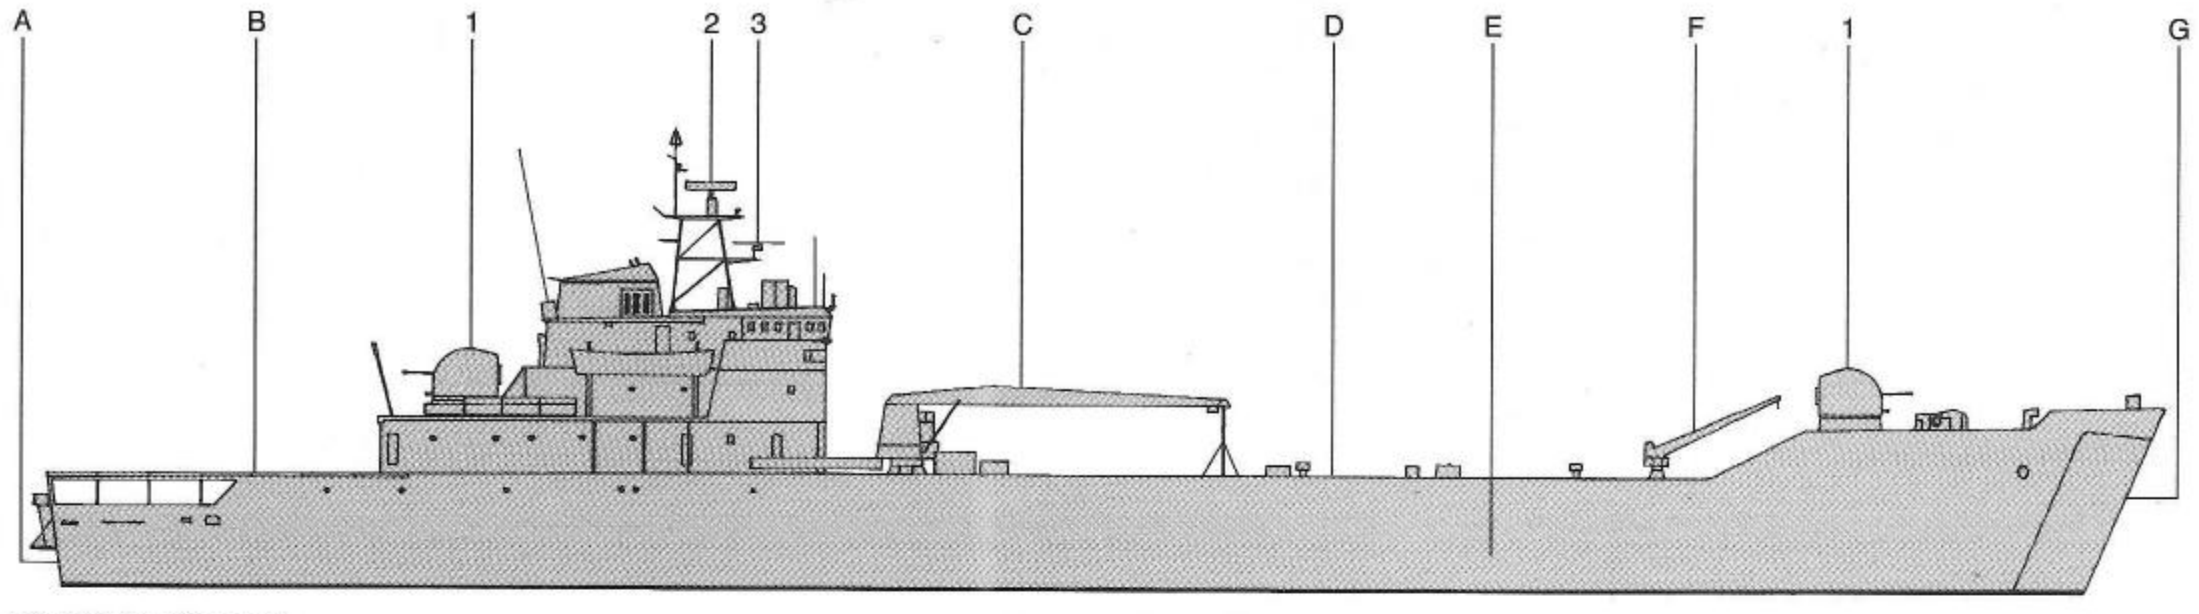
The mast is lowered, the wheelhouse retracted into the superstructure and the rails around the superstructure dropped to facilitate docking manoeuvres inside the LPDs.

DEPLOYMENT

Both vessels are assigned to the *Force d'Action Navale* (FAN)

CDIC approaching Foudre, *which can accommodate four loaded CTMs and one loaded CDIC. On the CDIC note the Giat 20F2 209 mm cannon on the stern* (DCN)

IBN OUF (PS 700)



PS 700 (Ian Sturton)

- Large crane on upper deck
- Kedge anchor at stern.

WEAPONS SYSTEMS

GUNS

Breda 40 mm/70 in twin mountings

Main armament is three twin OTOBREDA 40 mm/70; two are on the forecastle, one abaft the stack. The 40 mm Bofors L/70 is an automatic cannon for air defence roles which may also be used to engage surface targets. The Compact twin 40 mm mounting is designed for use against high-performance combat aircraft, against anti-ship missiles and for surface engagements. The mounting consists of two 40 mm guns 300 mm apart, a feeding system with magazine, a local control panel, a power supply rack, a converter and an air-water panel.

Specifications
Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s) (Breda)
Range:
anti-surface: 6.75 n miles (12.5 km)
anti-air: 8,700 m (28,500 ft)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 4,000 m (13,124 ft)
Rate of fire: 600 rds/min

Ammunition: 2.4 kg (5.3 lb) (HCHE, PFHE), 2.5 kg (5.5 lb) (HE-T)

Mounting
Traverse: Nominal 360° at 90°/s
Elevation: −13 to +85° at 60°/s
Crew: 2

One 81 mm mortar

One 81 mm mortar is carried for use in the run in to amphibious landings. Typical range for such a weapon is 1.94 n miles (3.6 km), firing a 4.05-4.15 kg (8.93-9.15 lb) bomb at a rate of approximately 10 rds/min.

WEAPONS CONTROL

CSEE Panda director with RADOP 20

Panda is an autonomous deck-mounted optical director for use in air defence and anti-surface operations, which operates in two modes: surveillance/target tracking and fire control. In the former the target may be designated by the ship's radar and the director slews to face it. The target is acquired visually and identified then tracked by the operator who moves the director with a joystick. In the fire-control mode the operator selects air or surface engagement and inserts target range data. The relevant guns are then slaved to the director whose operator then conducts the engagement.

Specifications
Panda
Height: 1.35 m (4.42 ft)
Width: 1.5 m (4.92 ft)
Weight: 480 kg (1,058 lb)
Elevation: −25 to +65°
Max velocity traverse: 60°/s
elevation: 60°/s

RADARS

Thomson-CSF Triton

This is a G/H-band, 5 cm wavelength, air and surface surveillance radar for shipboard mounting, and is used for surveillance and target designation functions with a range of 18 n miles (33 km). It is no longer in production.

Racal-Decca 1226

The Type 1226 surface search radar is part of the Solid State series and uses a 30 cm (11.8 in) PPI (Plan Position Indicator) display. It has an output of 20 kW, and comes equipped with a 1.83 m (6 ft) antenna.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 SEMT-Pielstick 16 PA4 V 185 diesels, delivering 3.93 MW (5,344 hp) sustained
Shafts: 2
Propellers: cp

FURTHER INFORMATION

PROGRAMME

These two tank landing ships were built for the Libyans by CNIM at La Seyne, France in the mid-1970s.

At several points, a third of the class has appeared in reference books: this appears to have been an error, probably caused by renumbering. Both ships were currently reported to be non-operational in 1995.

Ibn Harissa *(134) in 1981* (H & L van Ginderen Collection)

BATRAL

OVERVIEW

This small LST design has achieved some success, 13 having been built for five customers, including the French Navy, three Francophone countries and Chile. As with several other French amphibious vessels, the ships have been tailored to meet individual customer's requirements, and thus differ in detail, but all are to the general LST design of clamshell bow doors, an internal tank deck, a vehicle park on the upper deck and a helicopter platform aft. In the later ships, however, the helicopter platform is larger, and the bridge is one deck level higher.

Country	Class Name	Number in service	Commissioned	Built	Remarks
France	Champlain	5	1974 - 2 1983 - 2 1987 - 1	France	1987 ship from Gabon order
Chile	Maipo	3	1982 - 1 1983 - 1 1986 - 1	Chile	
Ivory Coast	L'Elephant	1	1977 - 1	France	
Gabon	Bongo	1	1984 - 1	France	Second ship ordered but not paid for; added to French fleet in 1987
Morocco	Daoud ben Aicha	3	1977 - 2 1978 - 1	France	One more may be on order

GUNS

Bofors 40 mm/60

The 40 mm/60 automatic cannon is designed for air defence roles, but can also be used to engage surface targets. Although described as a 60 calibre weapon it is, in fact, a 56.25 calibre gun.

Specifications

Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,890 ft/s) (new gun); 850 m/s (2,789 ft/s) (mid-life)
Range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,600 ft)
Rate of fire: 60 rds/min (practical), 120 rds/min (cyclic)
Ammunition: 2.21 kg (4.87 lb)

Breda 40 mm/70

The Breda 107 mount uses the 40 mm Bofors L/70 automatic cannon for air defence roles, with a secondary anti-surface role. Breda 107 single mounting has a 32-round feeder mechanism.

Specifications

Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s)
Range:
anti-surface: 6.75 n miles (12.5 km)
anti-air: 8,700 m (28,543 ft)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 4,000 m (13,100 ft)
Rate of fire: 600 rds/min
Ammunition: 2.4 kg (5.39 lb) (HCHE, PFHE), 2.5 kg (5.5 lb) (HE-T)

Mounting
Traverse: Nominal 260° at 90°/s
Elevation: −13 to +85° at 60°/s
Crew: 2

Giat 20F2 20 mm

This mounting is of the swivel fork-type, revolving on a fixed ferrule. The mounting, which is unpowered, is largely made up of light alloys and stainless steel to reduce weight.

Specifications

Calibre: 20 mm
Length of barrel: 90 calibres
Muzzle velocity: 1,050-1,250 m/s (3,445-4,100 ft/s)
Traverse: 325°
Elevation: −15 to +80°
Crew: 2
Range: 3.5-5.5 n miles (6.75-10 km)

81 mm mortar

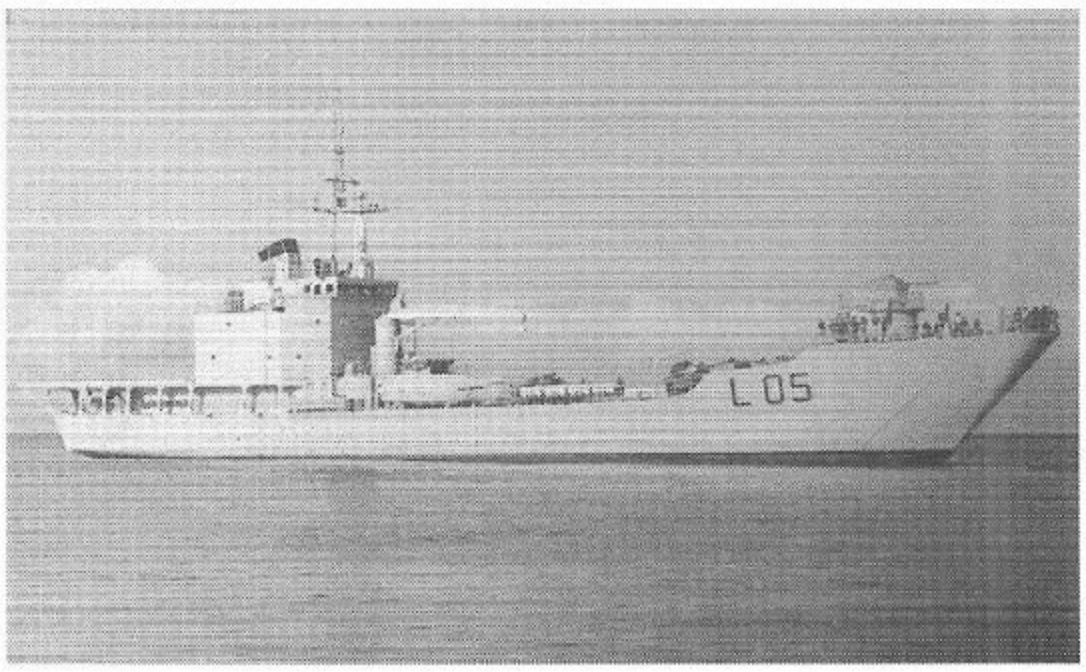
One 81 mm mortar is carried for use in the run in to amphibious landings. Typical range for such a weapon is 1.94 n miles (3.6 km), firing a 4.05-4.15 kg (8.93-9.15 lb) bomb at a rate of approximately 10 rds/min.

M2HB 12.7 mm machine guns

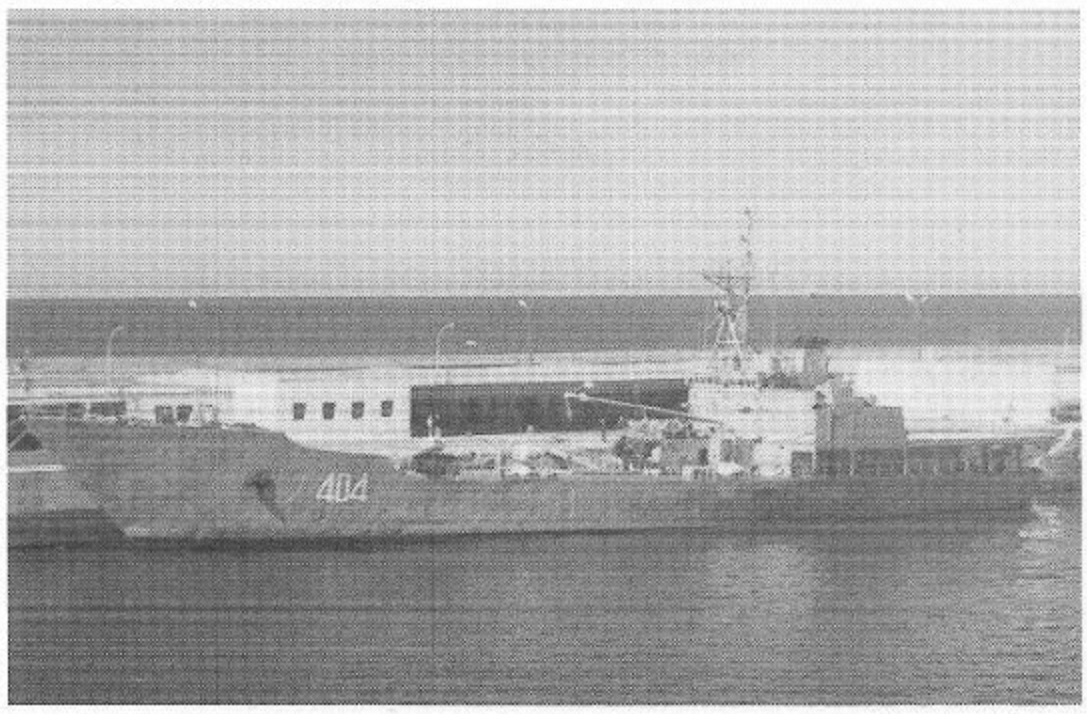
This is a selective-fire, short-recoil, automatic operation, air-cooled weapon with a 1,143 mm (45 in) long barrel and eight right-hand grooves turning once every 381 mm (1.5 in). The weapon uses 110-round belts.

Specifications

(M2HB)
Calibre: 12.7 mm
Length of barrel: 90 calibres
Gun weight: 38.1 kg (84.0 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)



President El Hadj Omar Bongo *(L 05). Note that in this second batch ship the 40 mm gun is mounted on a pedestal on the forecastle* (Gabon Navy)



Abou Abdallah el Ayachi *(404)* (Paul Beaver)

COMMAND AND CONTROL SYSTEMS

RADARS

Racal-Decca DRBN-32

All, less 'Maipo' class (Chile). DRBN-32 is the French designation for the Racal-Decca Type 1226 navigation radar.

Specifications

(DRBN 32/Type 1226)
Role: Navigation
Frequency: I-band
Beam: 1.2°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25/1.0 µs
Scan rate: 28 rpm
Typical range: 48 n miles

Manufacturer/Contractor

Racal-Decca, UK.

Racal-Decca 1229

Navigation radar is the widely used Racal-Decca, I-band Type 1229. Part of the company's 'Solid State' series, the type 1229 has a 30 cm (12 in) PPI (Plan Position Indication) display, a 20 kW output and 2.7 m (8.9 ft) antenna.

Manufacturer/Contractor

Racal-Decca, UK.

Specifications

(AC 1229)
Role: Navigation
Frequency: I/J-band
Beam: 1.2°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25/1.0 µs
PRF: 1,300/650 pps
Scan rate: 25 rpm
Typical range: 48 n miles

Manufacturer/Contractor

Racal-Decca, UK.

SONARS

Some reports credit these ships with two hull-mounted sonars, although as they are regularly beached it is difficult to assess where they might be mounted.

PROPULSION

All, less 'Maipo' class (Chile).

Specifications

System: Diesel
Main machinery: 2 SACM AGO 195 V12 diesels, 2.65 MW (3,600 hp) sustained
Shafts: 2
Propellers: Controllable pitch

'Maipo' class (Chile)

Specifications

System: Diesel
Main machinery: 2 SEMT-Pielstick 12 PA4 V 185 VC diesels, 2.95 MW sustained
Shafts: 2
Propellers: Controllable pitch

FURTHER INFORMATION

PROGRAMME

The first two ships for the French Navy were commissioned in 1974 and there was then a nine-year gap before the second two, which were then built to a modified design.

- Chile. Three were built in Chile, being completed between 1981 and 1984. These are to the original Batral design.
- Gabon. Gabon ordered two to the modified Batral design, one of which, *President el Hadj Omar Bongo,* was delivered in 1984. Gabon could not, however, pay for the second, which was eventually purchased by the French Navy and commissioned as *La Grandiere.*
- Ivory Coast. One was ordered in 1974 and delivered in 1977. It is built to the original design. It is reported in 1996 to be in poor condition but still seaworthy.

Morocco. Two were ordered in March 1975 and the third in August 1975. All were to the original Batral design. It is also reported that an order for a fourth was placed in 1995.

DESIGN

The Batral design is a classical LST, with a normal, ship-type bow with clamshell doors, a long, unobstructed tank deck with a ramp to enable vehicles to move between the tank and upper decks, and superstructure and machinery aft. There is also a medium-sized flight deck and a small hangar. LCVPs can be carried on the upper deck and there is a 37 tonne crane.

The first nine ships (two for France, three for Chile, one for the Ivory Coast and three for Morocco) were all to the same design. When the second French order was placed, however, the design was updated, which included an additional deck level in the superstructure, an enlarged helicopter deck and a crane in place of the boom on the upper deck. This enabled troop accommodation to be increased from 138 to 180.

CURRENT STATUS

All ships are in service, although there are reports that the Ivory Coast ship is in poor condition. Deployment of the French ships is:

- *Champlain* (L 9030) — Indian Ocean
- *Francis Garnier* (L 9031) — Antilles/French Guiana
- *Dumont D'Urville* (L 9032) — Papeete/Tahiti
- *Jacques Cartier* (L 9033) — New Caledonia
- *La Grandière* (L 9034) — FAN, Toulon.

Ahmed es Sakali *(403) of the Moroccan Navy* (H & L van Ginderen Collection)

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops 180-200
- Medium tanks 12
- Total payload 600 tonnes

SHIP-SHORE LIFT

- No special boats are carried.

AMPHIBIOUS FACILITIES

- Vehicle deck 425 m² (4,580 sq ft).
- There is a large, bottom-hinged hold ramp, with a shaped foot to provide minimal streamlining.
- There is no stern ramp.
- Cranes
  Frosch I. No crane
  Frosch II. 8 tonne capacity crane on upper deck.

WEAPONS SYSTEMS

GUNS

37 mm cannon
Since arrival in Indonesia all ships have been fitted with two twin 37 mm cannon in open mounts. This is most likely to be the Russian W-11-M mounting, which is used on some other Indonesian Navy ships, or a derivative of the Bofors 40 mm/60.

MINES

These vessels can be used as minelayers. The mine-rails run either side of the after superstructure leading to two angled chutes on either side of the stern. Maximum of 40 mines.

COMMAND AND CONTROL SYSTEMS

RADARS

Strut Curve
Strut Curve is a medium-range, general purpose, F-band radar, providing both air and surface search facilities. It has an elliptical lattice reflector, but no balance vanes. Performance against a 2 m² (21.5 sq ft) aircraft target at medium altitude is about 60.5 n miles (111 km), with a likely maximum range of 152 n miles (278 km).

TSR 333
The navigation radar is a TSR-333 operating in the I-band.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 diesels, 3.68 MW (5,000 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These are similar in design, although somewhat smaller than the 'Ropucha' class, which was built in Polish shipyards for the (then) Soviet Navy and formed part of the amphibious fleet assembled by the Baltic members of the erstwhile Warsaw Pact. Twelve Frosch Is and two Frosch IIs were built, all for the East German *Volksmarine*.

On reunification they became surplus to German requirements and were sold en bloc to Indonesia, in a sale which caused some political controversy in Indonesia at the time.

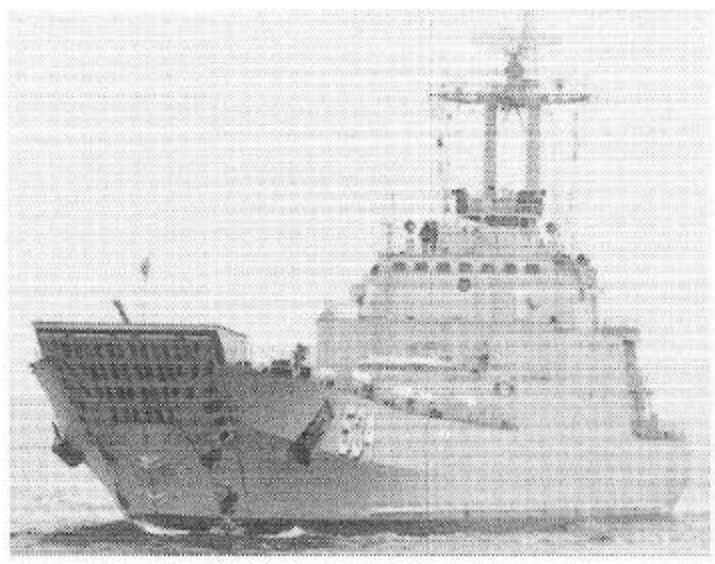
DESIGN

As built, the vessels were armed with four 57 mm and four 30 mm guns, arranged in four sets of twin mountings, together with two 122 mm rocket launchers. Prior to transfer to Indonesia, however, all these ships were refitted at Rostock, and the work included the removal of all weapons, as well as the associated Muff Cob fire control radar and High Pole B IFF.

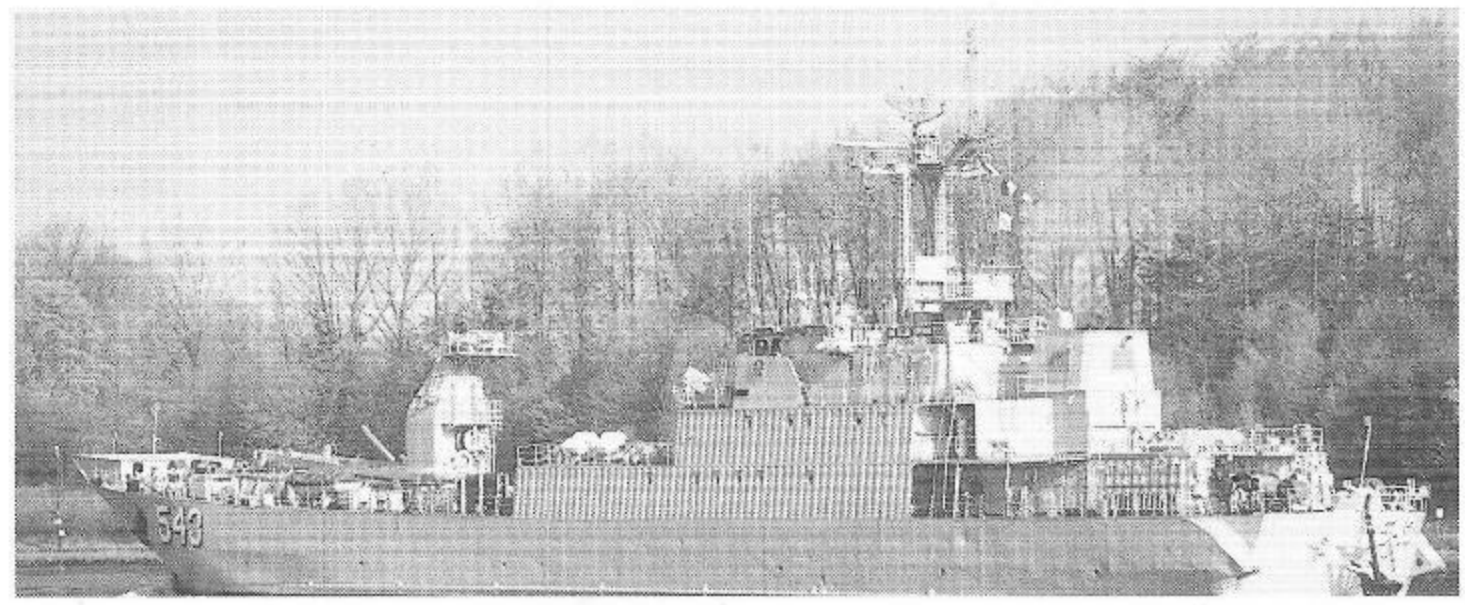
There are two types of ship (Frosch I, Frosch II) which have the same hull, propulsion and weapons, differing only in their purpose and minor fittings. Frosch I is the standard amphibious warfare vessel, while Frosch II is an 'armed resupply' *(Hochseeversorger)* type, intended for moving cargo, although it retains its beach-landing capability. For this role Frosch II has two large cargo hatches in the upper deck and an 8 tonne capacity crane.

DEPLOYMENT

Teluk Lampung was damaged by heavy seas during transit to Indonesia in June 1994 but has since been repaired. All ships are employed in moving troops, equipment and general cargo among the many islands in the Indonesian archipelago.

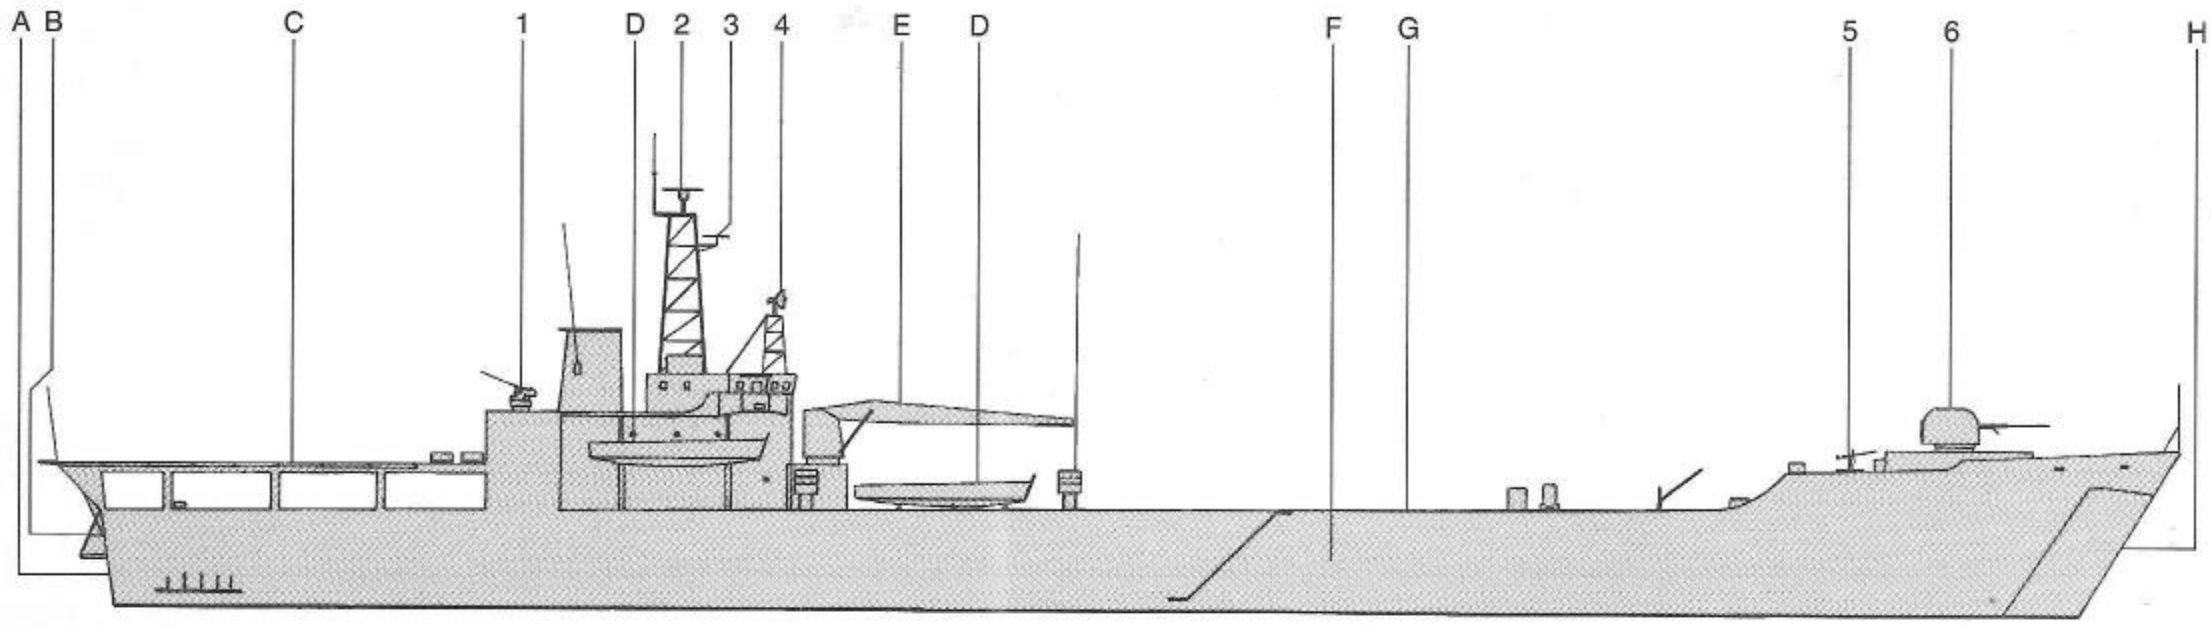


Teluk Berau *(534). Note the unusual flat, rectangular deck on the forecastle, the plate filling the gap left by the removal of the twin 57 mm and minelaying rails* (92 Wing NAAF)



Teluk Cirebon *(543), one of two 'Frosch IIs', is generally similar to 'Frosch I' but has a large, 8 tonne capacity crane on the foredeck and two cargo hatches* (92 Wing RAAF)

JASON



Jason (Ian Sturton)

Amphibious A *Stern door* **B** *Kedge anchor* **C** *Flight deck* **D** *LCVP* **E** *Crane* **F** *Tank deck* **G** *Vehicle deck* **H** *Bow doors with internal ramp (55 t)*

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- 300 troops plus vehicles.

SHIP-SHORE LIFT

- 4 LCVPs

AVIATION FACILITIES

Specifications
Flight deck: Large flight deck at stern, capable of accommodating two Seaking-size helicopters
Hangar: None
Helicopters: The platform could be used by any of the Greek Navy's helicopters, including Sikorsky S-70B-6 Seahawks, Aerospatiale SA 319B Alouette IIIs and Agusta 212ASW/212EW.

AMPHIBIOUS FACILITIES

- There are two clamshell doors and a bow ramp capable of handling 55 t vehicles (for example, Greek Army M60 and Leopard main battle tanks).
- Stern ramp.
- Crane.

WEAPONS SYSTEMS

GUNS

OTOBREDA 76 mm/62 Mod 9 Compact

There is one OTOBREDA 76 mm/62 gun mounted on the forecastle. The 76/62 Compact can fire 80 rounds without reloading, and the rate of fire is adjustable from 10 to 85 rds/min. The system is remotely controlled and a reaction time of 2.8 seconds is quoted.

Specifications
Calibre: 76 mm
Length of barrel: 62 calibres
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s
Weight (unloaded): 7.5 t
Muzzle velocity: 925 m/s (3,034 ft/s)
Rate of fire: 10-85 rds/min
Range: 8.6 n miles (16 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Breda 40 mm/70 in twin compact mountings

The 40 mm Bofors L/70 is an automatic cannon for air defence roles which may also be used to engage surface targets. The Compact twin 40 mm mounting is designed for use against high-performance combat aircraft, against anti-ship missiles and for surface engagements. The mounting consists of two 40 mm guns 300 mm apart, a feeding system with magazine, a local control panel, a power supply rack, a converter and an air-water panel.

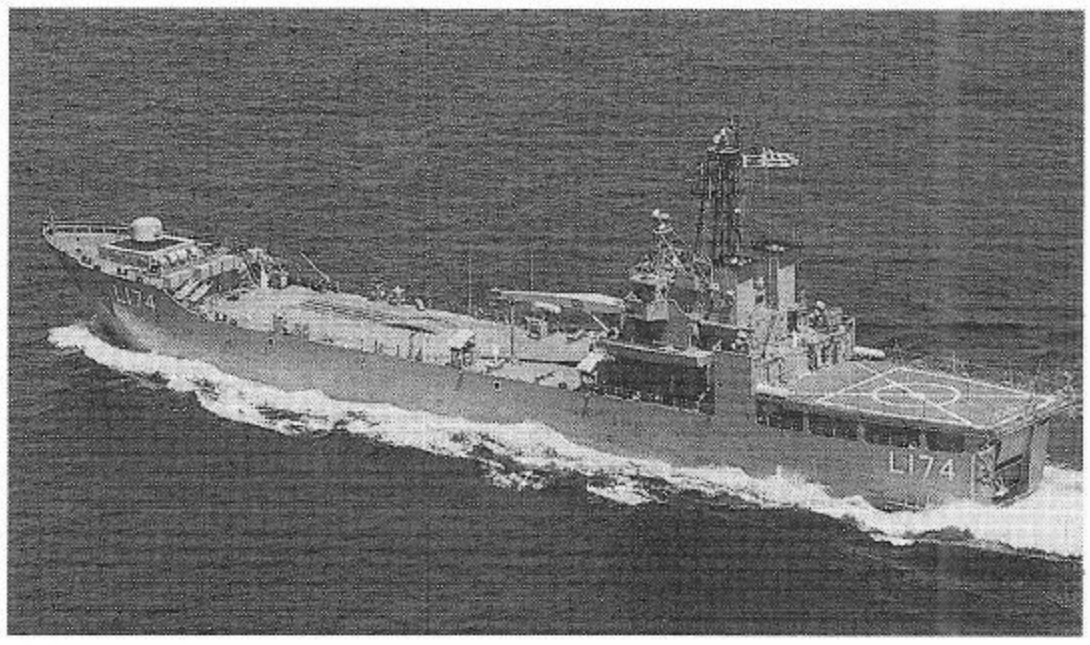
Specifications
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,280 ft)
Range:
anti-surface: 6.75 n miles (12.5 km)
anti-air: 8,700 m (28,500 ft)
Rate of fire: 600 rds/min
Ammunition: 2.4 kg (5.29 lb) (HCHE, PFHE), 2.5 kg (5.51 lb) (HE-T)

Mounting
Traverse: 360° at 90°/s
Elevation: −13 to +85° at 60°/s
Crew: 2

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Rheinmetall Rh-202 20 mm/85 multipurpose cannon

The 85 calibre Rh 202 is 2.61 m (8.56 ft) long, is capable of single shot or automatic fire. Naval versions use either a conventional single belt feed in which rounds enter from the right and spent cartridges are ejected to the left, or the Type 2 two-way belt-feed mechanism. The Rheinmetall powered twin mounting installed in the 'Jason' class is 4.05 m (13.28 ft) long, 1.67 m (5.47 ft)



Samos *(L 174)* (Hellenic Navy)

Chios *(L 173)* (H & L van Ginderen Collection)

high and 2.3 m (7.54 ft) across, and weighs 1.64 t. The twin guns, their ammunition boxes and the operator's seat are on a platform that can rotate through 360° . It has a three- or four-man crew.

Specifications

Gun - Rh 202
Calibre: 20 mm
Length of barrel: 85 calibres
Muzzle velocity: 1,050-1,250 m/s (3,444-4,100 ft)
Rate of fire: 800-1,000 rds/min

WEAPONS CONTROL

One CSEE Panda optical director

Panda is an autonomous deck-mounted optical director for use in air defence operations, the manned element rotating through a nominal 360° on a mounting bracket with electrical connectors. This element consists of the binocular optical unit with auxiliary sight, gyrometric units, bearing and elevation electrical units, servo controls, a ballistics computer on the right of the mounting, control and communications units. The optical sensor offers ×8 and ×2.5 magnification with fields of view of 19° and 6° respectively.

Panda operates in two modes: surveillance/target tracking and fire-control. In the former the target may be designated by the ship's radar and the director slews to face it. The target is acquired visually and identified then tracked by the operator who moves the director with a joystick. In the fire-control mode the operator selects air or surface engagement and inserts target range data. The relevant guns are then slaved to the director whose operator then conducts the engagement.

Manufacturer/Contractor

CS Defense, Paris, France.

COMMAND AND CONTROL SYSTEMS

RADARS

Thomson-CSF Triton II (TRS 3030/3035)

Triton II (TRS 3030/3035), G-band radar is used primarily for air/surface search, although it can also be used for target designation and navigation. It features a roll-stabilised antenna and a tunable magnetron transmitter with a peak power of 250 kW to provide a continuously variable transmission frequency over a wide band together with two pulse lengths of 0.5 and 0.7 µs. It has a claimed performance of detecting a 2 m² air target at a range of 16 n miles (30 km) and an altitude of 6,000 m (19,680 ft), while 10 m² surface targets can be detected at 24.25 n miles (45 km). (In the French Navy Triton II is designated DRBV 51.)

Specifications

(DRBV 51C)
Role: Air search
Frequency: G-band
Peak power: 250 kW
Pulsewidth: 0.5/0.7 µs
PRF: Varied
Scan rate: 30 rpm
Typical ranges:
2 m² air target at 16 n miles (30 km) and an altitude of 6,000 m (19,680 ft)
10 m² surface targets at 24.25 n miles (45 km)

Manufacturer/Contractor

Thomson-CSF, Paris Cedex 8, France.

Thomson-CSF Pollux

Triton can be used for fire-control purposes, but this task is normally allocated to the Pollux (TRS 3220), a fast-scanning radar with optional linear digital MTI processing, which uses a transmitter with a peak power of 200 kW to produce 0.3 µs pulses in a 3 beam. Circular polarisation and solid-state circuitry are employed in the system. Tracking accuracy is to within 20 m (65.6 ft) and angular accuracy on a point target is 0.5 mrad.

Manufacturer/Contractor

Thomson-CSF, Paris Cedex 8, France.

Kelvin Hughes Type 1007

Specifications

Role: Navigation/surface search
Frequency: H/I-band (9,410 MHz)
Beam: 1.0 × 18°/0.75 × 18°
Peak power: 25 kW
Pulsewidth: 0.08/0.3/0.8 µs
PRF: 1,600/800/400 pps
Scan rate: 26 rpm

Manufacturer/Contractor

Kelvin Hughes Ltd, Hainault, Essex, UK.

PROPULSION

Specifications

System: Diesel
Main machinery: 2 Wärtsilä Nohab 16V25 diesels, 6.76 MW (9,200 hp) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME

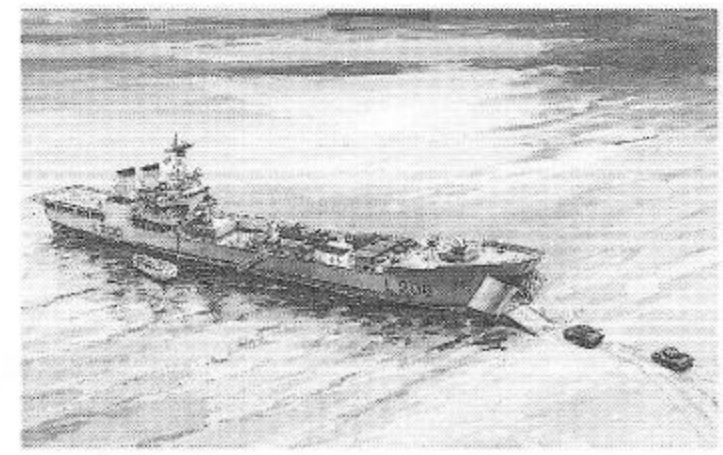
With its many islands, the Greek Navy has a requirement for a sizeable number of amphibious warfare ships, and currently operates some eight LSTs, one LSD, two LSMs, and a number of smaller vessels. Like many other smaller navies, however, it has made do with ex-US Navy vessels for many years, most of them of Second World War vintage. Some of these have now left service while most of the others are worn-out after many years service. The 'Jason' class is intended to replace the ex-US Navy LSTs.

The 'Jason' class is of Greek design and the contract for five ships was signed with the Eleusis shipyard on 15 May 1986. All five ships had been laid down by the end of 1989, but by late 1996, only two had been completed, due to severe financial difficulties at the yard. Completion dates for the remaining three must be regarded as provisional.

DESIGN

The design is a modern drive-through LST, with ramps at both bow and stern. There is also a ramp from the upper deck to the tank deck.

These ships are comparatively heavily armed, with one 76 mm gun, together with four 40 mm and four 20 mm cannon. The OTOBREDA 76 mm gun mounted on the forecastle is an unusual feature for an LST and will give good fire support, particularly during the final run in to a beach landing.



Chios *(L 200). Note the two-section bow ramp, vehicles parked on the upper deck, centreline ramp from upper- to tank-deck; and LCVP which has just been lowered by the onboard crane* (Thomson-CSF)

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Not known

SHIP-SHORE LIFT

- 4 LCVPs on davits (Rotork Sea Truck)

AVIATION FACILITIES

Specifications
Flight deck: Large flight deck aft
Hangar: In superstructure
Helicopter: Normally 1 Westland Sea King Mk 42C

AMPHIBIOUS FACILITIES

- Large, vertically-hinged, clamshell bow doors with internally-mounted ramp.
- No stern door (Not ro-ro)
- Beaching limits 1 in 40 or greater gradient.

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60

There are four single 40 mm Bofors L/60 mounted at each corner of the superstructure. The Bofors 40 mm is an automatic cannon for air defence roles which may also be used to engage surface targets. The type of mounting in the 'Magar' class is not known, but there are minor differences, between US and UK mounts.

Specifications
Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,880 ft/s)(new gun); 850 m/s (2,778 ft/s) (mid-life)

Range:
anti-surface: 5.5 n miles (10 km)
anti-air: AA: 6,900 m (22.600 ft)
Rate of fire: 80 rds/min (practical); 160 rds/min (cyclic) for water-cooled weapons
Ammunition: 2.21 kg (4.87 lb)

BM-21 multiple rocket launchers in the bow

Following Russian practice, there are two naval rocket mountings on the forecastle, with large blast screens to deflect the efflux. The naval BM-21s are used immediately before an amphibious assault and consist of two clusters, each of 20 tubes, on either side of an electrically operated mounting which holds the training and elevation gears. They are reloaded automatically from a below-deck magazine. The mounting can traverse 360° and elevate from 0 to +55°.

Specifications
Rockets
M-21-OF (9M22U)
Diameter: 122 mm
Length: 3.226 m (10.58 ft)
Weight: 77.5 kg (170.88 lb)
Range: 500-20,380 m (1,640-66,846 ft)
Warhead weight: 19.3-19.4 kg (42.55-42.77 lb)
Max velocity: 690 m/s (2,263 ft/s)

COMMAND AND CONTROL SYSTEMS

RADARS

Surface search radar

There is a surface search radar at the masthead; type unknown.

Bharat navigation radar

The Bharat navigation radar is an I-band equipment, which can also be used for short-range surface surveillance. It consists of a 1.83 m (6 ft) slotted array, transmitter/receiver, sector control unit and a 51 or 61 cm raster display. Two displays can be operated with one acting as master. The transmitter is solid state, apart from the thyratron and the magnetron. Sector transmission or blanking is a special feature which enables the operator to shut-off transmission intentionally in an

unwanted zone, and still have the radar coverage in the zone of interest. Optional features include a radar test set, a remote control for operating the transmitter/receiver, and RRA interface.

Specifications

Frequency: I-band (9,375 ±30 MHz)
Peak output power: 35 kW short pulse; 45 kW long pulse
Pulse length and PRF: 0.1 µs at 4,000 Hz (short pulse); 0.8 µs at 1,000 Hz (long pulse)
Beamwidth: 1.4 × 22°
Gain: 26 dB
Rotation speed: 22 rpm at 50 Hz or 27 rpm at 60 Hz

Manufacturer/Contractor

Bharat Electronics Limited, Bangalore, India.

PROPULSION

Specifications

System: Diesel
Main machinery: 2 SEMT-Pielstick 12 PA6 V280 diesels, 6.29 MW (8,560 hp) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME

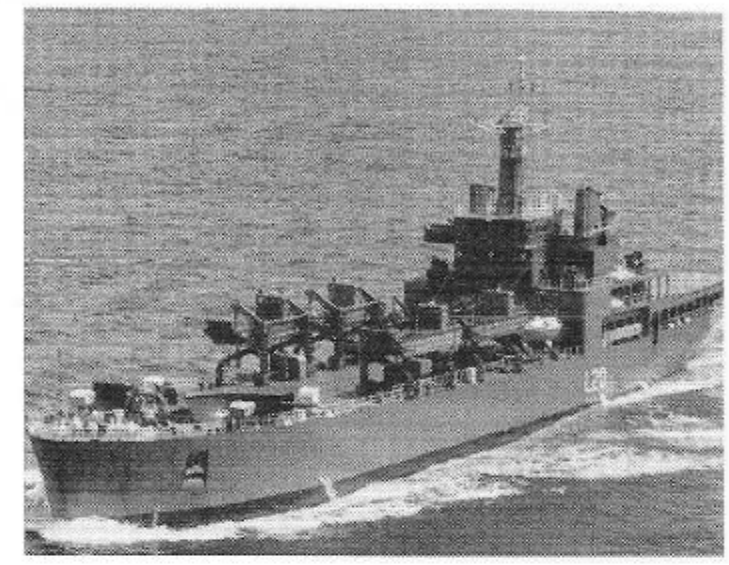
The first of class was launched in 1984 and commissioned in 1987. The original plan was for eight of the class, but there has been a nine year gap before the second *(Gharial)* was launched at the Hindustan shipyard and it was then transferred to Garden Reach to be fitted out. It is understood that the third has not yet been ordered.

DESIGN

This design has been reported in some quarters as being based on that of the British *Sir Lancelot* LSL. It has, however, been confirmed in the UK that, apart from a superficial physical resemblance, there is no connection between the two designs.

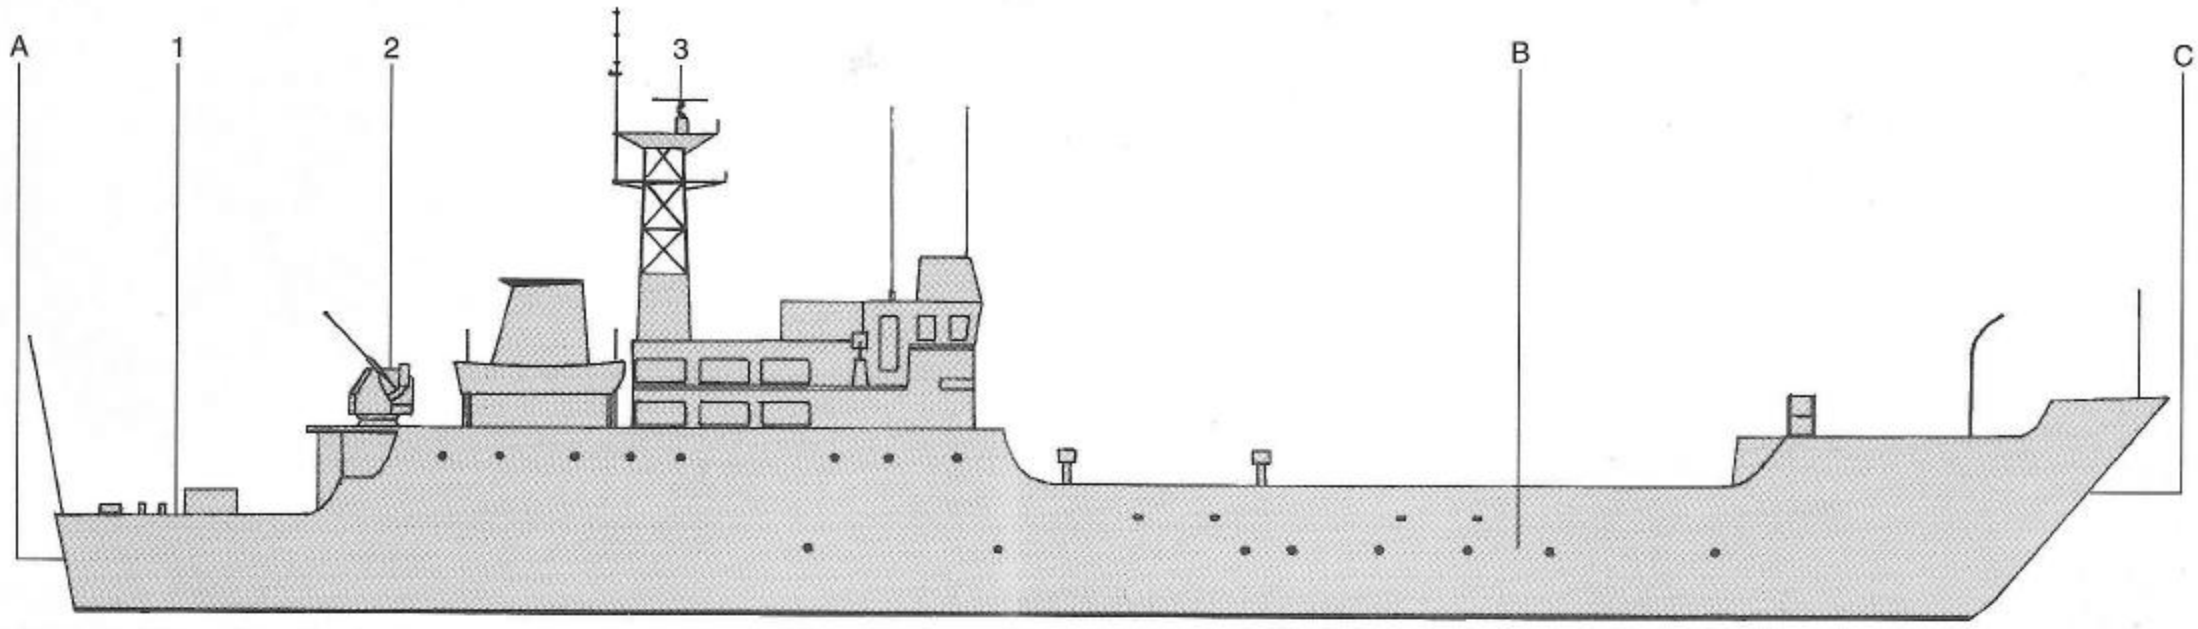
MODERNISATION/REFIT

Magar was refitted in 1995.



Magar *(L 20) the first major landing ship to be designed and built in India. Contrary to previous reports its design was not based on that of the British LSLs* (92 Wing RAAF)

VASCO DA GAMA



Vasco da Gama (Ian Sturton)
Amphibious A *Kedge anchor* **B** *Tank deck* **C** *Bow door/ramp*
General 1 *Mine rails* **2** *Bofors 40 mm/60 (two)* **3** *Racal-Decca 1229 navigation radar*

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops 200-250
- Vehicles: 2 PT 76 or 2 armoured personnel carriers.
- Cargo 250 tonnes

AMPHIBIOUS FACILITIES

- There is a flat-fronted, single-piece bow ramp.
- There is no stern door or ramp.

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60
Armament is two Bofors 40 mm/60 mounted aft which is an automatic cannon for air defence roles which may also be used to engage surface targets.

Specifications
Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,889 ft/s) (new gun); 850 m/s (2,788 ft) (mid-life)
Range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,600 ft)
Rate of fire: 80 rds/min (practical); 160 rds/min (cyclic) for water-cooled weapons
Ammunition: 2.21 kg (4.87 lb)

MINES

As with Soviet-designed amphibious vessels, these Indian vessels have a minelaying capability, dropping mines through chutes in the stern.

COMMAND AND CONTROL SYSTEMS

RADAR

Racal-Decca TM 1229
Part of the Solid State series, the Type 1229 has a 30 cm (12 in) Plan Position Indicator display, an output of 20 kW and a 2.7 m (8.8 ft) antenna.

PROPULSION

Specifications
System: Diesel
Main machinery: 3 Kirloskar-MAN V8V 17.5/22 AMAL diesels, 1.24 MW (1,686 hp)
Shafts: 3

FURTHER INFORMATION

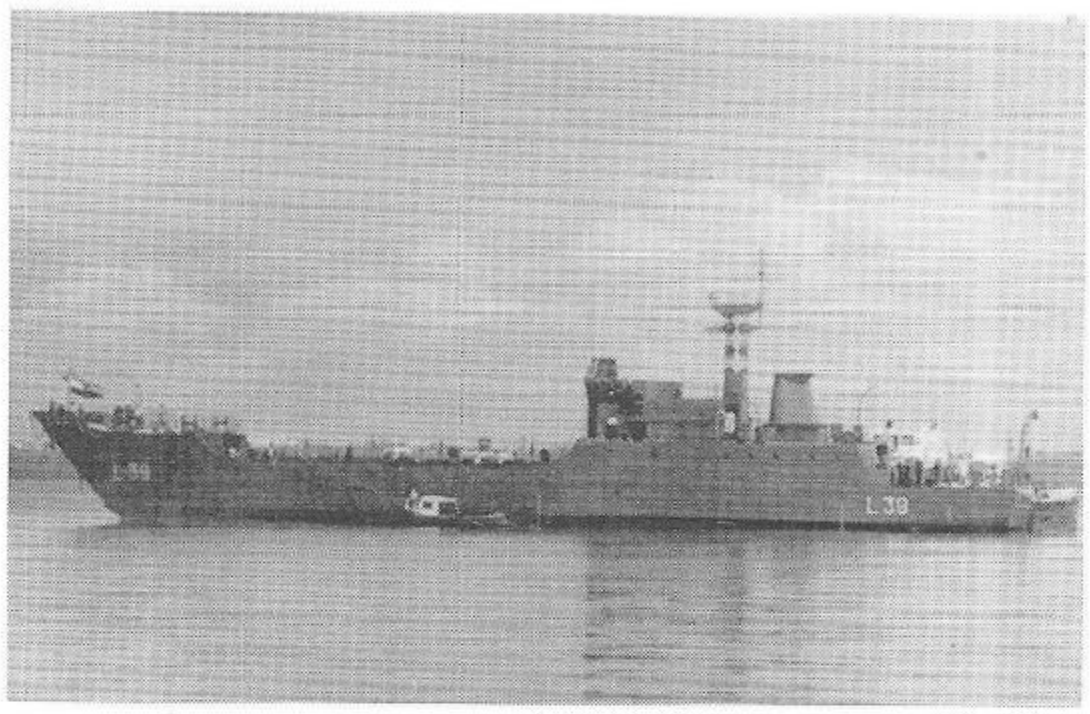
PROGRAMME

These are Indian-designed and -built landing craft, which can also be used also for minelaying. The first ship to be completed was *Vasco da Gama,* which was one of eight built by Goa Shipyard. The final ship in the series was commissioned on 25 Mar 1987. Two ships were built by Hooghly Dockyard and Engineering Company.

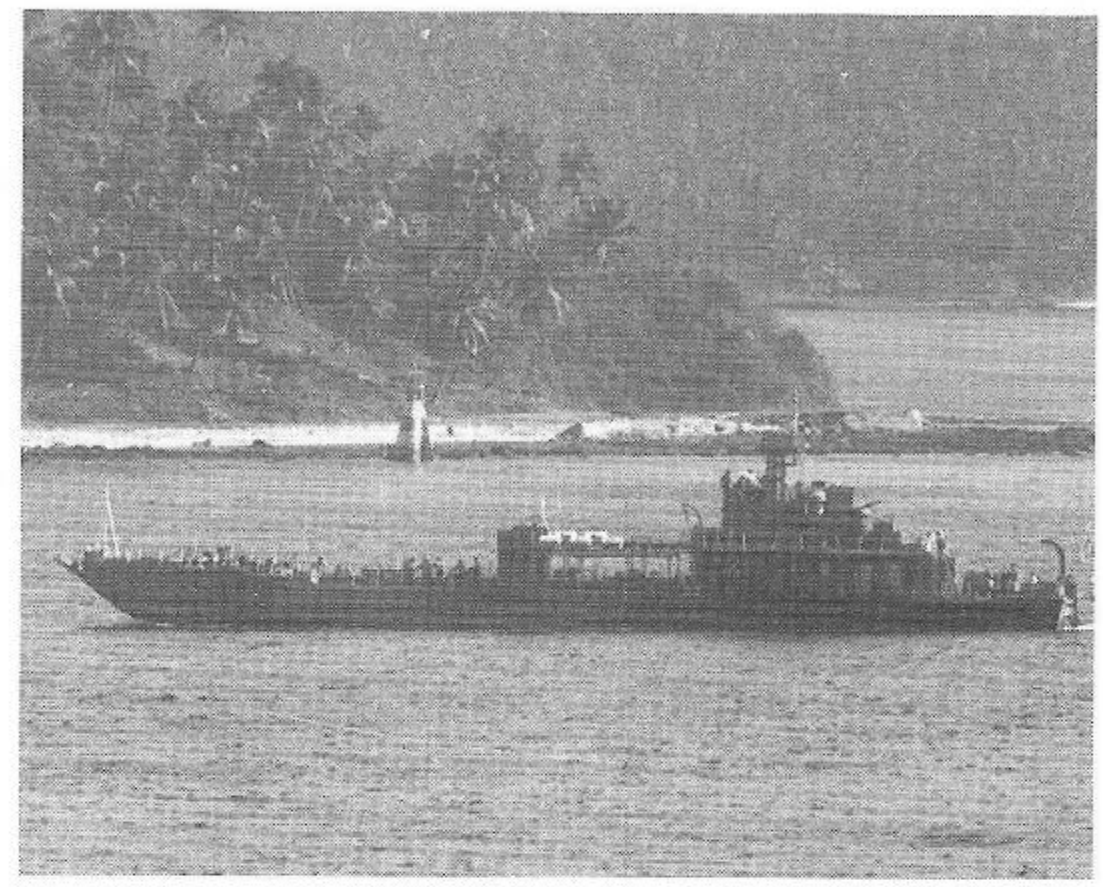
DESIGN

These are of conventional landing-craft design, with a flat bow ramp, a long open tank deck, and the superstructure, engine room and crew accommodation aft.

Differences can be seen between vessels in the class. At least one vessel, L 31, has a platform some 11 m (37 ft) long, forward of the bridge at 01 deck level. This is similar to the platform on the Polnochny D, which is also in service with the Indian Navy, and may also be a helicopter flight deck.



Mangala *(L 39)* (Mazagon Dock)



L 31, one of the class fitted with an additional platform forward of the bridge (92 Wing RAAF)

IRAN HORMUZ 21

GENERAL SPECIFICATIONS

Country of origin: Netherlands
Operator: Iran

Class: HORMUZ 21/MIG-S-5000 (LCT)

Active: 5

Displacement:
full load: 1,280 t

Dimensions
Length: 65 m (213.3 ft)
Beam: 12 m (39.4 ft)
Draught: 2.6 m (8.5 ft)

Speed: 9 kts

Complement: 12

SHIPS

HEJAZ (21)
KARABALA (22)
AMIR (23)
Builders: Ravenstein, Netherlands

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- 600 tonnes

PROPULSION

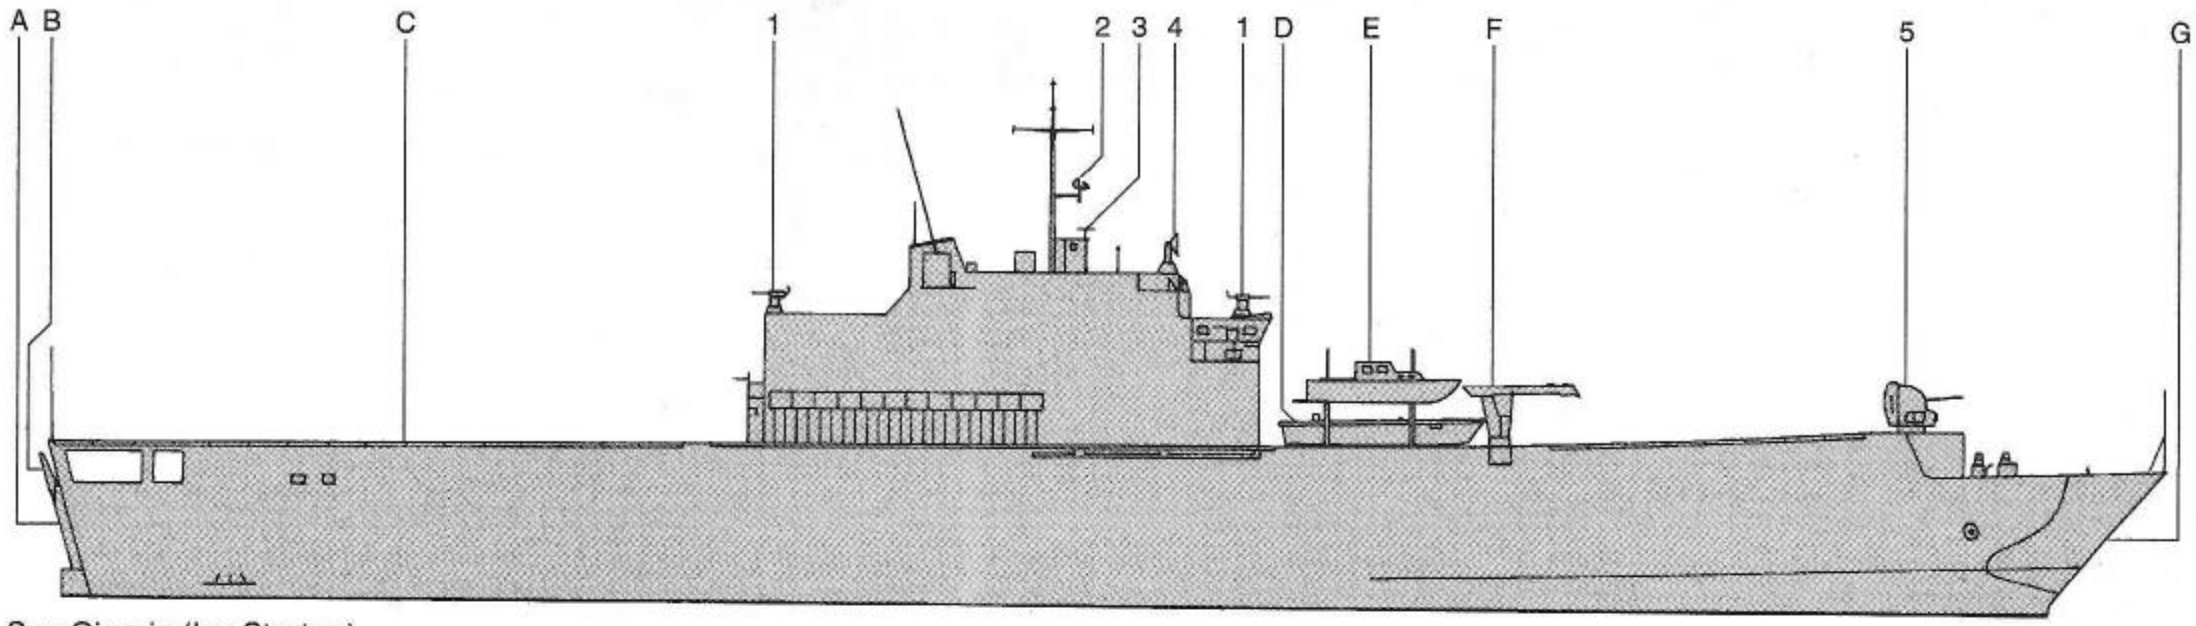
Two MAN V12V-12.5/14 or two MWM TBD 604 V12 diesels; delivering 1.07 MW (1,460 hp); two shafts

FURTHER INFORMATION

These ships have a flat bow ramp and are generally barge-like in design. Three were officially ordered for civilian use from Ravenstein, The Netherlands and delivered to Iran via Britain in 1985. It was reported at the time that they were intended for freighting, but it is believed that at least two of them are used by the Pasdaran revolutionary guards. A local version of the ship designated MIG-S-5000 is being assembled at Boushehr and one was launched in mid-1995, with a second apparently being built. (MIG is the abbreviated title for the Marine Industries Group, Teheran, Iran)

The class has been allocated the international reporting name 'Iran Hormuz 21' class;with individual ships being designated *Iran Hormuz 21, Iran Hormuz 22* and *Iran Hormuz 23.* (They are, though, no relation to the Korean-built class designated 'Iran Hormuz 24').

SAN GIORGIO



San Giorgio (Ian Sturton)

Amphibious A *Stern gate* **B** *Kedge anchor* **C** *Flight deck* **D** *LCVP* **E** *LCPL* **F** *Crane* **G** *Vertically opening bow door with internal ramp*

General 1 *Oerlikon 20 mm cannon* **2** *SMA SPS-702 air/surface search* **3** *SMA SPN-748 navigation radar* **4** *Alenia SPG-70 fire-control radar* **5** *OTOBREDA 76 mm/62 MMI automatic gun*

GENERAL SPECIFICATIONS

Operator: Italy

Class: SAN GIORGIO (LPD)

Built: 3
Active: 3

Displacement:
standard: 6,794 t
full load: 7,788 tonne (San Giusto 8,078 t)

Dimensions
Length: 133.3 m (437.2 ft) (San Giusto 137 m (449.5 ft))
Beam: 20.5 m (67.3 ft)
Draught: 5.3 m (17.4 ft)

Speed: 21 kts
Range: 7,500 n miles at 16 kts; 4,500 n miles at 20 kts

Complement: 163, including 17 officers (San Giusto 196, including 16 officers)

SHIPS

SAN GIORGIO (L 9892)	
Builder	Fincantieri, Riva Trigoso, Italy
Laid down	27 Jun 1985
Launched	25 Feb 1987
Commissioned	9 Oct 1987

SAN MARCO (L 9893)	
Builder	Fincantieri, Riva Trigoso, Italy
Laid down	28 Jun 1986
Launched	21 Oct 1987
Commissioned	18 Mar 1988

SAN GIUSTO (L 9894)	
Builder	Fincantieri, Riva Trigoso, Italy
Laid down	30 Nov 1992
Launched	2 Dec 1993
Commissioned	9 Apr 1994

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops. 400 (one infantry battalion) plus either 30-36 armoured personnel carriers or 30 medium tanks.
- Typical load is 78 VCC-1 APCs (36 on vehicle deck, 42 on flight deck) or 80, 9 m (29.52 ft) long trucks, or 63 semi-trailers.

SHIP-SHORE LIFT

- Three LCMs (in stern docking well).
- Plus two LCVPs (San Giorgio, San Marco) or three LCVPs (San Giusto) on upper deck.
- One LCPL.

AVIATION FACILITES

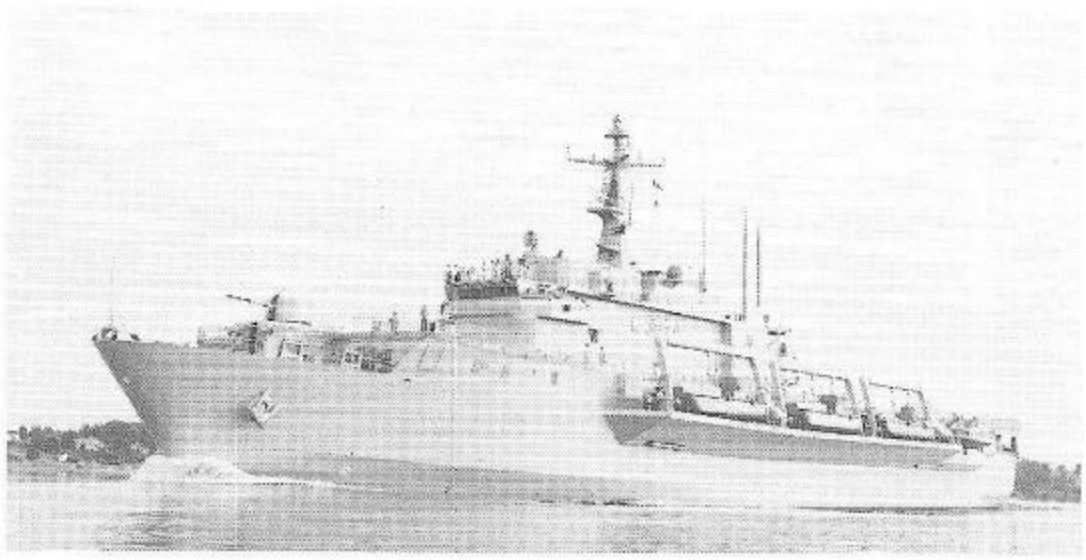
Specifications
Flight deck: 100 × 20.5 m (328.1 × 67.3 ft)
Landing spots: 3
Aircraft: 3 SH-3D Sea Kings or five Agusta AB212s can be carried.

AMPHIBIOUS FACILITIES

San Giorgio, San Marco only
- Visor-type bow door and ramp for discharging vehicles onto a jetty. It is not possible to ground the ship and discharge vehicles directly onto a beach.
- Stern docking well: 20.5 × 7 m (67.2 × 23 ft).

San Giusto only
- Stern docking well: 20.5 × 7 m (67.2 × 23 ft) (Note: San Giusto does not have bow doors)

All ships
- All three ships have an elevator with a 30 tonne capacity, and measuring 13.5 × 3.5 m (44.28 × 11.48 ft) for vehicles and stores (not helicopters)
- Two 40 tonne travelling cranes transfer LCMs between vehicle deck and docking well.
- 16 tonne crane on flight deck.
- All ships have lateral door to discharge vehicles direct from the vehicle deck onto a jetty.
- Vehicle deck is 110 m (360.8 ft) long, 14 m (45.92 ft) wide and 5 m (16.4 ft) high.



San Giusto *(L 9894), third of class. Note the port-side sponson for the LCVPs, which clears the flight deck, and the lack of a bow door* (H & L van Ginderen Collection)

Launch of San Giorgio *(L 9892), showing the bulb at the foot of the stern. The opening bow door is fitted to facilitate loading/unloading to jetties, and the ships are not designed to beach* (Fincantieri)

WEAPONS SYSTEMS

GUNS

OTOBREDA 76 MM (3 in)/62 MMI/ Compact

San Giorgio and San Marco only — one OTOBREDA 76 mm (3 in)

MMI. San Giusto only — one OTOBREDA 76 mm (3 in)/62 Compact.

These three ships each have a single OTOBREDA 76 mm/62 gun, but of slightly different models. San Giorgio and San Marco are armed with refurbished guns of the original MMI (MMI = *Marina Marittimo Italiana* (Italian Navy)) model, while the last to be built, San Giusto has the later Compact version, which is lighter and has a higher and variable rate of fire.

Specifications

Mountings - MMI
Elevation: −15 to +85°
Training speed: 70°/s
Elevation speed: 40°/s
Weight (unloaded): 12 t
Muzzle velocity: 900 m/s (2,952 ft/s)
Rate of fire: 59 rds/min
Range: 8.5 n miles (15.75 km)

Mountings - Compact
Elevation: −15 to +85°
Training speed: 70°/s
Elevation speed: 40°/s
Weight (unloaded): 7.5 t
Muzzle velocity: 925 m/s (3,034 ft/s)
Rate of fire: 10-85 rds/min
Range: 8.6 n miles (16 km)

Manufacturer/Contractor

OTOBREDA, La Spezia, Italy.

Oerlikon 20 mm

There are two Oerlikon 20 mm cannon in each ship.

Specifications

Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,739 ft/s)
Range
anti-surface: 1.5 km
anti-air: 1,150 m (3,772 ft)
Rate of fire: 450 rds/min
Round weight: 241 g (8.5 oz)
Projectile: 122 g (4.3 oz)
Elevation: −15 to +90°

M2HB 12.7 mm machine guns

At least two M2HB 12.7 mm machine guns are carried.

Specifications (M2HB)

Calibre: 12.7 mm
Barrel: 90 calibres
Gun weight: 38.1 kg (84.0 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

SLR-730

San Giorgio and San Marco only. The SLR-730 radar-frequencies intercept set. These ships appear to have no jamming capability.

SLQ-747

San Giusto only. SLQ-747 combined ESM/ECM suite is installed in San Giusto only, giving both an intercept and a jamming capability.

San Giusto (L 9894)
(H & L van Ginderen Collection)

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Selenia Sadoc 2/IPN 10

Sadoc 2 *(Sistema Automatico Direzione delle Operazioni de Combattimento)* entered service aboard the frigate Lupo in September 1977 and was also selected for the San Giorgio ships. Sadoc 2 is designed to produce an up-to-date picture of the tactical situation within the vicinity of both the ship and task group and has a mainframe architecture designed for processing and presenting data acquired by sensors. It can also be used for a number of other functions, including evaluation, threat evaluation and weapons control, ECM management, aircraft control, conducting ASW operations, datalink databank management.

WEAPONS CONTROL

Elsag NA 10 Mod 2

The NA 10 system is designed for surface engagement, air engagements or shore bombardments and can control three guns of two calibres simultaneously. It uses an RTN 10X fire-control radar which was supplemented in earlier versions by two optical periscope sights. Electro-optical equipment which could be mounted on the director included IR camera, TV camera and laser rangefinder while a CW illuminator could also be installed. The system is operated through the Main Control Unit (MCU) which is a console with ballistic computer. A TV display may be added when electro-optical units are used. The MCU is used for target acquisition, tracking and engagement either manually or automatically. Two periscope sights may also be used to provide supplementary target data input to the radar and permit a second target to be engaged.

RADARS

SMA SPS-702

The SMA MM/SPS-702 naval radar is a frequency-agile, I-band system, providing search of surface targets, air search at low and very low altitude optimised for sea skimmers search, helicopter control, assistance to weapon systems, and aids to navigation. It incorporates high angular and range resolution, high capability of operation in dense clutter environments, digital moving target indicator with high subclutter visibility, a power magnetron, a stabilised antenna with narrow beamwidth and extensive electronic counter-countermeasures facilities. A lightweight double curvature parabolic reflector with cosec² vertical pattern, and roll and pitch stabilisation is provided.

Manufacturer/Contractor

SMA, Florence, Italy.

SMA SPN-748

Navigation radar is the I-Band SPN-748

Alenia SPG-70

The Orion RTN-10X (Italian Navy designation SPG-70) is an I-band radar used in conjunction with different fire-control systems (including Alenia Elsag NA-21 and Ferranti WSA-4) to control gun and missile firings. It is based on a conical scan narrow beam antenna, with a tri-port feed and uses a magnetron with fast tuning capabilities. The system employs different receiver signal and data processing techniques to ensure a high-level protection from jamming and interference and also to maintain accurate tracking of both high- and low-flying targets.

Specifications

Frequency: I-band (8-10 GHz)
Antenna type: High-gain, tri-port feed
Tracking method: Conical scan
Transmitter: Frequency changeable, high-power magnetron
Receiver: Linear receiver and ECCM receiver capable of withstanding most jammers
Range: >37 km (22.99 miles) on a fighter aircraft

Manufacturer/Contractor

Alenia Elsag Sistemi Navali, Rome.

PROPULSION

Specifications

System: Diesel
Main machinery: 2 Fincantieri GMT A 420.12 diesels, 12.35 MW (16,800 hp) sustained
Shafts: 2
Propellers: Controllable pitch
Thruster: Bow thruster, 1,000 hp
Ship's services: 4 GMT/Ansaldo 770 kW diesel-generator sets.
Emergency power: 1 ,250 kW diesel-generator set

FURTHER INFORMATION

PROGRAMME

These ships provide Italy with an excellent combination of capabilities: amphibious warfare and disaster relief. Both roles require a ship which can carry large numbers of troops, vehicles and supplies, and deploy them ashore rapidly using either helicopters or landing craft. *San Giorgio* was paid for out of the naval budget, but *San Marco* was paid for by the Ministry of Civil Protection and is specially fitted for disaster relief work, though still run by the Navy and still capable of being used as a landing ship if required.

DESIGN

These ships resemble a miniature version of the American 'Tarawa' class, with a virtually full length helicopter deck and a floodable stern dock. There is a stern well and the ships can flood down to allow landing craft to leave and enter. Unusually among LPDs the docking well is below the waterline, enabling it to be flooded by gravity, avoiding a bulky and heavy ballasting installation. *San Giorgio* and *San Marco* have a vertically opening bow door and landing, although as there is a large bulb at the foot of the stem it is doubtful whether they could land troops and vehicles over anything except a sharply shelving beach.

The island is located, aircraft-carrier style on the starboard side. In *San Giorgio* and *San Marco,* the LCVPs are stowed on the flight deck opposite the island, effectively forming a 'waist' and narrowing the usable space on the flight deck.

The last of class, *San Giusto,* has some important differences. First, there is no bow door or ramp and thus there is no option to discharge vehicles through the bows and onto a jetty. Secondly, there is a sponson on the port side, half a deck level below the flight deck, which accommodates three LCVPs, with the davits outboard. This not only increases the landing capability by one LCVP, but also frees a considerable amount of space on the flight deck. San Giusto's island is also longer than on the first two ships. The ship has 300 tonne greater displacement than the first two.

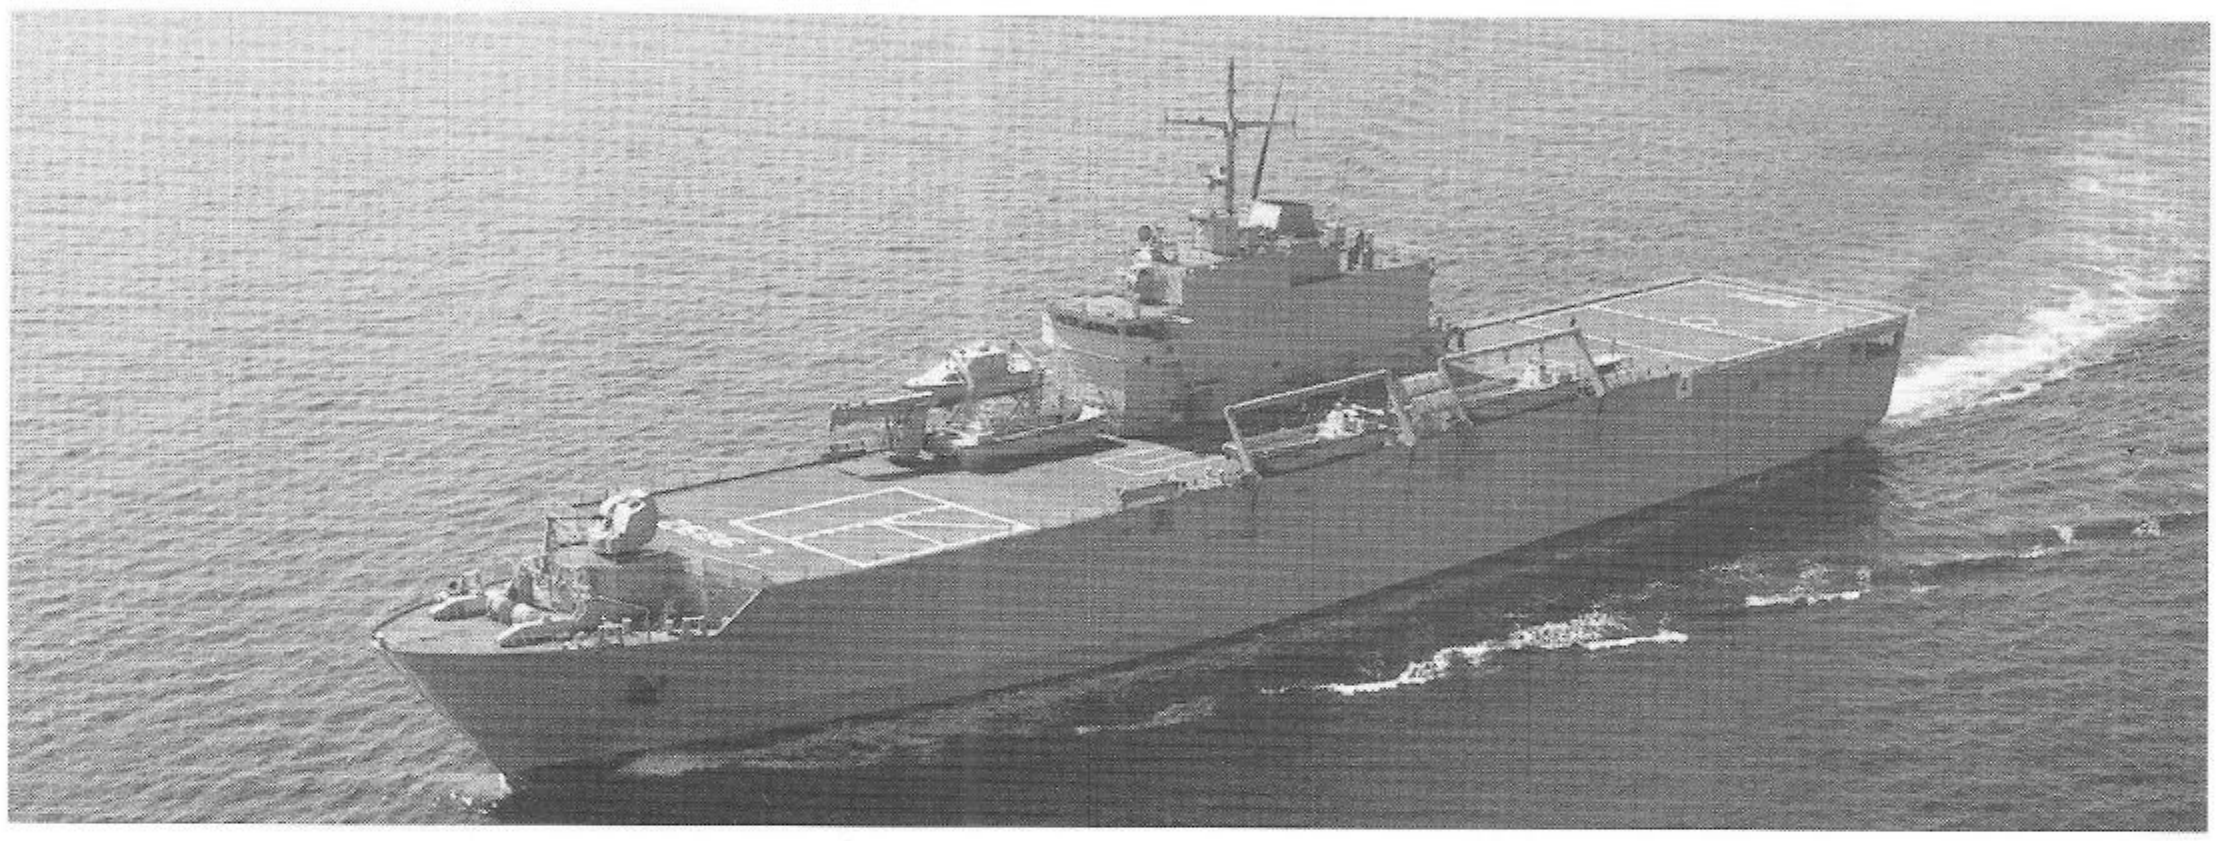
The ships are designed in accordance with Italian Navy stability criteria, so that with any two adjacent compartments (or any three adjacent compartments forward of amidships) flooded, buoyancy, longitudinal trim and transverse stability remain within acceptable limits, even in worst-case load conditions (vehicle and flight deck fully loaded, dock flooded and roll-stabilisation tank empty).

There are four firefighting stations: dock control room, machinery control centre, vehicle deck, and flight deck.

DEPLOYMENT

These ships can be used not just for amphibious operations, but also for a whole range of other roll-on, roll-off tasks including disaster relief, and search and rescue. As such, the design has interested several other navies, though none has so far joined the Italian Navy in ordering one.

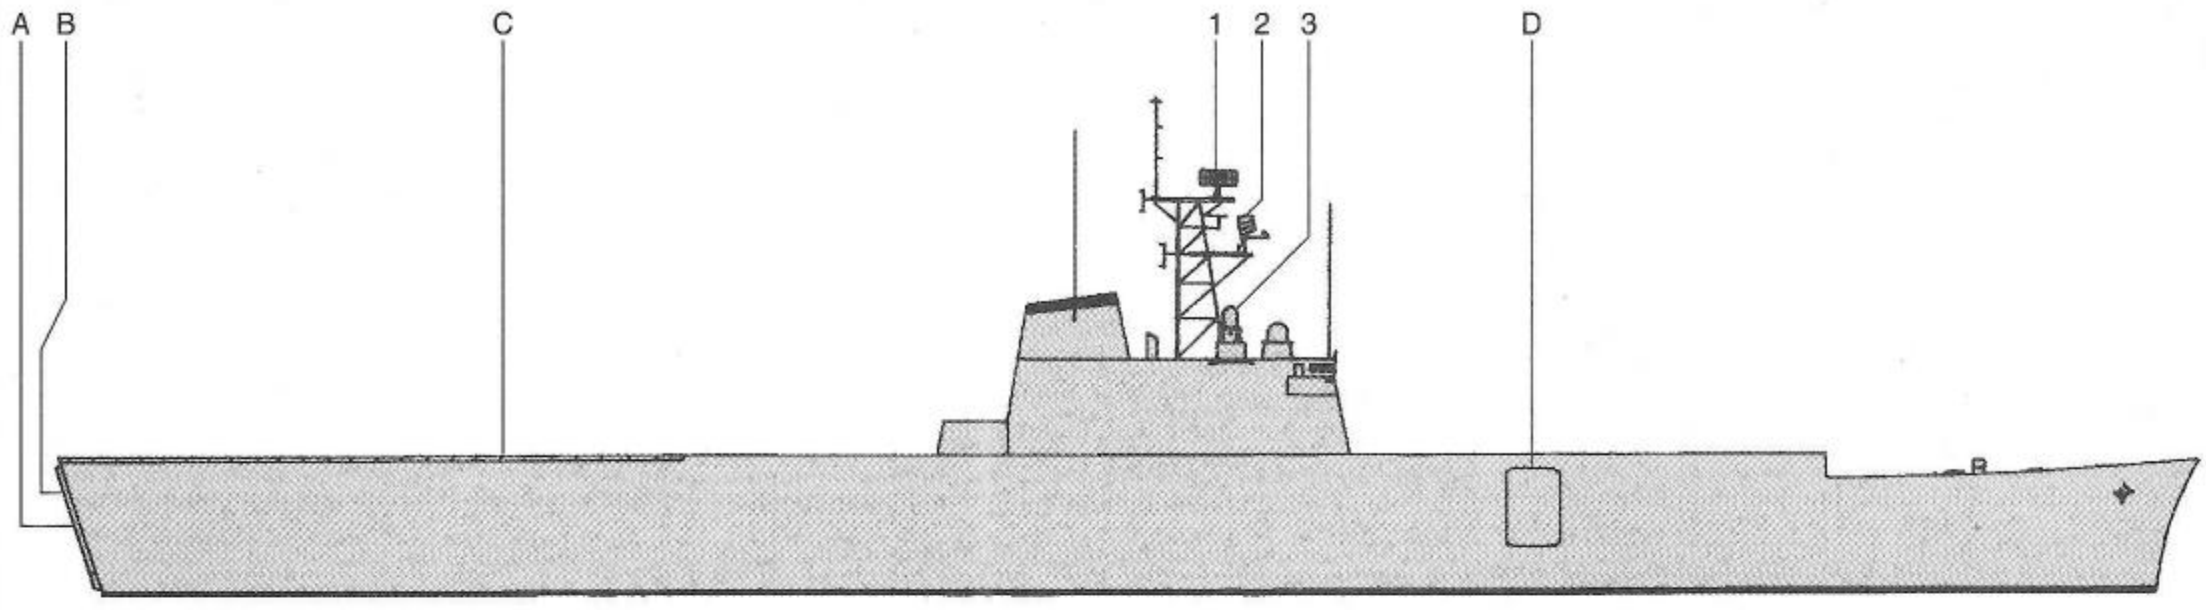
All three are based at Brindisi and assigned to the Third Naval Division. San Giusto is attached to the Naval Academy at Livorno for the duration of the annual three-month summer cruise.



San Giorgio *(L 9892)* (Italian Navy)

San Marco *(L 9893). Note how stowing the LCVPs on the flight deck creates a 'waist' which cannot be used for flying operations, a problem overcome in* San Giusto, *the third ship in the class* (Italian Navy)

JMSDF LST/LPD



Japanese *LST (speculative)* (Ian Sturton)
Amphibious A *Stern gate* **B** *Kedge anchor* **C** *Flight deck* **D** *Loading port*

General 1 *MELCO OPS-14C air/surface search radar* **2** *Navigation radar* **3** *Hughes Mk 15 Vulcan Phalanx CIWS*

Operator: Japan

Class: LST/LPD

Building: 1

Displacement:
standard: 8,900 t

Dimensions
Length: 170 m (557.7 ft)
Beam: 23 m (75.5 ft)
Draught: 6.1 m (20 ft)

Speed: 20 kts

Complement: 127

SHIPS

(—)

Builder	Mitsui, Tamano, Japan
Laid down	Dec 1995
Launched	Dec 1996
Commissioned	Mar 1998

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops 330
- Type 90 tanks 10
- Cargo 1,400 tonnes

SHIP-SHORE LIFT

- Two LCAC

AVIATION FACILITIES

Specifications
Flight deck: 130 × 23 m (426.5 × 75.5 ft)
The Japanese-built Chinook, CH-47J, is likely to be carried.

AMPHIBIOUS FACILITIES

- No details have been published but if the ship is to carry two LCACs it must have a stern door and a docking well measuring at least 100 × 15 m (328 × 50 ft)

WEAPONS SYSTEMS

GUNS

Hughes Mk 15 CIWS Phalanx
Two Hughes Mk 15 Phalanx close in weapons systems (CIWS) will be mounted to provide the innermost layer of defence against anti-ship missiles (with outer layers being provided by other ships in the task group). The 20 mm M61A1 Vulcan, six-barrel, Gatling-principle gun has a cylindrical magazine with the feed mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,380 ft/s)
Rate of fire: 3,000 rds/min

Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse-Doppler

Manufacturer/Contractor
Hughes Missile Systems, Tucson, Arizona, USA.

COMMAND AND CONTROL SYSTEMS

RADAR

Air/surface search: MELCO OPS-14C
Medium-range air search radar developed by Mitsubishi Electric (MELCO) which is reported to have entered service with the Japanese Maritime Self-Defense Force in 1971. OPS-14 has been developed in A, B and C models.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 diesels, 20.29 MW (27,600 hp);
Shafts: 2
Bow thrusters: 2

FURTHER INFORMATION

PROGRAMME

The JMSDF already operates six large LSTs and a number of smaller amphibious vessels. Despite this capability, the plan to build a larger tank landing/amphibious transport ship with a significant aviation capability has been politically controversial, and, as a result, almost no information has been released. The original proposal was for a 5,500 tonne LST, with the published design resembled the Italian 'San Giorgio' class. This was put forward for approval in the 1989 budget, but was refused, as was a similar proposal the following year. There was then silence for two years, but the 1993 budget request included a substantially larger ship, apparently based on the US Navy's 'LPH' class, though smaller than the American ships.

This vessel, with some modifications, was approved in the 1993 estimates and was laid down in December 1995 at Mitsui.

The project remains politically sensitive and there have been no statements on the types of aircraft to be carried. Two LCACs for this ship have already been ordered from the USA and will be delivered in 1997.

WEAPONS SYSTEMS

GUNS

US Navy 76 mm (3 in)/50 in Mk 33 twin mounting

The single twin 76 mm turret is mounted in the bows, where it can be used in the direct fire role during the run into an amphibious landing. The guns are 50 calibre Mk 22 barrels and the Mk 33 twin-barrel mounting can be under local or remote control.

Specifications

Gun

Calibre: 76.2 mm (3 in)
Length of barrel: 50 calibres
Muzzle velocity: 823 m/s (2,699 ft/s) (new); 808 m/s (2,650 ft/s) (mid-life)
Range:
anti-surface: 7 n miles (13 km)
anti-air: 8,800 m (29,000 ft)
Ammunition: 10.9 kg (24 lb)

Mk 33 Mounting

Traverse: 360° at 30°/s
Elevation: −15 to +85° at 24°/s
Rate of fire: 100 rds/min

Bofors 40 mm L/70

One twin Bofors 40 mm AA mount is aft, above the stern.

Specifications

Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000-1,025 m/s (3,280-3,362 ft)
Range:
anti-surface: 6,900 m (22,632 ft)
anti-air: 6.75 n miles (12.5 km)
Rate of fire: 300 rds/min (practical)
Ammunition: 2.21 kg (4.87 lb)

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Gun Fire-Control System 1B (GFCS-1)

Miura (only). GFCS-1B (also known as Type 72-1B) is used by the JMSDF for 76 mm (3 in) guns, but in this class is installed in *Miura* only. The director is mounted on a dedicated platform above and behind the turret.

US Mk 63

Ojika and Satsuma: *Ojika* and *Satsuma* have the US Mk 63 GFCS for their 76 mm (3 in) guns. The FCS is mounted on the turret and has a US AN/SPG-50 radar.

US Mk 51 Mod 2

All ships. The Mk 51 is an elementary remote sight, mounted in all three ships and provides fire control for the 40 mm guns.

Satcom

Satcom terminals were fitted to all three vessels at one stage, but all have now been removed.

RADARS

Mitsubishi OPS 14B

OPS-14B is a B/C-band air search radar. Peak power is 400 kW and beam width is 5°.

Manufacturer/Contractor

Mitsubishi Electric Corporation (MELCO), Tokyo, Japan.

JRC OPS-16

Miura only. OPS-16 is reported to be a D-band surface search radar developed by the Japan Radio Company (JRC).

JRC OPS-18

Ojika and Satsuma only. OPS-18 is a G/H-band surface search radar, developed by JRC, and reportedly based on the American AN/SPS-10 equipment. It is being replaced by OPS-28 in most applications.

PROPULSION

Specifications

System: Diesel
Main machinery: 2 Kawasaki-MAN V8V22/30ATL diesels, 2.94 MW (4,000 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

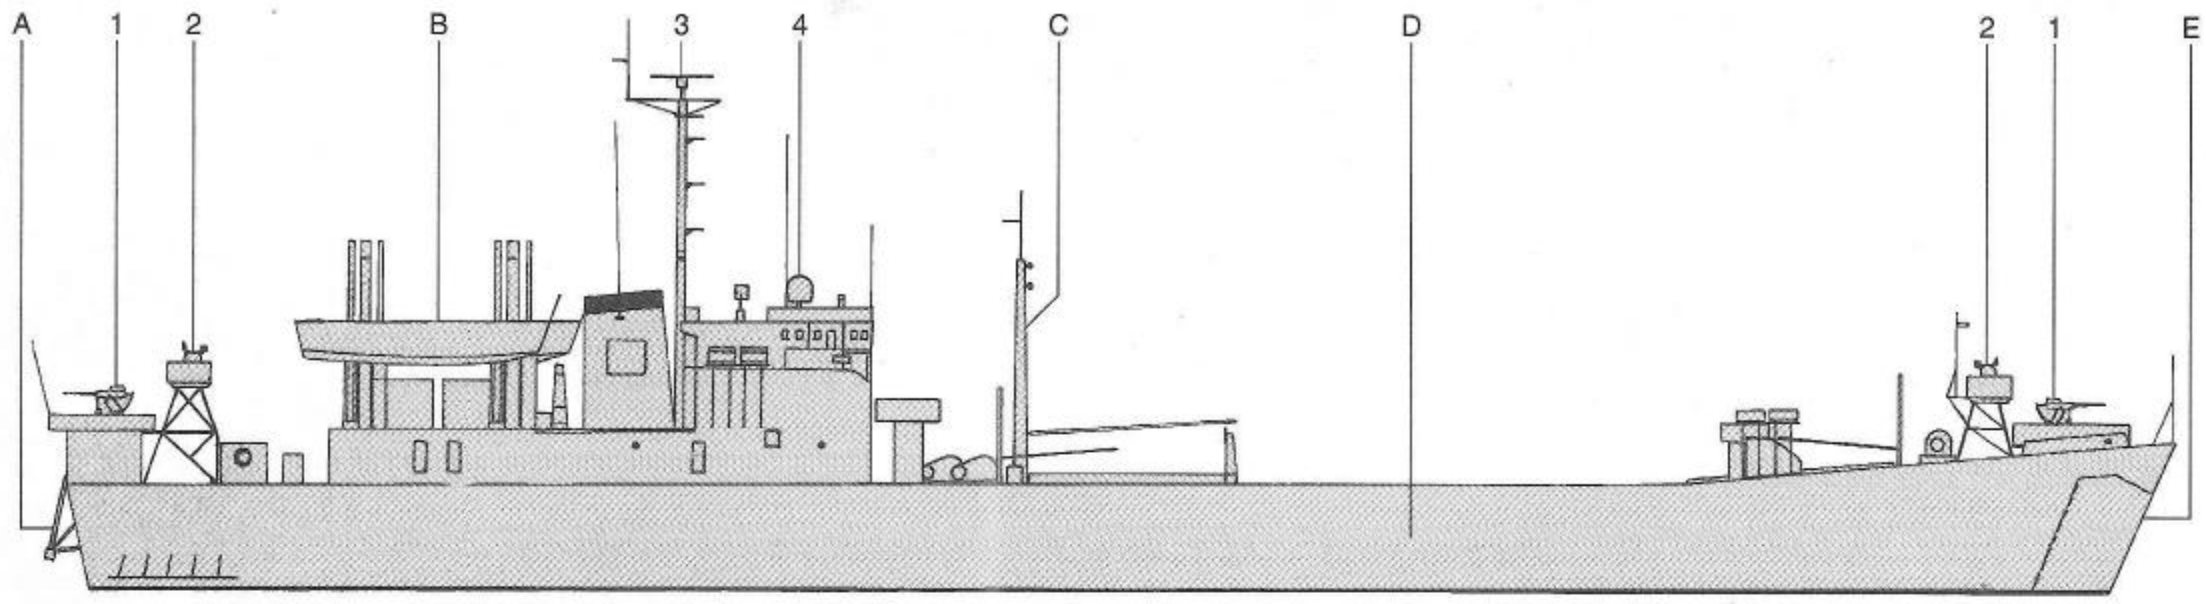
Although they joined the fleet as long ago as the mid-1970s these are the latest large amphibious warfare vessels to be commissioned into the JMSDF.

DESIGN

These are of traditional LST design with clamshell-type bow doors, a long tank deck, and the machinery and superstructure concentrated aft.

Miura *(L 4151) can carry 200 troops and 10 main battle tanks, or 1,800 tonnes of cargo* (Hachiro Nakai)

ATSUMI



Atsumi (Ian Sturton)
Amphibious A *Kedge anchor* **B** *LCVP (two)* **C** *King post* **D** *Tank deck* **E** *Clamshell doors with internal ramp*

General 1 *Bofors 40 mm/70* **2** *US Mk 51 Mod 2 fire control* **3** *Fujitsu OPS-9 navigation radar* **4** *Satcom (not always installed)*

GENERAL SPECIFICATIONS

Operator: Japan

Class: ATSUMI (LST)

Built: 3
Active: 3

Displacement:
standard: 1,503 tonne (LST 4101); 1,574 tonne (LST 4102, 4103)

Dimensions
Length: 89 m (291.9 ft)
Beam: 13 m (42.6 ft)
Draught: 2.7 m (8.9 ft)

Speed: 14 kts (LST4101); 13 kts (LST 4102, 4103)
Range: 9,000 n miles at 12 kts

Complement: 100 (LST 4101); 95 (LST 4102, 4103)

SHIPS

ATSUMI (LST 4101)

Builder	Sasebo Heavy Industries, Japan
Laid down	7 Dec 1971
Launched	13 Jun 1972
Commissioned	27 Nov 1972

MOTOBU (LST 4102)

Builder	Sasebo Heavy Industries, Japan
Laid down	23 Apr 1973
Launched	3 Aug 1973
Commissioned	21 Dec 1973

NEMURO (LST 4103)

Builder	Sasebo Heavy Industries, Japan
Laid down	18 Nov 1976
Launched	16 Jun 1977
Commissioned	27 Oct 1977

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops 130
- Cargo including five Type 74 tanks 400 tonnes

SHIP-SHORE LIFT

- LCVPs 2

AMPHIBIOUS FACILITIES

- All have clamshell bow doors and internal vehicle ramp.
- **Nemuro only.** *Nemuro* has an electric crane fitted at the after end of the tank deck.
- **Atsumi, Nemuro only.** *Atsumi* and *Nemuro* have a king-post and boom, but no crane.
- The two LCVPs are mounted on gravity davits abaft the stack, with two skids per craft.
- Large kedge anchor at stern.

WEAPONS SYSTEMS

GUNS

Bofors 40 mm L/70
Two twin Bofors 40 mm are mounted: one is in the bows, the second on a platform above the stern.

Specifications
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 - 1,025 m/s (3,280-3,362 ft/s)
Range:
anti-surface: 6,900 m (22,632 ft)
anti-air: 6.75 n miles (12.5 km)

Rate of fire: 300 rds/min (practical)
Ammunition: 2.21 kg (4.87 lb)

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

US Mk 51 Mod 2
The Mk 51 is an elementary remote sight, mounted in all three ships and providedes fire control for the 40 mm guns.

RADAR

Fujitsu OPS-9
An I-band (8-10 GHz) surface search/navigation radar produced by Fujitsu.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Kawasaki-MAN V8V22/30ATL diesels, 2.94 MW (4,000 hp)
Shafts: 2

FURTHER INFORMATION

For many years the JMSDF operated ex-US Navy amphibious warfare ships of which the largest were three 'Terrebonne County' class LSTs, which were acquired in 1961 and disposed of between 1974 and 1976. To replace these, the JMSDF designed and built these three 'Atsumi' class LSTs, two of which joined the fleet in 1972 and 1973, with the third following some time later in 1977. In design, they are of very similar concept to the US LSTs they replaced.

Atsumi *(L 4101). This class of three were the first LSTs to be built by the JMSDF after the Second World War* (Hachiro Nakai)

YURA

GENERAL SPECIFICATIONS

Operator: Japan

Class: YURA (LSU/LCU)

Built: 2
Active: 2

Displacement:
standard: 590 t

Dimensions
Length: 58 m (190.2 ft)
Beam: 9.5 m (31.2 ft)
Draught: 1.7 m (5.6 ft)

Speed: 12 kts

Complement: 31

SHIPS

YURA (LSU 4171)

Builder	Sasebo Heavy Industries, Tokyo, Japan
Laid down	23 Apr 1980
Launched	15 Oct 1980
Commissioned	27 Mar 1981

NOTO (LSU 4172)

Builder	Sasebo Heavy Industries, Tokyo, Japan
Laid down	23 Apr 1980
Launched	12 Nov 1980
Commissioned	27 Mar 1981

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops 70

AMPHIBIOUS FACILITIES

- Large, flat, bottom-hinged bow door and internal landing ramp.
- There are two cranes above the tank deck.

WEAPONS SYSTEMS

GUNS

Hughes 20 mm/76 Sea Vulcan 20P/ JM-1MB

One Hughes 20 mm/76 Sea Vulcan 20P, with three barrels per mounting. The Sea Vulcan 20P is a manually-operated weapon which has been adopted by the Japanese Maritime Self Defense Force as JM 61MB, and is, in essence, an M-197 gun on the mounting of the old 20 mm single US Navy Oerlikon Mk 10. The M-197 gun is an externally powered weapon using a cluster of three 20 mm barrels. Each barrel is 1.52 m long and weighs 8.18 kg. The weapon uses Mk 149 APDS, Mk 220 TPT and Mk 246 HEI-TSD and each barrel has a life of 15,000 rounds.

Specifications
Calibre: 20 mm
Length of barrel: 76
Muzzle velocity: 1,030 m/s (3,378 ft/s)
Rate of fire: 600-1,200 rds/min
Weight of shell: 294 g (10.36 oz)

Range (effective):
anti-surface: 1 n mile (2 km)
anti-air: 1,200 m (3,936 ft)
Traverse: 360°
Elevation: −15 to +75°

Manufacturer/Contractor
General Electric Company, Armament Systems Department (Sea Vulcan).

COMMAND AND CONTROL SYSTEMS

RADAR

Fujitsu OPS-9

An I-band (8-10 GHz) surface search and navigation radar

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Fuji 6L27.5XF diesel engines, 2.39 MW (3,250 hp)

Shafts: 2
Propellers: Controllable pitch

FURTHER INFORMATION

The JMSDF orders classes of 2-3 amphibious warfare vessels at a time, and these two entered service in 1981. They have a flat, bottom-hinged bow door and a relatively large superstructure.

Yura *(LSU 4171) was the lead ship in a class of two, which entered service in 1981. Note the flat bow ramp, the twin cranes and the relatively large superstructure* (H & L van Ginderen Collection)

YUSOTEI

GENERAL SPECIFICATIONS

Operator: Japan

Class: YUSOTEI (LCU)

Built: 2
Active: 2

Displacement:
standard: 420 t

Dimensions
Length: 52 m (170.6 ft)
Beam: 8.7 m (28.5 ft)
Draught: 1.6 m (5.2 ft)

Speed: 12 kts

Complement: 28

SHIPS

YUSOTEI-ICHI-GO (2001)

Builder	Sasebo Heavy Industries, Tokyo, Japan
Laid down	11 May 1987
Launched	9 Oct 1987
Commissioned	17 Mar 1988

YUSOTEI-NI-GO (2002)

Builder	Sasebo Heavy Industries, Tokyo, Japan
Laid down	17 May 1991
Launched	7 Oct 1991
Commissioned	11 Mar 1992

WEAPONS SYSTEMS

GUNS

GE 20 mm/76 Sea Vulcan 20P/JM-1MB

One GE 20 mm/76 Sea Vulcan 20P, with three barrels per mounting. The Sea Vulcan 20P is a manually operated weapon which has been adopted by the Japanese Maritime Self Defense Force as JM 61MB, and is, in essence, an M-197 gun on the mounting of the old 20 mm single US Navy Oerlikon Mk 10. The M-197 gun is an externally powered weapon using a cluster of three 20 mm barrels. Each barrel is 1.52 m (4.98 ft) long and weighs 8.18 kg (18.03 lb). The weapon uses Mk 149 APDS, Mk 220 TPT and Mk 246 HEI-TSD and each barrel has a life of 15,000 rounds.

Specifications
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,378 ft/s)
Rate of fire: 600-1,200 rds/min
Weight of shell: 294 g (10.36 oz)
Range (effective):
anti-surface: 1 n mile (2 km)
anti-air: 1,200 m (3,936 ft)
Traverse: 360°
Elevation: −15 to +75°

Manufacturer/Contractor
General Electric Company, Armament Systems Department (Sea Vulcan).

COMMAND AND CONTROL SYSTEMS

RADAR

Fujitsu OPS-9

An I-band (8-10 GHz) surface search and navigation radar produced by Fujitsu.

PROPULSION

Specifications
System: Diesels
Main machinery: 2 Mitsubishi S6U-MTK diesel engines, 2.23 MW (3,040 hp (m))
Shafts: 2

FURTHER INFORMATION

These medium-sized landing craft are officially designated 'landing craft utility' with pennant numbers LCU 01 and LCU 02. Plans for a third in the class appear to have been scrapped.

ALLIGATOR[1]

OVERVIEW

The Korea-Tacoma Yard has for some years offered a series of landing ship logistic (LSL) designs for the export market, obviously with a view to replacing the many ex-US Navy LSTs now approaching the end of their useful lives. Six were built for Indonesia and delivered in 1981/82. This was followed by an order for four ships for Venezuela, all of which were delivered in 1984, which were to a slightly different design. Latest is the series now building for the RoK Navy which appears to be generally similar to the last two ships built for Indonesia.

Footnote

1. The South Korean 'Alligator' class LST is totally unrelated to the Russian 'Alligator' class.

ALLIGATOR

GENERAL SPECIFICATIONS

Operator: South Korea

Class: ALLIGATOR (LST)

Active: 2
Building: 1 (+?)

Displacement:
full load: 4,200 t

Dimensions
Length: 106.9 m (350.7 ft)
Beam: 15.3 m (50.2 ft)
Draught: 3 m (9.8 ft)

Speed: 16 kts
Range: 10,000 n miles at 12 kts

Complement: 120 including 14 officers

SHIPS

Neither names nor numbers are known.

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Vehicles 700 tonnes
- Landing craft 200 tonnes

SHIP-SHORE LIFT

- There are several LCMs on the upper deck, with davits. These are probably ex-US LCM 8s of which the RoK Navy operates 10. There are also at least two LCVPs.

WEAPONS SYSTEMS

OTOBREDA 40 mm L/70 Compact (Type 70)

Two twin 40 mm turrets are mounted.

Specifications

Traverse: 360° (nominal) at 90°/s
Elevation: −13° to +85° at 60°/s
Rate of fire: 600 rds/min/mount
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 6 km (3.25 n miles)
anti-air: 4,000 m (2.2 n miles)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

Oerlikon 20 mm cannon

Two single, manually operated Oerlikon 20 mm cannon are mounted, but actual location cannot be confirmed.

Specifications

Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,738 ft/s)
Range:
surface target: 1.5 km (0.93 miles)
air target: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g (8.5 oz)
Projectile: 122 g (4.3 oz)
Elevation: −15 to +90°

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Electro-optic director

There is visual evidence of an electro-optic director; type not known.

RADARS

Surface search

One E/F band set.

Navigation

One I-band set

AVIATION

Specifications

Flight deck: Large flight deck aft.

Hangar: Visual inspection suggests that there is a hangar.

PROPULSION

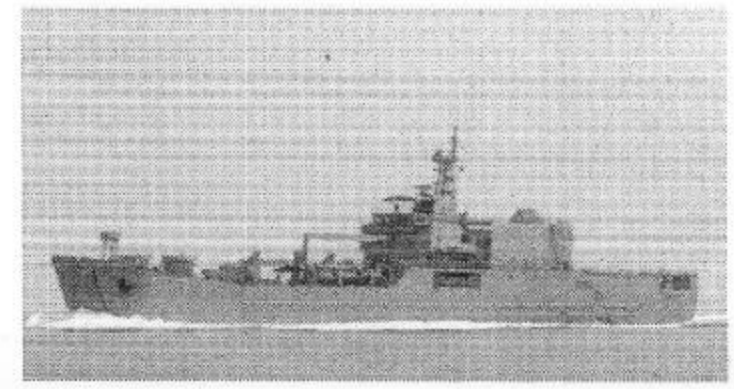
Specifications

System: Diesel
Main machinery: 2 SEMT-Pielstick 16 PA6 V 280, 9.41 MW (12,800 hp) sustained
Shafts: 2

FURTHER INFORMATION

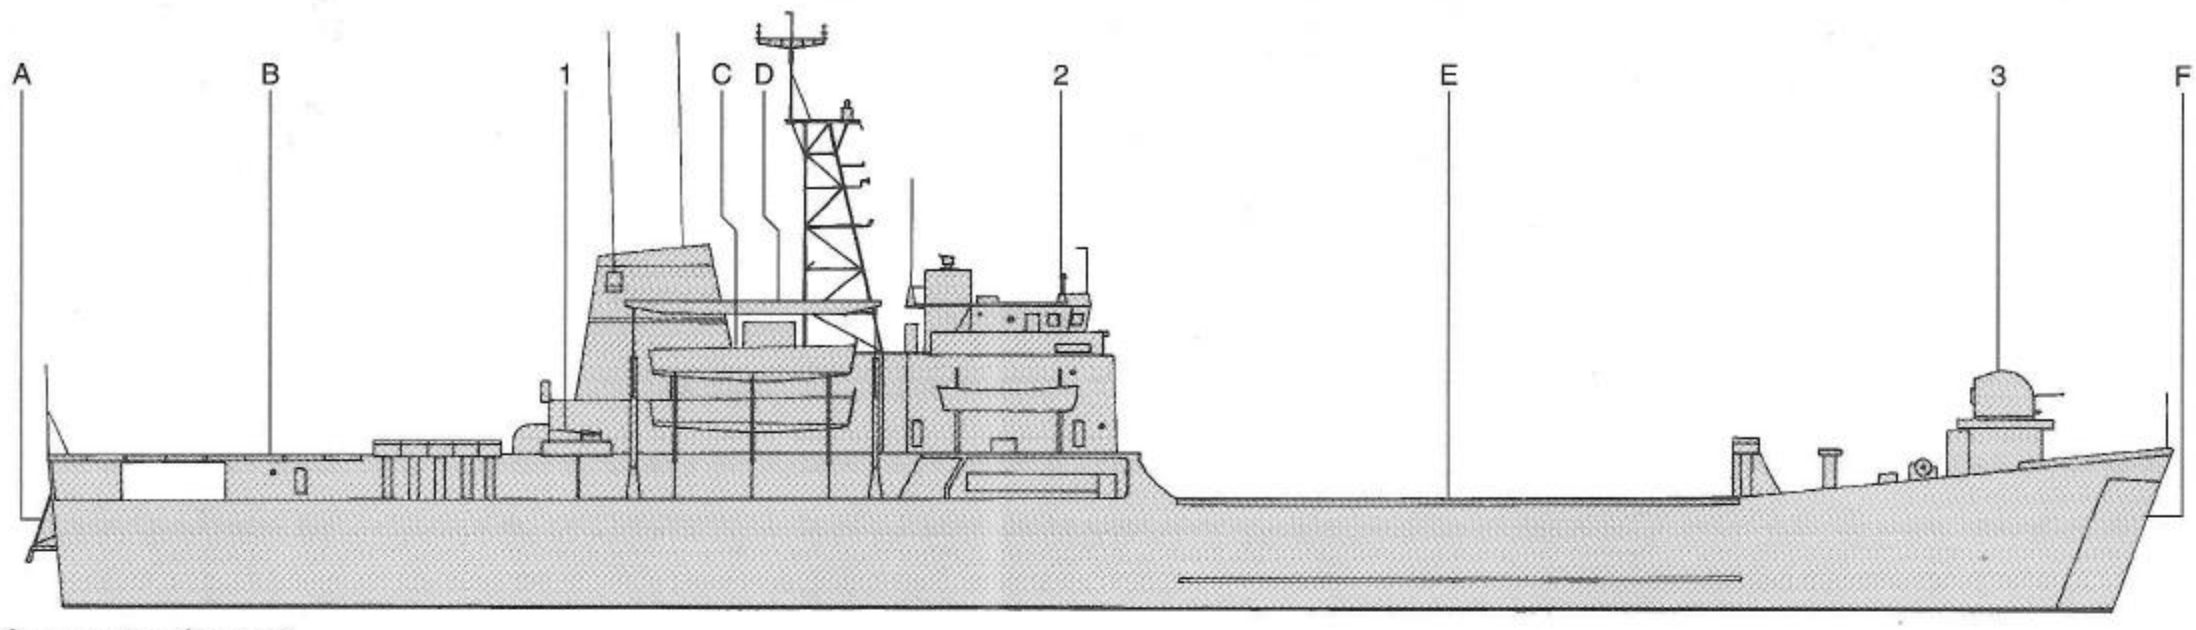
PROGRAMME

These vessels seem to be shrouded in an unusual degree of secrecy, and information has been minimal since the order for the first was placed in June 1990. The details given above are for the Hyundai HDL-4000 which has been advertised commercially, but the version built for the RoK Navy may well be different. Financial problems appear to have delayed the ships, but sea trials were reported to have started in late 1993 and two of the class were reported as having been commissioned by the end of 1994. Up to nine may be built if the intention is to replace the ageing ex-US Navy LSTs.



'Alligator' class LST of the RoK Navy

CAPANA (Alligator III)



Capana (Ian Sturton)
Amphibious A *Kedge anchor* **B** *Flight deck (no hangar)* **C** *LCVP* **D** *Davit* **E** *Tank deck* **F** *Clamshell doors with internal ramp*

General 1 *Rheinmetall Rh-202 20 mm cannon* **2** *Navigation radar* **3** *OTOBREDA 40/70 twin cannon*

GENERAL SPECIFICATIONS

Country of origin: South Korea
Operator: Venezuela
Type: Alligator (LST)

Class: CAPANA

Built: 4
Active: 4

Displacement:
full load: 4,070 t

Dimensions
Length: 104.8 m (343.8 ft)
Beam: 15.4 m (50.5 ft)
Draught: 3 m (9.8 ft)

Speed: 14 kts
Range: 5,600 n miles at 11 kts

Complement: 117, including 13 officers

SHIPS

CAPANA (T 61)
Builder Korea Tacoma Marine, Chinhae, South Korea
Commissioned 24 Jul 1984

ESEQUIBO (T 62)
Builder Korea Tacoma Marine, Chinhae, South Korea

GOAJIRA (T 63)
Builder Korea Tacoma Marine, Chinhae, South Korea
Commissioned 20 Nov 1984

LOS LLANOS (T 64)
Builder Korea Tacoma Marine, Chinhae, South Korea
Commissioned 20 Nov 1984

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops 202
- Cargo 1,600 tonnes

SHIP-SHORE LIFT

- 4 LCVPs on davits

AMPHIBIOUS FACILITIES

- Two clamshell, vertically hinged bow doors and bow ramp.
- Stern kedge anchor; no stern gate.
- 50 tonne tank turntable and an elevator between decks.

WEAPONS SYSTEMS

GUNS

OTOBREDA 40 mm L/70 Compact (Type 70)

One twin 40 mm turret is mounted on the forecastle.

Specifications
Traverse: 360° (nominal) at 90°/s
Elevation: −13° to +85° at 60°/s
Rate of fire: 600 rds/min/mount
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 6 km (3.25 n miles)
anti-air: 4,000 m (2.2 n miles)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

Oerlikon 20 mm GAM-BO1

There are two single Oerlikon 20 mm cannon in GAM-BO1 mountings. The KAA is a single barrel, gas-operated, air-cooled, link-belt fed weapon with feeding from either side and the GAM is an unpowered light, compact mounting.

Specifications
KAA Gun
Calibre: 20 mm
Length of barrel: 85 calibres
Muzzle velocity: 1,050-1,150 m/s (3,444-3,772 ft/s)
Range
anti-surface: 1.7 km
anti-air: 1,700 m (5,576 ft)
Rate of fire: 900 rds/min
Round weight: 320-345 g (11.28-12.16 oz)
Projectile: 110-125 g (3.87-4.19 oz)

GAM-BO1 Mounting
Elevation: −15 to +60°
Weight: 500 kg (1,102 lb) (loaded)

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Selenia NA 18/V electro-optic director
NA-18 is used to control the guns and consists of a TV camera, laser rangefinder and an infra-red camera.

RADAR

Navigation radar
There is a navigation radar; type unknown.

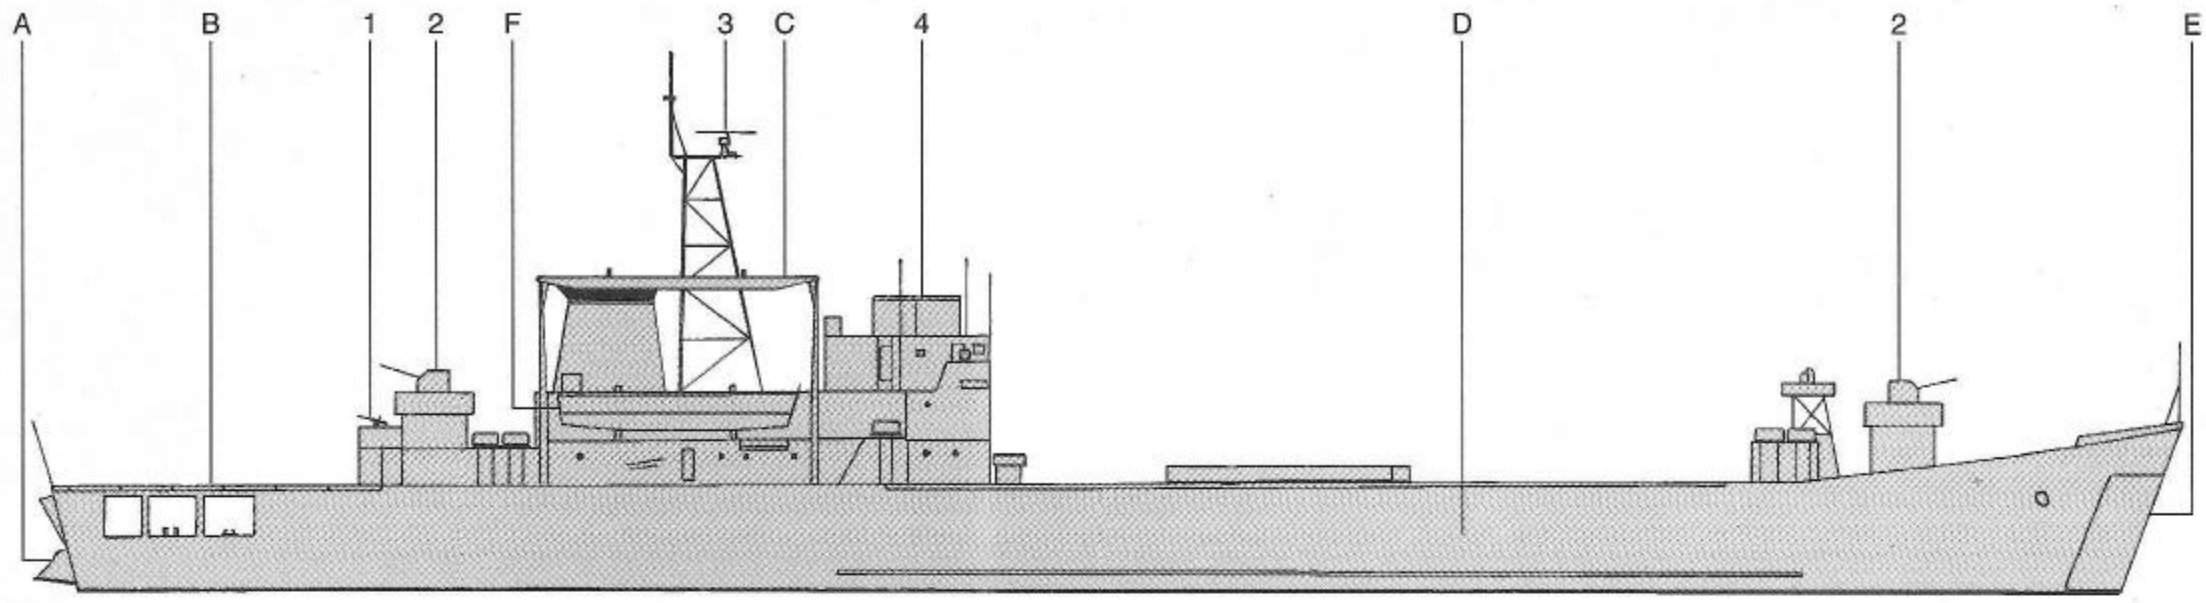
PROPULSION

Specifications
System: Diesel
Main machinery: 2 SEMT-Pielstick 16 PA6 V diesels, 5.04 MW (6,860 hp)
Shafts: 2

FURTHER INFORMATION

These ships are based on the Alligator design supplied to Indonesia and were all delivered in 1984. *Goajira* (T 63) was out of service from June 1987 to May 1993, following a serious fire.

TELUK SEMANGKA (Alligator)



Teluk Semangka (Ian Sturton)
Amphibious A *Kedge anchor* **B** *Flight deck* **C** *Davits* **D** *Tank deck* **E** *Clamshell doors with internal ramp* **F** *LCVP (total four)*

General 1 *Rheinmetal RH-202 20 mm cannon* **2** *Bofors 40 mm/70* **3** *Surface search radar* **4** *Racal-Decca navigation radar*

GENERAL SPECIFICATIONS

Country of origin: South Korea
Operator: Indonesia
Type: Alligator (LST)

Class: TELUK SEMANGKA

Built: 6
Active: 6

Displacement:
full load: 3,750 t

Dimensions
Length: 100 m (328 ft)
Beam: 14.4 m (47.2 ft)
Draught: 4.2 m (13.8 ft)

Speed: 15 kts
Range: 7,500 n miles at 13 kts

Complement: 90, including 13 officers

SHIPS

TELUK SEMANGKA (512)
Builder Korea-Tacoma, Masan, South Korea
Commissioned 20 Jan 1981

TELUK PENJU (513)
Builder Korea-Tacoma, Masan, South Korea
Commissioned 20 Jan 1981

TELUK MANDAR (514)
Builder Korea-Tacoma, Masan, South Korea
Commissioned July 1981

TELUK SAMPIT (515)
Builder Korea-Tacoma, Masan, South Korea
Commissioned June 1981

TELUK BANTEN (516)
Builder Korea-Tacoma, Masan, South Korea
Commissioned May 1982

TELUK ENDE (517)
Builder Korea-Tacoma, Masan, South Korea
Commissioned 2 Sep 1982

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- 1,800 tonnes, including 17 main battle tanks and 200 troops.
- If no tanks are carried, a marine battalion (500-600 men) can be embarked.

SHIP-SHORE LIFT

- Four LCVP mounted on davits.

AMPHIBIOUS FACILITIES

- Two, vertically-hinged, clamshell bow doors.
- 50 tonne capacity turntable on tank deck.
- Elevator to main deck.

Teluk Semangka *(512). The dimensions of these Korean-built ships — 100 m long, 14.4 m beam — are almost identical to those of the Second World War LSTs they were designed to replace, although the general design and machinery are obviously more up to date* (92 Wing RAAF)

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60

Teluk Semangka, Teluk Penju, Teluk Mandar and *Teluk Sampit:* three Bofors 40 mm/60.
Teluk Banten and *Teluk Ende:* two Bofors 40 mm/60.

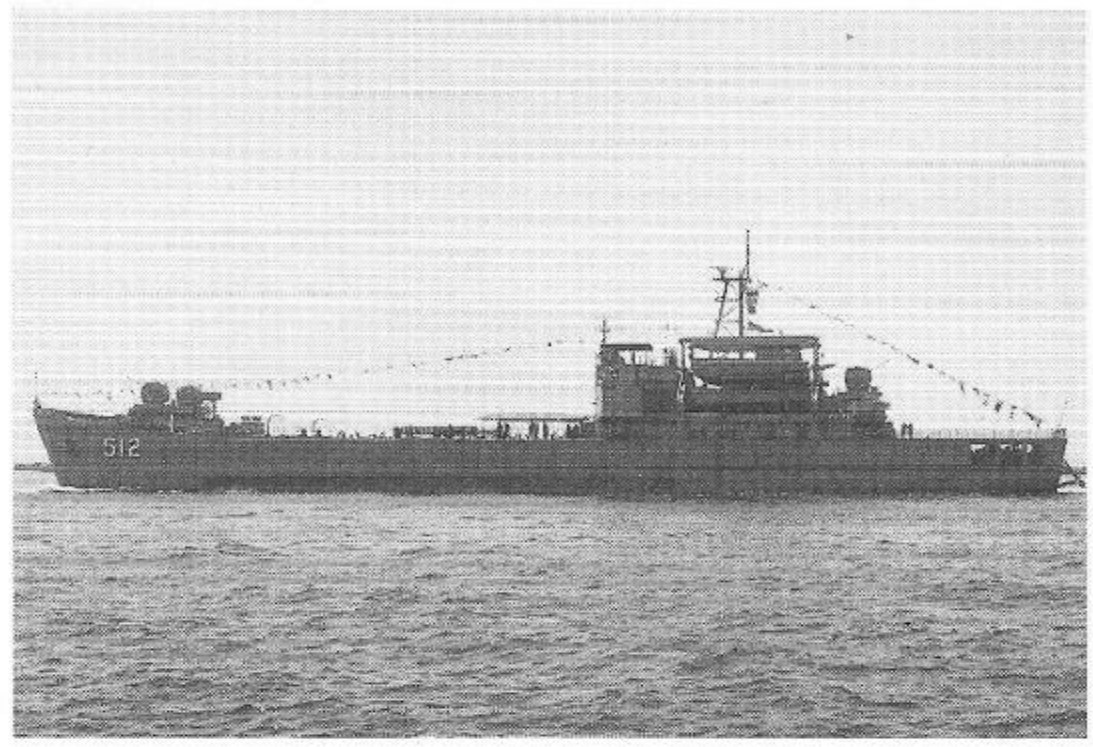
Specifications
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 - 1,025 m/s (3,280-3,362 ft/s)
Range:
anti-surface: 6.75 n miles (12.5 km)
anti-air: 6,900 m (22,632 ft)
Rate of fire: 300 rds/min (practical)
Ammunition: 2.21 kg (4.87 lb)

Rheinmetall 20 mm/85 multipurpose cannon

Two Rheinmetall 20 mm multipurpose cannon in manual mounts. The 85 calibre Rh 202 is 2.61 m (8.56 ft) long and is capable of single shot or automatic fire. Naval versions use either a conventional single belt feed in which rounds enter from the right and spent cartridges are ejected to the left, or the Type 2 two-way belt-feed mechanism.

Specifications
Gun: Rh 202
Calibre: 20 mm
Length of barrel: 85 calibres
Muzzle velocity: 1,050-1,250 m/s (3,444-4,100 ft/s)
Rate of fire: 800-1,000 rds/min
Crew: 1-2
Range: 1 n mile (2 km)

Teluk Banten *(516) one of two of the six Indonesian ships completed as command ships. Two hangars have been built aft and the LCVPs moved onto the foredeck. Three Nurtanio-built Cougars can be embarked*



Teluk Semangka *(512) one of the original four with a flight deck (but no hangar) and LCVPs abaft the bridge* (H & L van Ginderen Collection)

COMMAND AND CONTROL SYSTEMS

RADARS

Surface search

Teluk Banten and *Teluk Ende* only. These two ships have a surface search, E/F-band radar with an antenna mounted on the bridge roof. The type is not known.

Navigation

All ships have a Racal-Decca I-band navigation radar; model not known.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 diesels, 5.04 MW (6,860 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

A total of six ships was built for the Indonesian Navy by Korea-Tacoma. The first four were ordered in 1979 and delivered in 1981, while the last two, to a slightly different design, were ordered in 1980 and delivered in 1982.

DESIGN

The first four are almost identical in concept, layout and size to the US Navy's wartime LST 1-1152 design, except for the addition of a small flight deck aft (but no hangar). One curious feature is that they have an elevator to transfer vehicles and stores between the tank and upper deck, as in the earlier US LSTs, as opposed to the ramp, which the Americans used in their later model LSTs. Also, in the first four, the landing craft are mounted in davits on either side of the stack.

The last two were built as command ships, but retaining their amphibious capability. They use the same hull, but the layout is altered to suit the new role. Thus, the superstructure has been moved forward to free space aft for a much larger flight deck and a hangar. The davits and LCVPs have been moved and are now forward of the bridge, and the stack has been deleted, to be replaced by two drowned exhausts. They also have only two 40 mm guns and have a surface search radar fitted above the bridge. Presumably, these two also have additional communications for their function as command ships.

Teluk Ende has also been observed with large red crosses on the hangar sides. The ship retained its armament and whether it constituted a hospital ship in accordance with International Red Cross and International Red Crescent rules is not clear.

HORMUZ 24

GENERAL SPECIFICATIONS

Country of origin: South Korea
Operator: Iran

Class: HORMUZ 24 (LST)

Purchased: 3
Active: 3

Displacement:
full load: 2,014 t

Dimensions
Length: 73.1 m (239.8 ft)
Beam: 14.2 m (46.6 ft)
Draught: 2.5 m (8.2 ft)

Speed: 12 kts

Complement: 30, plus 110 berths

SHIPS

FARSI (24)
SARDASHT (25)
SAB SAHEL (26)

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Nine tanks and 140 troops.
- Berths for 110 passengers in addition to crew.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Daihatsu 6DLM-22 diesel engines, 1.76 MW (2,400 hp (m))
Shafts: 2

FURTHER INFORMATION

STATUS

These are officially registered as merchant vessels and are under the control of the Iranian Ministry for Merchant Marine, which makes them *bona fide* merchant vessels. However, there are reports that they have been used for Pasdaran (revolutionary guards) activities, which might prejudice their civilian status. They could also be employed in support of military amphibious operations, but that is no different from, for example, British practice in employing merchant vessels as 'Ships Taken Up From Trade' (STUFT).

DESIGNATION

'Hormuz 24' is an internationally recognised reporting name for the class, equivalent to NATO reporting names for Russian equipment, and is used as the Iranian name is not known.

PROGRAMME

These ships were built in Korean yards at Inchon in the mid-1980s, with large bow doors.

DUTCH AMPHIBIOUS TRANSPORT SHIP (ATS)/SPANISH LANDING PLATFORM DOCK (LPD)

OVERVIEW

The Dutch/Spanish LPD programme started as a national project by the Netherlands, which has a long-standing requirement for an amphibious transport ship (ATS) to remove from its dependence on UK ships or merchant vessels. The staff requirement was formalised in 1988 and work was proceeding along national lines when the R Neth N became aware that the Spanish Navy was working on a similar LPD project and the two navies decided to pursue the project jointly, signing a memorandum of understanding (MoU) in March 1992. Progress was helped by the fact that the two navies were already co-operating successfully on an AOR programme. The common staff requirement was agreed in May 1992 and the joint ATS/LPD design was finalised at the end of 1993. The design reflects a high degree of commonality, but as in the AOR and LCF programmes this has not been taken to extremes. Thus, the two ships differ in their propulsion systems, garage deck arrangements and accommodation areas (to reflect national traditions and preferences), and in their CIWS, with the Dutch opting for Goalkeeper and the Spanish for Meroka. There will also doubtless be differences in command and control and other electronic systems.

It appears that the Dutch will build only one of these ships, but there is pressure in Spain for a second of the class, not least from shipyard unions concerned at a likely dearth of naval work once the present LPD is launched.

GENERAL SPECIFICATIONS

Countries of origin: Netherlands/Spain
Operators: Netherlands, Spain
Type: Amphibious Transport Ship (ATS)/Landing Platform Dock (LPD)

Class: ROTTERDAM/JUAN DE AUSTRIA

Active: 0
Building: 2

Displacement:
full load: 11,000 t (ATS); 12,250 t (LPD)

Dimensions
Length: 163 m (534.8 ft) oa; 142.2 m (466.5 ft) wl

Beam: 25 m (82 ft)
Draught: 5.8 m (19.03 ft)

Speed: 19 kts (ATS); 19.4 kts (LPD)
Range: 6,000 n miles at 12 kts

Complement: 128 crew, plus 611 marines

SHIPS

ROTTERDAM (L 800)

Builder	Royal Schelde, Merwede Shipyard, Netherlands
Laid down	23 Feb 1996
Launched	Jan 1997
Commissioned	Dec 1997

JUAN DE AUSTRIA (L51)

Builder	Bazan, Ferrol, Spain
Laid down	Apr 1996
Launched	Jun 1997
Commissioned	Apr 1998

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops 611 (41 officers, 156 petty officers, 414 enlisted men)
- Vehicles 170 armoured personnel carriers or 33 main battle tanks
- Endurance:

Passengers 611 — 30 days
Passengers 661 — 48 hours
Passengers 811 — 24 hours

SHIP-SHORE LIFT

- LCVP Mk 3: 6
- LCU Mk 9: 4
- LCM 8: 4

AMPHIBIOUS FACILITIES

- Garage capacity 900 m²
- General cargo 460 m²
- General stores (embarked force) 630 m²
- Ammunition (embarked force) 320 m²
- Additional 880m² for vehicles, if the dock is used.
- Additional 510 m² for vehicles, if hangar is used.
- Two cranes: 1 × 25 t; 1 × 2.5 t
- Stern ramp: 10.5 m (34.5 ft) long
- Side ramp: 4.5 m (14.76 ft) long
- Cargo elevators: 1 × 25 t; 1 × 7.5 t; 1 × 4 t
- Can carry up to 36 torpedoes and 300 sonobuoys.

AVIATION FACILITIES

Specifications
Flight deck: 56 × 25 m (184 × 82 ft)
Hangar: Accommodation for 4 heavy or 6 medium helicopters
Helicopters: 4 EH-101 or six NFH-90

HOSPITAL

- Pre-medication area.
- Operating theatre.
- Intensive care sickbay (10 beds).
- Laboratory.
- Dental facilities.
- Hospital ward for 100 patients.

WEAPONS SYSTEMS

GUNS

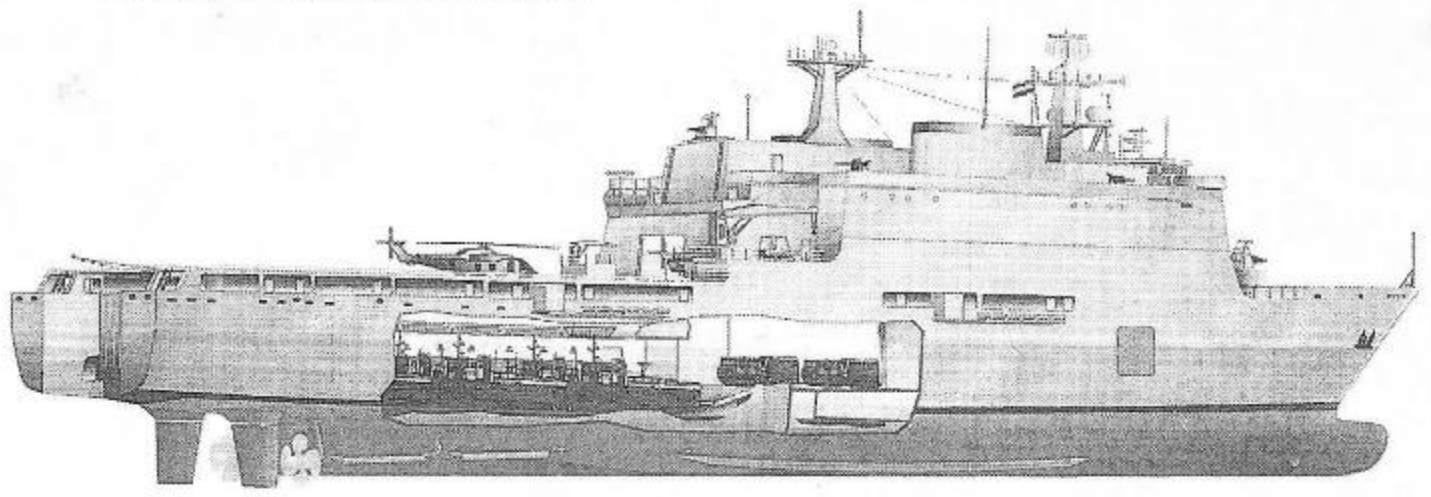
Signaal Goalkeeper 30 mm CIWS

Netherlands ATS only. Two Signaal/Hughes 30 mm 7-barrelled Gatling Goalkeeper close in weapons system will be mounted. Goalkeeper is an autonomous, fully automatic system, consisting of a General Electric Sea Vulcan 30 gun, I-band search radar, I/K-band tracking radar, TV camera, and ancillaries. The Sea Vulcan 30 is based upon the electrohydraulically-powered GAU-8/A 30 mm seven-barrel, Gatling gun, with each barrel firing once during each revolution of the barrel cluster. The gun is very reliable, with 33,000 mean rounds between stoppages. The mounting has an ammunition capacity of 1,190 rounds carried in a linkless system using a feed and storage drum, which is claimed to be sufficient for several target engagements before reloading is necessary. The warhead kill capability of Goalkeeper against anti-ship missiles is achieved by use of MPDS rounds which have high-density, tungsten-alloy penetrators. For 'soft' targets, HEI and TP types of ammunition can be used.

The I-band search radar uses a 2,050 × 280 mm linear array antenna with an integrated sidelobe suppression antenna. The antenna rotates at 60 rpm and has a horizontal beamwidth of 1.7° and a vertical beam width of 60°. The radar is powered by a water-cooled, synthesiser-driven, TWT transmitter with high output power for greater frequency and PRF flexibility in the face of ECM threats.

Specifications

Calibre: 30 mm
Muzzle velocity: 1,020 m/s (3,345 ft/s) (TP, HEI); 1,150 m/s (3,772 ft/s) (APDS)
Traverse: 360°
Elevation: −25 to +85°
Mounting weight: 6,800 kg (14,994 lb)
Crew: 0
Range: 200 m to 3 km (1.61 n miles)
Rate of fire: 4,200 rds/min
Ammunition: 369 g (13.01 oz) (TP, HEI, HEISD, API, MPDS)



Cutaway of the Dutch ATS. The twin rudders and bow thruster will give excellent manoeuvrability and it is stated that the six landing craft or two LCACs will be able to use the dock in Sea State 4 (Royal Schelde)

Manufacturers/Contractors

Hollandse Signaalapparaten BV, Hengelo, Netherlands (system/radar).
Hughes (gun).

Bazan Meroka CIWS

Spanish LPD only. Two Bazan Meroka Mod 2A/2B 12-barrelled 20 mm/120 close in weapons system (CIWS) will be mounted. This Spanish-designed weapon is unique in its configuration and operation. The weapon itself consists of 12 Oerlikon 20 mm KAA barrels and uses standard Oerlikon 20 mm ammunition, but these barrels are arranged in a single unit of two superimposed rows of 6 with a common breech-block. All operations, such as loading, feeding and unlocking, are carried out using compressed air from reservoirs on the mounting, which are recharged from an onboard compressor. Ammunition is brought to the barrels by two belt feeds, supplied by a hydraulically-powered, rotating, 72 round magazine.

Specifications

Calibre: 20 mm
Length of barrel: 120 calibres
Muzzle velocity: 1,215 m/s (3,985 ft/s)
Traverse: 360° at 90°/s
Elevation: −20 to +85°
Crew: 0
Range: 0.75 n miles (1.5 km)
Rate of fire: 2,700-3,600 rds/min
Ammunition: 337 g (11.88 oz) (TP-T, HEI, SAPHEI-T, AP-T); 310 g (10.93 oz) (APDS-T)

Manufacturer/Contractor

Fabrica de Artilleria de Bazan, Spain.

Oerlikon 20 mm

ATS and LPD. Four Oerlikon 20 mm guns will be mounted either side of the bridge superstructure.

Specifications

Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,738 ft/s)
Range:
surface target: 1.5 km
air target: 1,150 m (3,800 ft)
Rate of fire: 450 m/s (1,476 ft/s)
Round weight: 241 g (8.5 oz)
Projectile: 122 g (4.3 oz)
Elevation: −15 to +55°

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Details of EW system have not been made public.

DECOYS

Four SRBOC chaff launchers

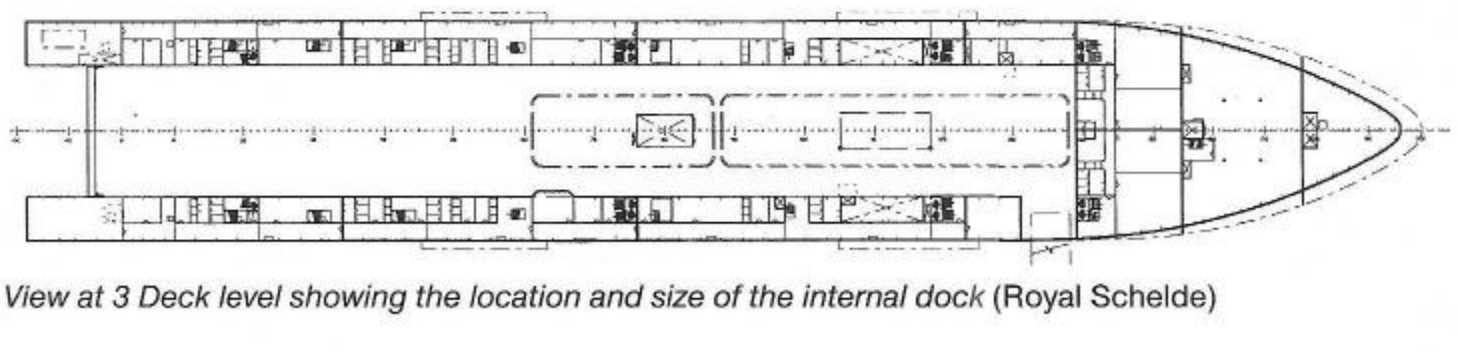
The Mk 36 SRBOC (Super Rapid Boom Offboard Countermeasures) system consists of launcher, launcher control, power supplies, ready service lockers and munitions. The Mk 137 launcher has six 130 mm fixed tubes arranged in parallel rows at angles of 45 and 60°. The firing circuits use electromagnetic induction to initiate the propelling charges in the cartridges. The prime cartridge is the Mk 182 Torch with chaff payload.

Specifications

Launcher dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Launcher weight: 173 kg (381.46 lb)
Mk 182 cartridge dimensions: 1,209 × 130 mm (47.59 × 5.11 in)
Cartridge weight: 22.7 kg (50.05 lb)

AN/SLQ-25 Nixie acoustic torpedo decoy system

The AN/SLQ-25 Nixie is a solid-state, modular design electro-acoustic countermeasures decoy system used to protect various classes of ships from acoustic homing torpedoes. It consists of a remote-control unit which can activate, deactivate and monitor the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming and recovering the towed bodies (which are stored on racks attached to the winch), a coaxial switching unit which selects the appropriate cable or load, and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body and either a deck edge tow chock or two fleet angle compensators (below-deck installations only).



View at 3 Deck level showing the location and size of the internal dock (Royal Schelde)

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

No announcement has been made but combat data systems will be installed.

COMMUNICATIONS SYSTEMS

Link 14
Satcom

WEAPONS CONTROL

Signaal IRSCAN Infra-red detector

Dutch LPD. It has been announced that this ship will carry the IRSCAN fast-reaction infra-red surveillance system, which has been under development by Signaal

since the mid-1980s, which is designed to detect both air and surface targets, which will be retrofitted into the Royal Netherlands Navy's Goalkeeper systems. IRSCAN is a modular, lightweight (336 kg), omnidirectional passive surveillance system which will be used in this application to detect and track targets in support of the Goalkeeper system. It consists of a stabilised sensor head, an air drier, an electronics cabinet and a control console all linked by fibre optic cable. The system can automatically track up to 32 targets, with a typical detection range of 6.5 n miles (12 km) against missiles and 8.1 n miles (15 km) against aircraft, and a typical reaction time is 2.5 seconds. The scanner has a 1,024 element staggered line array with CMT elements covering only the 8 to 12 μm range. The scanner has a scanning speed of 84 rpm and an elevation coverage of 14°.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

RADARS

Signaal DA08

Dutch ATS only. The DA08 is a high-power, coherent F-band radar for medium- to long-range surveillance and target indication to weapon control systems. The antenna is mounted on a lightweight hydraulically stabilised platform, providing considerable top weight reduction. The synthesiser-driven travelling wave tube transmitter provides for a great flexibility over a wide-band frequency, with pulse-to-pulse frequency agility. Together with the low sidelobe level of the antenna, the radar has a high performance in an electronic countermeasures polluted environment. Excellent clutter suppression is the result of the application of stabilisation, a dual beam antenna, dual receiver with a high dynamic range, quadrature digital Moving Target Indicator (MTI) or Fast Fourier Transform (FFT) processing, and circular polarisation.

Specifications

Beamwidth azimuth: 1.55°
Beamwidth elevation: Cosec² up to 40°
Rotation speed: 10/20 rpm
Processing: MTI
Stabilisation: Roll and pitch
Transmitter: F-band coherent (3-4 GHz) TWT system
Power output: 145 kW peak; 5 kW average
PRF: 500/1,000 Hz
Detection range (2 m² target): MTI version 185 km (115 n miles)
Resolution: Bearing 1.55°; range 90 m (295.2 ft)

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

Kelvin Hughes ARPA

Dutch ATS only. A Kelvin Hughes ARPA will be used for surface search. It operates in the I-Band.

Navigation and CCA

Dutch ATS only. Two I-band sets, probably identical, will be used for navigation and carrier-controlled approach (CCA).

Spanish LPD
No details of the radar fit have yet been given.

PROPULSION

Dutch ATS only

Specifications

System: Diesel electric
Main machinery: 4 Stork-Werkspoor 12SW28 diesel generators, 14.6 MW sustained; 2 Holec electric motors, 12 MW (16,320 hp)
Shafts: 2, fixed pitch
Thruster: 1 bow thruster, 185 kW (252 hp)
Emergency power: 1—1,000 kW generator set

Spanish LPD only

Specifications

System: Diesel
Main machinery: 4 Bazan-MAN-B&W diesel engines, 8 MW
Shafts: 2
Thrusters: 2 bow thrusters (2 × 500 kW)
Auxiliary power: 4 1,500 kW diesel generators; one 400 kW emergency generator

FURTHER INFORMATION

PROGRAMME

Dutch ATS

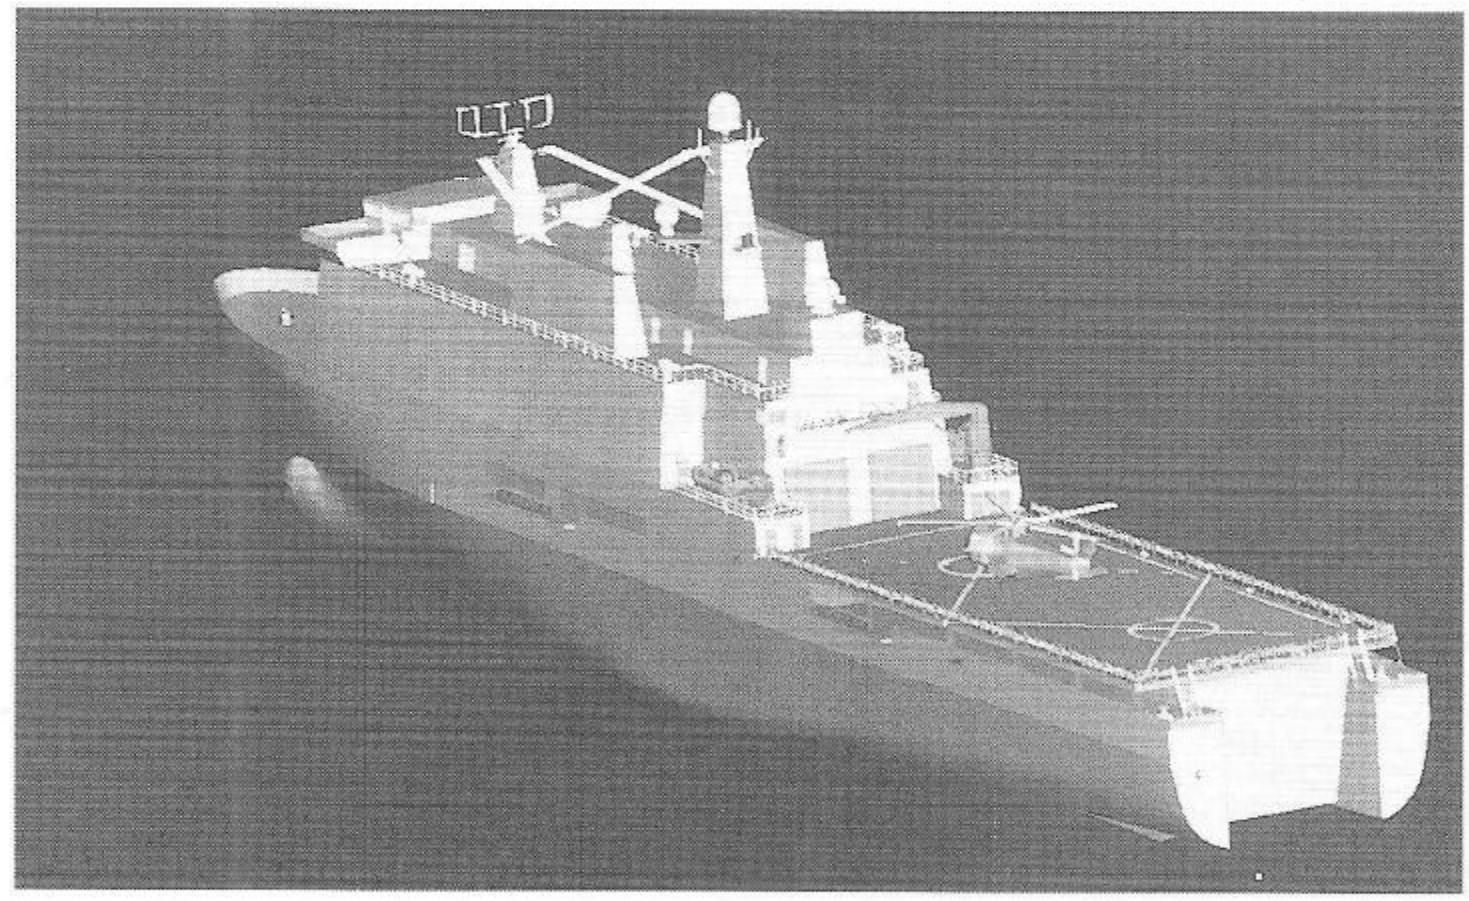
From the national point-of-view, the Dutch ATS is required to be an open ocean vessel, capable of operating anywhere in the world (except the Arctic) as part of a national or international task group, the latter either as part of the UK-NL Amphibious Force or some other NATO or ad hoc coalition. The ship is required to carry out its missions in sea-states up to 6 and to deploy and recover its landing craft up to Sea State 4.

Apart from amphibious operations, the ATS is required to be capable of operating as a helicopter carrier for ASW operations, as a support/ headquarters vessel for mine countermeasures operations, as well as acting as a general personnel or vehicle transport. In addition, in peacetime it is intended to be capable of carrying out search-and-rescue missions for environmental and disaster relief, which could include accommodating and evacuating refugees, provision of medical services and acting as a pollution control vessel. Finally, it is also expected to be capable of acting as a submarine rescue platform. It has a full range of naval and military command and control facilities, and has an NBCD citadel.

The design and procurement strategy is that the specification is based on the use of commercial standards (Lloyd's +100A1) and commercial equipment, except where military equipment is absolutely essential. The ship is being built to Lloyd's Register of Shipping rules and incorporates the latest IMO/SOLAS/MARPOL requirements, while overall quality control standards must meet ISO9001.

Spanish LPD

The name of this ship has been long rumoured but remains unconfirmed. The ship was authorised on 29 July 1994 and the second of class may be authorised in 1996/97. Ship will be able to transport a fully equipped battalion of marines and will be built to commercial standards with military command and control and NBCD facilities. As well as amphibious functions, the ship can also be used as general logistics support ship for both military and civil operations, including environmental and disaster relief.



Spanish LPD (Bazan)

PROPULSION

One of the major differences between the Dutch and Spanish versions of the ship, is the propulsion system, with the Dutch ship having diesel-electric propulsion. The Dutch analysis revealed that the ship will have a very varied operational profile. For amphibious operations it will be required to proceed at below 5 kts, but with a high auxiliary load, while in transit it will be required to maintain a speed of 12-15 kts for very long periods. Other elements requiring power include elevators, ramps, cranes a bow-thruster, while the 'hotel' requirements for some 700 people in conditions ranging from tropical to semi-arctic impose considerable loads.

The choice eventually narrowed to two options. One was a diesel direct hybrid system, consisting of a diesel engine with a small electric motor added to each gearbox. The other was a diesel-electric system, using asynchronous motors, with speed control using a pulsewidth modulation convertor, and fixed-pitch propellers. The latter was eventually selected, partly on the grounds of its operational efficiency, but also because it offers a substantial reduction in through-life costs.

NBCD

For NBCD the ship is provided with an NBCD citadel, with a single decontamination centre, and a washdown system. Deep shelters are available and the ship is designed to operate for up to 24 hours in a 'closed' down condition.

A wet pressurised firemain is installed, subdivided into four sections. All accommodation areas will have a wet sprinkler system and the ammunition magazines will have a separate IMO standard sprinkler system. Machinery spaces and other hazardous areas will have a fixed foam system. Standard Royal Netherlands Navy portable firefighting and damage control equipment will be installed throughout the ship.

Main machinery:
Unmodernised: *Reinøysund* (L 4502), *Rotsund* (L 4505). Two MTU MD diesels, 992 kW (1,350 hp)

Modernised: *Sørøysund* (L 4503), *Maursund* (L 4504), *Tjeldsund* (L 4506). Two Deutz MWM TBD 234 V12 diesels 992 kW (1,350 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

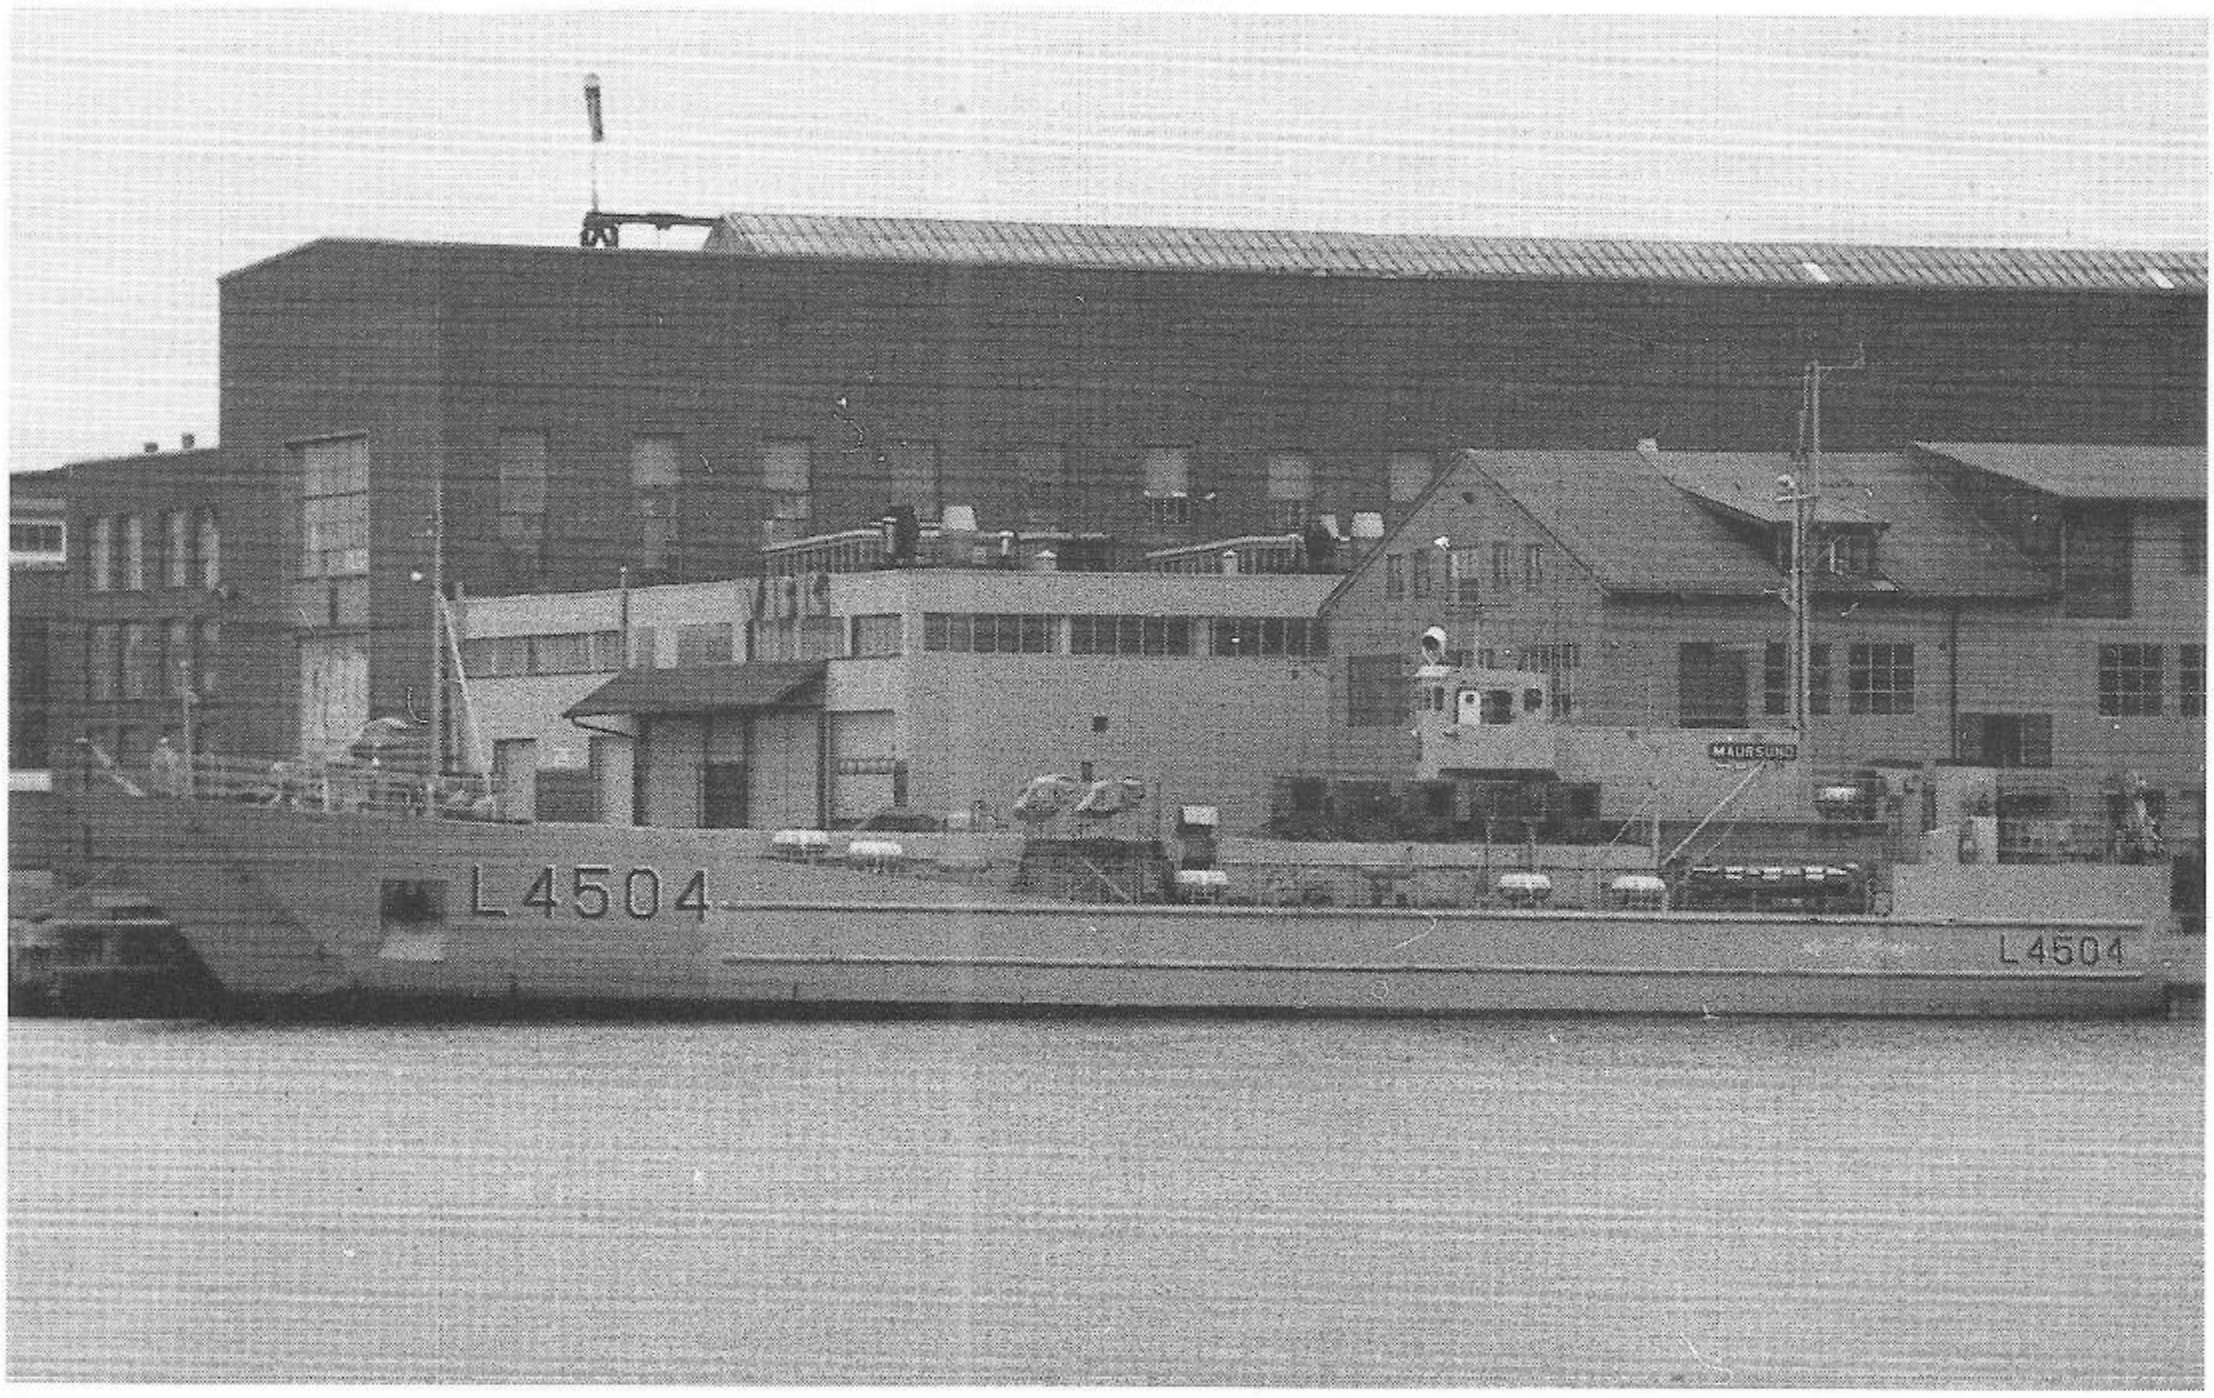
Two 'Kvalsund' class landing craft utility (LCU) were built for the Royal Norwegian Navy (R Nor N) in 1970. The five-strong 'Reinøysund' class was built slightly later, but to the same basic design. The 'Kvalsund' class was deleted in 1992, but the 'Reinøysund' class will remain in service until its replacements are completed, which is scheduled to be in about 1999.

DESIGN

These small LCUs which were built for the Royal Norwgian Navy have two clamshell, vertically-hinged doors, with a long, double-hinged, bow ramp protruding above them when closed. The superstructure is offset to starboard. The tank deck will hold seven Leopard tanks of the type operated by the Norwegian Army. These vessels have also been used as minelayers, and at one time had rails for 120 mines.

MODERNISATION

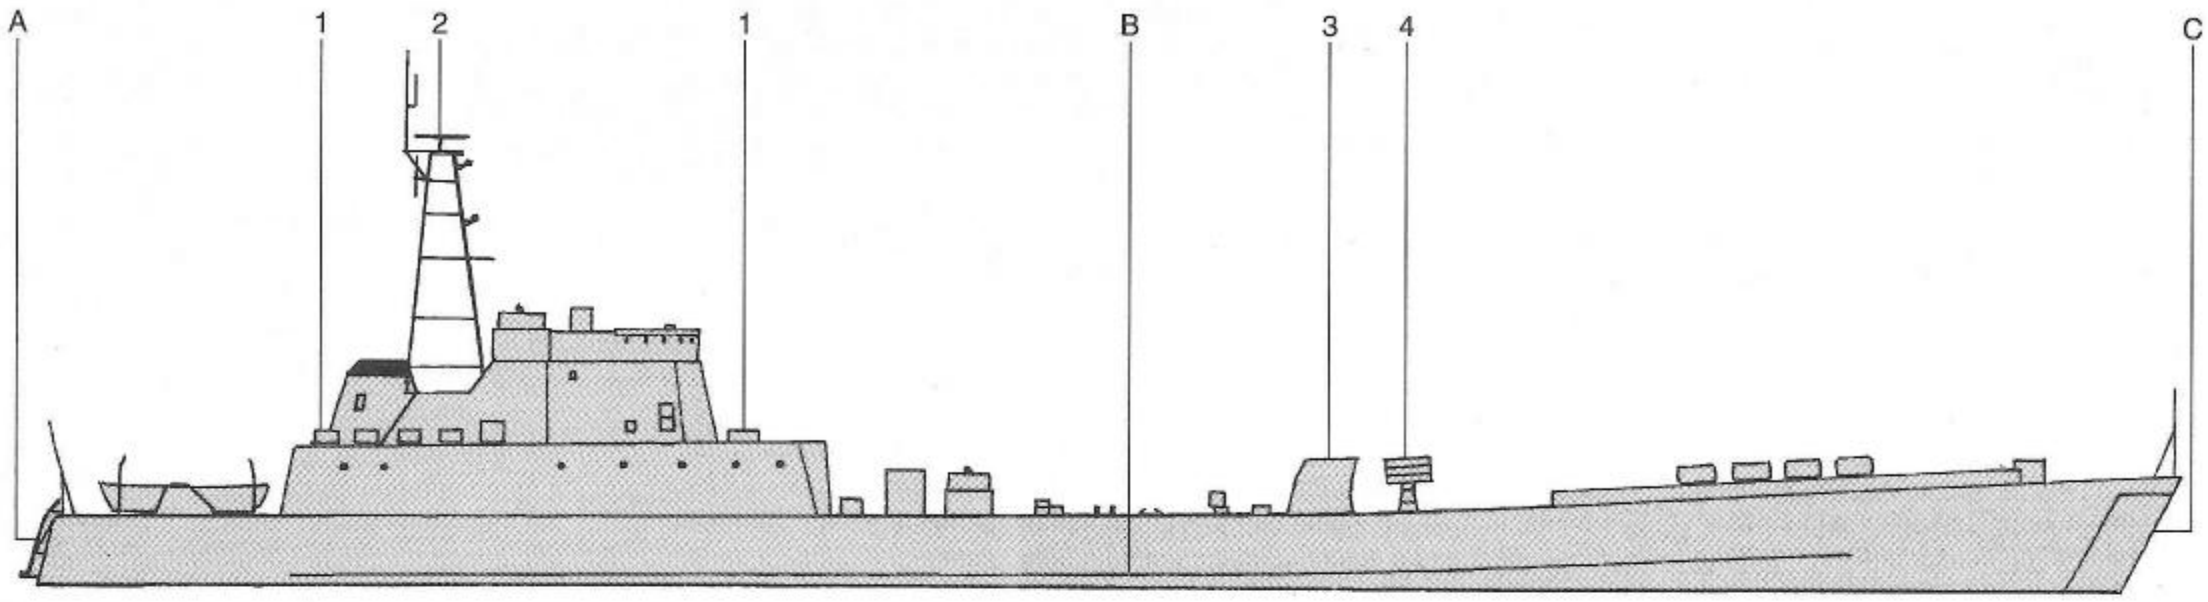
In 1995/96 three of the class were lengthened and given more modern engines. The remaining two are scheduled to receive a similar refit in 1996/97.



Maursund *(L 4504)*

POLNOCHNY

OVERVIEW



Polnochny A (Ian Sturton)
Amphibious A *Kedge anchor* **B** *Tank deck* **C** *Clamshell bow doors with internal ramp*

General 1 *AK-230 30 mm CIWS* **2** *Strut Curve navigation radar* **3** *Rocket efflux deflection screen* **4** *BM-14 18-tube rocket launcher*

PROGRAMME

Some 86 of these landing ships were built at the Polnochny yard at Gdansk in Poland from 1963 onwards, most being supplied to the Russian fleet, from which many were later re-exported to third parties. 24 were also built for the Polish Navy. The numbers in the Russian fleet are reducing rapidly, while many others, both in the Russian and other fleets, are in varying states of disrepair, with spares being a problem for many users, although they will be seen on the world's oceans for many years to come.

DESIGN

There are four sub-types, all to the same basic design, although there are a number of differences, particularly in the length, and, as a result, the carrying capacity. Thus, the original design, Polnochny A was 73.0 m (239.5 ft) long, while the -B was 75.0 m (246.1 ft), the -C 81.3 m (266.7 ft), and the final (export-only) -D version 83.9 m (275.3 ft). There were other changes, also, with the convex forecastle shape and almost vertical stern in the Polnochny A giving way to a more weatherly concave shape, increased flare and a more acutely angled stern in later types. There are also minor variations in the stack, that in the Polonochny-B being much taller than in other variants. Polnochny-As and -Bs have pole masts, while -Cs and -Ds have lattice masts. Polnochny-Cs and -Ds also have a somewhat longer built-up section amidships. There are also variations in armament.

Alone in the class, the Polnochny-D has a helicopter deck forward of the superstructure, with a large rectangular hatch in it. This is too small for the helicopter to be lowered and appears to be used to raise stores from the upper deck, prior to loading in or under the helicopter.

The relatively small size and low freeboard suggest that these are essentially short range ships, designed for coastal operations. The clamshell bow doors are on lifting hinges which enable them to lift slightly and then draw back along the side of the bow. Inside, there is a long off-loading ramp. There is a large, sliding hatch in the forward end of the upper deck to enable stores to be loaded or unloaded by a dock-side crane direct into the tank deck. There is, however, no ramp to enable vehicles to access the upper deck from the tank deck.

DESIGNATION

The designation 'Polnochny' is the NATO reporting name, and is, in fact, the Polish name of the shipyard where the ships were built. Under the Polish system the four designs were allocated type numbers:

TABLE I: 'POLNOCHNY' CLASS - MAJOR CHARACTERISTICS

Specification	Polnochny A	Polnochny B	Polnochny C	Polnochny D

Vietnam	3*	1979-80	Polnochny B	3	
Yemen	3*	1973 - 1 1977 - 1 1979 - 1	Polnochny A	1	
TOTAL				**50**	

Notes:
* Built in Poland, supplied to the Russian Navy and later transferred to third parties.
** Built in Poland and exported direct.
*** Built in Poland for Polish Navy

1. Both are reported to be unserviceable.
2. Units of the Russian Caspian Fleet were transferred to Azerbaijan in 1992, including two Polnochny Bs. Russia resumed control in 1995 in order to ensure adequate maintenance and support, but the two ships are listed separately to reflect their actual ownership.
3. One Polnochny A was transferred from Russia to Somalia in December 1976. After the Somali revolution in 1991, all naval ships except the Polnochny and four 'Mol' class torpedo boats were sunk, but the survivors were ransacked, with every fixture and fitting removed. The fate of the Polnochny is not known, but it is unlikely to be serviceable.
4. At least two appear to remain in service, but as general transports.

POLNOCHNY A (Type 770)

- Two clamshell doors with lifting hinges.
- Tank deck 36.9 × 5.2 m (120 × 17 ft).
- Kedge anchor at stern.

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

SA-N-5 Grail (Strela-2M)

All Russian ships and some others, but not the Bulgarians, are armed with two SA-N-5 Grail quad launchers, each with 32 missiles. SA-N-5 is the NATO designation for the Russian Strela-2M (Strela = arrow), which is the naval version of the very widely used Strela-2 (NATO = SA-7 Grail) land-based, shoulder-launched short-range missile system. In the naval version, four missiles are mounted on a metal framework, with the operator standing inside the framework, leaning back into a lumbar pad, with the missiles at shoulder level, as in the land-based system.

When the target is acquired the operator selects a missile and then activates the thermal battery. When the seeker acquires the target the operator receives an audio signal and he partially pulls the trigger to activate the missile gyros, which are tame some four to six seconds to warm up. The operator uses stadia reference marks in his optical sight to compute the lead angle to the target then fully engages the trigger to launch the missile. The booster burns for 0.05 seconds, ejecting the missile from the launch tube at a speed of 28 m/s (91.84 ft/s) and spinning it up. Then, at a distance of 6 m (19.6 ft), the sustainer ignites and the trailing fins pop out.

The missile homes on the 'hottest' part of the aircraft and probably has an impact fuze on its 1.1 kg armour-piercing RDX warhead. In Strela 2M the (SA-7B 'Grail' Mod 1) the seeker has a filter for improved performance and the warhead has improved fragmentation uniformity.

According to a Polish source, the missile installation is designated Fasta 4M while the missiles are designated Strzala-2M and a total of 16 missiles are carried.

Specifications
(Strela 2)
Length: 1.45 m (4.76 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (21.98 lb)
Speed: Mach 1.7
Range: 2.6 n miles (5.5 km)
Altitude: 18 - 4,500 m (60 - 15,000 ft)
Guidance: IR homing

Manufacturer/Contractor
Fakel, Russia.

GUNS

AK-230 30 mm/65 twin

These ships have two twin AK-230, remotely operated, twin barrel, automatic anti-aircraft guns, with one mounting before the bridge, the other at the after end of the superstructure. These are designed to engage air targets at heights of up to 4,000 m (13,120 ft) and are also capable of engaging surface targets at ranges up to 2.2 n miles (4 km). The electrically-powered mounting consists of two 64.2 calibre, water-cooled, NN30 guns, each with a liner and a rotating breech with four chambers. The elevating mechanism is on the carriage together with a compressed air tank and associated equipment for the loading system. Russian ammunition for this weapon consists of two rounds; BR-83 and OF-83D (see Specifications).

The fire-control radar is the I/J-band Rys (NATO = Drum Tilt) fire-control radar, whose maximum acquisition range is approximately 22 n miles (40 km).

Specifications
NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,444 ft/s)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,120 ft/s)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s
Mounting weight: 1,857-1,905 kg (4,094-4,200 lb))
Crew: 2 (off mount)

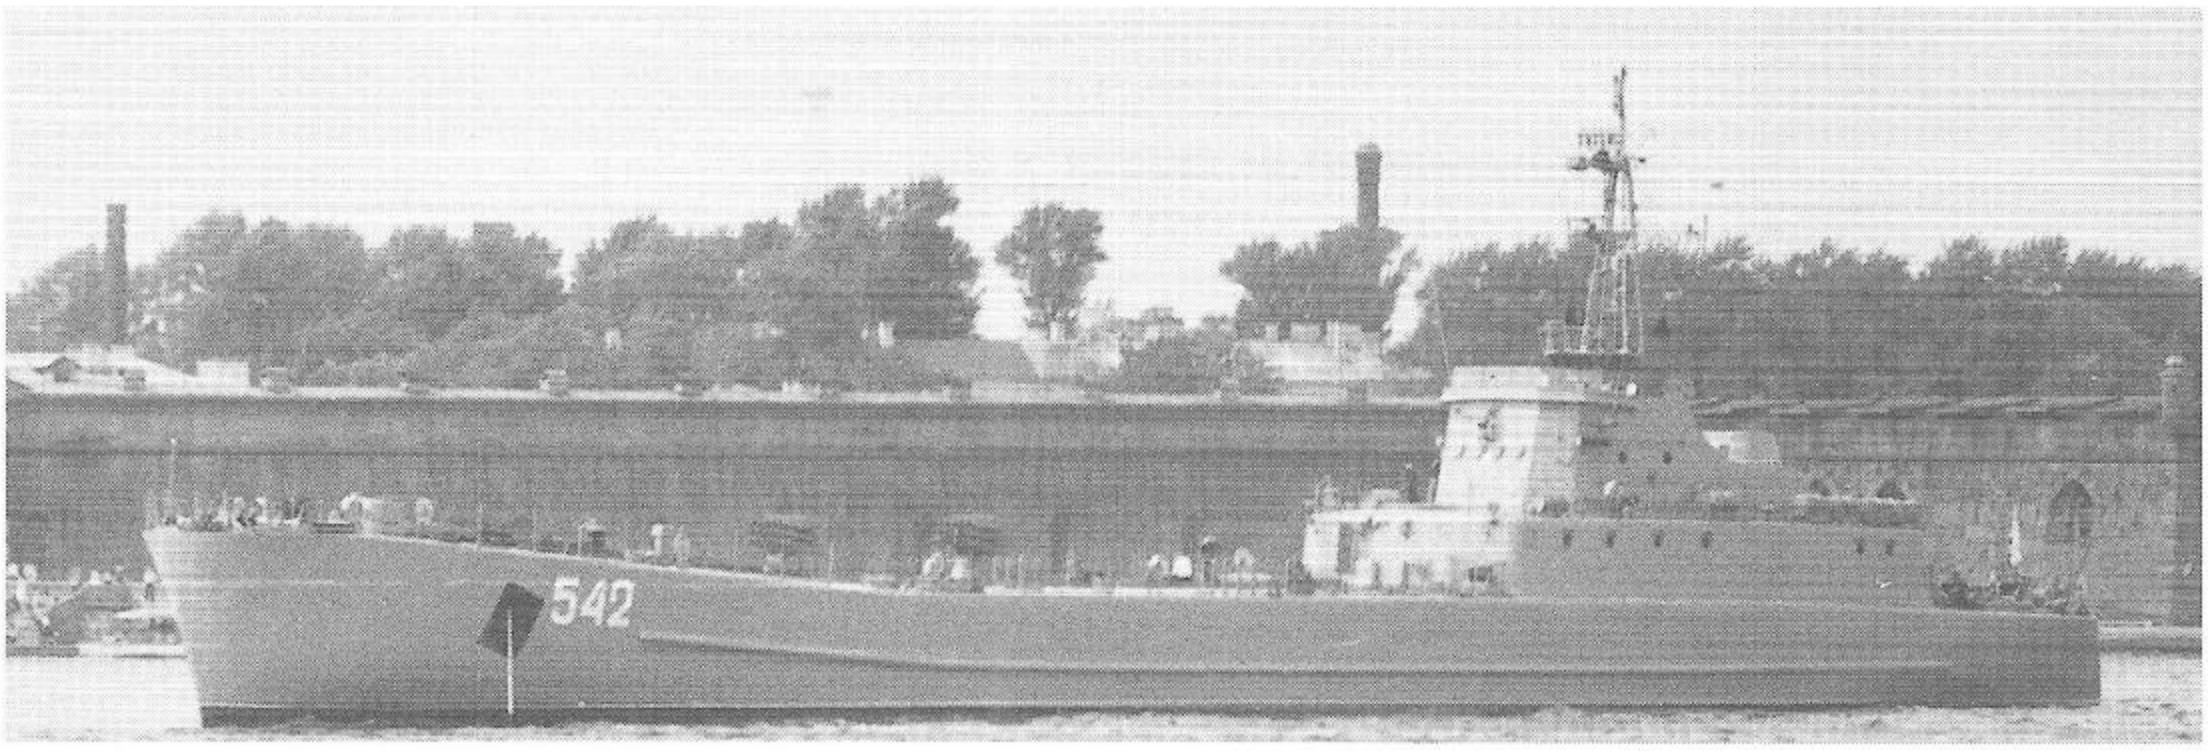
Ammunition
BR-83:
Type: Armour-piercing tracer
Weight (complete round): 1.47 kg (3.24 lb)
Weight (projectile): 0.35 kg (0.77 lb)

OF-83D:
Type: High explosive
Weight (complete round): 1.40 kg (3.1 lb)
Projectile: 0.27 kg (0.59 lb)
Explosive: 30 g (A-XI-2) (1.05 oz)

BM-14 140 mm 18-tube rocket launchers

Two BM-14 rocket launchers are mounted on the upper deck. The BM-14 was developed specifically for the 'Polnochny' class and consists of 18 launch tubes in a framework fitted to an electrically-operated pintle mounting. The launch tubes are reloaded manually and like the land-based system it is likely to be able to traverse 200° and to elevate 0 to +52°. The launcher fires 139 mm (5.5 in) diameter unguided spin-stabilised M-14-OF rockets which have either HE-fragmentation, smoke or chemical warheads.

Specifications
Rockets
Diameter: 139.7 mm (5.5 in)
Length: 1.092 m (3.58 ft)
Weight:
round: 39.62 kg (87.35 lb)
warhead: 18.3-18.8 kg (40.3-41.45 lb)
Range: 400-9,810 m (437-10,730 yd)
Max velocity: 402 m/s (1,320 ft/s)



A Polnochny A of the (then) Soviet Navy. Note the almost vertical stern, concave shape to the forecastle and short superstructure (H & L van Ginderen Collection)

COMMAND AND CONTROL SYSTEMS

RADARS

Spin Trough

All except Egyptian ships. Spin Trough is a Russian-made, I-band, navigation radar.

Racal-Decca

Egyptian ships only. One Racal-Decca, I-band set for navigation.

Drum Tilt

All except Bulgarian ships. This is a pedestal-mounted fire-control radar providing acquisition and tracking functions only for the 30 mm guns. It is housed in a weatherproof container which is attached to the scanner assembly tilted at about 25°. Maximum acquisition range of aerial targets is approximately 22 n miles (41 km). Operating frequency is in the I-band.

AVIATION

None

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Kolomna Type 40-D diesels, 3.2 MW (4,400 hp) sustained
Shafts: 2

FURTHER INFORMATION

Bulgaria
The Bulgarian ships were transferred from Russia in 1986/87 and are fitted with neither the SA-N-5 Grail surface-to-air missile system nor the Drum Tilt fire-control radar. Plans to convert them to minelayers have been shelved and both are now used as transports, based at Atiya. Bulgaria is reported to be planning drastic reductions to its naval fleet, which may well effect the future of these ships.

Egypt
The Egyptian ships were transferred from Russia in 1973/74. All were used to provide logistic support during the Gulf War in 1990/91. Some may carry SA-N-5 launchers.

Poland
Poland acquired 23 Polnochny-As for its own use, but none are now employed in the amphibious role. Most have been stricken, but at least two, *Goplo* (809) and *Gdynia* (810), are used as general transports.

Russia
Many of the Russian Navy's Polnochnys have already been paid off, and some of the survivors are thought to be in doubtful condition. The four surviving Polnochny As are all in the Caspian Sea.

Vietnam
The Russian Navy transferred two Polnochny Bs to Vietnam, one in May 1979 the other February 1980, which was followed by the third — a Polnochny A — in November 1979.

Yemen
Three Polnochnys were transferred from the Russian Navy to the People's Democratic Republic of South Yemen: two in August 1973 and one in July 1977. No 138 burned out in March 1986 and No 136 was unserviceable by 1993, but No 137 was reported still to be seaworthy in late 1995

FURTHER INFORMATION

Algeria
The ship was transferred from Russia in August 1976 and was originally numbered 555.

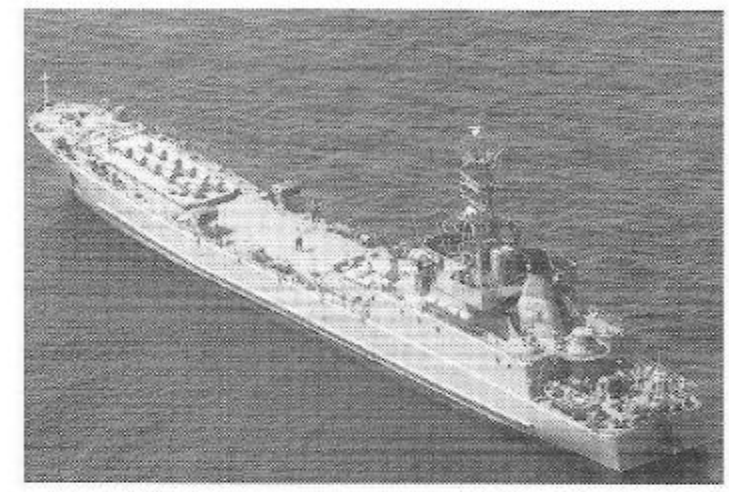
Cuba
The ship was transferred from Russia on 4 December 1982 and is reported to be currently non-operational, despite using a second of the class for spares.

Russia
Many of these ships have already been paid off, and some of the survivors are thought to be in doubtful condition.

Eight of the surviving Polnochny Bs are in the Caspian Sea and two of these are actually owned by Azerbaijan, though operated on that country's behalf by the Russian Navy.

Four of the Russian Navy's Type Bs were converted for mines countermeasures operations (LCMs), but all except one have been stricken.

Syria
The first ship was transferred from the Russian Navy in January 1984, followed by the second pair in February 1985. All three are operational and are based at Tartous.



Polnochny B. Note the tall, thin, tapering stack, kedge anchor at stern and BM-14 rocket launchers. No rocket efflux deflectors are fitted

FURTHER INFORMATION

India
India purchased four Polnochny Cs direct from the Polish shipyard rather than through transfers through the Russian Navy, as were most the Polnochnys which went to other countries. All the Polnochny Cs are still operational, though suffering for want of spares.

Ukraine
In the share-out of the Black Sea Fleet, the Ukrainian Navy received one Polnochny C in 1994. The ship is reported to have been laid up.

IBN AL FARAT (118)
Builder Naval Shipyard, Gdynia, Poland
Transferred to Libya Jun 1978

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops 160
- Five main battle tanks, or four armoured personnel carriers, or five anti-aircraft guns, or eight trucks.
- 350 tonnes of stores.

AMPHIBIOUS FACILITIES

- Two clamshell bow doors with ramp.
- Tank deck. 53.3 × 6.7 m (175 × 22 ft).
- Kedge anchor at stern.

WEAPONS SYSTEMS

GUNS

AK-230 30 mm/65 twin

These ships have two twin AK-230, remotely operated, twin barrel, automatic anti-aircraft guns, which are designed to engage air targets at heights of up to 4,000 m (13,123 ft). It is also capable of engaging surface targets at ranges up to 2.2 n miles (4 km). The electrically powered mounting is 1.46 m (4.78 ft) high, 3.11 m (10.20 ft) long and 2.1 m (6.88 ft) wide, and consists of two 64.2 calibre, water-cooled, NN30 guns, each with a liner and a rotating breech with four chambers. The elevating mechanism is on the carriage together with a compressed air tank and associated equipment for the loading system. Russian ammunition for this weapon consists of two rounds; BR-83 and OF-83D (see Specifications).

The fire-control radar is the I/J-band Rys (NATO = Drum Tilt) fire-control radar, whose maximum acquisition range is approximately 40 km (22 n miles).

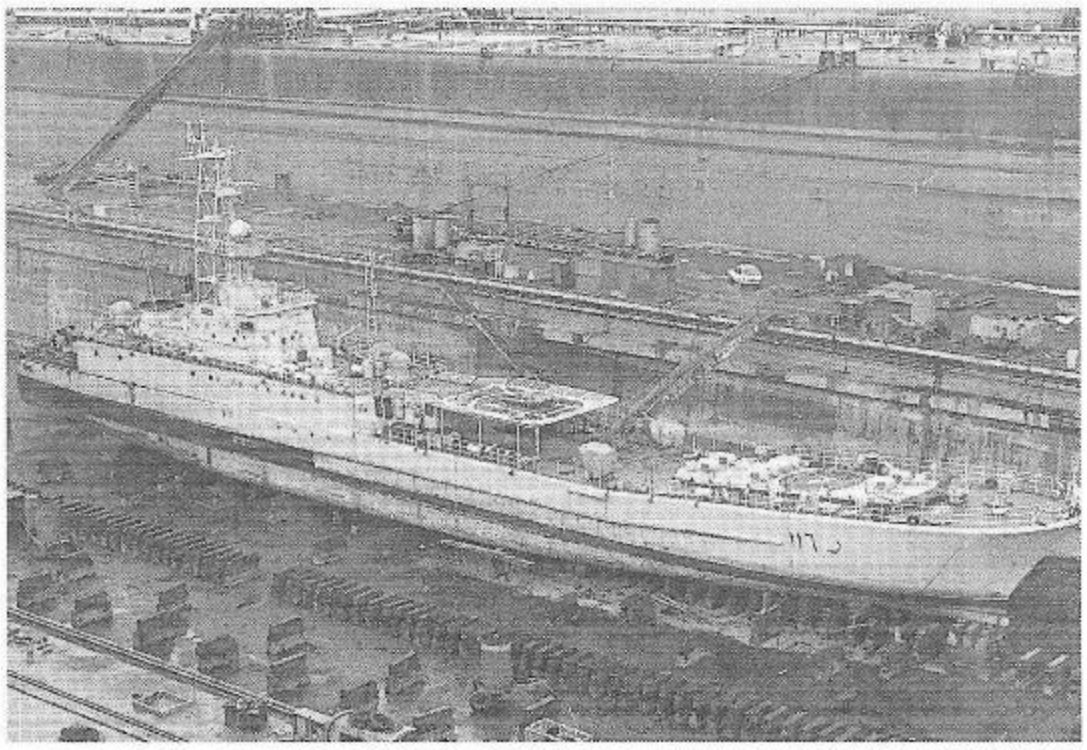
Specifications

NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,450 ft/s)

Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,000 ft)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s
Crew: 2 (off mount)

Ammunition
BR-83:
Type: Armour-piercing tracer



Ibn Umayaa *(116) of the Libyan Navy in drydock in Malta*

Cheetah *(L 18) of the Indian Navy. The platform is used for a single light helicopter but there is no hangar* (92 Wing RAAF)

Weight (complete round): 1.47 kg (3.24 lb)
Weight (projectile): 0.35 kg (0.77 lb)

OF-83D:
Type: High explosive
Weight (complete round): 1.40 kg (3.08 lb)
Projectile: 0.27 kg (0.59 lb)
Explosive: 30 g (10.58 oz) (A-XI-2)

BM-14 140 mm 18-tube rocket launchers

Two BM-14 rocket launchers are mounted. The BM-14 was developed specifically for the 'Polnochny' class. The BM-14 consists of 18 launch tubes in a framework fitted to an electrically-operated pintle mounting. The launch tubes are reloaded manually and like the land-based system it is likely to be able to traverse 200° and to elevate 0 to +52°.

The launcher fires 139 mm diameter unguided spin-stabilised M-14-OF rockets which weigh more than 39 kg (86 lb) and are 1.092 m (3.58 ft) long. They can have either HE-fragmentation, smoke or chemical warheads.

Specifications

Rockets
Diameter: 139.7 mm (5.5 in)
Length: 1.092 m (3.58 ft)
Weight:
round: 39.62 kg (87.35 lb)
warhead: 18.3-18.8 kg (40.3-41.45 lb)
Range: 400-9,810 m (437-10,730 yd)
Max velocity: 402 m/s (1,320 ft/s)

MINES

Up to 100 mines can be carried.

COMMAND AND CONTROL SYSTEMS

RADARS

Don 2 or Radwar SRN-745

Don-2 is the standard Russian navigational radar in use from the mid 1950s. The Radwar SRN-745 is a Polish-made, I-band,
equivalent.

Drum Tilt in I-band

Drum Tilt is a pedestal-mounted fire-control radar which probably provides acquisition and tracking functions only for 25 and 30 mm anti-aircraft guns. It is housed in a weatherproof container which is attached to the scanner assembly tilted at about 25°. Maximum acquisition range of aerial targets is approximately 41 km (25 miles). Operating frequency is in the I-band.

AVIATION

Specifications

Flight deck: Forward of bridge
Hangar: None

Helicopters: Likely to be used by — India — Sea King, Kamov Ka-27/28s, or SA319B Chetak (Alouette III). Libya — SA319B Alouette III

PROPULSION

Specifications

System: Diesel
Main machinery: 2 Kolomna Type 40-D diesels, 3.2 MW (4,400 hp) sustained
Shafts: 2

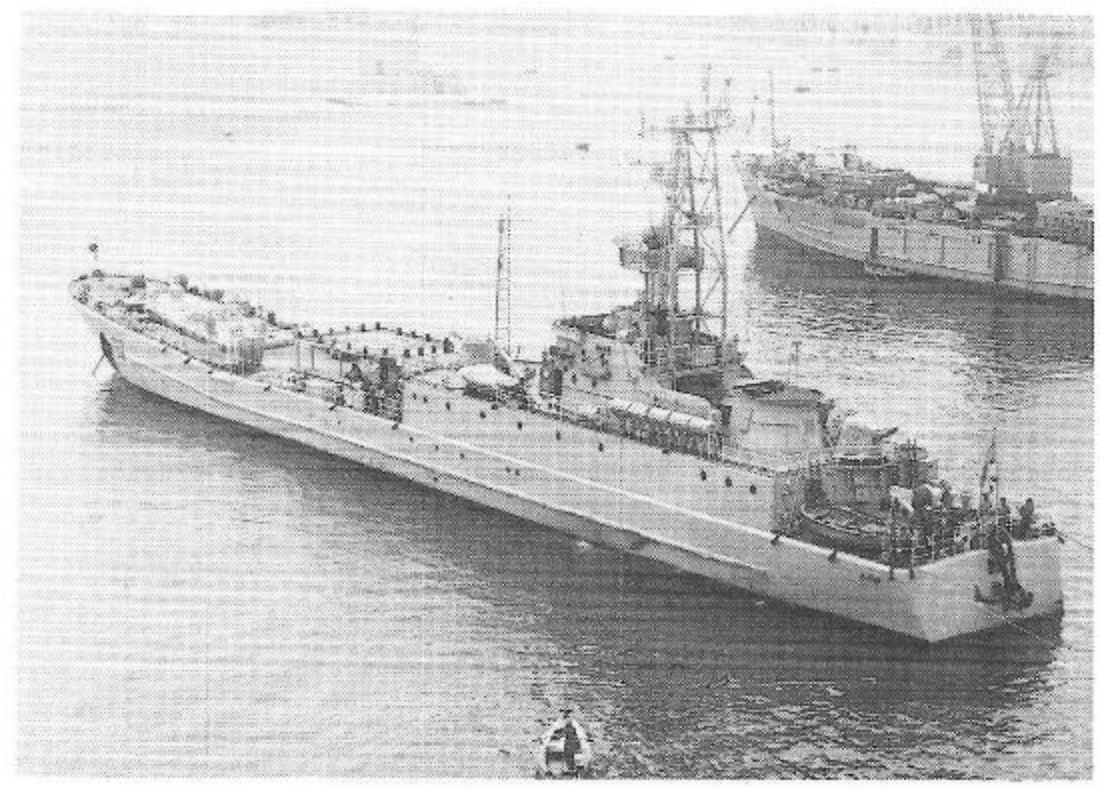
FURTHER INFORMATION

India
India purchased four Polnochny Ds direct from Poland. This version is generally similar to the Polnochny C, but is slightly longer, has a helicopter deck forward of the bridge, and different radars. All the Ds are still operational, although suffering for want of spares.

Iraq
Iraq took delivery of four Polnochny-Ds; two in 1977, one in 1978 and one in 1979. Of these, one was sunk in 1980 by an Iranian Harpoon anti-ship missile, two were sunk in 1991, and one defected to Iran in 1991 and, as far as is known, is still there, although it does not appear to have been absorbed into the Iranian Navy.

Libya
Four Polnochny-Ds were sold to Libya, but one, *Ibn al Qis* (113), was burned out during a landing exercise on 14 September 1978 and was a total loss. The operational status of these ships is now doubtful; all appear to be used for minelaying as well as amphibious work.

Ibn Al Farat *(118), a Polnochny D of the Libyan Navy. Note the large additional platform above the upper deck, the major characteristic of this version. Sensors include Drum Tilt (atop small tower on the bridge roof), with the Polish SRN-745 navigation radar above it and Square Head IFF interrogator at the mast head* (H & L van Ginderen Collection)



Ibn al Hadrami *(112). Note Kedge anchor and large winch on quarterdeck* (H & L van Ginderen Collection)

POLNOCHNY C (Modified)

GENERAL SPECIFICATIONS

Country of origin: Poland
Operator: Poland
Type: Type 776

Class: MODIFIED POLNOCHNY C

Built: 1
Active: 1

Displacement:
full load: 1,253 t

Dimensions
Length: 81.3 m (266.7 ft)
Beam: 9.7 m (31.8 ft)
Draught: 2.4 m (7.9 ft)

Speed: 18 kts
Range: 1,000 n miles at 18 kts; 2,600 n miles at 12 kts

Complement: 45 plus 54 flag staff

SHIPS

GRUNWALD (811)

Builder	Northern Shipyard, Gdansk, Poland	**Launched**	29 Sep 1972
		Commissioned	28 Apr 1973

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Military lift is much reduced, due to the conversion to the amphibious command role. It carries two light trucks in a small area behind the bow doors.

SHIP-SHORE LIFT

None

RAMPS, DECKS

- The bow doors still operate.
- The tank deck is almost totally used for operations centres and offices.

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

SA-N-5 Grail (Strela-2M)

SA-N-5 is the NATO designation for the Russian Strela-2M (*Strela* = arrow), which is the naval version of the very widely used Strela-2 (NATO = SA-7 Grail) land-based, shoulder-launched short-range missile system. In the naval version, four missiles are mounted on a metal framework, with the operator standing inside the framework, leaning back into a lumbar pad, with the missiles at shoulder level, as in the land-based system.

When the target is acquired the operator selects a missile and then activates the thermal battery. When the seeker acquires the target the operator receives an audio signal and he partially pulls the trigger to activate the missile gyros, which are tame some four to six seconds to warm up. The operator uses stadia reference marks in his optical sight to compute the lead angle to the target then fully engages the trigger to launch the missile. The booster burns for 0.05 seconds, ejecting the missile from the launch tube at a speed of 28 m/s (91.8 ft/s) and spinning it up. Then, at a distance of 6 m, the sustainer ignites and the trailing fins pop out.

The missile has four small fins of cruciform configuration and two pop-out trailing fins behind the exhaust. The missile homes on the 'hottest' part of the aircraft and probably has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead. In Strela 2M the (SA-7B 'Grail' Mod 1) the seeker has a filter for improved performance and the warhead has improved fragmentation uniformity.

According to a Polish source, the missile installation is designated Fasta 4M while the missiles are designated Strzala-2M and a total of 16 missiles are carried.

Specifications
(Strela 2)
Length: 1.45 m (4.76 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (21.98 lb)
Speed: Mach 1.7
Range: 5.5 km (2.6 n miles)
Altitude: 18-4,500 m (60-15,000 ft)
Guidance: IR homing

Manufacturer/Contractor
Fakel, Russia.

Grunwald *(881) is a converted Polnochny C, used by the Polish Navy as a command and control ship for amphibious operations. It is the only Polnochy remaining in the Polish Navy* (H & L van Ginderen Collection)

GUNS

AK-230 30 mm/65 twin

FURTHER INFORMATION

Having built all the Polnochnys and at one time operated 23 Polnochny As, the only one of the class now remaining in Polish service is the *Grunwald*. This is a Polnochny C, which has been substantially modified to produce an amphibious command and control ship, which has been achieved by converting the tank deck into a command centre, and installing the necessary staff facilities and communications equipment.

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- 10 main battle tanks, plus 190 troops
- or 24 armoured fighting vehicles plus 170 troops.

SHIP-SHORE LIFT

- No landing craft are carried.

AMPHIBIOUS FACILITIES

- There are two, vertically-hinged, clamshell bow doors.
- The upper deck cannot be used for vehicles.
- There is a large, sliding hatch cover inset in the upper deck through which vehicles and heavy cargo can be loaded/unloaded by a dockside crane direct into the tank deck. (There is no on-board crane).

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

SA-N-5 Grail (Strela-2M)

A number of these ships, but not all, are armed with four SA-N-5 Grail quad launchers, each with 32 missiles. SA-N-5 is the NATO designation for the Russian Strela-2M (*Strela* = arrow), which is the naval version of the very widely used Strela-2 (NATO = SA-7 Grail) land-based, shoulder-launched short-range missile system. In the naval version, four missiles are mounted on a metal framework, with the operator standing inside the framework, leaning back into a lumbar pad, with the missiles at shoulder level, as in the land-based system.

When the target is acquired the operator selects a missile and then activates the thermal battery. When the seeker acquires the target the operator receives an audio signal and he partially pulls the trigger to activate the missile gyros, which are tame some four to six seconds to warm up. The operator uses stadia reference marks in his optical sight to compute the lead angle to the target then fully engages the trigger to launch the missile. The booster burns for 0.05 seconds, ejecting the missile from the launch tube at a speed of 28 m/s (91.84 ft/s) and spinning it up. Then, at a distance of 6 m (19.68 ft), the sustainer ignites and the trailing fins pop out.

Specifications

(Strela 2)
Length: 1.45 m (4.76 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (21.98 lb)
Speed: Mach 1.7
Range: 5.5 km (2.6 n miles)
Altitude: 18 - 4,500 m (60 - 15,000 ft)
Guidance: IR homing

Manufacturer/Contractor

Fakel, Russia.

GUNS

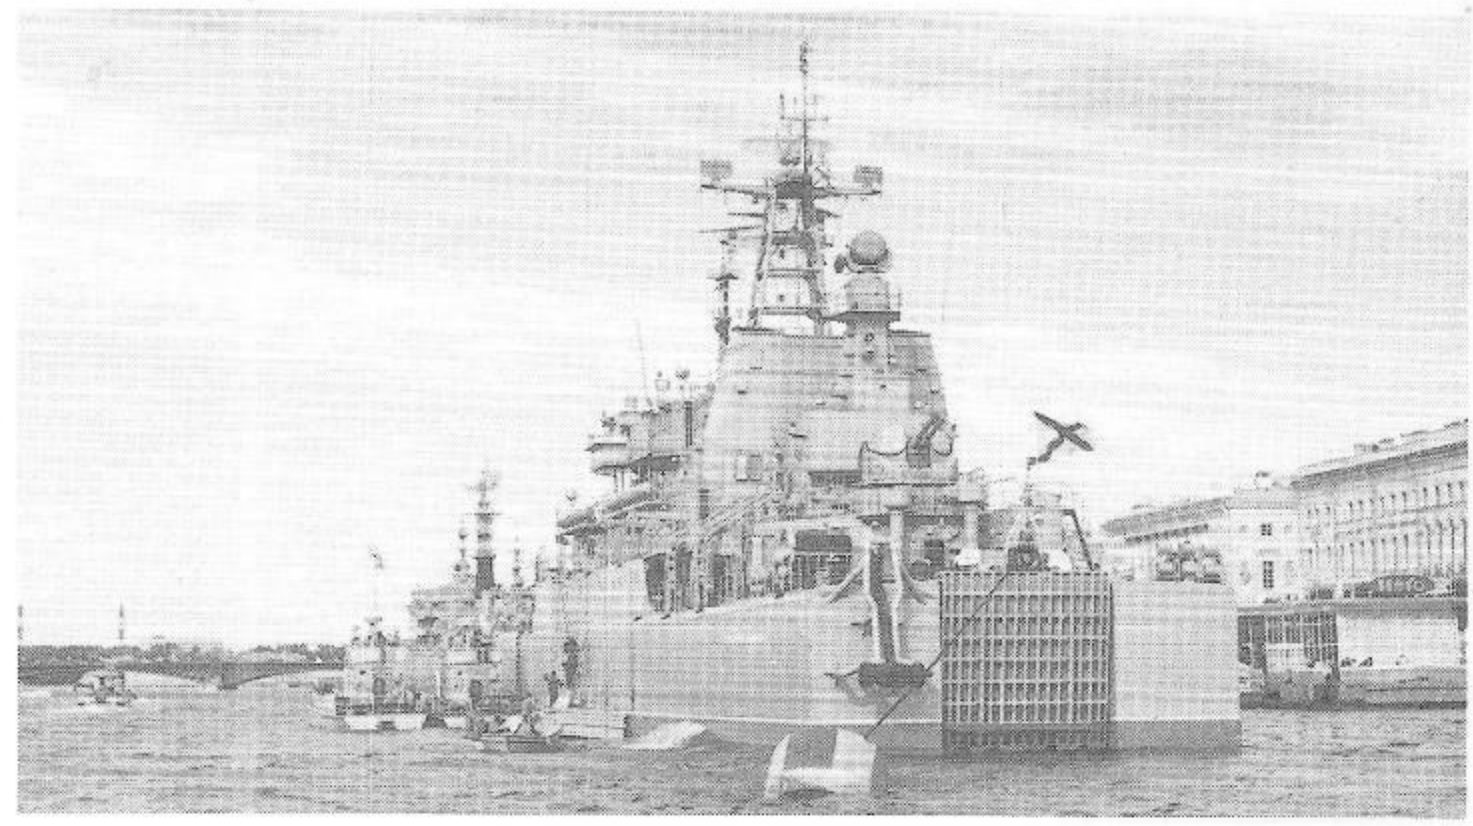
57 mm twin L/75 (ZIF-72/AK 725)

Ropucha I only. There are two twin 57 mm L/75 mountings: one is before the bridge, the other at the after end of the superstructure. This Russian weapon was designed for prolonged air defence engagements, but can also be used against seaborne and land targets. The 4.57 m (14.98 ft) long barrels are water-cooled and the mounting consists of the elevating mass with two automatic weapons and the cradle, the rotating structure for the elevating mass with gun drives, firing system and other elements, all on a slip ring with two arrays of ball-bearings.

There are two operators in the fire-control station, which is associated with the 'Muff Cob' fire-control system. 'Muff Cob' has its antenna in a 1 m wide, weatherproof mounting suspended from a trunnion-yoke carried on a traversing mounting. The radar is supplemented by an electro-optic sensor. The height of the mounting is about 3 m (9.84 ft) and the H-band radar can probably tilt from −10 to +50° as with the gun mounting. The mounting is controlled from the compartment housing the radar display system. Remote laying is controlled through a servo follower drive which ensures smooth slew rate changes at all speeds. Manual operation of the mounting is confined to maintenance and repair functions.

Specifications

Length of barrel: 75 calibres
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Traverse: ±200°
Elevation: −10 to +85°
Range:
anti-surface: 3.25 n miles (6 km)
anti-air: 6,000 m (19,680 ft)
Rate of fire: 120 rds/min/barrel
Projectile weight: 6.61 kg (14.6 lb)



Russian Navy Ropucha I class, Aleksandr Shabalin. *Masthead sensors are Strut Curve air/surface search radar with two Square Head IFF at yard-arms. Further aft is Muff Cob atop a small tower, below which is one of the two twin 57 mm mounts. The two cylindrical devices are air vents from the tank deck below. On the transom are the stern door and the housing for a large Kedge anchor*

AK-726 76 mm (3 in)/59 mounting

Ropucha II only. Ropucha II has one single 76 mm turret before the bridge, replacing one of the twin 57 mm mountings in the Ropucha I.

Specifications

Calibre: 100 mm (3.9 in)
Length of barrel: 59 calibres
Muzzle velocity: 880 m/s (2,886 ft/s)
Traverse: 200° at 30°/s
Elevation: −10 to +85° at 20°/s
Weight of projectile: 15.6 kg (34.39 lb)
Rate of fire: 60 rds/min
Range
anti-surface: 8 n miles (15 km)

30 mm AK-630 close in weapon system

Ropucha II only. There are two AK-630 close in weapon system (CIWS) turrets on either side of the after superstructure, replacing the twin 57 mm turret in the Ropucha I. This multibarrel, high volume-of-fire gun system, has a separate fire-control radar and a below-deck control station with remote optical and/or electro-optical sensor. It fires five types of fire mission: against anti-ship missiles, aircraft, small surface vessels, drifting mines, and unprotected shore targets. The weapon consists of six water-cooled barrels, using the Gatling-principle with a fixed breech-block and revolving barrels. The magazine contains 2,000 rounds of HE-I and HE-T ammunition. The gun fires bursts of up to 400 rounds, during which both the barrel and the breech-block are cooled, with used cartridges and links being ejected into a bin below the elevating mass. The mounting is unusual in having an ignition system for burning off gun gases accumulating within it during firing.

Specifications

Calibre: 30 mm
Length of barrel: 65 calibres
Muzzle velocity: 890 m/s (2.919 ft/s)
Traverse: 360° (depending on location of turret) at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range:
radar fire-control: 4,000 m (13,123 ft)
electro-optic fire-control: 5,000 m (16,400 ft)
Rate of fire: 4,000-5,000 rds/min
Ammunition:
round: 1.224 kg (2.69 lb)
projectile weight:
UOF-84: 384 g (0.13 oz)
UOR-84: 388 g (13.68 oz)

BM-21 122 mm 20-barrelled rocket launchers

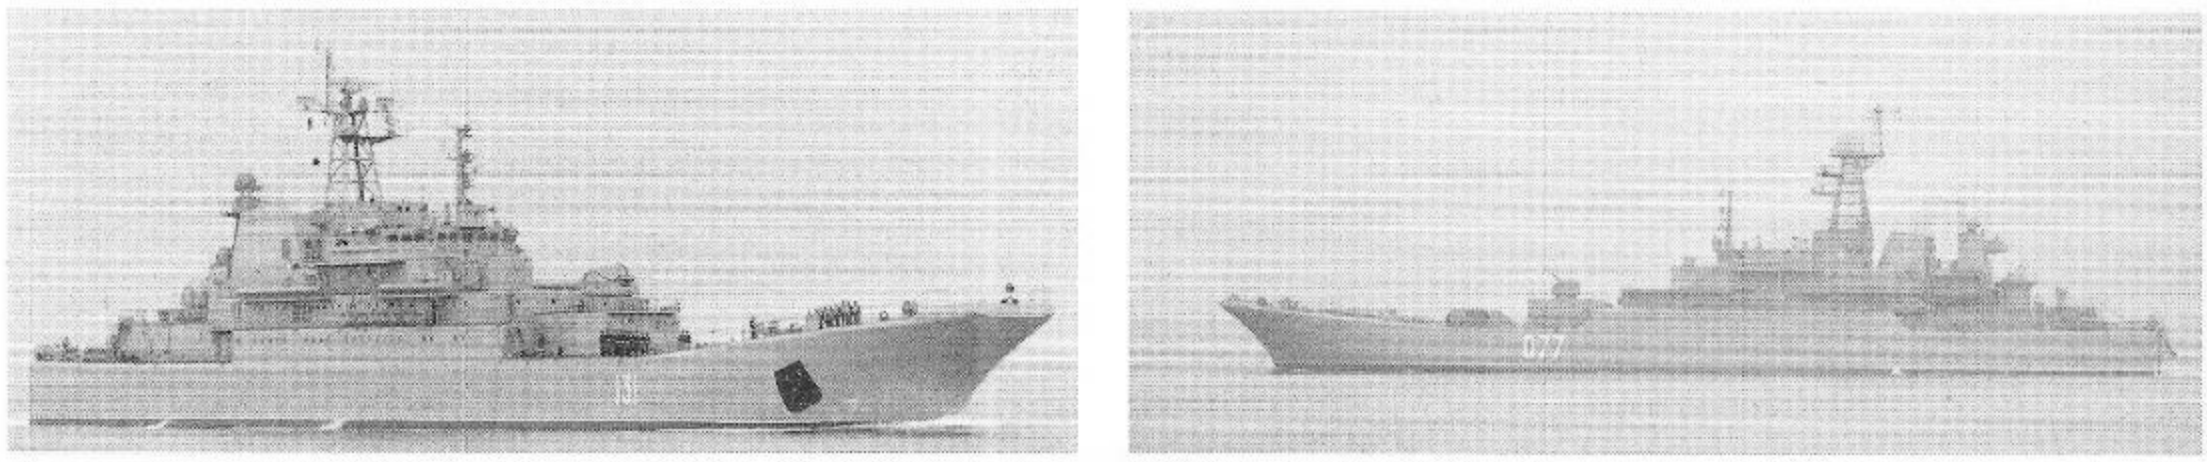
All ships are fitted for two BM-21 122 mm 20-barrelled rocket launchers, but only occasionally are ships seen at sea with the weapons mounted and the blast deflection screens fitted. These weapons are intended for use immediately before an amphibious assault and consist of two clusters, each of 10 tubes, on either side of an electrically operated mounting which holds the training and elevation gears. They are reloaded automatically from a below-deck magazine. The mounting can traverse 360° and elevate from 0 to +55°.

Specifications

Rockets
M-21-OF (9M22U)
Diameter: 122 mm (4.8 in)
Length: 3.226 m (10.58 ft)
Weight: 77.5 kg (170.8 lb)
Range: 500-20,380 m (1,640-66,846 ft)
Warhead weight: 19.3-19.4 kg (42.55-42.77 lb)
Max velocity: 690 m/s (2,263 ft/s)

MINES

As with many LSTs, the Ropchas have a secondary minelaying capability and can carry up to 92 contact type mines. While being employed as a minelayer the ship would not normally be used to carry troops or vehicles.



Ropucha I (left) and Ropucha II (right). The differences between the two types include the main radar (Ropucha I — Strut Curve; Ropucha II — Cross Dome) and weapons (Ropucha I — two twin 57 mm; Ropucha II — one 76 mm, two AK-630 CIWS) (Left picture: H & L van Ginderen Collection)

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Squeeze Box electro-optic director
Two Squeeze Box. Squeeze Box is the NATO reporting name for an electro-optic sensor used with fire-control radars in shore bombardment operations.

Other sensors
Two other sensors, believed to have a weapons control function, are Hood Wink and Odd Box

RADARS

Strut Curve
Ropucha I only. Strut Curve is a medium-range, general purpose, air- and surface search radar, operating in the F-band. An elliptical lattice reflector is used, illuminated by a horn feed carried by a boom projecting from the lower edge of the scanner. Somewhat unusually for Russian naval radars, Strut Curve has no balance vanes behind the reflector. Range against a 2 m² aircraft target at medium altitude is about 60 n miles (111 km) with a likely maximum range of 150 n miles (278 km).

Cross Dome
Ropucha II. Cross Dome replaces Strut Curve in the Ropucha II. It is an F-band, air- and surface-search radar.

Don 2 or Nayada
Two I-band navigation radars are carried: Don 2 and Nayada. The latter has one of the longest ranges of any Russian navigation radar, up to 65 n miles (119 km).

Muff Cob fire-control radar
Ropucha I only. Muff Cob fire-control radar is similar in general appearance to the Drum Tilt fire-control radar, but the former has provision for elevation motion, being supported by a trunnion yoke carried on the traversing mounting. The operating frequency is in H-band. Some drawings of Muff Cob show what appears to be an on-mount TV or optical tracking subsystem, but this has not been confirmed. In all the installations of Muff Cob studied, this radar is employed for gunfire control purposes only. One radar director usually controls one or two gun mountings.

Bass Tilt fire-control radar
Ropucha II only. Bass Tilt resembles and Muff Cob in general appearance and broad functional purpose, but is more modern, having entered service in the mid-1970s. It is used for the radar direction of small or medium calibre anti-aircraft guns, and is mounted on a pedestal, with the 1.2 m (3.93 ft) diameter, drum-shaped radome inclined at an angle of approximately 45°. The director is 2 m (6.56 ft) high and 1.45 m (4.75 ft) long. The radar is linked to a ballistic computer and each director controls one or two gun mountings.

IFF
Two High Pole A or Salt Pot A

SONARS

Mouse Tail VDS
Some are believed to carry Moose Tail VDS.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Zgoda-Sulzer 16ZVB40/48 diesels, 14.14 MW (19,230 hp) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME

Together with the much larger 'Ivan Rogov' class LPDs, these sophisticated and well-designed LSLs, were an important element of the (then) Soviet Navy's efforts to achieve a global capability. The Russian type name is *Bolshoy Desantny Korabl* (BDK) (large landing ship) and 28 were built at the Gdansk Northern Shipyard in Poland for the Russian Navy, plus one for Yemen. None went to the Polish Navy.

DESIGN

The 'Ropucha' class is of classic LST design, but with a certain elegance of line lacking in most other amphibious ships. The ship has clamshell bow doors, a stern gate, and a tank deck running the full length of the hull for ro-ro operation. They also have a greater payload in relation to their size than almost any other LST. There are no aviation facilities.

There are two known variants, designated Ropucha I (Russian Type 775) and Ropucha II (Type 755M). The differences are, however, confined to the armament, fire-control systems and the main radar. Ropucha I has two twin 57 mm turrets and Muff Cob, while Ropucha II has one 76 mm, two 30 mm CIWS and Drum Tilt.

PRODUCTION

The class was built in three batches. There were 25 in the first batch, with the third batch of just three ships designated as a separate sub-class, the Ropucha II (Type 775M). In practice, there appear to have been some minor variations between individual ships throughout the class.

Batch I, built from 1974 to 1978, consisted of 12 ships, one of which was sold to what was then South Yemen (now Yemen) in 1979. This remains the only Ropucha outside the Russian Navy. A second batch of 10 was built between 1980 and 1988, with the three Ropucha IIs following between 1987, when the first was laid down and January 1992, when the last was commissioned. Four, possibly five, of the class have so far been scrapped, though it is thought that others are in a poor state of repair.

NUMBERS/NAMES

It appears that only four ships have names, but all have pennant numbers prefixed by the type abbreviation, BDK.

DEPLOYMENT

Seven are attached to the Northern fleet, five are in the Baltic, five in the Black Sea and three in the Pacific. The deleted vessels, which were in poor repair, were in the Pacific fleet.

YEMEN

One standard Ropucha I was supplied to Yemen in 1979, where it was given the pennant number, 139. It returned to the Baltic in 1991 for a refit and returned to Yemen in 1993. It remains the only Ropucha in service outside the Russian Navy.

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 135 plus equipment
- Armoured vehicles: nine 45 tonne main battle tanks (for example, T-72, T-80, T-55), amphibious tanks (PT-76), or armoured personnel carriers (Topas, MT-LB).
- Wheeled vehicles: 17 (for example, BRDM-2 armoured cars)

AMPHIBIOUS FACILITIES

- The bow includes a flat, telescopic ramp of unusual design.
- The stern includes a folding ramp.
- The tank deck extends the full length of the ship.

WEAPONS SYSTEMS

GUNS

Wrobel II: combined twin ZU-23-2MR 23 mm gun/SA-N-5 missiles

Four Wrobel II systems are mounted, which are a combination of twin 23 mm gun mountings with surface-to-air missiles. Wrobel II consists of a ZU-23-2MR 23 mm gun mounting with SA-7B Grail Mod 1 (Russian and Polish designation Strela 2M) short-range surface-to-air missiles. The mounting consists of the gunner's cabin, which is enclosed in transparent plastic, with elevation and training gears, two 23 mm guns, two launcher-containers for missiles, a night-sight and an optional GP-02MR tachometric sight. The rear part of the cabin contains the spent round ejection system and a ventilation system. The missile launchers are fitted above the cabin.

Wrobel II is not linked to the ship's fire-control system and the operator receives oral instructions for engaging the target. Targets are engaged using either the missile alone or both weapons in combination. The missiles can engage targets at altitudes of 50 to 2,300 m (164-7,546 ft) at elevation angles of 20-60°. For attacks on oncoming targets they can be used at distances up to 1.5 n miles (2.8 km) and for retreating targets at distances up to 2.25 n miles (4.2 km).

'Lublin' class tank-landing ship/minelayer (MoD Bonn)

The guns, which have a practical firing rate of 400 rds/min, can engage targets at angles up to 90°. They can engage air targets below 2.3 km (7,544 ft) and surface targets up to 1 n mile (2 km).

Specifications

Weapons: 23 mm gun; Grail (Strela 2M) missile
Traverse: 360°
Elevation: −10 to +90° (gun); +20 to +60° (missile)
Rate of fire: 400 rds/min
Range: 2.25 n miles (4.2 km) (missile); 1 n mile (2 km) (gun)
Altitude: 2,300 m (7,544 ft)

DEPTH CHARGES

There are nine throwers for counter-mining depth charges. This is designated the LWD-100/5,000 Sosna system

MINES

Between 50 and 134 mines can be carried, depending on type, which are mounted on two mine rails and laid over the stern gate.

ELECTRONIC WARFARE SYSTEMS

DECOYS

Two Derkacz 12-tube chaff launchers.

RADARS

SRN-7453 Nogat
SRN-7453 is a surface search radar. It operates in the I-band.

SRN-443XTA
SRN-443XTA is an I-band navigation radar.

PROPULSION

Specifications

System: Diesel
Main machinery: 3 Cegielski-Sulzer 6ATL25D diesels, 3.96 MW (5,390 hp) at 1,000 rpm
Shafts: 3
Auxiliary power: 3 Wola 250 kVA generators.

FURTHER INFORMATION

PROGRAMME

Having produced large numbers of 'Polnochny' and 'Ropucha' class vessels for the Russian and other navies, Poland designed an unusual type of LST for its own navy. Five were built at the Northern Shipyard in Gdansk, being commissioned between 1989 and 1991.

DESIGN

The ship is a modern design of combined landing ship and minelayer, with a through deck from bow to stern, with folding ramps at either end and a stern anchor. The bottom hinge of the bow ramp is raised as far clear of the water as possible, enabling the hull to present a reasonably streamlined shape to the water. The consequence is that the depth forward is slightly greater than with a normal flat bow, so that the ramp has to be telescopic to enable vehicles to land.

The ships also have a pressurised 'citadel' for nuclear, biological and chemical warfare defence, and an upper deck washdown system. In weapon systems, the 'Lublin' class is the first to be equipped with the novel Polish-designed, gun and missile combination, the Wrobel II.

DEPLOYMENT

All five ships are based at Swinoujscie (Swinemunde), Poland's westernmost base on the Baltic, where they form the 8th Squadron of the 2nd Transport and Mining Division *(Dywizjon Okretow Transportowo-Minowych)*.

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 522 (one naval infantry battalion)
- Tanks: 20 (or equivalent weight of armoured personnel carriers and trucks).
- Cargo: 1,600 tonnes

SHIP-SHORE LIFT

- 3 'Lebed' class ACVs (docking bay)
- 6 'Serna' class LCM (docking bay)

AVIATION FACILITIES

Specifications
Flight deck: 2 flight decks. 1 aft, 1 on foredeck
Hangar: The hangar is in the superstructure. Helicopters can enter the hangar from both front and rear
Helicopters: 4 Ka-29 Helix B

AMPHIBIOUS FACILITIES

- Bow ramp with beaching capacity leads directly from tank deck.
- Tank deck measures 61 × 13.7 m (200 × 45 ft)
- Stern doors open into docking bay.
- Docking bay measures 76.2 × 13.7 m (250 × 45 ft)

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

SA-N-4 short-range missile system

There is one SA-N-4 launcher at the after end of the superstructure, with a magazine holding 20 missiles. The twin-rail launcher lies beneath a hinged flat cover plate, emerging to launch its missiles and retracting to reload. This is likely to result in a low rate of fire which must be slowed even further by the need to close the magazine cover before firing. Below the launcher are four revolving drums each with five missiles while the electromechanical and hydraulic machinery is below that. On launch, the booster burns for 2 seconds allowing the radar to gather the missile at a range of 0.75 n miles (1.5 km), following which the sustainer burns for 15 seconds. Command and control is via the Pop Group system (see Command and Control Systems).

Specifications
Length: 3.1 m (10.17 ft)
Diameter: 21 cm (8.27 in)
Wing span: 64 cm (25.2 in)
Weight: 130 kg (286.6 lb)
Speed: Mach 2.5
Warhead: 50 kg (110 lb) HE
Range: 0.75-8 n miles (1.5-15 km)
Height: 9-3,000 m (30-10,000 ft)
Guidance: Semi-active radar homing

SA-N-5 Grail (Strela-2M)

There are two SA-N-5 Grail quad launchers, each with 32 missiles. SA-N-5 is the NATO designation for the Russian Strela-2M (Strela = arrow), which is the naval version of the very widely used Strela-2 (NATO = SA-7 Grail) land-based, shoulder-launched short-range missile system. In the naval version, four missiles are mounted on a metal framework, with the operator standing inside the framework, leaning back into a lumbar pad, with the missiles at shoulder level, as in the land-based system.

When the target is acquired the operator selects a missile and then activates the thermal battery. When the seeker acquires the target, the operator receives an audio signal and he partially pulls the trigger to activate the missile gyros, which take some four to six seconds to warm up. The operator uses stadia reference marks in his optical sight to compute the lead angle to the target then fully engages the trigger to launch the missile. The booster burns for 0.05 seconds, ejecting the missile from the launch tube at a speed of 28 m/s (92 ft/s) and spinning it up. Then, at a distance of 6 m (20 ft), the sustainer ignites and the trailing fins pop out.

The missile has four small fins of cruciform configuration and two pop-out trailing fins behind the exhaust. The missile homes on the 'hottest' part of the aircraft and probably has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead. In Strela 2M (SA-7B 'Grail' Mod 1) the seeker has a filter for improved performance and the warhead has improved fragmentation uniformity.

According to a Polish source, the missile installation is designated Fasta 4M while the missiles are designated Strela-2M and a total of 16 missiles is carried.

Specifications
Strela 2
Length: 1.45 m (4.76 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (21.98 lb)
Speed: Mach 1.7
Range: 2.6 n miles (5.5 km)
Altitude: 18-4,500 m (60-15,000 ft)
Guidance: IR homing

Manufacturer/Contractor
Fakel.

GUNS

76 mm/59 AK-726 twin mounting

There is one twin 76 mm turret on the forecastle. Production of the AK-726 radar-controlled automatic 76 mm gun system began around 1960; the aim was for a multipurpose weapon for air defence, surface engagement and shore bombardment. The AK-726 has two barrels and requires a five-man crew within the turret. It is used in this class with the conical scan fire-control radar, Owl Screech.

Specifications
Calibre: 76 mm
Length of barrel: 59 calibres
Muzzle velocity: 980 m/s (3,215 ft/s)
Traverse: 360° at 36°/s
Elevation: −7 to +85° at 32°/s
Ammunition (total): 16 kg (35 lb)
Rate of fire: 90 rds/min
Range:
anti-surface: 8 n miles (15 km)
anti-air: 10,000 m (32,810 ft) max

Third of class, Mitrofan Moskalenko. *As so often in the Cold War, Russian designers took a completely new look at the design of ships for particular tasks and the 'Ivan Rogov' class was unlike anything produced previously for amphibious warfare. The ship can transport a battalion group of marines and deliver them by landing craft, ACV, helicopter or directly over a suitable beach. Note the Top Plate A air/surface search radar at the masthead*

BM-21 multiple rocket launcher

One BM-21 is mounted on the foredeck. Naval BM-21s are to be used immediately before an amphibious assault and consist of two clusters, each of 20 tubes, on either side of an electrically operated mounting which holds training and elevation gears. They are reloaded automatically from a below-deck magazine. The mounting is about 2 m (6.5 ft) high and 2 m (6.5 ft) long and can traverse 360° and elevate from 0 to +55°. The standard missile for these weapons is the M-21-OF spin- and fin-stabilised rocket which comes in 3.226 (10.6) and 2.87 m (9.4 ft) lengths and can carry high explosive fragmentation, smoke, incendiary or chemical warheads.

Mitrofan Moskalenko (H & L van Ginderen Collection)

Specifications

Rockets	M-21-OF (9M22U)	M-21-OF (9M22M)
Diameter	122 mm	122 mm
Length	3.226 m (10.6 ft)	2.87 m (9.4 ft)
Weight	77.5 kg (171 lb)	66 kg (145.5 lb)
Range	500-20,380 m (1,640-66,867 ft)	500-20,000 m (1,640-65,620 ft)
Warhead weight	19.3-19.4 kg (42.5-42.8 lb)	18.4 kg (40.6 lb)
Max velocity	690 m/s (2,264 ft/s)	700 m/s (2,296 ft/s)

30 mm/65 AK 630 close in weapon systems

Four 30 mm/65 AK 630 close in weapon systems, two port and two starboard, outboard of the mainmast and one deck down. AK-630 is a multibarrel high volume of fire gun system with separate fire-control radar and a below-deck control station, with remote optical and/or electro-optical sensor. The gun is the water-cooled six-barrel AO-18 which fires 1.224 kg (2.7 lb) rounds with 0.39 kg (0.86 lb) projectiles. The AK 630 system includes the radar detector, Bass Tilt.

Specifications

Calibre: 30 mm
Length of barrel: 65 calibres
Muzzle velocity: 890 m/s (2,920 ft/s)
Traverse: 360° at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range: 4,000 m (13,124 ft) with radar fire control; 5,000 m (16,405 ft) with electro-optic fire control
Rate of fire: 4,000-5,000 rds/min

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Bell Shroud, Bell Squat

The ESM/ECM suite consists of two Bell Shroud intercept systems and two Bell Squat jammers. Bell Shroud is basically a Watch Dog B system with two extra pairs of receiver antennas to cover higher frequencies in the radar spectrum. Bell Shroud is the standard intercept system used on destroyers and frigates of the Russian Navy, and is used in conjunction with Bell Squat as the standard intercept/jamming system. Bell Squat was derived from the earlier Top Hat with the frequency bands increased to cover K-band. Two types of ECM system are in use, Bell Squat A which uses barrage jamming, and Bell Squat B which employs deception jamming.

DECOYS

PK-10

The PK-10 system consists of four KT-216 launchers, a control console and three types of munition. The launcher is a 10-barrel unit, with the 120 mm barrels fixed at about 45°, and is able to rotate. The control console is of a relatively simple design. The munitions are all for seduction purposes. The SR-50 is a chaff round with a payload of 11 kg (24.2 lb). The SOM-50 is a heat-seeker/laser-guided missile seduction round with 7.3 kg (16 lb) payload while the SK.50 is a combined round with 9.1 kg (20 lb) of payload.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Squeeze Box electro-optic director

There are two Squeeze Box. Squeeze Box is the NATO reporting name for an electro-optic sensor used with fire-control radars in shore bombardment operations.

RADARS

Head Net C

***Ivan Rogov* and *Aleksandr Nikolaev* only.** Head Net C is an E/F-band, 3D radar with two Head Net A scanners, one which has aperture (its span dimension) tilted from the horizontal by approximately 30°, thus displacing the resulting fan-shaped elevation beam by the same amount from the vertical. This beam, in combination with the vertical beam produced by the companion scanner, provides the means for height-finding by the so-called 'V-beam technique'. The Head Net series has been one of the most widely fitted of the numerous radars employed on major Russian warships, and appears to be of fairly conventional construction. It has a large (about 6 × 1.5 m) (19.7 × 4.9 ft) elliptical paraboloid reflector of open lattice construction. The scanner mounting is distinctive, with a tall, thin, conical profile and a domed top. Detection range on aircraft at medium altitude is of the order of 60-70 n miles (111-130 km).

Top Plate A

***Mitrofan Moskalenko* only.** Top Plate is a true 3D system employing back to back antennas and operating in D/E-bands. A version of Top Plate, known as *Fregat-Mae* is being offered for export. The system weighs 7.5 tonnes (of which 2.2 tonnes is contributed by the single antenna array), draws 30 kW of power and is available with peak elevations of 45 or 55°.

Don Kay/Palm Frond

Two navigation radars, either Don Kay or Palm Frond. Some 16 types of Russian shipboard navigation/short-range surface search radars have been identified to date, all operating in the band 9,400 to 9,600 MHz. The new Palm Frond equipment has been replacing the Don series since 1985.

Owl Screech

Owl Screech is the fire-control radar for the 76 mm guns. It has a circular dish scanner, behind which are fairly bulky housings containing the transmitter and receiver, together with the turning and stabilisation gear. The complete radar is pedestal mounted. The 2.3 m (7.5 ft) diameter scanner has a central feed supported by a four-leg structure. Feed arrangements could incorporate a rotating dipole to provide a conical scan search pattern. Dish diameter is approximately 2 m (6.5 ft). Operating frequency is in the H/I-band for both types.

Bass Tilt

Bass Tilt is the fire-control radar for the 30 mm CIWS. It is mounted on a pedestal, with the drum-shaped antenna radome, 1.2 m (3.9 ft) in diameter, inclined at an angle of approximately 45°. The director is 2 m (6.5 ft) high and 1.45 m (4.8 ft) long. The radar is linked to a ballistic computer and each director controls one or two gun mountings.

Pop Group

Pop Group is the NATO reporting name for the fire-control radar group associated with the SA-N-4 surface-to-air missile system. The NATO reporting name was assigned because the launcher for this missile system 'pops up' from a silo-type housing preparatory to launching. Pop Group has two antennas for radar functions, with a third for the transmission of command signals to the missile. The arrangement consists of a cube-shaped container with sides of about 2.2 m (7.2 ft), in which is probably housed the bulk of the electronics (transmitter/receiver units), power supplies, and turning gear, and on the top of this is a trainable radar head assembly. The latter unit has a parabolic antenna of about 2 m (6.5 ft) aperture for target search and which rotates independently of the rest of the radar head. On the front face of the head are two circular arrays for target tracking and missile guidance. The system operates in the G/J-bands. It appears probable that the Pop Group radar is a monopulse frequency-agile system.

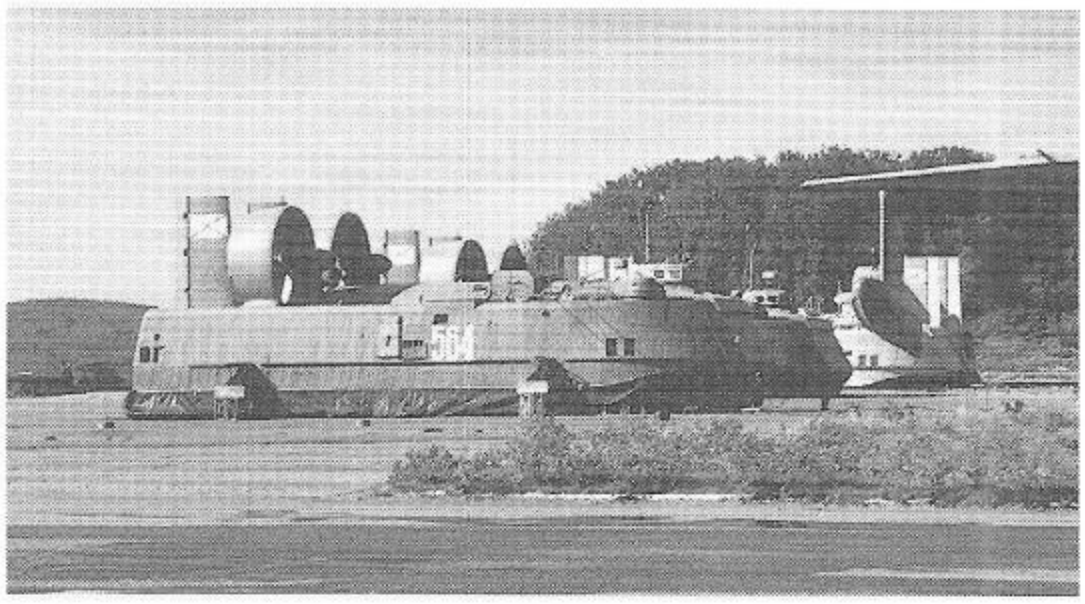
Fly Screen/Fly Spike
Fly Screen and Fly Spike are I-band carrier-controlled approach (CCA) radars.

IFF
Salt Pot B.

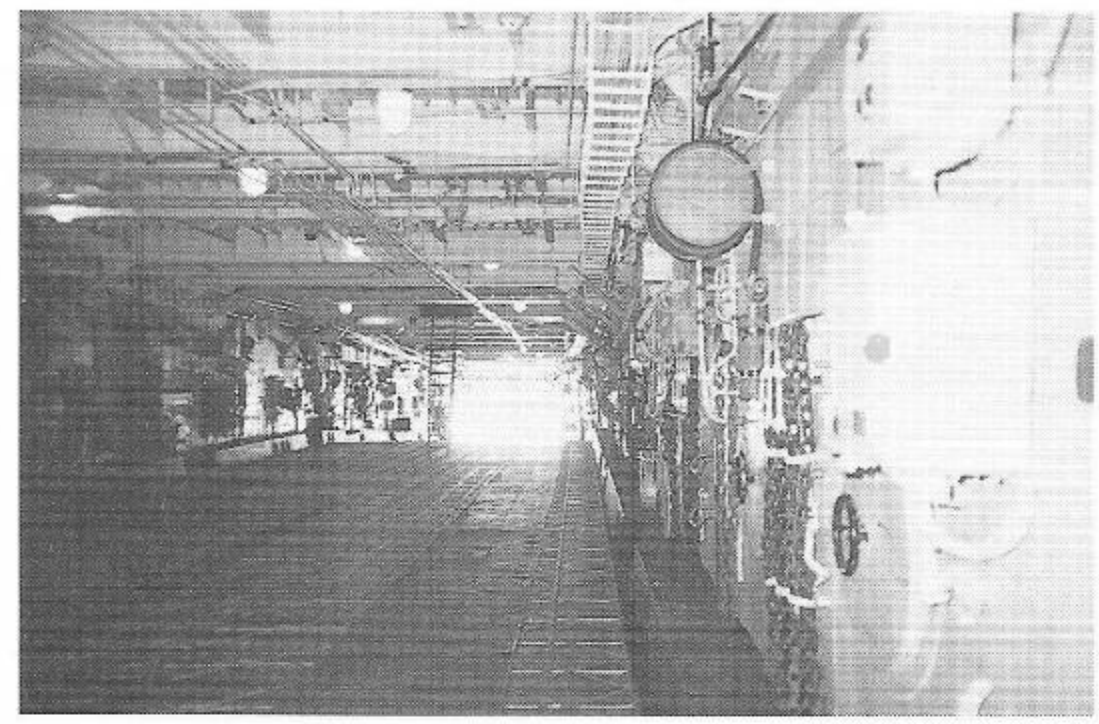
Round House
There are two Round House TACAN arrays. One is on a small platform on the forward side of the foremast, the other is atop its own dedicated lattice tower at the after end of the superstructure.

SONAR

Mouse Tail
Mouse Tail variable depth sonar has been seen streamed from the stern door on *Mitrofan Moskalenko*. This may have been a trial, as the ship has no ASW weapons.



The 'Ivan Rogov' class is designed to carry two of the 'Lebed' class air-cushion vehicles. With a footprint of 24.4 × 12.2 m (80.1 × 36.7 ft) these ACVs can carry two tracked vehicles, 40 tonnes of cargo or 120 troops. They have a range of 100 n miles at 50 knots



Interior of 'Lebed' class ACV

PROPULSION

Specifications
System: Gas turbine
Main machinery: 2 M8E gas turbines, 29.4 MW (39,998 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These were the largest and most impressive amphibious warfare ships ever built for the (then) Soviet Navy and indicated the intention to produce an amphibious force with a global capability. Until these ships appeared, the largest vessels in the Soviet amphibious fleet had been the 'Ropucha' class LSTs, displacing some 4,080 t, which followed traditional LST design. The 'Ivan Rogov' class, however, combined good helicopter facilities with a docking well for LCMs and a bow door for landing on a beach. NATO observers were also impressed with the speed of these vessels: virtually equal to anything the US had achieved, and a big step forward from previous Soviet amphibious designs.

DESIGN

These are, by a very large margin, the largest amphibious warfare ships ever designed to deliver troops direct onto a beach. They have a flat bottom and, despite a large bulb at the foot of the stern, are capable of beaching and landing troops, trucks and tanks over an articulated ramp. Finding beaches with the necessary gradients to accept such a long ship with a draught of 6.5 m (21.2 ft) could, however, be a major limitation on its use in this role.

They are able to carry a complete naval infantry (marine) battalion group, complete with 10 amphibious tanks (PT-76), 30 armoured personnel carriers (BMP), trucks and guns. These can be landed directly onto a beach, by helicopter, landing craft and air-cushion vehicles, or onto a jetty.

As always with Russian ships of the 1970s and 1980s they possess a substantial armament, with the usual SAMs and guns being augmented by a single BM-22 rocket launcher.

Soviet planners and designers did not overlook the question of command and control, either, which is always a very complex business in amphibious operations. Thus, space has been allocated to the naval and amphibious force command centres and there is evidence of an extensive communications fit.

Aviation facilities include two flight decks, one on the stern, the other on the foredeck.

DEPLOYMENT

The first two are in the Pacific Fleet and *Mitrofan Moskalenko* is with the Northern Fleet. Two of the three now appear to be in a poor state along with many other ships of the Russian Navy.

'Serna' class has replaced the previous 'Ondatra' class LCMs. Using an 'air-lubrication' system it is capable of speeds up to 30 knots and can carry up to 90 troops, tracked or wheeled vehicles or cargo of up to 45 tonnes in weight. Loading and unloading is via a bow ramp. Power is provided by two M503A-3 diesels (3,300 hp at 1,900 rpm) and two DGR1A-16/1500 diesel-generators (each 16 kW) (Russvoorzhenie)

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 300 plus
- Tanks: 20
- Armoured personnel carriers: 40
- Total payload:
  Normal operations: 1,700 tonnes
  Beaching: 600 tonnes

SHIP-SHORE LIFT

- No landing craft are carried, but amphibious APCs can be used.

AMPHIBIOUS FACILITIES

- Clamshell bow doors and internal ramp.
- Stern door and ramp.
- Tank deck 91 m (300 ft) long and approximately 12 m (40 ft) wide.
- Large hatches enable tanks and vehicles to be loaded/unloaded by dockside cranes.
- Onboard cranes; all ships have one 15 tonne crane, some have an additional 5 tonne crane.

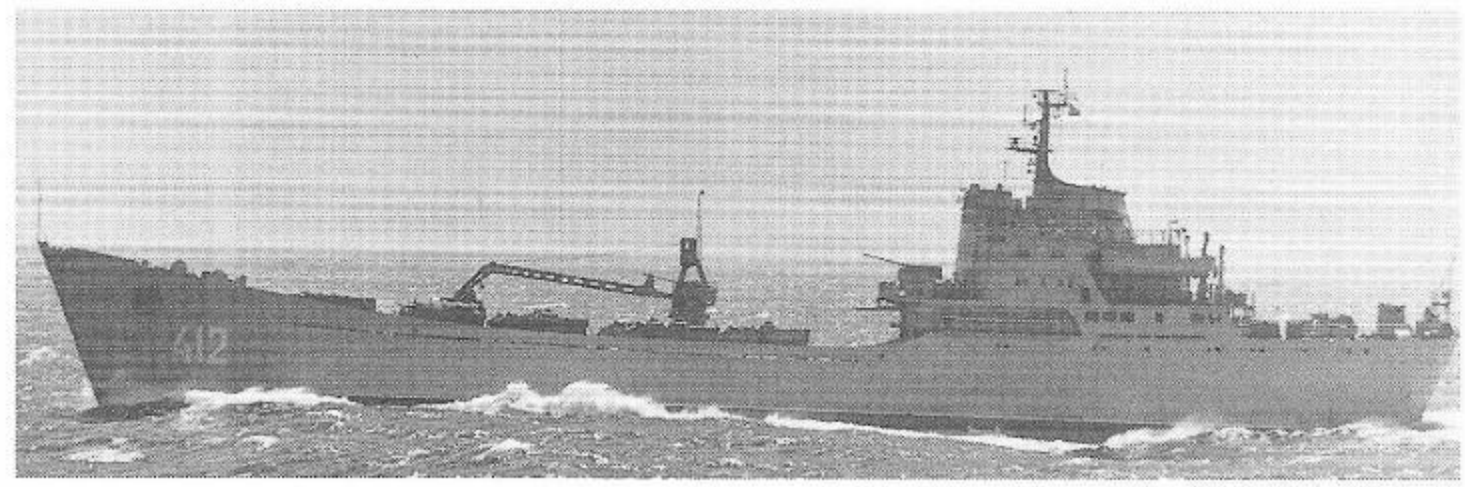
WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

SA-N-5 Grail (Strela-2M)

There are two SA-N-5 Grail quad launchers, each with 32 missiles. SA-N-5 is the NATO designation for the Russian Strela-2M (*Strela* = arrow), which is the naval version of the very widely used Strela-2 (NATO = SA-7 Grail) land-based, shoulder-launched short-range missile system. In the naval version, four missiles are mounted on a metal framework, with the operator standing inside the framework, leaning back into a lumbar pad, with the missiles at shoulder level, as in the land-based system.

When the target is acquired, the operator selects a missile and then activates the thermal battery. When the seeker acquires the target, the operator receives an audio signal and partially pulls the trigger to activate the missile gyros, which take some four to six seconds to warm up. The operator uses stadia reference marks in his optical sight to compute the lead angle to the target, then fully engages the trigger to launch the missile. The booster burns for 0.05 seconds, ejecting the missile from the launch tube at a speed of 28 m/s (92 ft/s) and spinning it up. Then, at a distance of 6 m (19.7 ft), the sustainer ignites and the trailing fins pop out.



Alligator Type 2. The first large amphibious warfare ships to be completed for the Russian Navy, these ships were essentially freighters with a roll-on/roll-off capability. Note the 15 tonne capacity crane, and the trucks and armoured personnel carriers on the upper deck. Sole armament is the twin 57 mm mount before the bridge (US Navy)

Specifications
Strela 2
Length: 1.45 m (4.76 ft)
Diameter: 7 cm (2.75 in)

Weight: 9.97 kg (21.98 lb)
Speed: Mach 1.7
Range: 2.6 n miles (5.5 km)
Altitude: 18-4,500 m (60-15,000 ft)
Guidance: IR homing

Manufacturer/Contractor
Fakel, Russia.

GUNS

Twin 57 mm/70 (ZIF-31B)
There is one twin 57 mm/70 is an open mount on a platform immediately before the bridge. This Russian weapon was designed for prolonged air defence engagements, but can also be used against seaborne and land targets. The 4.57 m (15.6 ft) long barrels are water-cooled and the mounting consists of the elevating mass with two automatic weapons and the cradle, the rotating structure for the elevating mass with gun drives, firing system and other elements, all on a slip ring with two arrays of ball-bearings.

Specifications
Length of barrel: 70 calibres
Muzzle velocity: 1,020 m/s (3,346 ft/s)
Traverse: ±200°
Elevation: −10 to +90°
Range:
anti-surface: 3.25 n miles (6 km)
anti-air: 4,500 m (14,800 ft)
Rate of fire: 120 rds/min/barrel
Projectile weight: 6.61 kg (14.6 lb)

2-M-3 25 mm/60
Type Four only. Four in two twin mountings. The 2-M-3 consists of two guns installed one above the other in separate cradles and on their sides so that they are fed from the side. The 1.5 m (4.9 ft) long, air-cooled barrels have a flash suppressor at one end and an exposed spring recuperator wrapped around the barrel near the breech. The mounting weighs 1.735 tonnes and it has two on-mount operators and five loader-carriers.

Specifications
Calibre: 25 mm
Length of barrel: 60 calibres
Traverse: 360° at 25°/s
Elevation: −10 to +85° at 15°/s
Rates of fire: 450 rds/min/barrel
Projectile: 0.28 kg (0.61 lb) HEI-T
Range:
anti-surface: 1.5 n miles (2.75 km)
anti-surface: 2,800 m (9,186 ft)

BM-21 multiple rocket launcher
Types Three and Four only. One BM-21 is mounted on the roof of a small deckhouse on the foredeck. BM-21s are designed for use immediately before an amphibious assault and consist of two clusters, each of 20 tubes, on either side of an electrically operated mounting which holds training and elevation gears. They are reloaded automatically from a below-deck magazine. The mounting is about 2 m (6.5 ft) high and 2 m (6.5 ft) long and can traverse 360° and elevate from 0 to +55°. The standard missile for these weapons is the M-21-OF spin- and fin-stabilised rocket which comes in 3.226 (10.6) and 2.87 m (9.4 ft) lengths and can carry high explosive fragmentation, smoke, incendiary or chemical warheads.

Specifications

Rockets	M-21-OF (9M22U)	M-21-OF (9M22M)
Diameter	122 mm	122 mm
Length	3.226 m (10.6 ft)	2.87 m (9.4 ft)
Weight	77.5 kg (171 lb)	66 kg (145.5 lb)
Range	500-20,380 m (1,640-66,867 ft)	500-20,000 m (1,640-65,620 ft)
Warhead weight	19.3-19.4 kg (42.5-42.8 lb)	18.4 kg (40.6 lb)
Max velocity	690 m/s (2,264 ft/s)	700 m/s (2,296 ft/s)

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Squeeze Box optronic director
Types Three and Four only. Squeeze Box is the NATO codename for an electro-optic sensor used with fire-control radars in shore bombardment operations.

RADAR

Navigation radars
Type One has one Don-2 and one Spin Trough. Others have two Don 2.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 diesels, 6.6 MW (9,000 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

Fourteen of these LSTs were built at the Yantar yard at Kaliningrad on the Baltic between the mid-1960s and the mid-1970s; six have been deleted in recent years and one of the eight survivors has gone to the Ukraine Navy rather than the Russian Navy.

DESIGN

The design is that of a conventional freighter with large clamshell doors, a long tank deck, superstructure and machinery aft, and a stern door and ramp. They have a particularly high freeboard. Within the class, there are four types, distinguished by different crane arrangements, structures and armaments:

Type One (four built) has two cranes, whereas the other three types carried just one. One survives.
Type Two (two built) is the basic design. Both survive.
Type Three (six built) has a raised bridge structure and an extra forward deckhouse to accommodate the shore bombardment rocket launchers. Three survive.
Type Four (two built) has a similar structure to Type Three, but with an additional two twin 25 mm gun mountings on the centreline aft of the bridge superstructure. Both ships survive.

The Alligators' primary role is as a tank carrier, with a tank deck 91 m (300 ft) long, which stretches across the whole width of the ship. In the 1970s and 1980s, they operated worldwide, usually with Naval Infantry units on board, but since the end of the Cold War they have been more confined to local waters.

DEPLOYMENT

Two of the survivors are in the Black Sea, three in the Pacific Fleet, one in the Northern Fleet and one in the Baltic. A further Type Three belongs to Ukraine.

Alligator Type 2 (US Navy)

Nikolay Vilkov, *an Alligator Type 4. Note the deckhouse forward with BM-21 rocket launcher and deflector screen, and the two 25 mm/8 mounts on new platforms aft of the stack* (92 Wing RAAF)

Builder	Ital Thai, Bangkok, Thailand
Launched	14 Apr 1987
Commissioned	9 Oct 1987

SURIN (722)

Builder	Bangkok Dock Co Ltd, Bangkok, Thailand
Launched	12 Apr 1988
Commissioned	16 Dec 1988

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops 348
- Tanks 14 tanks (each 50 tonnes) or 12 armoured personnel carriers
- Cargo 850 t

SHIP-SHORE LIFT

- 3 LCVPs
- 1 LCPL

- These landing craft are carried at the forward end of the upper deck and lifted in/out of the water by crane.

AVIATION FACILITIES

Specifications
Flight deck: 2 flight decks, 1 aft, the second on the foredeck
Hangar: None
Helicopters: 2 Bell 212

AMPHIBIOUS FACILITIES

- Clamshell bow doors.
- Vehicle ramp is 17 m (55.8 ft) long.
- Beaching draught is 2.88 m (9.45 ft).
- Crane on foredeck for landing craft.

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/70

One Bofors 40 mm L/70 automatic cannon is mounted on the forecastle. This is used for both air defence and for fire support during the run in to a beach. The barrel is of monobloc construction with a flash suppressor at the end and it is 2.8 m (9.2 ft) long and weighs 163 kg (359.4 lb). A recoil spring is wrapped around the end of the barrel. The barrel is inserted into the cylindrical section in the front of the breech rings by a threaded mounting.

Specifications
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Range: 6.75 n miles (12.5 km), 8,700 m.
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 4,000 m (13,124 ft)
Rate of fire: 300 rds/min
Ammunition: 2.4 kg (5.3 lb) (HCHE, PFHE), 2.5 kg (5.5 lb) (HE-T)

Oerlikon 20 mm in GAM-C01 mounting

One Oerlikon 20 mm cannon in a GAM-C01 mounting.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 1.5 km
anti-air: 1,150 m (3,773 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g

Mounting
Elevation: −15 to +90°
Total weight: 497 kg (1,096 lb) (including shield)

M2HB 12.7 mm machine guns

Two M2HB 12.7 mm machine guns are carried. The M2HB is a selective short recoil automatic operation weapon with a 1,143 mm long barrel and eight

right-hand grooves turning once every 381 mm. The weapon uses 110-round belts.

Specifications
M2HB
Calibre: 12.7 mm
Barrel: 90 calibres
Gun weight: 38.1 kg (84.0 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

81 mm mortar
As with other French amphibious warship designs, these ships carry one 81 mm mortar for use during the run in to amphibious landings. Typical range for such a weapon is 1.94 n miles (3.6 km), firing a 4.05-4.15 kg (8.9-9.1 lb) bomb at a rate of approximately 10 rds/min.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

British Aerospace Sea Archer Mk 1A electro-optic directors
Two British Aerospace Sea Archer Mk 1A electro-optic directors provide complete integration of a TV subsystem with below-decks control by joystick, giving an improved surveillance capability and the option of manned or unmanned director on deck. The system consists of two basic elements: the MSI-Defence Systems Optical Fire Director (OFD) with a combination of electro-optic tracking sensors and a laser rangefinder; and a gun control console containing a predictor operator control panel and system communications. The system is capable of three modes of gunfire control: air defence, surface, naval gunfire support. The Thai ships have the Mod 1 version which includes a thermal imager and autotrack capabilities.

Specifications
Traverse: 360°
Elevation: -20 to +70°
Laser: Nd:YAG
Beamwidth: 2 mrad
Repetition rate: 20 Hz

Manufacturer/Contractor
British Aerospace Systems and Equipment Ltd, UK.

RADAR

Racal-Decca 1226
The Type 1226 is part of the Solid State series and uses a 30 cm (11.8 in) PPI (Plan Position Indicator) display. It operates in the I-band, has 20 kW output and is equipped with a 1.83 m (6.0 ft) antenna.

Specifications
Type 1226
Role: Surface search
Frequency: I-band
Range: 48 n miles (89 km)
Beam: 1.2°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25/1.0 µs
Scan rate: 28 rpm

Manufacturer/Contractor
Racal-Decca, UK.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU 20V 1163 TB82 diesels, 8.1 MW (11,000 hp) (see 'Further Information' below)
Shafts: 2
Propellers: Controllable pitch

FURTHER INFORMATION

PROGRAMME

These ships were built under licence to the French Chantier du Nord (Normed) 'PS 700' design by Ital Thai in Bangkok, Thailand, with technical assistance from the Korea-Tacoma company. They are the largest naval ships yet built in Thailand, the task for the Bangkok yard being made even more difficult when it was decided that, since the ship could not accommodate a full infantry battalion, the hull had to be extended after the launch.

At one time a total of six was planned, but so far only two have been completed, while the third has not yet been laid down, the order still being 'under consideration' in 1996.

DESIGN

A conventional LST design, with clamshell bow doors, a long tank deck and superstructure aft. There is a large flight deck aft and a second flight deck on the foredeck. The hull of the first of class had to be extended by the insertion of a 6 m (19.68 ft) plug after the launch.

The second ship, *Surin* (722) incorporates a number of changes. It is 9.5 m (31.2 ft) longer than (the lengthened) *Sichang* (721) and the flight deck aft is one deck level higher. There are also reports that *Surin* (722) may have different engines, possibly MWM.

Sichang *(721)* (Royal Thai Navy)

Surin *(722). Note that the flight deck is one deck level higher than in* Sichang *(721)* (Royal Thai Navy)

FURTHER INFORMATION

PROGRAMME

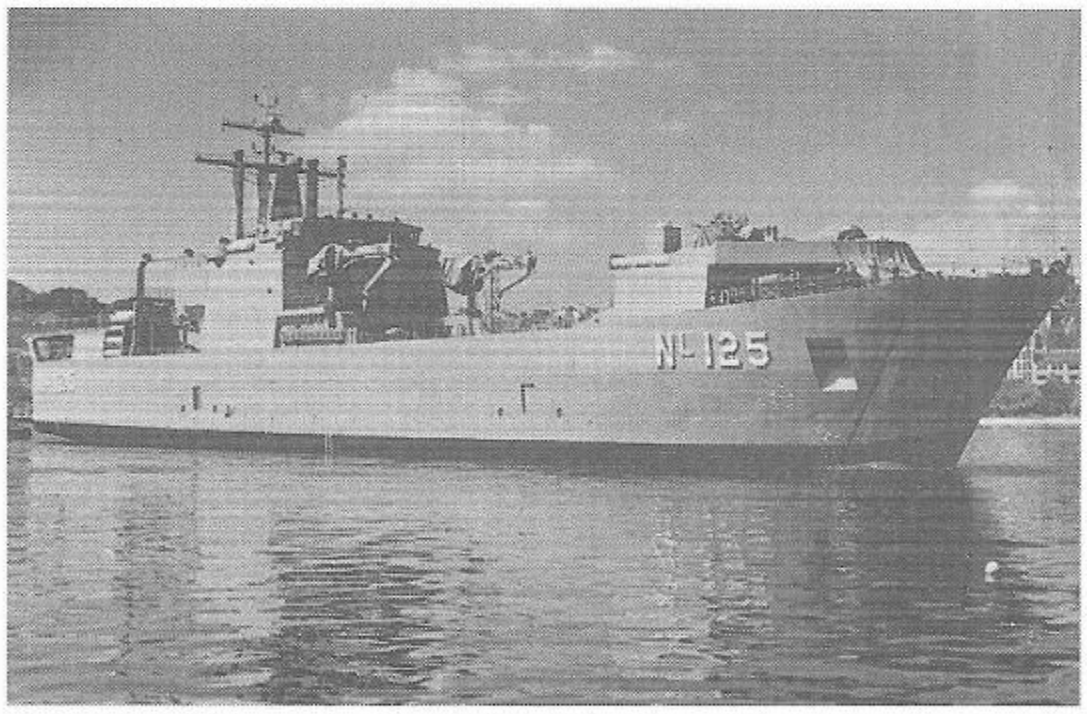
Osman Gazi (N^L 125) is the latest amphibious warfare ship in a series of one- or two-ship classes for the Turkish Navy. It was originally announced that there would be at least two ships in this class, but the second was cancelled in 1991 and *Osman Gazi* remains the only ship in its class. The ship took a full four years between launch and completion — an unusually long time.

DESIGN

The ship is a tank landing ship of approximately the same size as the two 40-year-old former US Navy 'Terrebonne Parish' class LSTs still operated by the Turkish Navy. The design has full nuclear, biological and chemical defence (NBCD) protection. It also has a support weapons co-ordination centre for amphibious task forces.

Although this ship is not normally listed as a minelayer, *Osman Gazi* has two ports on either side normally associated with loading mines and what appears to be a large chute in the starboard side of the transom. It therefore appears probable that it is a minelayer.

Also noteworthy are two large cranes on the foredeck.



Osman Gazi *(N^L 125) prior to completion. Note the unusual gantry over the forward part of the tank deck and the two cranes* (Turkish Navy)

Shafts: 3

FURTHER INFORMATION

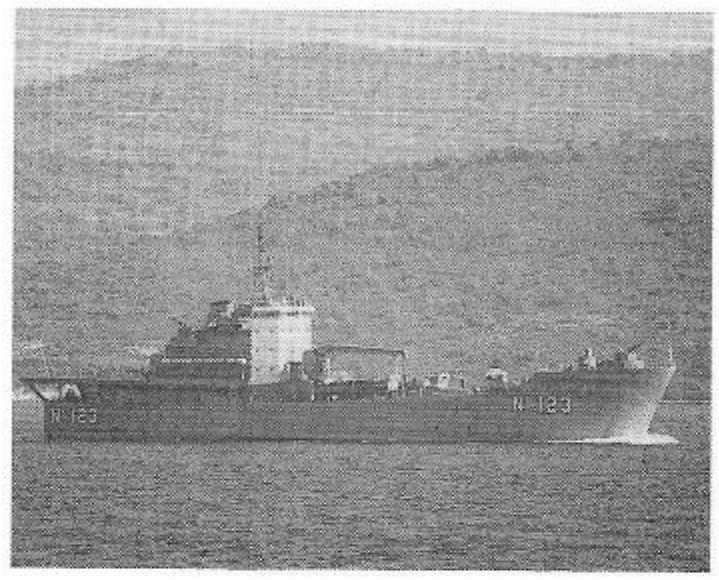
PROGRAMME

A two-ship class of LSTs which represents a major advance on the 'Çakabey' class. As with other Turkish amphibious vessel types, there are fewer of these ships than had initially been intended; the original plan was to build five but, in the event, only two were completed, being commissioned in 1984 and 1985, respectively.

DESIGN

This is essentially an enlarged and much improved version of the Çakabey dual-purpose minelayer/landing ship design. There is a proper helicopter deck aft, a raised forecastle, and the superstructure is somewhat larger. There is also a large articulated crane amidships to handle the LCVPs.

There are two large ports on each side on the tank deck. These are basically intended for embarking the mines, but are also used as embarkation/disembarkation ports for troops.



Saruçabey (N^{L} 123) belongs to the second two-ship class landing ships/minelayers built in Turkey.

ÇAKABEY

GENERAL SPECIFICATIONS

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60 in Mk 1 twin mountings

Four Bofors 40 mm/60 in two Mk 1 twin mountings. The Mk 1 mounting is power-driven on a stand and base ring with twin water-cooled Mk 1 and Mk 2 guns which are 243 mm apart. A steel platform is attached to the rear of the weapon's base. Both the gun-layer (pointer) and trainer have optical ring sights, and manual elevation and training gear. The mounting has no provision for ammunition storage but a shield is usually provided. The mounting uses 3 or 5 HP elevation and training motors and the muzzle arc radius is 231 cm (90 in) while the working circle radius is 213 cm (84 in).

Specifications

Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,890 ft/s) (new gun); 850 m/s (2,789 ft/s) (mid-life)
Range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,639 ft)
Rate of fire: 80 rds/min (practical), 160 rds/min (cyclic)
Ammunition: 2.21 kg (4.9 lb)

Mounting
Weight, empty: 4.45-6.76 t
Traverse: 360° at 30°/s
Elevation: −15 to +85/90° at 24°/s
Crew: 4

Oerlikon 20 mm in twin Mk 24 mountings

Four Oerlikon 20 mm in two twin Mk 24 mountings. The two mounts are on the forecastle.

Specifications

Gun
Calibre: 35 mm
Length of barrel: 90 calibres
Muzzle velocity: 1,175 m/s (3,855 ft/s)
Range:
anti-surface: 2.7 n miles (5 km)
anti-air: 4,500 m (14,764 ft)
Rate of fire: 550 rds/min/barrel
Ammunition: 1.56 kg (3.4 lb)

US Mk 24 mounting
Traverse: 360°
Elevation: −15 to +90°
Weight: 481-649 kg (1,060-1,431 lb) (unloaded)

MINES

150 mines can be carried and laid in lieu of the amphibious load.

COMMAND AND CONTROL SYSTEMS

RADARS

Racal-Decca Type 1226

The Type 1226 is part of the Solid State series and uses a 30 cm PPI (Plan Position Indicator) display. It operates in the I-band, has 20 kW output and is equipped with a 1.83 m (6.0 ft) antenna.

Specifications

Type 1226
Role: Surface search
Frequency: I-band
Range: 48 n miles (89 km)
Beam: 1.2°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25/1.0 µs
Scan rate: 28 rpm

Manufacturer/Contractor

Racal-Decca, UK.

PROPULSION

Specifications

System: Diesel
Main machinery: 3 diesels, 3.2 MW (4,320 hp)
Shafts: 3

FURTHER INFORMATION

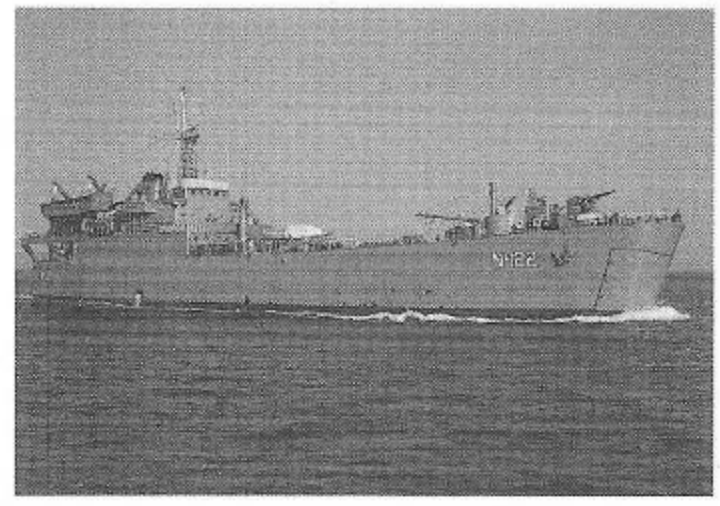
PROGRAMME

The first of several classes of Turkish-designed and built combined minelayers and amphibious warfare vessels. The original intention was to build four of the class but, in the event, only one was completed and two of a larger version, the 'Saruçabey' class, were built instead.

DESIGN

This is a dual-purpose tank landing ship and minelayer design, with bow doors. There are two landing spots for helicopters: one on the foredeck, the other on a platform aft.

An unusual feature is the side disembarkation ports, two on each side, leading directly onto the tank deck. These are for loading the mines and their use by troops is an incidental advantage.



Çakabey *(N[L] 122) the first combined landing ship/minelayer to be built in Turkey* (Turkish Navy)

Çakabey *(N[L] 122). Note the open mineloading ports in the ship's side and the minelaying ports in the transom* (H & L van Ginderen Collection)

GUNS

Oerlikon 20 mm in twin Mk 10 mountings
Two Oerlikon 20 mm in Mk 10 mountings.

Specifications
Gun
Calibre: 35 mm
Length of barrel: 90 calibres
Muzzle velocity: 1,175 m/s (3,855 ft/s)
Range:
anti-surface: 2.7 n miles (5 km)
anti-air: 4,500 m (14,764 ft)
Rate of fire: 550 rds/min/barrel
Ammunition: 1.56 kg (3.4 lb)

Mounting
Elevation: −15 to +90°
Weight: 431-499 kg (950-1,100 lb) (unloaded). Includes 12.7 mm shield weighing 109 kg (240 lb)

M2HB 12.7 mm machine guns
Two M2HB 12.7 mm machine guns are carried. The M2HB is a selective short recoil automatic operation weapon with a 1,143 mm long barrel and eight right-hand grooves turning once every 381 mm.

Specifications
M2HB
Calibre: 12.7 mm
Barrel: 90 calibres
Gun weight: 38.1 kg (84.0 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

COMMAND AND CONTROL SYSTEMS

RADAR

Racal-Decca
One Racal-Decca, I-band, navigation radar is installed, type unknown.

PROPULSION

Specifications
System: Diesel
Main machinery: 3 General Motors GM 6-71 diesels, 390 kW (522 hp) sustained
Shafts: 3

FURTHER INFORMATION

PROGRAMME

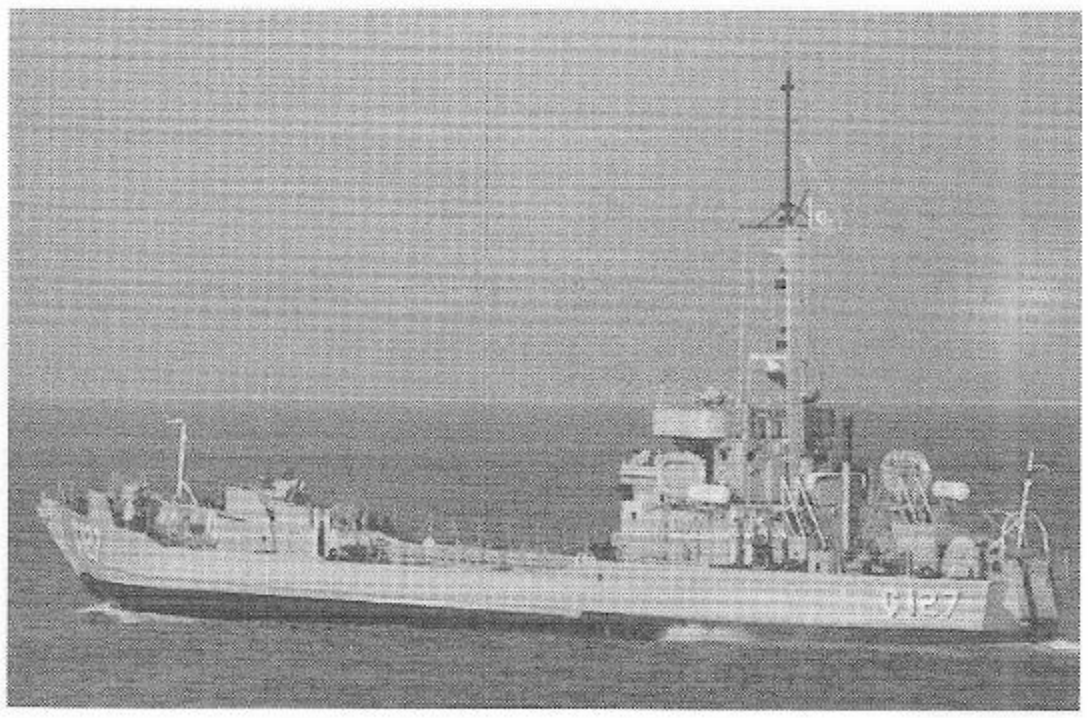
Turkey
Construction of these craft started at the naval yards of Golçuk and Taşkizak in 1977 and continued at a rate of two or three a year until 1987. The two launched in July 1987 were not completed and commissioned until 1991, and three more were then built, being completed in 1992.

Ç130 and Ç131 were transferred to Libya in 1979, plus one other later. Ç136 sank in 1985.

Libya
Libya operates three former Turkish Navy LCTs, Nos Ç130 and Ç131, built at the Turkish naval yards of Golçuk and Taşkizak and transferred on 7 December 1979 to Libya. A third of the class was reported in 1991, but its former Turkish number is not known. At one stage, the number of these ships in the Libyan Navy was thought to be much greater. It is unclear how many of these three remain operational.

DESIGN

Although sometimes described as 'EDIC-type' the design of these craft was based on the earlier Ç-107 class which was, in turn based on the British LCT Mk 4, of which the Turkish Navy operated six. The Turkish craft have virtually the same dimensions as the British design but differ in having three General Motors diesels instead of two Paxman diesels.



Ç127, one of a large number of LCTs of various classes operated by the Turkish Navy

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 227
- Tanks: 9
- Cargo: 600 tonnes

SHIP-SHORE LIFT

- Two LCVPs (MiG-G-1200SC) are carried on chocks on the foredeck.
- Small landing craft are carried on davits.

AVIATION FACILITIES

Specifications
Flight deck: Large flight deck aft
Hangar: None
Helicopters: Can embark one Sikorsky MH-53D

AMPHIBIOUS FACILITIES

- Clamshell bow doors with internal ramp.
- 10 tonne crane
- Vehicle deck 39.6 × 8.9 m (130 × 29 ft)

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60 in Mk 3 single mountings

***Hengam, Larak* only.** Four Bofors 40 mm/60 in four single mountings.

Specifications
Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,890 ft/s) (new gun); 850 m/s (2,789 ft/s) (mid-life)
Range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,639 ft)
Rate of fire:
practical: 80 rds/min
cyclic: 160 rds/min for water-cooled weapons
Ammunition: 2.21 kg (4.9 lb)

Mountings
Traverse: Nominal 360° at 30°/s
Elevation: −15 to 85/90° at 24°/s

Russian ZU-23-2 23 mm/80 in four twin mountings

***Tonb* and *Lavan* only.** Eight former Soviet 23 mm/80 in four twin mountings. The Soviet Army ZU-23 was not produced for the Soviet Navy, which preferred 30 mm weapons, but the mounting has been adapted as the ZU-23-2 by a number of navies to produce a cheap, lightweight, short-range, point defence system on both large and small warships. They are most extensively used by Iran and Poland but during the Iran-Iraq War a number of Indian merchantmen carried these weapons for self-protection. The ZU-23-2 consists of two air-cooled 2A14 cannon fed from 50-round belts in boxes fitted to each side of the trunnions. A ZAP-23 optical sight is attached to the rear of the weapon which is on a manually operated firing platform. The whole mounting weighs 893 kg (1,969 lb) and it has a five-man crew, of whom two are on the mounting and three are ammunition carriers and loaders.

Lavan *(514) the fourth of the 'Hengam' class LSLs built by Yarrow for the Iranian Navy. The crane is used to transfer the LCVPs into the water* (Yarrow)

Specifications
Calibre: 23 mm
Length of barrel: 87 calibres
Traverse: 360°
Elevation: −10 to +90
Rates of fire: 200 rds/min/barrel (practical)
Projectile: 0.19 kg (0.42 lb)
Range:
anti-surface: 1.1 n miles (2 km)
anti-air: 1,500 m (4,920 ft)

12.7 mm machine guns
There are two 12.7 mm machine guns on all four vessels. The type is not known but they are probably Russian-made Degtyarev DShK-38/46 or DShK-M. The performance of the latter is given as an example.

Specifications
DShK-M
Gun weight: 35.7 kg (78.7 lb)
Muzzle velocity: 860 m/s (2,822 ft/s)
Cyclic rate of fire: 575 rds/min
Practical rate of fire: 80 rds/min
Effective range: 0.80 n miles (1.5 km)

BM-21 multiple rocket launcher
One BM-21 is mounted on the foredeck, which must have been fitted in all four after arrival in Iran. BM-21s are designed for use immediately before an amphibious assault and consist of two clusters, each of 20 tubes, on either side of an electrically operated mounting which holds training and elevation gears. They are reloaded automatically from a below-deck magazine. The mounting is about 2 m (6.5 ft) high and 2 m (6.5 ft) long and can traverse 360° and elevate from 0 to +55°. The standard missile for these weapons is the M-21-OF spin- and fin-stabilised rocket which comes in 3.226 (10.6) and 2.87 m (9.4 ft) lengths and can carry high explosive fragmentation, smoke, incendiary or chemical warheads.

Specifications
Rockets

	M-21-OF (9M22U)	M-21-OF (9M22M)
Diameter	122 mm	122 mm
Length	3.226 m (10.6 ft)	2.87 m (9.4 ft)
Weight	77.5 kg (170.8 lb)	66 kg (145.5 lb)
Range	500-20,380 m (1,640-66,867 ft)	500-20,000 m (1,640-65,620 ft)
Warhead weight	19.3-19.4 kg (42.5-43 lb)	18.4 kg (40.5 lb)
Max velocity	690 m/s (2,263 ft/s)	700 m/s (2,297 ft/s)

'Hengam' class LSLs carry two LCVPs, which are military versions of this MiG-G-1200-SC, which is made in Iran. The craft is 12.4 m (40.7 ft) long with a beam of 3.0 m (9.8 ft) and carries 30 troops or 1.66 tonnes at a speed of 23 knots (IRI Marine Industries)

PROPULSION

Specifications
System: Diesels
Main machinery:
***Hengam* and *Larak* only** — 4 Paxman 12YJCM diesels, 2.24 MW (3,000 hp) sustained
***Tonb* and *Lavan* only** — 4 MTU 16V 652 TB81 diesels 3.38 MW (4,600 hp) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME

Two ships of this class were ordered by the Shah of Iran's regime in 1972 and delivered by Scottish shipyard Yarrow two years later. In 1977, the Shah's regime ordered four more, the first two of which were close to launch (and much of the material for the other two had been ordered), when the Shah was overthrown but the new Iranian Government cancelled the order. Yarrow had little choice but to go ahead and finish the hulls of the second pair and launch them.

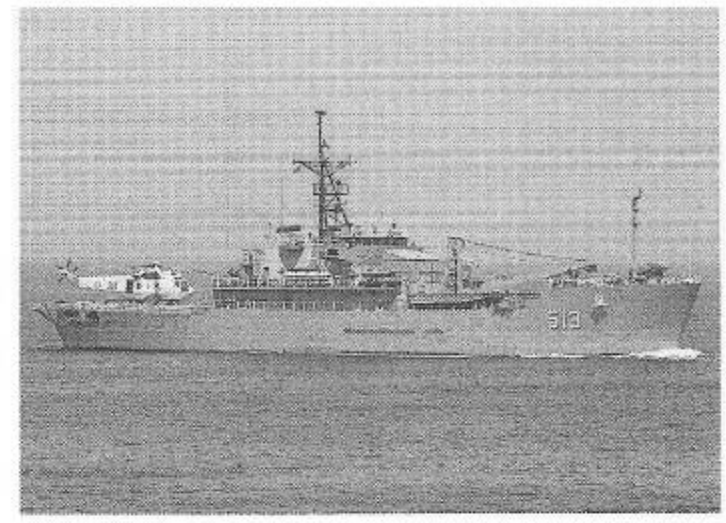
The new Iranian Government then asked for the order to be reinstated, but Yarrow did not obtain British Government authorisation to proceed with the sale until 1985, when the ships were declared to be 'hospital ships'. The third, final pair was never built. The 'hospital ships' are now armed with eight 23 mm cannon, two 12.7 mm machine guns and a BM-21 rocket launcher.

DESIGN

These ships are a straightforward LSL design with bow doors, but do not have a stern ramp. They have a large flight deck capable of handling a CH-53, of which six to seven are still operational, although it is more usual to see SH-3D aboard.

DEPLOYMENT

These are employed as amphibious ships, but also act as depot ships for mine countermeasures vessels (MCMVs) and other small craft. They have also been used to ferry Pasdaran small craft around the Gulf.



Tonb *(513) with Iranian Air Force Sikorsky SH-3 on the flight deck*

FEARLESS (L 10)

Builder	Harland & Wolff, Belfast, UK
Laid down	25 Jul 1962
Launched	19 Dec 1963
Commissioned	25 Nov 1965

INTREPID (L 11) (in reserve)

Builder	John Brown, Clydebank, UK
Laid down	19 Dec 1962
Launched	25 June 1964
Commissioned	11 Mar 1967

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 380-400 (normal); 1,000 (hard-lying)
- Tanks 15 main battle tanks, plus seven 4-tonne trucks, plus 20 Land Rover trucks (specimen load).

SHIP-SHORE LIFT

- 4 LCU Mk 9 in dock
- 4 LCVP Mk 4 in davits

AVIATION FACILITIES

Specifications
Flight deck: Large flight deck aft. 2 landing spots
Hangar: In superstructure
Helicopters: 4 Westland Sea King HC 4

AMPHIBIOUS FACILITIES

- Stern gate
- Docking well accommodates four LCM Mk 9
- Mezzanine deck for light vehicles
- Tank deck

WEAPONS SYSTEMS

GUNS

Hughes Mk 15 CIWS Phalanx

Fearless (L10) — two Hughes Mk 15 CIWS Phalanx. *Intrepid* (L 11) — fitted for but not with two Hughes Mk 15 CIWS Phalanx. Vulcan Phalanx is a close in weapons system (CIWS) and two units are mounted atop the superstructure to provide the innermost layer of defence against anti-ship missiles. The 20 mm M61A1 Vulcan, six-barrel, Gatling-principal gun has a cylindrical magazine with the feed mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,380 ft/s)
Rate of fire: 3,000 rds/min
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor
Hughes Missile Systems, Tucson, Arizona, USA.

RO/Oerlikon 30 mm/75 in GCM-A03 mountings

***Intrepid* (L 11) only.** Four RO/BMARC 30 mm/75 cannon in two GCM-A03 twin mountings. The GCM-A03-1 is a locally operated mounting with enclosed position which may be air conditioned, with a magazine carrying 320 or 500 rounds of ammunition. The similar GCM-A03-2 (the more likely of the two to be used in these ships) has an open operator mounting with two boxes of ammunition, each with 250 rounds.

Specifications
Gun
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Range:
anti-surface: 1.15 n miles (3 km)
anti-air: 3,500 m (11,483 ft)
Rate of fire: 650 rds/min/barrel
Ammunition: 870 kg (1,918 lb)

Mounting (GCM-A03)
Traverse: 360° at 80°/s
Elevation: −15 to +85° at 60°/s

Manufacturer/Contractor
Royal Ordnance, UK.

RO/Oerlikon 20 mm in GAM-BO1 mounting
Both ships have two single Oerlikon 20 mm cannon in GAM-BO1 mountings.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 85 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 1.7 km
anti-air: 1,700 m (5,578 ft)
Rate of fire: 900 rds/min
Round weight: 320-345 g
Projectile: 110-125 g

Mounting
Elevation: −15 to +60°
Total weight: 500 kg (1,102 lb) (including shield)

Fearless *(L 10) in 1994, prior to the recent modifications, the outline showing the general similarity to the US Navy's 'Raleigh' class. The two British ships,* Fearless *and* Intrepid *were commissioned in 1965 and 1967 respectively and have now exceeded their expected lives by a wide margin* (H M Steele)

Manufacturer/Contractor
Royal Ordnance, UK.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

GEC-Marconi Mentor A; radar warning
Mentor A is a low-cost threat warning equipment for detecting, measuring and analysing radar signals. Identification uses an easily updated mission library to give immediate and accurate warning of threats, although the lack of a jammer prevents any passive countermeasures. The system gives a capability over the E through J-bands (2 to 20 GHz) with optional C/D-band (0.5 to 2 GHz) coverage available if required. Mentor comes as a set of lightweight units. The two detector units are mounted on either side of the mast or superstructure and wired to a compact signal processing unit.

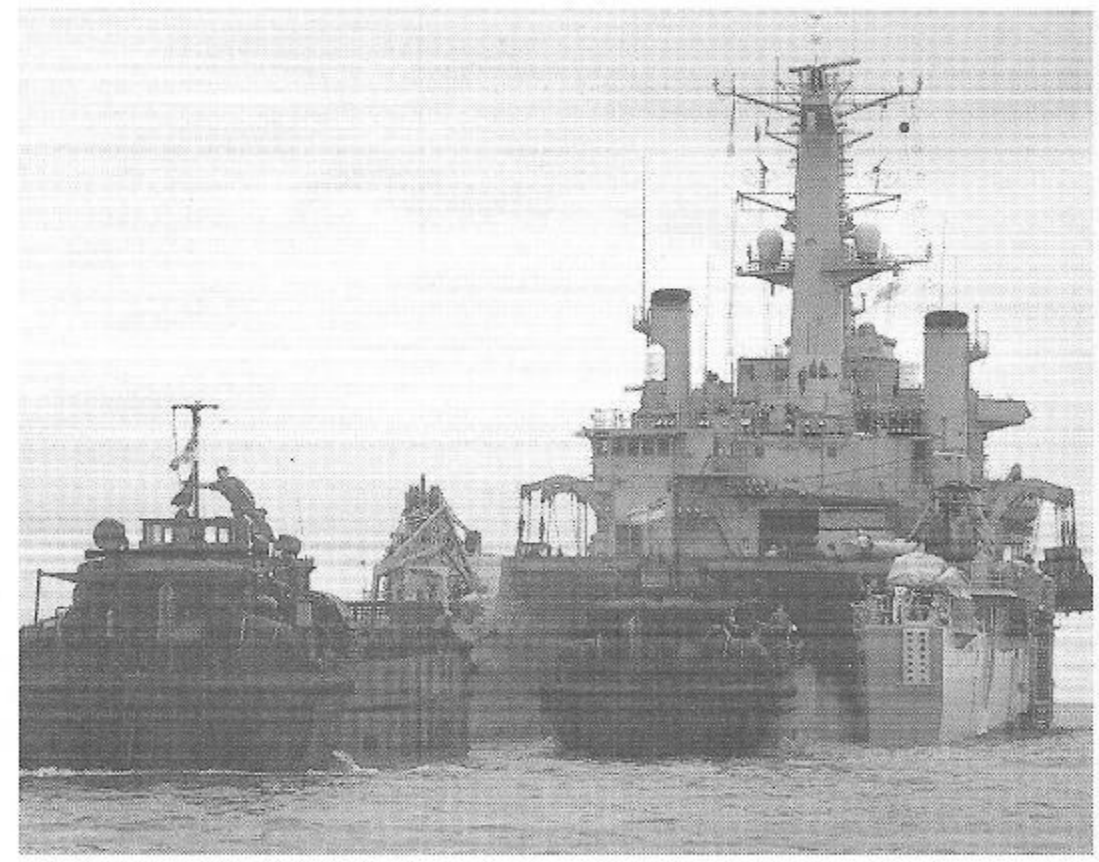
Manufacturer/Contractor
GEC-Marconi Radar and Defence Systems Ltd, Defence Systems Division, Stanmore, Middlesex, UK.

DECOYS

Outfit DLJ(1)
Outfit DLJ is the British Royal Navy designation for the NATO Sea Gnat system; the version in these LPDs is DLJ(1) with four Sea Gnat 130 mm/102 mm launchers. The system uses a new control unit, new launcher with 130 mm tubes and new munitions. The control unit provides for the launching of the most effective combination of rounds for distraction and centroid/seduction, taking into account the type, speed and direction of the threat, the ship's speed and heading as well as wind direction and speed. The munitions involved are the Mk 214 RF seduction and Mk 216 RF distraction rounds which are provided by Chemring Ltd. A Mk 218 IR seduction round entered service in 1995.

The basic system, Outfit DLB, has four Hunting Engineering 130 mm six-barrel launchers which are grouped in pairs on either beam and a modified version replaces the rear two barrels with 102 mm barrels for N4 rockets pending introduction of the Mk 216 Mod 1. The version in the LPDs is Outfit DLJ, a version of Outfit DLB optimised for larger warships: DLJ(1) has four DLB and four DLD (SRBOC) launchers, while DLJ(2) has eight DLB launchers.

Fearless *ballasted down and with the stern gate open ready to receive landing craft. There are two Sea King HC4 on the flight deck, with a third preparing to land. In addition, a loaded LCVP Mk 4 is being lowered into the water from its davits* (H M Steele)



Two Royal Marine-operated LCM Mk 9 enter Fearless' *docking well* (H M Steele)

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Plessey Nautis
Both ships are fitted with the Nautis (AN/SYQ-15) command system, which grew out of a purely tactical picture compilation system, using the NAUTIC (Naval AUTonomous Intelligent Console) multifunction intelligent workstation. NAUTIC is based upon the Intel iAPX-86 16-bit processor with 3 Mbyte RAM together with 2 Mbyte non-volatile magnetic bubble memory. Dual iAPX-286 microprocessors are used in Multibus configurates, while iAPX-186 microprocessors are used for intelligent interfaces. The system capacity is 200 to 300 air, surface and submarine tracks and reference points with integral radar auto-tracking for up to 80 air and surface targets. A dual-redundant MIL-STD-1553B highway links the workstations, each of which uses 150,000 lines of Ada-language software code to support Nautis. The system database is replicated in each console and can typically cover an area of 2,000 × 2,000 n miles (3,704 km²), including radar and sonar tracks, route/search plans, user-designated tactical maps and synthetic charts. The database can include up to six user-designated tactical maps, 15 synthetic charts, 200 labelled reference points, 5,000 fully detailed underwater contacts and 32 labelled bearing lines. Manually initiated automatic radar tracking is possible for a minimum of 20 tracks.

The system for major amphibious warfare ships is to provide mission planning, surveillance, target tracking,

self-defence, control of landing craft and helicopters as well as task force command. For smaller vessels there can be one or two consoles providing command and surface picture compilation facilities while for larger vessels there can be six or seven consoles. The system selected for HMS *Fearless* has seven monochrome display consoles and interfaces with Type 994 surface search radar and Type 1006 navigation radar and Sea Gnat ECM system together with the Phalanx close in weapon system.

Manufacturer/Contractor
Siemens-Plessey, UK.

RADAR

Siemens-Plessey Type 994
The E/F-band Type 994 uses the Outfit AKD 'quarter cheese' antenna from the earlier Type 993 mated to the transceiver from the Plessey (now Siemens-Plessey Systems) AWS-4 equipment.

Specifications
Type 994
Role: Air/surface search
Frequency: E/F-band
Beam: 2 × 35°
Peak power: 500 kW
Pulsewidth: 0.7/1.5/1.9 µs
PRF: 500 pps
Scan rate: 5/10/15 rpm

LCU Mk 9 (LCU — Landing Craft Utility) of which 12 are operated by the Royal Marines. These craft are 27.5 m (90.2 ft) long with a beam of 6.8 m (21.5 ft), and can carry one main battle tank, 120 troops or 70 tonnes of stores (H & L van Ginderen Collection)

Manufacturer/Contractor
Siemens-Plessey, UK.

NAVIGATION

Kelvin Hughes Type 1006 in I-Band

Specifications
Type 1006
Role: Navigation
Frequency: I-band
Range: 64 n miles (118 km)
Beam: 1 × 18°/0.75 × 18°
Peak power: 25 kW
Gain: 31 dB/34 dB
Pulsewidth: 0.8 or 0.25 µs/0.75 µs
PRF: 1,600/800 pps
Scan rate: 24 rpm

Manufacturer/Contractor
Kelvin Hughes Ltd, Hainault, Essex, UK.

PROPULSION

Specifications
System: Steam turbine
Main machinery: 2 Babcock & Wilcox boilers, 38.66 kg/cm² (550 psi) and 454°C (850°F); 2 English Electric steam-turbines, 16.4 MW (22,000 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These two ships have had an unusual history. They were ordered in 1962 and were represented at the time as being to an exceptional new concept, although they were, in fact, simply updated versions of the wartime LSD, but with improved seaworthiness and capacity, and the addition of a helicopter flight deck. They were, in fact, generally very similar to, but smaller than, the US Navy's contemporary 'Raleigh' class assault ships.

Having entered service in 1963-64, their first set-back was in 1976 when a Defence cost-savings exercise led to *Intrepid* being placed in reserve and *Fearless* being relegated to a training role. *Intrepid* returned to service briefly between 1979 and 1981 to enable *Fearless* to be refitted, but was then offered for sale. Argentina expressed strong interest but the details had not been finalised when the Falklands (Malvinas) War broke out. (Had the sale been completed, presumably the former *Intrepid* would have led the Argentine invasion forces.) Both ships took part in the Falklands (Malvinas) War. They are now due to continue to serve until the LPD(R)s enter service, which could not now be earlier than 2002, for the first, and 2003/4 for the second.

DESIGN

These ships have a large docking well aft which can accommodate four medium LCUs, and a large flight deck for helicopters. They are thus good examples of the amphibious warfare ship design in the transitional period between the Second World War originals and the modern era where airborne capability has primacy. Landing craft are floated through the open stern by flooding compartments of the ship and lowering her in the water.

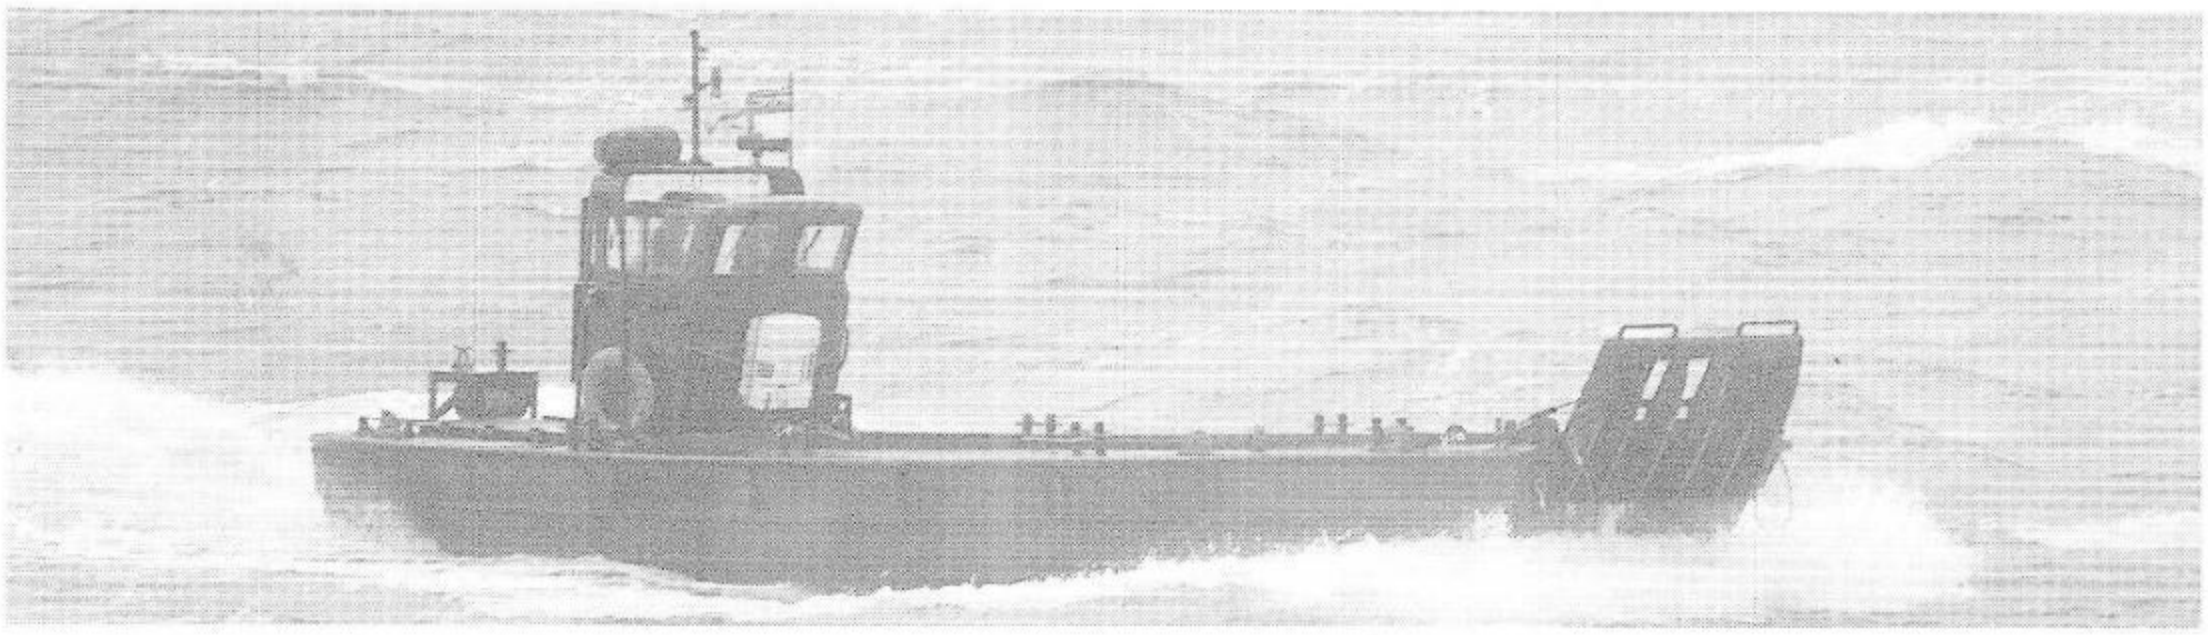
One of the important innovations at the time they entered service were their extensive command and control facilities, which enabled them to act as Naval Assault Group/Commando Brigade headquarters. They are fitted with an assault operations room from which naval and military personnel can mount and control the progress of an assault operation.

MODERNISATION

Fearless was refitted in 1979-81 and given a major modernisation in 1987-90, which included two Vulcan Phalanx CIWS gun mountings and new decoy launchers. *Intrepid* was refitted in 1984-85 but, although some further work was carried out while it was in reserve in 1993, the work concentrated on fitting for rather than with items such as Vulcan Phalanx and chaff launchers. *Intrepid* is now in a state euphemistically known as 'Preservation by Operation', which is supposed to mean that it could be brought up to operational status in 30 days. Few believe that to be credible and, if such a requirement was to arise, it seems more likely that the carriers *Illustrious* and *Invincible* would be equipped to become temporary amphibious command ships, and additional troop-carrying capacity would be obtained by leasing suitable merchant ships.

These were the last ships in the UK Royal Navy to be armed with the Seacat missile, but the installations were removed from both ships in late 1994.

These two ships must, therefore, continue in service for several more years. *Fearless* is operational while *Intrepid* is in reserve at Portsmouth and the intention is that it should not be used again. However, until the navy gets its new LPDs, both ships will have to be maintained.



LCVP Mk 4 (LCVP — Landing Craft Vehicles and Personnel). Four are carried on davits and they can carry a light vehicle, 20 troops or 5.5 tonnes of stores (H & L van Ginderen Collection)

VSEL LSL

OVERVIEW

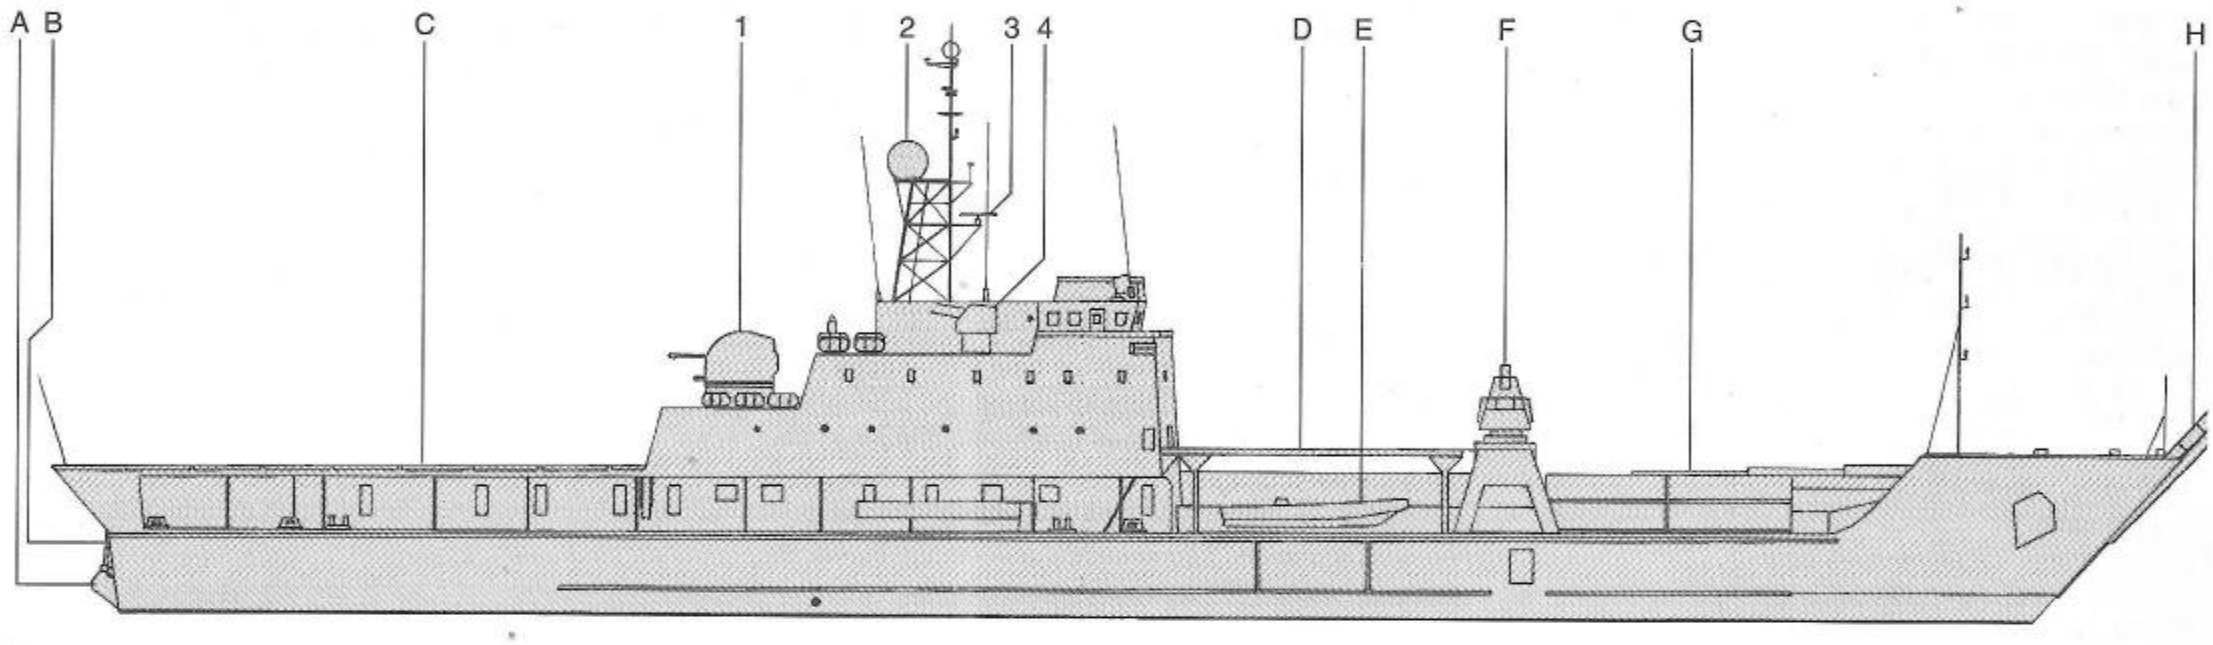
In the late 1970s the British shipbuilding company Brooke Marine produced a design for a 2,500 t landing ship logistics (LSL). This has a flat bow door, which incorporates an articulated 60-tonne capacity ramp, a straight-through hold, and a 60-tonne capacity stern ramp. The hold will accommodate 16 60-tonne tanks, which is equivalent to a squadron/company of the heaviest main battle tanks.

The design also incorporates a travelling gantry crane over the forward hold and a flight deck aft, capable of handling a Sea King-size helicopter.

Three were built, two by Brooke Marine and one by Vosper-Thornycroft at Woolston, both in the UK. Two went to Algeria and one to Oman, but no more have been sold.

When Brooke Marine went out of business, VSEL purchased the designs.

KALA'AT BENI HAMMAD (VSEL LSL)



Kala'at Beni Rached (Ian Sturton)
Amphibious A *Kedge anchor* **B** *Stern door* **C** *Flight deck* **D** *Platform for pontoon sections* **E** *LCPL* **F** *Travelling gantry crane* **G** *Sliding hold cover* **H** *Bow door/ramp*

GENERAL SPECIFICATIONS

Country of Origin: United Kingdom
Operator: Algeria
Type: Brooke Marine LSL (Landing Ships Logistic)

Class: KALA'AT BENI HAMMAD

Built: 2
Active: 2

Displacement:
full load: 2,450 t

Dimensions
Length: 93 m (305 ft)
Beam: 15.5 m (50.9 ft)
Draught: 2.5 m (8.1 ft)

Speed: 15 kts
Range: 3,000 n miles at 12 kts

Complement: 81

SHIPS

KALA'AT BENI HAMMAD (472)
Builder Brooke Marine, Lowestoft, Suffolk, UK
Launched 18 May 1983
Commissioned Apr 1984

KALA'AT BENI RACHED (473)
Builder Vosper Thornycroft, Woolston, Hampshire, UK
Launched 15 May 1984
Commissioned Oct 1984

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

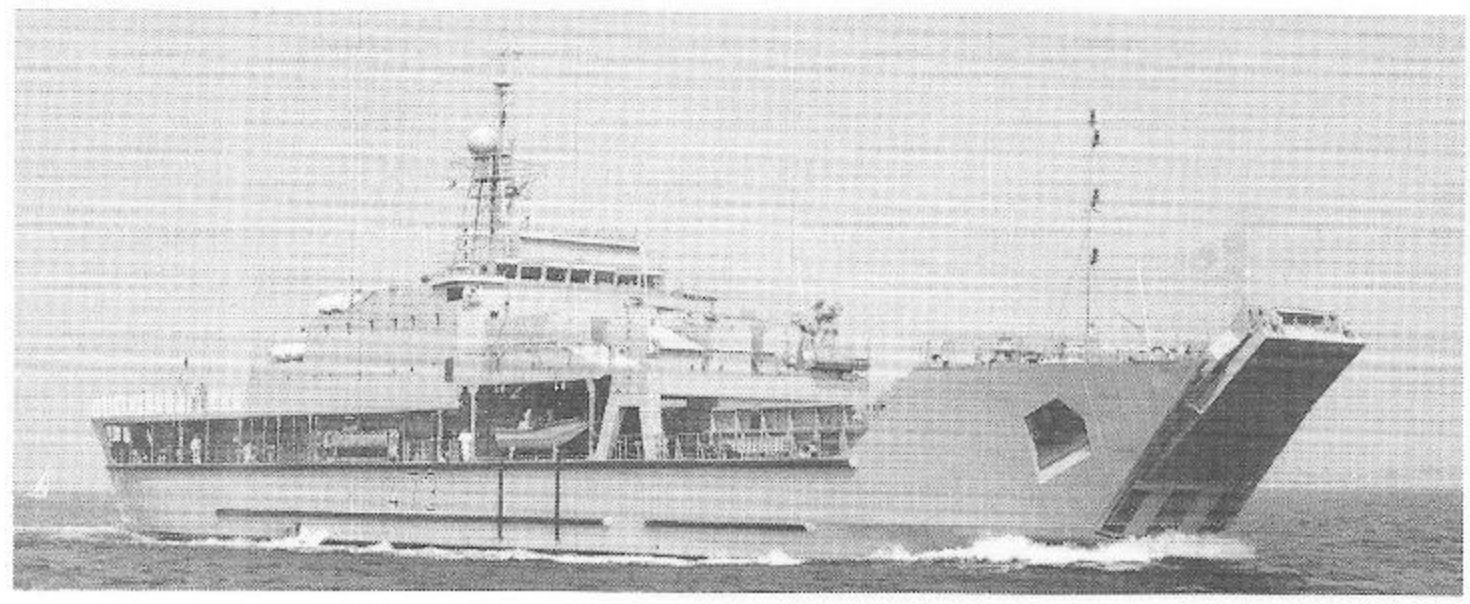
- Troops: 240
- Tanks: 16 main battle tanks and 380 tonnes of other cargo

SHIP-SHORE LIFT

- 2 LCPL on davits

AVIATION FACILITIES

Specifications
Flight deck: Large flight deck aft
Hangar: None



Kala'at beni Rached *(473), built by Vosper Thornycroft and commissioned in 1984. Note the travelling gantry crane and the floating pontoon sections on the platform between the gantry and the bridge* (Vosper Thornycroft)

Helicopter: The Algerian Navy does not operate any helicopters.

AMPHIBIOUS FACILITIES

- Through tank deck measures 75 m × 7.4 m (246 × 24.3 ft).
- Forward ramp. Two sections, 18 m (59 ft) long (extended), 5 m (16.4 ft) wide. 60 tonnes capacity.
- Stern ramp. Single-section ramp, 4.3 × 4 m (14.1 × 13 ft) with the addition of 1.1 m (3.61 ft) finger flaps. 60 tonnes capacity.
- Side access doors are provided on each side forward.
- The tank deck bulkheads extend 2.25 m (7.4 ft) above the upper deck between the forecastle and the forward end of the superstructure, and provide two hatch openings to the tank deck below.
- 16 tonne crane with athwartships travel.

WEAPONS SYSTEMS

GUNS

OTOBREDA 40 mm/70

One OTOBREDA 40 mm/70 twin mounting, located on the centreline abaft the superstructure. The Compact twin 40 mm mounting is designed for use against high-performance combat aircraft, against anti-ship missiles and for surface engagements. The mounting consists of two 40 mm guns which are 300 mm (12 in) apart, a feeding system with magazine, a local control panel, a power supply rack, a converter and an air-water panel.

Specifications

Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,281 ft/s) (Breda)
Range:
anti-surface: 6.75 n miles (12.5 km)
anti-air: 8,700 m (28,544 ft)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 4,000 m (13,124 ft)
Rate of fire: 600 rds/min
Ammunition: 2.4 kg (5.3 lb) (HCHE, PFHE), 2.5 kg (5.5 lb) (HE-T)

Mounting
Weight (unloaded): 5.6/5.4 t
Traverse: Nominal 360° at 90°/s
Elevation: −13 to +85° at 60°/s
Crew: 2

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

Russian 2-M-3 25 mm/60 in twin mountings

Four Russian 25 mm/60 in two twin mountings. The 2-M-3 consists of two guns installed one above the other in separate cradles and on their sides so that it is fed from the side. The guns have 1.5 m (5.0 ft) long air-cooled barrels of monobloc construction with flash suppressors at one end and an exposed spring recuperator wrapped around the barrel near the breech.

The mounting, which is 1.2 m (3.9 ft) high, 1.6 m (5.2 ft) long (excluding the barrel) and 1.5 m (4.9 ft) wide, may be either hydraulically or manually operated. With ammunition, the mounting weighs 1.735 tonnes and it has two on-mount operators and five loader-carriers.

Specifications

Calibre: 25 mm
Length of barrel: 60 calibres
Traverse: 360° at 25°/s manual; 70°/s hydraulic
Elevation: −10 to +85° at 15°/s manual; 40°/s hydraulic
Rates of fire: 450 rds/min/barrel
Projectile: 0.28 kg (0.6 lb) HEI-T
Range:
anti-surface: 1.5 n miles (2.75 km)
anti-air: 2,800 m (9,186 ft)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Racal Cutlass B1 ESM system

Cutlass B1 is designed for operation in very dense signal environments, receiving signals in the 1 to 18 GHz frequency range, measuring their parameters, comparing these with those in the radar library which contains the parameters of 2,000 radars, and displaying the information — all within one second. The EW operator is presented with a tabular display for threat identity and threat evaluation, and a tactical display giving a pictorial representation of the RF environment. Selected digital outputs can be sent to other local systems, and hard copy printout of the intercepted radar is also available. The tabular display can indicate 150 intercepts, in the order of priority. Cutlass is wide open in both bearing and frequency: that is, it does not employ sweep techniques, giving a very high intercept probability (nearly 100 per cent). Cutlass B1 uses the Cutlass processor and an Instantaneous Frequency Measurement (IFM) receiver. It has a 32-element array antenna to provide bearing measurement by phase analysis techniques. This antenna also provides RF for the IFM. In both systems the processor is provided with fast and accurate information on incoming pulses.

Specifications

Frequency coverage: 2-18 GHz
Accuracy: 2° RMS in bearing
Coverage: 360° azimuth; +40 to −10° elevation
Pulse density capability: 500,000/s
Radar store capability: 2,000 modes

Manufacturer/Contractor
Racal Radar Defence Systems Ltd, Chessington, Surrey, UK.

ELECTRONIC COUNTERMEASURES (ECM)

Racal Cygnus B1 jammer

The Cygnus radar jammer operates in the I or J-bands and was designed for integration with Cutlass ESM equipment. Cygnus uses both responsive noise and deception jamming to provide an effective jamming capability against all types of radar including early warning, target acquisition and missile guidance. It has a narrow beamwidth giving high effective radiated power (300 kW) and is kept on target by a built-in, interferometer-type, passive tracking system in both azimuth and elevation. The tracking system may also be used to relay accurate position data to systems of other ships. RF received by the tracking antennas is also used as the basis of transmitted RF and modulation and power management is under the control of a processor which also controls the tracking procedure. Types of modulation sequence available include range gate pull off and false target generation.

Manufacturer/Contractor
Racal Radar Defence Systems, Chessington, Surrey, UK.

DECOYS

ML Aviation Barricade countermeasures system

Barricade (whose British Royal Navy designation is Outfit DLK) is designed to provide ships with an effective and lightweight means of deploying chaff and infra-red decoys as countermeasures to missile attack. The system gives a layered defence against the various phases and types of anti-ship missile attack, ranging from the long-range confusion mode, through medium-range distraction and dump modes to the close in centroid mode. The complete system consists of port and starboard launchers, safety switches, a control unit, ready-use ammunition lockers (27 rockets) and rockets. The launcher consists of six sets of triple cells, the outer three sets being angled 60° from the next in bearing so that the launchers provide all-round coverage.

Manufacturer/Contractor
ML Aviation Ltd.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

CSEE Naja electro-optical/optical directors

Naja is an improved version of the Panda Mk 2 with CILAS TMY 113 high-repetition rate Nd:YAG laser rangefinder, an automatic tracking capability, local or remote-control, a three-axis gyro unit and multiple weapon capability. The laser rangefinder operates in the 1.06 μm wavelength, has a peak power of >5 MW and a PRF of 20 pps.

Specifications

Naja
Height: 1.35 m (4.4 ft)
Width: 1.5 m (4.9 ft)
Weight: 480 kg (1,058 lb)
Elevation: −20 to +70°
Max velocity:
traverse: 60°/s
elevation: 60°/s

Manufacturer/Contractor
CSEE Défense, Paris, France.

RADARS

Racal-Decca 1226

The Type 1226 is part of the Solid State series and uses a 30 cm (11.8 in) PPI (Plan Position Indicator) display. It operates in the I-band, has 20 kW output and is equipped with a 1.83 m (6.0 ft) antenna.

Specifications

Type 1226
Role: Surface search
Frequency: I-band

Range: 48 n miles (89 km)
Beam: 1.2°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25/1.0 µs
Scan rate: 28 rpm

Manufacturer/Contractor
Racal-Decca, UK.

Marconi S 800
The Marconi S 800 is an I-band navigation radar.

GEC-Marconi S 820
These ships are fitted with the GEC-Marconi S 820 fire-control radar. The antenna is housed in the small spherical radome at the masthead.

Specifications
Role: Fire control
Frequency: E/F-band (tunable)
Beam: 3 × 30°
Peak power: 200 kW
Pulsewidth: 1.2/0.6 µs
PRF: 750/1,500 pps
Scan rate: 24 rpm
Typical range: 44 n miles (80 km)

Manufacturer/Contractor
GEC-Marconi, Chelmsford, UK.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU 16V 1163 TB82 diesels, 6.5 MW (8,880 hp) sustained
Shafts: 2

Traverse: Nominal 360° at 90°/s
Elevation: −13 to +85° at 60°/s
Crew: 2

RO/Oerlikon 20 mm in GAM-BO1 mounting

Both ships have two single Oerlikon 20 mm cannon in GAM-BO1 mountings.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 85 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 1.7 km
anti-air: 1,700 m (5,578 ft)
Rate of fire: 900 rds/min
Round weight: 320-345 g
Projectile: 110-125 g

Mounting
Elevation: −15 to +60°
Total weight: 500 kg (1,102 lb) (including shield)

12.7 mm machine guns

Two M2HB machine guns are carried. This is a selective short recoil automatic operation air-cooled weapon with a 1,143 mm long barrel using 110-round belts.

Specifications
Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

Nasr al Bahr *(L 2), giving a good view of the forward hatch covers and the travelling crane* (H & L van Ginderen Collection)

ELECTRONIC WARFARE SYSTEMS

DECOYS

ML Aviation Barricade countermeasures system

Barricade (whose British Royal Navy designation is Outfit DLK) is designed to provide ships with an effective and lightweight means of deploying chaff and infra-red decoys as countermeasures to missile attack. The system gives a layered defence against the various phases and types of anti-ship missile attack, ranging from the long-range confusion mode, through medium-range distraction and dump modes to the close in centroid mode. The complete system consists of port and starboard launchers, safety switches, a control unit, ready-use ammunition lockers (27 rockets) and rockets. The launcher consists of six sets of triple cells, the outer three sets being angled 60° from the next in bearing so that the launchers provide all-round coverage.

Manufacturer/Contractor
ML Aviation Ltd, UK.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

CelsiusTech 9LV 100 GFCS

The CelsiusTech 9LV system is intended to control one or two 30 mm to 76 mm guns against air and surface targets as well as surface-to-surface missiles. It can track up to two air or surface targets and can receive designation from search and navigation radars or designators as well as being capable of being slaved to other types of directors. The main elements of the 9LV 100 are an electro-optic director weighing 140 kg (308.7 lb) with Saab TV camera and Ericsson 1.06 µm laser with optional infra-red tracker, a control and display console with a 41 cm (16 in) screen, gun and director controls, two bridge pointers for designation, and the fire-control computer.

Manufacturer/Contractor
CelsiusTech AB, Sweden.

RADAR

Racal-Decca 1226

The Type 1226 navigation radar is part of the Solid State series and uses a 30 cm (12 in) PPI (Plan Position Indicator) display. It operates in the I-band, has 20 kW output and is equipped with a 1.83 m (6.0 ft) antenna.

Specifications
Type 1226
Role: Surface search
Frequency: I-band
Range: 48 n miles (89 km)

GENERAL SPECIFICATIONS

Operator: United Kingdom

Class: OCEAN (LPH)

Active: 0
Building: 1

Displacement:
full load: 20,500 t

Dimensions
Length: 203 m (666 ft) (oa); 193 m (633.2 ft) (pp)
Beam: 36.1 m (118.4 ft)
Draught: 6.6 m (21.3 ft)

Speed: 18 kts
Range: 8,000 n miles at 15 kts

Complement: 255, plus 206 aircrew

SHIPS

OCEAN (L12)		**Laid down**	30 May 1994
Builder		**Launched**	11 Oct 1995
Hull	Kvaerner Govan, Glasgow, UK	**Commissioned**	Mar 1998
Fitting out	VSEL, Barrow-in-Furness, Cumbria, UK		

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops
  Normal: 480 Royal Marines
  Hard lying: 800 Royal Marines
- Air wing: 206 aircrew
- Vehicles: 40 vehicles and 'most' equipment for a Royal Marine commando*

Note: *In the British Royal Marines a 'Commando' unit is equivalent in size to an infantry battalion and is some 500 strong.

SHIP-SHORE LIFT

- 4 LCVPs on davits

AVIATION FACILITIES

Specifications
Flight deck: 145 × 36 m (480 × 120 ft) (approximate). There will be six landing and six parking slots for aircraft.
Hangar: Below flight deck
Helicopters: 12 Sea King or EH 101 Merlins, plus six Lynx

Fixed-wing: Up to 20 Sea Harriers or Harrier GR7 can be carried, though not supported, with corresponding reductions in the number of helicopters carried.

AMPHIBIOUS FACILITIES

- Great attention has been paid to movement of troops within the ship, especially to the flight deck and exit ports.
- Large crane on starboard side abaft superstructure.

WEAPONS SYSTEMS

GUNS

RO 30 mm/75 in GCM-A03 mounting
Eight RO 30 mm/75 cannon in GCM-A03 twin mountings. The four mountings are on either side of the flight deck forward (two) and atop the transom (two). The GCM-A03-1 is a locally operated mounting with enclosed position which may be air conditioned, with a magazine carrying 320 or 500 rounds of ammunition. The similar GCM-A03-2 (the more likely of the two to be used on these ships) has an open operator mounting with two boxes of ammunition, each with 250 rounds.

Specifications
Gun
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Range:
anti-surface: 1.15 n miles (3 km)
anti-air: 3,500 m (11,483 ft)
Rate of fire: 650 rds/min/barrel
Ammunition: 870 kg (1,918 lb)

Mounting (GCM-A03)
Traverse: 360° at 80°/s
Elevation: −15 to +85° at 60°/s

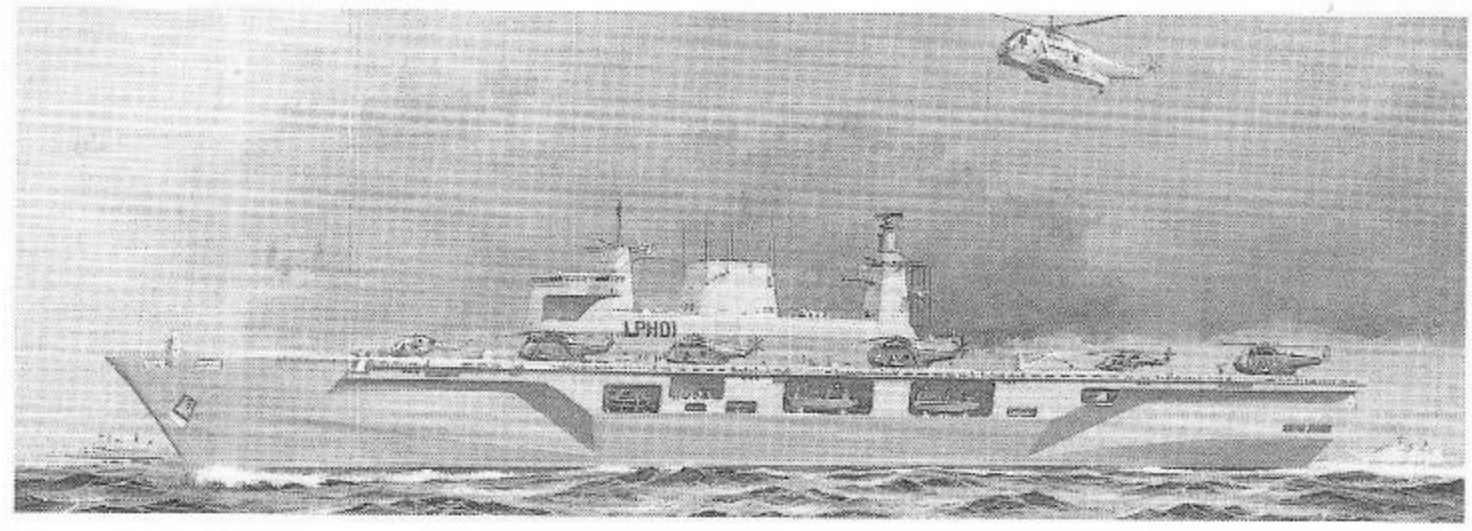
Manufacturer/Contractor
Royal Ordnance, UK.

Hughes Mk 15 CIWS Phalanx
Three Hughes Mk 15 CIWS Phalanx close in weapons systems (CIWS) will be mounted to provide the innermost layer of defence against anti-ship missiles. One will be at the forward end of the flight deck, the other two on sponsons on the transom. The 20 mm M61A1 Vulcan, six-barrel, Gatling-principal gun has a cylindrical magazine with the feed mechanism suspended beneath. Firing usually begins at 1 n mile (1.85 km) with a maximum probable kill at 460 m (1,500 ft). System reaction time is reported to be 3 seconds.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,380 ft/s)
Rate of fire: 3,000 rds/min
Range: 0.75 n miles (1.47 km) (effective, horizontal)
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

AN/UPS-2 radar
Frequency: 12-18 GHz (J-band)
System: Pulse Doppler

Manufacturer/Contractor
Hughes Missile Systems, Tucson, Arizona, USA.



The new British helicopter carrier, Ocean *(LPH 01). The hull design is based on that of the 'Invincible' class aircraft carriers, but with the internal arrangements and the flight deck optimised for helicopter operations* (VSEL)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Racal-Thorn Outfit UAT (1)

Outfit UAT(1) is based on the Racal-Thorn Sceptre XL equipment and consists of three major components: an eight-element antenna array, a receiver/processor and an operator's console, and can be integrated with the ship's command system. Processing is undertaken by a system based on transputers. An integrated receiver system is employed and software control is used heavily across the entire system. The display is based on that of the Sceptre XL with two screens, one a situation display and the other an alphanumeric tabular display with emitter data information.

Manufacturer/Contractor
Racal-Thorn Defence, Crawley, Sussex, UK.

ELECTRONIC COUNTERMEASURES (ECM)

Thorn EMI Type 675 (2) jammer

Type 675 (Guardian) is an active/passive EW system designed to counter a wide range of threats, particularly radar-guided missiles. The system counters and confuses surveillance and missile homing radars by the use of selective jamming techniques for both area and point defence. Coverage is 360° in azimuth and 50° in elevation, with a detection range of up to 270 n miles (500 km). Type 675 has two antenna mounts to ensure uninterrupted all-round view, which can be installed either port and starboard, or forward and aft. Each antenna mount carries a direction-finding receiving antenna together with transmit antennas, using mechanical steering to give full azimuth and elevation coverage. Received signals are passed to a wideband receiver, where they are analysed and those representing a threat are then processed to allow generation of the jamming signal. High-power transmitter subsystems, matched to the antenna, provide jamming capability against several types of target simultaneously. A comprehensive ECM library stores the appropriate countermeasures to a range of potential threats and, on receipt of a warning from the ESM system, the ECM processor selects the appropriate jamming mode to give fast response.

Manufacturer/Contractor
Thorn EMI Electronics Ltd, Crawley, Sussex, UK.

DECOYS

Outfit DLJ

Outfit DLJ is the British Royal Navy designation for the NATO Sea Gnat system. Eight Sea Gnat 130 mm/102 mm launchers will be mounted in *Ocean*. The system uses a new control unit, new launcher with 130 mm tubes and new munitions. The control unit provides for the launching of the most effective combination of rounds for distraction and centroid/seduction, taking into account the type, speed and direction of the threat, the ship's speed and heading as well as wind direction and speed.

The munitions involved are the Mk 214 RF seduction and Mk 216 RF distraction rounds which are provided by Chemring Ltd. A Mk 218 IR seduction round entered service in 1995.

The basic system, Outfit DLB, has four Hunting Engineering 130 mm six-barrel launchers which are grouped in pairs on either beam and a modified version replaces the rear two barrels with 102 mm barrels for N4 rockets pending introduction of the Mk 216 Mod 1. The version planned for *Ocean* is Outfit DLJ, which is a version of Outfit DLB optimised for larger warships: DLJ(1) has four DLB and four DLD (SRBOC) launchers, while DLJ(2) has eight DLB launchers.

Manufacturers/Contractors
Thorn EMI/AB Precision Ltd (control unit)
Hunting Engineering (launchers).
Chemring Ltd (munitions).

Outfit DLH offboard decoys

Outfit DLH is also known as 'Replica', 'Rubber Duck' and, in the US Navy, as AN/SLQ-49. The system is a rapidly deployed, passive naval decoy which presents a ship-like image to the radar seeker of an incoming anti-ship missile. The equipment consists of a launcher and a pair of liferaft-type containers, each housing one octahedral-shaped radar reflector. The two reflecting bodies start to inflate as they leave the ship and, once in the water, they are linked to each other by a 5 m (16 ft) line with one of the container lids acting as a sea-anchor to ensure that they remain apart. The distance between the opposite tips of the decoy is approximately 2.5 m (8.2 ft) and it contains metal-coated nylon mesh curtains which are suspended from aluminium alloy tubes.

Manufacturer/Contractor
Irvin, Letchworth, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

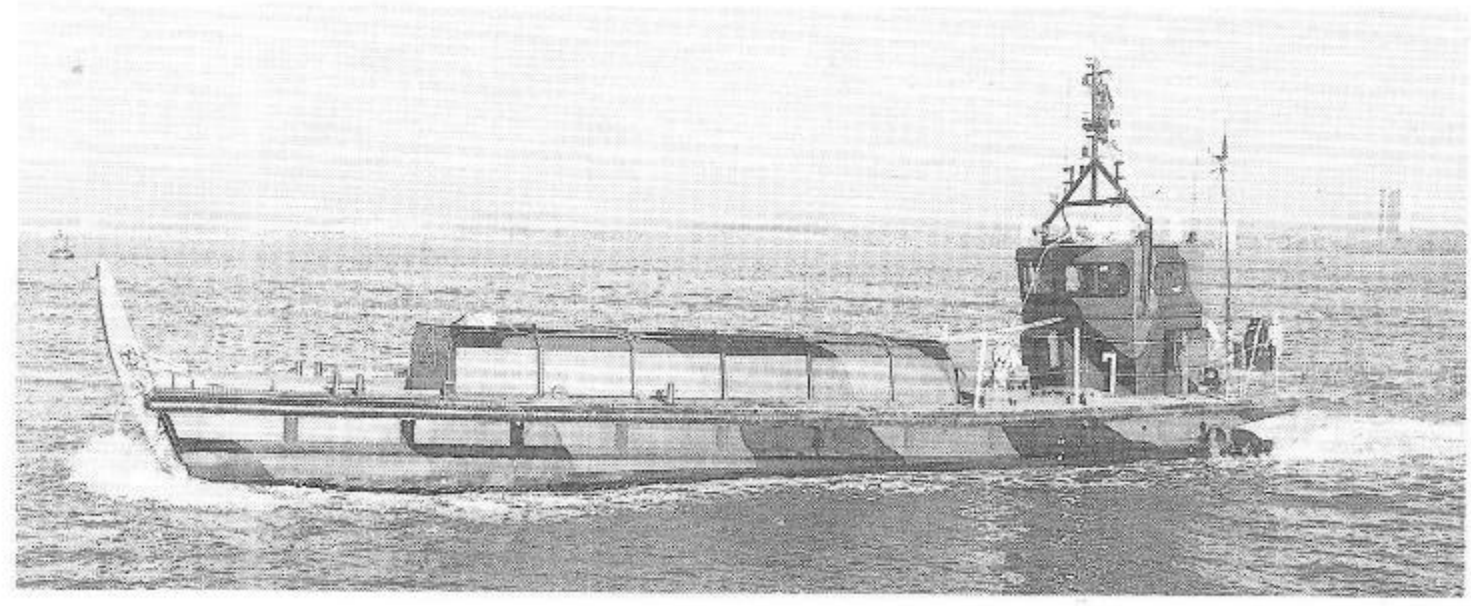
Ferranti ADAWS 2000

ADAWS creates a detailed picture of the air, surface and subsurface tactical situation around a task group or task force and directs responses to threats. The systems differ in detail but they are usually optimised for air defence and the following description of ADAWS 4/7 is generally applicable to the other systems.

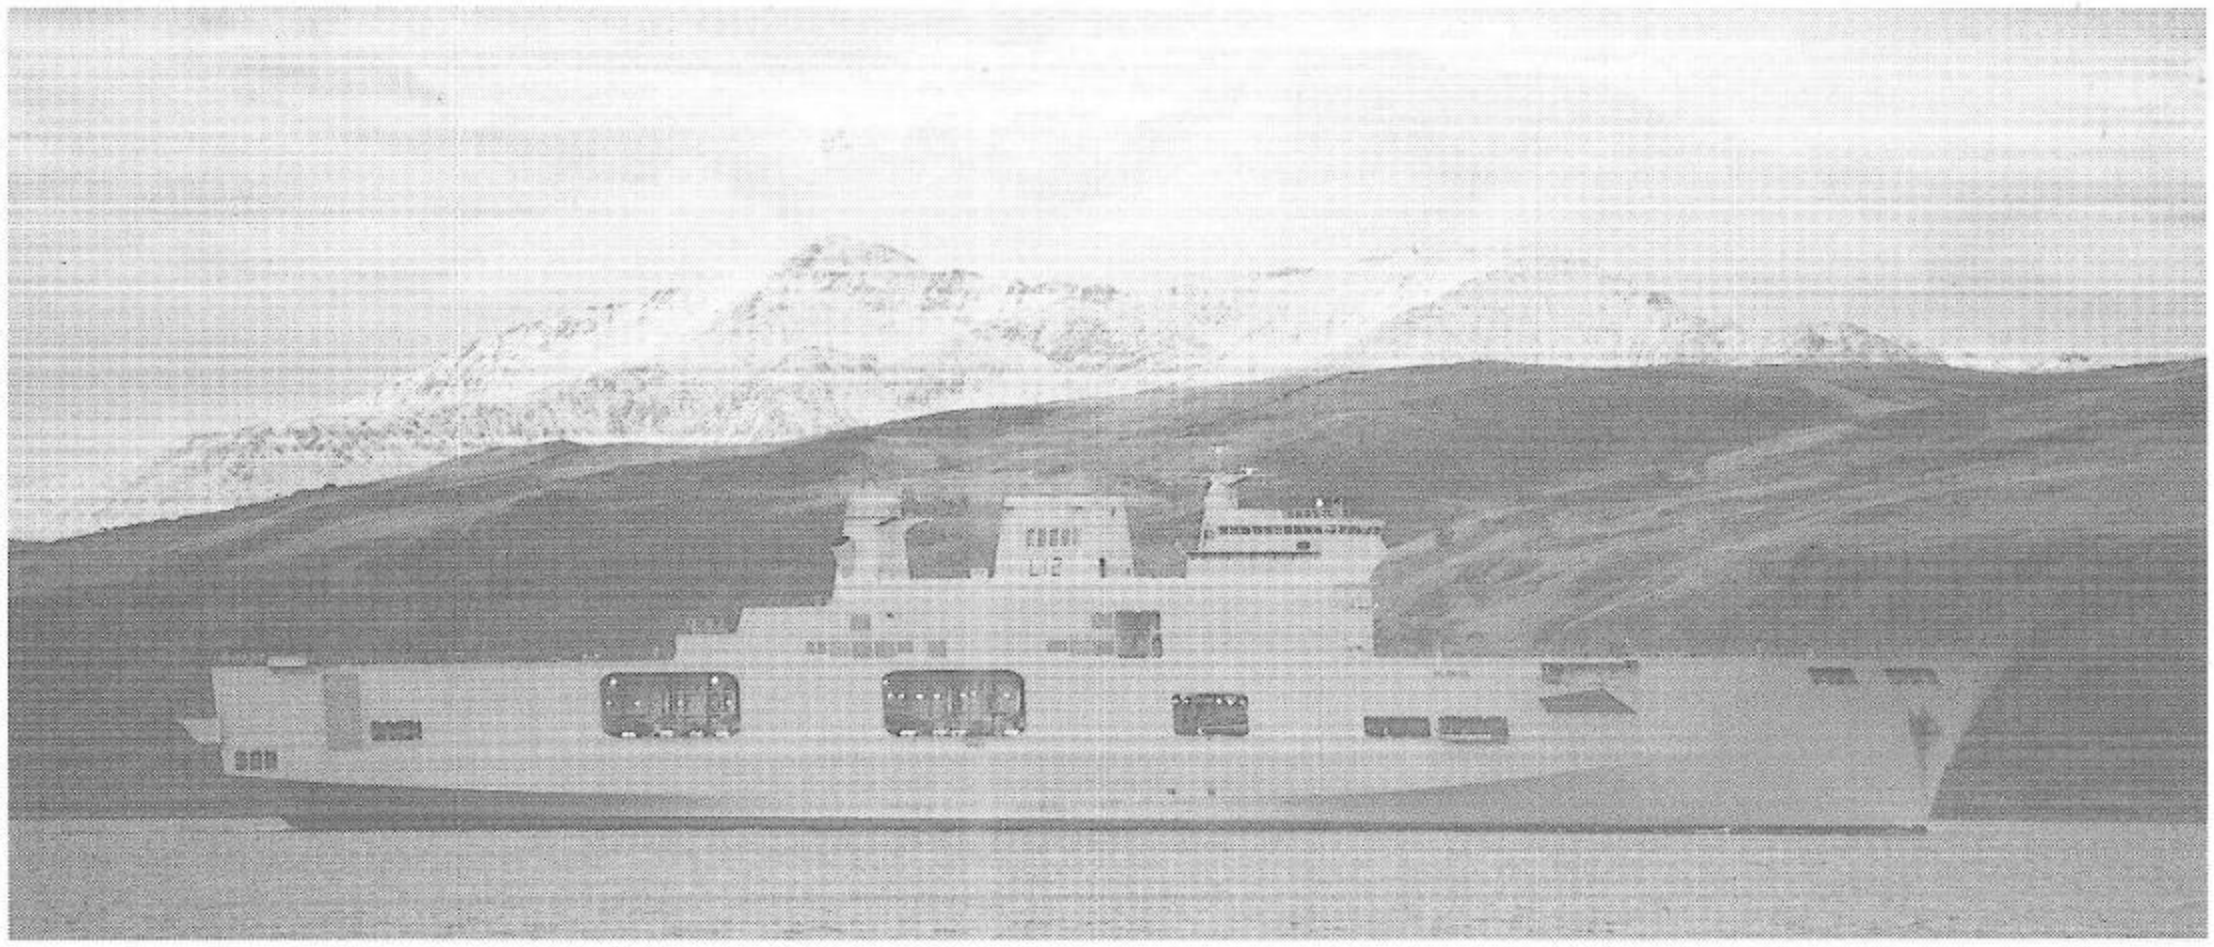
ADAWS is a mainframe architecture system based upon two Ferranti computers using Coral 66 language software. The computers receive data from ship sensors and from off-ship radars (via Link 11), process them and then present the result to the display systems. A DataLink PreProcessor (DLPP) is included to act as an interface with the Link 11 datalink. The computers also evaluate the threats from different targets and designate them to the most appropriate weapon system. They can also calculate data for controlling the operational use of both ASW helicopters and fighters. Autotracking of targets is available using LFX (Limited area/Full eXtraction) and LAX (Limited area Auto eXtraction) with or without auto-initiation of tracks. The system also features an AS 1077 sonar trainer, for onboard training, and is linked to the sensors and displays by a data highway.

ADAWS 2000 makes considerable use of commercial off-the-shelf (COTS) hardware and uses two F2420 computers but with an Ethernet standard local area network supplementing the CSH in the Royal Navy. The system supports workstations, single or double display consoles which can operate with Ada and C language software. Ada, Assembler and some limited Coral 66 software are used for the input/output gateway which links the consoles to the local area network, as well as providing the interface between CSH and the Ethernet highways.

The consoles will be based upon Motorola 68000 family microprocessors, UNIX, X-Windows and Motif software, and will use COTS software including an encyclopaedic database and spreadsheets for planning, fast signal traffic transfer using the e-mail package and the Maritime Asset Planning System (MAPS). The consoles have a radar scan converter and a powerful graphics engine with an HCI selected from QWERTY keyboards, electroluminescent panels, touchscreen,



The new LCVP Mk 5 developed specifically for use aboard Ocean. *The craft displaces 20 tonnes fully loaded and carries 35 troops or a 35 tonne payload at speeds up to 17 knots* (Vosper Thornycroft)



Ocean *en route from Glasgow to Barrow-in-Furness for fitting-out* (H M Steele)

rollerball, mouse or joystick. There will be 48.26 cm (19 in) 1,280 × 1,024 pixel display screens and the consoles will be capable of operating for 10 minutes after the total loss of ship's power. The system features a 1,000 track database on which 10 per cent can be updated every second. It will interface with up to seven radars, and with all sensors and weapon control systems and will be capable of data fusion, aircraft control and amphibious operations.

Manufacturer/Contractor
Ferranti International Defence Systems Integration.

RADARS

Air/surface search: Plessey Type 996, using E/F-Band
The Plessey Type 996 is used for air/surface search. This is an E/F-band, 3D surveillance and target indication radar and there is an unconfirmed report that the radar is equipped with a jammer location receiver subsystem.

Specifications
Type 996(2)
Role: Air/surface search
Frequency: E/F-band
Beam: 1.4 × 1.5°
Peak power: 125 kW
Gain: 41 dB
Pulsewidth:
low angle: 65 µs
high angle: 31.5 µs
PRF: 550-3,000 µs
Scan rate: 12.5-20 rpm
Typical range: More than 80 n miles (150 km) against MPA (maritime patrol aircraft)

Manufacturer/Contractor
Siemens Plessey Systems, Air Defence Division, Cowes, Isle of Wight.

Kelvin Hughes Type 1007
Two Type 1007s are used for surface search, navigation and carrier-control approach. The Type 1007 is the standard I-band navigation radar for the UK Royal Navy.

Specifications
Type 1007
Role: Navigation/surface search/CCA
Band: H/I (9,410 MHz)
Beam: 1.0 × 18°/0.75 × 18°
Peak power: 25 kW
Pulsewidth: 0.08/0.3/0.8 µs
PRF: 1,600/800/400 pps
Scan rate: 26 rpm

Manufacturer/Contractor
Kelvin Hughes Ltd, Hainault, Essex, UK.

PROPULSION

Specifications
System:
Main machinery: 2 Crossley-Pielstick 16 PC2.6 V 400 diesels, 17.57 MW (23,904 hp) sustained

Shafts: 2
Propellers: 2 KaMeWa controllable pitch
Thruster: 1 bow thruster

FURTHER INFORMATION

PROGRAMME

The British Royal Navy was one of the early pioneers of vertical (helicopter-borne) assault and several otherwise redundant light fleet, fixed-wing aircraft carriers were refitted as 'commando carrier' in the 1950s, 1960s and 1970s. With the retirement of *Bulwark* (R 08) in 1981 there was a long period during which there was no dedicated commando carrier and the bid for a replacement failed to achieve sufficient priority for it to be funded. There was a brief period of optimism in 1987 when 'invitations to tender' were issued to industry, but these were allowed to lapse. Eventually, the contract was placed in 1993, with the hull to be built by Kvaerner/Govan on Clydeside, Scotland, with outfitting to take place at the VSEL yard at Barrow-in-Furness. There was some damage to the hull at the launch, but it was repaired without disrupting the schedule and the ship moved to Barrow-in-Furness in November 1996 for completion.

It is intended that *Ocean* should provide a helicopter lift and assault capability. The prime role will be to embark, support and operate a squadron of helicopters, currently Westland Sea King HC-4s, later EH 101 Merlins, and carry most of a Royal Marines commando unit, including vehicles, arms and ammunition. A second of the class is needed to meet the operational requirement fully; without it, the LPH will link with the new LPDs *Albion* and *Bulwark*.

DESIGN

Unlike its predecessors, *Ocean* is a purpose-built helicopter carrier (LPH) and is intended to provide the major proportion of the helicopter-carrying capacity for an amphibious assault group, with the balance being provided by the new LPDs, which were ordered in July 1996. Very careful consideration has been given to the proper accommodation of troops, and to efficient and rapid outloading, which should make it among the most effective of its type in any navy.

The hull form is based on that of the 'Invincible' class aircraft carriers with a modified superstructure and a large flight deck, which is strong enough to take Chinook helicopters. Unlike the Invincible design there is no separate forecastle, thus restricting the arena available to aircraft, but it has still been found unavoidable to locate a Phalanx CIWS in the eyes of the ship. Despite the intended secondary use of the ship for V/STOL Harriers and Sea Harriers there is no ski ramp to assist take off as that would restrict helicopter operations.

There are two centreline lifts of sufficient size to handle EH101 Merlin helicopters (with rotors and tail folded) and Sea Harriers. They will not, however, accept Chinook helicopters which, if embarked, will remain on the flight deck.

Sea Harrier and Harrier V/STOL aircraft can be embarked.

ALBION

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops:
  Normal 300
  Hard lying 600
- Vehicles: 70 support vehicles

SHIP-SHORE LIFT

- 4 LCU Mk 10 in dock
- 4 LCVP Mk 5 on davits

AVIATION FACILITIES

Specifications
Flight deck: Large flight deck aft
Hangar: In after end of superstructure
Helicopters: Two Merlin EH 101

AMPHIBIOUS FACILITIES

- Docking well entered through stern gate.
- 4 davits for LCVP Mk 10
- Large crane on starboard side of flight deck
- Side ramp access.

WEAPONS SYSTEMS

GUNS

RO 30 mm/75 in GCM-A03 mountings
Eight RO/BMARC 30 mm/75 cannon in four GCM-A03 twin mountings. The four mountings are on either side of the flight deck forward (two) and atop the transom (two).

Specifications
Gun
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Range:
anti-surface: 1.15 n miles (3 km)
anti-air: 3,500 m (11,483 ft)
Rate of fire: 650 rds/min/barrel
Ammunition: 870 kg (1,918 lb)

Mounting (GCM-A03)
Traverse: 360° at 80°/s
Elevation: −15 to +85° at 60°/s

Manufacturer/Contractor
Royal Ordnance, UK.

Signaal/Hughes SGE-30 30 mm Goalkeeper close in weapons system
Two Signaal/Hughes 30 mm 7-barrelled Gatling Goalkeeper close in weapons system will be installed. One will be mounted on a pedestal on the foredeck, the other on the hangar roof.

Goalkeeper is an autonomous, fully automatic system consisting of a Hughes Sea Vulcan 30 gun, I-band search radar, I/K-band tracking radar, TV camera, and ancillaries. The Sea Vulcan 30 is based upon the electrohydraulically powered GAU-8/A 30 mm seven-barrel, Gatling gun, with each barrel firing once during each revolution of the barrel cluster. The gun is very reliable, with 33,000 mean rounds between stoppages. The mounting has an ammunition capacity of 1,190 rounds carried in a linkless system using a feed and storage drum, which is claimed to be sufficient for several target engagements before reloading is necessary. The warhead kill capability of Goalkeeper against anti-ship missiles is achieved by use of MPDS rounds which have high-density, tungsten alloy penetrators. For 'soft' targets, HEI and TP types of ammunition can be used.

The I-band search radar uses a 2,050 × 280 mm linear array antenna with an integrated sidelobe suppression antenna. The antenna rotates at 60 rpm and has a horizontal beamwidth of 1.7° and a vertical beamwidth of 60°. The radar is powered by a water-cooled, synthesiser-driven, TWT transmitter with high output

power for greater frequency and PRF flexibility in the face of ECM threats.

Specifications
Calibre: 30 mm
Muzzle velocity: 1,020 m/s (3,346 ft/s) (TP, HEI); 1,150 m/s (3,773 ft/s) (APDS)
Traverse: 360°
Elevation: −25 to +85°
Mounting weight: 6,800 kg (14,994 lb)
Crew: 0
Range: 200 m to 3 km (1.61 n miles)
Rate of fire: 4,200 rds/min
Ammunition: 369 g (TP, HEI, HEISD, API, MPDS)

Manufacturers/Contractors
Hollandse Signaalapparaten, Hengelo, The Netherlands (system/radar).
Hughes, Armament Systems Department, USA (gun).

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Racal-Thorn Outfit UAT (1)
Outfit UAT(1) is based on the Racal-Thorn Sceptre XL equipment and consists of three major components: an eight-element antenna array, a receiver/processor and an operator's console, and is integrated with the ship's command system. Processing is undertaken by a system based on transputers. An integrated receiver system is employed and software control is used heavily across the entire system. The display is based on that of the Sceptre XL with two screens, one a situation display and the other an alphanumeric tabular display with emitter data information.

Manufacturer/Contractor
Racal-Thorn Defence, Crawley, Sussex, UK.

ELECTRONIC COUNTERMEASURES (ECM)

Thorn EMI Type 675 (2) jammer
Type 675 (Guardian) is an active/passive EW system designed to counter a wide range of threats, particularly radar-guided missiles. The system counters and confuses surveillance and missile homing radars by the use of selective jamming techniques for both area and point defence. Coverage is 360° in azimuth and 50° in elevation, with a detection range of up to 270 n miles (500 km). Type 675 has two antenna mounts to ensure uninterrupted all-round view, which can be installed either port and starboard, or forward and aft. Each antenna mount carries a direction-finding receiving antenna together with transmit antennas, using mechanical steering to give full azimuth and elevation coverage. Received signals are passed to a wideband receiver, where they are analysed and those representing a threat are then processed to allow generation of the jamming signal. High power transmitter subsystems, matched to the antenna, provide jamming capability against several types of target simultaneously. A comprehensive ECM library stores the appropriate countermeasures to a range of potential threats and, on receipt of a warning from the ESM system, the ECM processor selects the appropriate jamming mode to give fast response.

Manufacturer/Contractor
Thorn EMI Electronics Ltd, Crawley, Sussex, UK.

DECOYS

Outfit DLJ
Outfit DLJ is the British Royal Navy designation for the NATO Sea Gnat system. Eight Sea Gnat 130 mm/102 mm launchers will be mounted in each LPD (R). The system uses a new control unit, new launcher with 130 mm tubes and new munitions. The control unit provides for the launching of the most effective combination of rounds for distraction and centroid/seduction, taking into account the type, speed and direction of the threat, the ship's speed and heading as well as wind direction and speed.

The munitions involved are the Mk 214 RF seduction and Mk 216 RF distraction rounds which are provided by Chemring Ltd. A Mk 218 IR seduction round entered service in 1995.

The basic system, Outfit DLB, has four Hunting Engineering 130 mm six-barrel launchers which are grouped in pairs on either beam and a modified version replaces the rear two barrels with 102 mm barrels for N4 rockets pending introduction of the Mk 216 Mod 1. The version planned for the two LPDs is Outfit DLJ which is a version of Outfit DLB optimised for larger warships: DLJ(1) has four DLB and four DLD (SRBOC) launchers, while DLJ(2) has eight DLB launchers.

Manufacturer/Contractor
Thorn EMI/AB Precision Ltd (control unit).
Hunting Engineering (launchers).
Chemring Ltd (munitions).

Outfit DLH offboard decoys
Outfit DLH is also known as 'Replica', 'Rubber Duck' and in the US Navy as AN/SLQ-49. The system is a rapidly deployed, passive naval decoy which presents a ship-like image to the radar seeker of an incoming anti-ship missile. The equipment consists of a launcher and a pair of liferaft-type containers, each housing one octahedral-shaped radar reflector. The two reflecting bodies start to inflate as they leave the ship and, once in the water, they are linked to each other by a 5 m (16 ft) line with one of the container lids acting as a sea-anchor to ensure that they remain apart. The distance between the opposite tips of the decoy is approximately 2.5 m (8.2 ft) and it contains metal-coated nylon mesh curtains, which are suspended from aluminium alloy tubes.

Manufacturer/Contractor
Irvin, Letchworth, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

ADAWS 2000 Command System
ADAWS 2000 has been developed from proven ADAWS software, using an Open Systems architecture to produce a low-risk, high-performance system. The system offers a 1,000 track database with over 100 track updates per second and interfaces with a maximum of seven radar, IFF, sonar, all missile and gun systems, datalinks and EW equipment. In addition to weapon control and Threat Evaluation and Weapon Assignment (TEWA) it employs the latest data fusion techniques to present a clear tactical picture from multi-platform inputs over large operational areas. Commercial Off-The-Shelf (COTS) hardware and software is used with modular software (Ada, C and Assembler) for each function and common infrastructure software. Radar Scan Conversion is used for the multiple radar inputs and a powerful graphics engine drives single or twin colour consoles and large-screen displays which feature CCTV input, electroluminescent and touch panels with soft keys and pull-down menus. The system has a dual-redundant Ethernet LAN which connects to the dual-redundant Combat System Highway.

Manufacturer/Contractor
GEC-Marconi Naval Systems Ltd, Combat Systems Division, Addlestone, Surrey.

FURTHER INFORMATION

PROGRAMME

Like numerous other British projects, the LPD(R) (R = replacement) has had a very protracted gestation period, and while the discussions grew longer, the two ships to be replaced (*Fearless* and *Intrepid*) have become ever older and more expensive to maintain.

Three yards (VSEL, Yarrow and Vosper-Thornycroft) were invited to bid, but only one eventually tendered. The UK Ministry of Defence announced on 18 July 1996 that it had placed a UK £450 million order with GEC-Marine to build the two LPDs at the VSEL shipyard at Barrow-in-Furness, Cumbria. The ships will be named *Albion* and *Bulwark* (taking the names of two previous amphibious warfare ships) and are expected to enter service 'early in the next decade'. This was originally intended to be August 2000 and October 2002, respectively, but this has been delayed due to prevarication over the placing of the order.

The two new ships will replace the existing assault ships, *Fearless* and *Intrepid,* and will be based at Plymouth, Devon, UK.

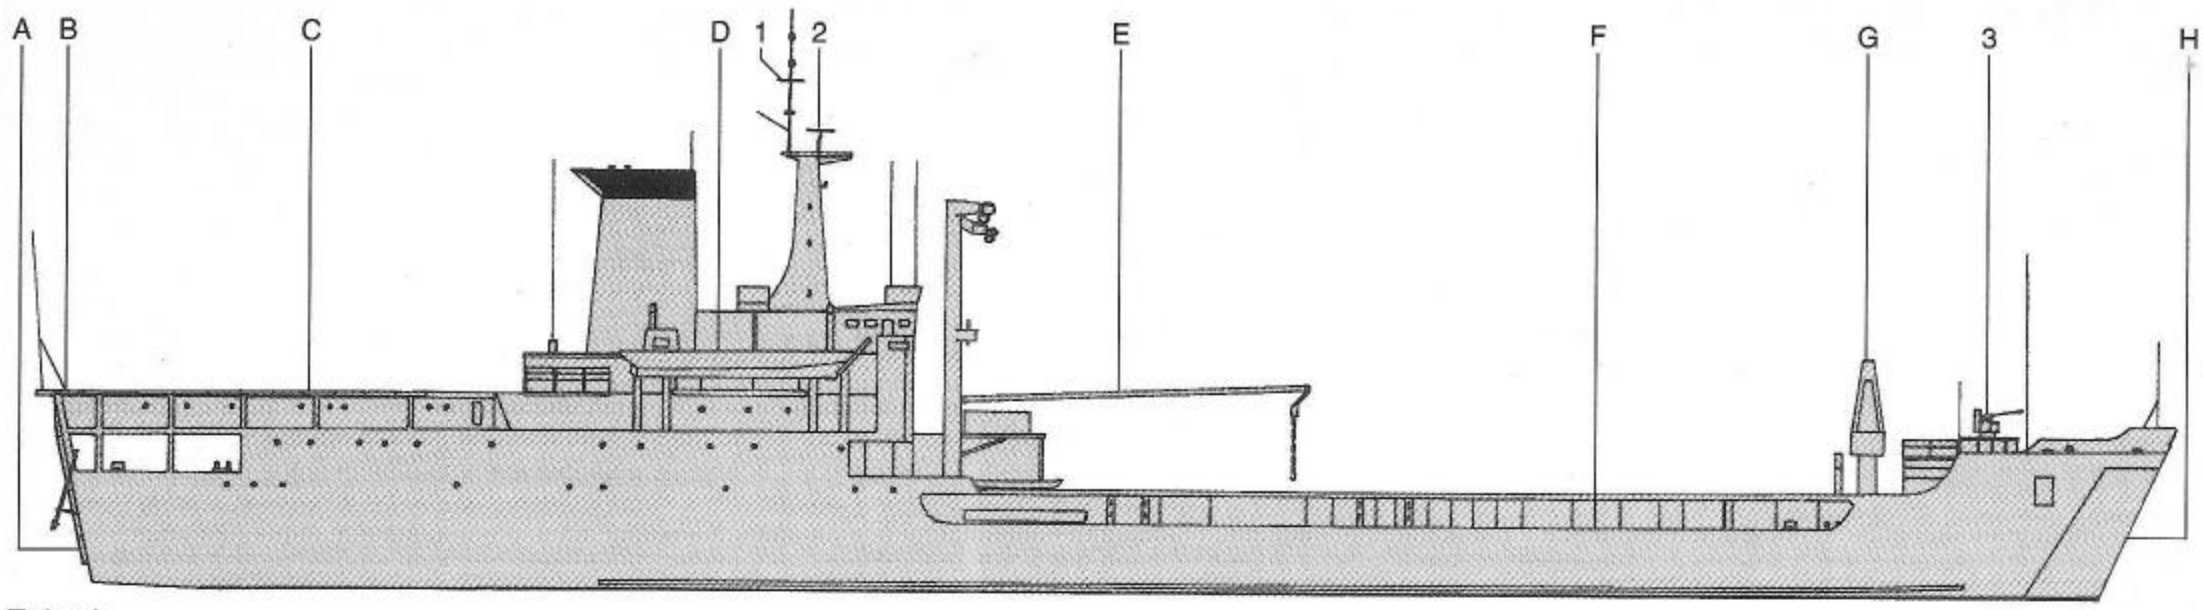
General 1 *Satcom* **2** *Kelvin-Hughes Type 1007 navigation radar* **3** *INMARSAT*

The British LSLs stem from a staff requirement issued by the War Office (the predecessor to the present-day Ministry of Defence (Army Department)) in the late 1950s to replace the wartime Landing Ships Tank Mk 3 (LST(3)). First to be completed was *Sir Lancelot* (L 3029), which served, in effect, as a prototype and the remaining five were of a slightly larger design. The ships were procured by the Ministry of Transport on behalf of the British Army, and were named after six of the twelve legendary 'Knights of the Round Table', but their operation was originally contracted to the British India Steamship Line. In 1970 the ships were taken over by the Royal Navy, which managed them on behalf of the Army, but designated the ships Royal Fleet Auxiliaries (Government-owned merchant ships) and manned them with officers and mariners of the Royal Fleet Auxiliary Service (RFA), which has operated them ever since.

Their peacetime role has always been logistical in nature, transporting troops, equipment, materiel and ammunition in support of the Army, either on routine peacetime deployments or on exercises. In the 1982 Falklands (Malvinas) War, however, they served as front-line amphibious warfare ships, taking part in the main British landing at San Carlos, while two were later bombed (8 June 1982) by A-4 Skyhawks of the Argentine Navy when taking part in a landing operation at Bluff Cove. The two ships, *Sir Galahad* and *Sir Tristram,* were both severely damaged. *Sir Galahad* (i) caught fire and there were numerous casualties, and after the war the hulk was towed out to sea and sunk as a war grave.



Tobruk
Amphibious A *Stern door* **B** *Kedge anchors* **C** Flight deck **D** *LCVP (two)* **E** *70 tonne derrick* **F** *Tank deck* **G** *4.25 tonne crane (two)* **H** *Bow doors*

General 1 *Kelvin Hughes Type 1006 surface search radar* **2** *Racal Decca RM 916 navigation radar* **3** *Bofors 40 mm gun (two)*

The other ship, *Sir Tristram,* was less badly damaged and was used as an accommodation ship in Stanley Harbour until June 1983 when it was carried back to the UK aboard a transporter ship to be rebuilt.

The work carried out on *Sir Tristram* amounted to a rebuild to the existing design, but with some improvements, which included replacing the aluminium alloy superstructure, which had been virtually destroyed in the Argentine attack, with a new steel structure. This resulted in a major increase in weight aft, which had to be compensated by lengthening the hull, with an 8.84 m (29 ft) plug being inserted in the forward part of the ship to restore the balance. This, of course, resulted in increased carrying capacity, but that was an incidental advantage and not the fundamental reason for the plug. Other changes include a new flight deck, which is slighlty longer and narrower than previously, and a new gantry-type mainmast.

Meanwhile, the loss of *Sir Galahad* was made good by the construction of a new replacment ship[1]. Although the replacement ship was built to the same basic design, the opportunity was taken to incorporate improvements including a longer hull, a new type of bow door, and new engines.

Faced with the approaching end of life of the remaining three original LSLs the Ministry of Defence decided to give *Sir Bedivere* a much more fundamental rebuild, designated the Ship Life Extension Programme, or SLEP, which results in what amounts to a new ship. This is described in the 'Sir Bedivere (SLEP)' entry below.

The UK has an urgent need to expand its amphibious capabilities and a variety of options has been examined. The situation has been partially eased by leasing the civilian ro-ro ship, *Sea Consort,* to meet the requirements of the Joint Rapid Deployment Force (JRDF). One of the choices facing the planners lay between purchasing the redundant Australian heavy-lift ship, *Tobruk* (which is, in fact, to virtually the same design as the LSLs) or to SLEP the remaining two original LSLs. At one stage these two proposals were considered of equal merit, but it now appears that the LSL SLEP option is the favoured one, although a final decision will not be made until the work on *Sir Bedivere* has been completed and its effectiveness assessed.

All LSLs have two landing spots: one on the flight deck and a second on the foredeck. Note also the stern ramp and the two kedge anchors, used to assist in hauling the ship off a beach

The tank deck of an LSL transporting vehicles on a UN deployment, a role these ships have frequently had to fulfil over the past decade

Sir Geraint *(L 3027) is representative of the original standard of the UK LSLs. Note the clamshell bow doors, the twin 4 tonne cranes at the forward end of the vehicle deck and the 20 tonne crane at the after end. If not used for vehicles the foredeck can be used as a helicopter landing deck. Only two of the British-operated ships —* Sir Geraint *and* Sir Percivale *— remain at this standard* (UK MoD)

The rebuilt Sir Tristram *(L 3505) with a MEXEFLOTE strapped to the side. The MEXEFLOTE (Military EXperimental Establishment FLOTation Equipment) is a modular, self-propelled pontoon used to move troops and vehicles between ship and shore*

It is however, reported that the SLEP is taking considerably longer than forecast and that much extra work has been done — all of which has increased the cost very considerably. In fact, a third option — building two completely new ships, may be the most cost-effective solution.

Footnote: [1] The British pennant number system causes a difficulty in that the new ship has exactly the same name and pennant number, *Sir Galahad* (L 3005), as the original ship. For the purposes of this book, they will be referred to as: the original ship, launched in 1966 and sunk in 1982 — *Sir Galahad* (i); the new ship launched in 1986 — *Sir Galahad* (ii).

OTHER DESIGNS

The basic LSL design gave rise to some derivatives and the Australian LSL, *Tobruk,* is so close as to be included in the same class. In addition, the replacement *Sir Galahad,* while larger, is generally similar in design and layout. The Indian 'Magar' class, on the other hand, although it has certain superficial similarities with the British LSLs, is a completely different design.[2]

Footnote: [2] Confirmed by UK MoD.

DEPLOYMENT

The British LSLs are constantly operational, operating from the military port at Marchwood in support of the British armed forces and, to a lesser extent, the other two Services. All of the class saw action in the Gulf War of 1990/91, being fitted with additional 20 mm guns, decoy systems and navigation equipment.

SUMMARY

In summary seven LSLs were built and seven are in service:

- *Perseverance,* in service with the Republic of Singapore Navy (RSN) was the original *Sir Lancelot.*
- *Sir Geraint* and *Sir Percivale* are the last two in British service still in their original state. Their future is uncertain.
- *Sir Tristram* was given a complete reconstruction after being damaged in the Falklands War; it is now longer than *Sir Geraint* and *Sir Percivale* but otherwise generally similar.
- *Sir Bedivere* is currently undergoing a SLEP and will be different from *Sir Tristram.*
- *Sir Galahad* (ii) was built as a replacement for *Sir Galahad* (i) and is to a modified and modernised design.
- *Tobruk* was built in Australia and is generally similar to *Sir Geraint.*

Builder	Fairfield, Glasgow, UK	**Transferred to UK Royal Fleet Auxiliary**	1970 (RFA *Sir Lancelot* (L 3029))	**Recommissioned (Republic of Singapore Navy)**	5 May 1994 *(Perseverance)*
Laid down	Mar 1962	**Paid off by RFA**	1989		
Launched	25 Jun 1963	**On various civil registers**	1989-1992 *(Lowland Lancer)*		
Entered service (British Army)	16 Jan 1964 (SS *Sir Lancelot)*	**Purchased by Singapore**	Oct 1992		

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops
  normal: 340
  hard-lying: 534
- Tanks: 16
- Mixed vehicles: 34
- Petroleum, oil and lubricants: 120 tonnes
- Ammunition: 30 tonnes

SHIP-SHORE LIFT

- Facilities exist for two MEXEFLOTE self-propelled pontoons to be carried (each MEXEFLOTE carried reduces vehicle deck capacity by seven 4-tonne (equivalents). However, it is not known whether the RSN has purchased MEXEFLOTES.
- Two Fast Craft Utility (FCU) on davits

AVIATION FACILITIES

Specifications
Flight deck: Platform for two medium helicopters
Hangar: None
Helicopters: The RSN does not operate helicopters, but army helicopters could be embarked

AMPHIBIOUS FACILITIES

- Fitted for bow and stern loading with drive-through facilities and deck-to-deck ramps.
- One 20 tonne crane; two 4.5 tonne cranes.

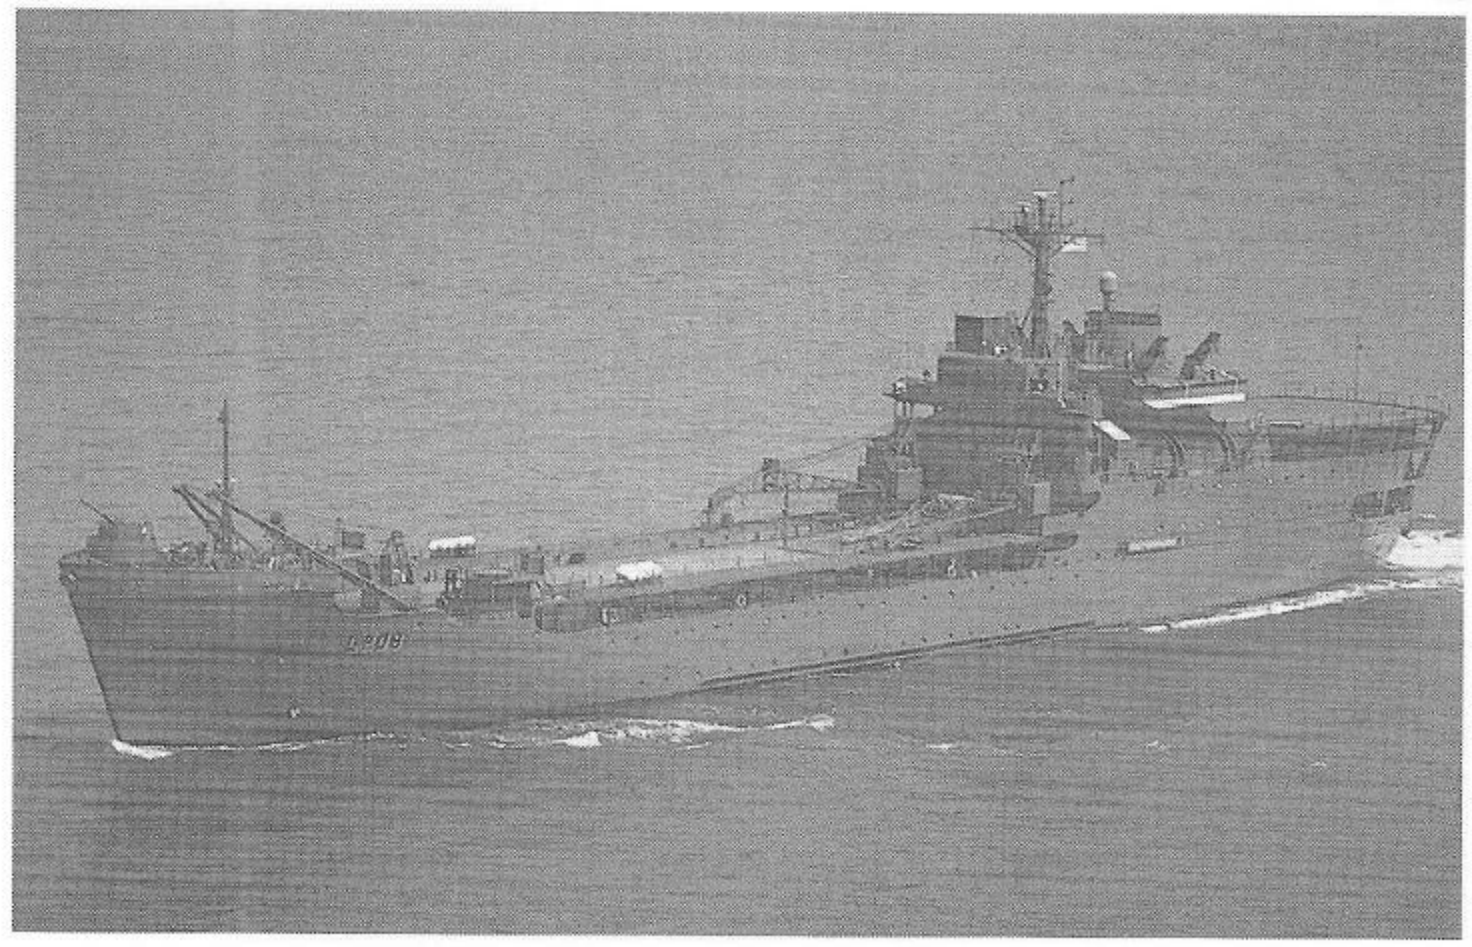
WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

Matra SIMBAD close in weapons system
There are four SIMBAD *(Système Intégre de Mistral Bi-tube d'Auto-Défense)* launchers, each with two Mistral missiles. The Mistral missile contains a SAT two-colour (3-5 µm infra-red and ultraviolet) seeker under IR-transparent magnesium fluoride panels. The seeker has a field of view of ±38° and is cooled concurrently with gyro run-up, in approximately 2 seconds. The whole system has a reaction time of approximately 5 seconds and the missile leaves its launch tube with a velocity of 40 m/s (131 ft/s) accelerating rapidly to its maximum speed of Mach 2.5.

SIMBAD is manually operated, with two missile launcher-containers. When the target is designated, the operator tracks it, selects a missile and activates the battery/coolant unit to cool the seeker and warm up the missile, while the prelaunch electronics box uses the seeker to determine whether or not the target is within range. If the answer is positive, the seeker locks on and the operator receives an audio signal allowing him to launch the missile. If, for some reason, the firing has to be postponed, the missile system automatically compensates minor aiming errors and remains ready for launch.

Specifications
Mistral Missile
Length: 1.81 m (6.0 ft)
Diameter: 9.2 cm (3.6 in)
Wing span: 1.9 cm (0.7 in)
Weight: 18.4 kg (40.5 lb)
Speed: Mach 2.6
Range: 700 m to 5 km



Perseverance *(L 206) under the Singapore flag. Note the Bofors 40 mm on the forecastle, the box-shaped structure on the bridge roof (purpose unknown) and the satellite antenna above the stack* (Republic of Singapore Navy)

Warhead:
HE: 1 kg (2.2 lb)
tungsten balls: 1.95 kg (4.3 lb)
Booster: 2 SNPE rocket motors

Manufacturer/Contractor
Matra Defénse, France.

GUNS

One Bofors 40 mm/70
There is one Bofors 40 mm/L 70 mounting in the bows.

Specifications
Calibre: 40 mm

Length of barrel: 70 calibres
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Rate of fire: 300 rds/min
Ammunition: 2.4 kg (5.3 lb) (HCHE, PFHE), 2.5 kg (5.5 lb) (HE-T)

M2HB 12.7 mm machine guns

Six M2HB 12.7 mm (0.50 in) machine guns are carried.

Specifications
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

COMMAND AND CONTROL SYSTEMS

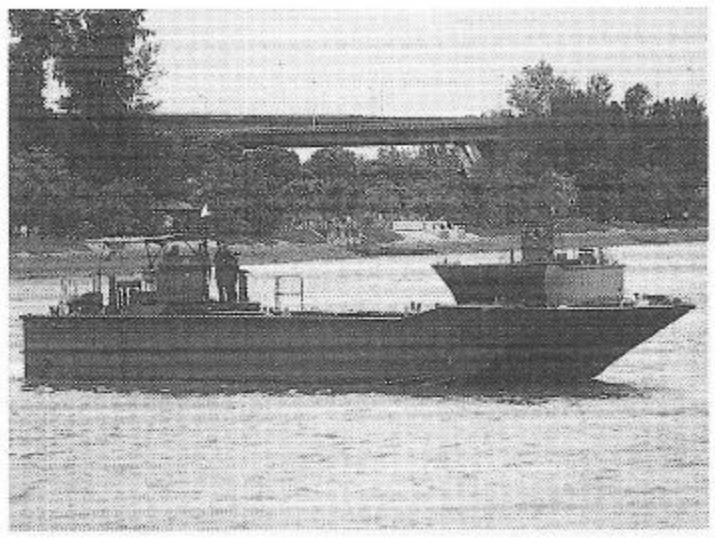
RADARS

Kelvin Hughes Type 1006

The Type 1006 has, for many years, been the standard I-band navigation radar for the British Royal Navy and many other navies.

Specifications
Type 1006
Role: Navigation
Frequency: I-band (approximately 9,445 MHz)
Beam: 1 × 18°/0.75 × 18°
Peak power: 25 kW
Gain: 31 dB/34 dB
Pulsewidth: 0.8 or 0.25/0.75 µs
PRF: 1,600/800 pps
Scan rate: 24 rpm
Typical range: 64 n miles

Manufacturer/Contractor
Kelvin Hughes Ltd, Hainault, Essex, UK.



Two Singapore-designed and built Fast Craft Utility (FCU) are carried on davits. These craft can carry a load of 18 tonnes at a speed of 20 knots
(David Boey)

PROPULSION

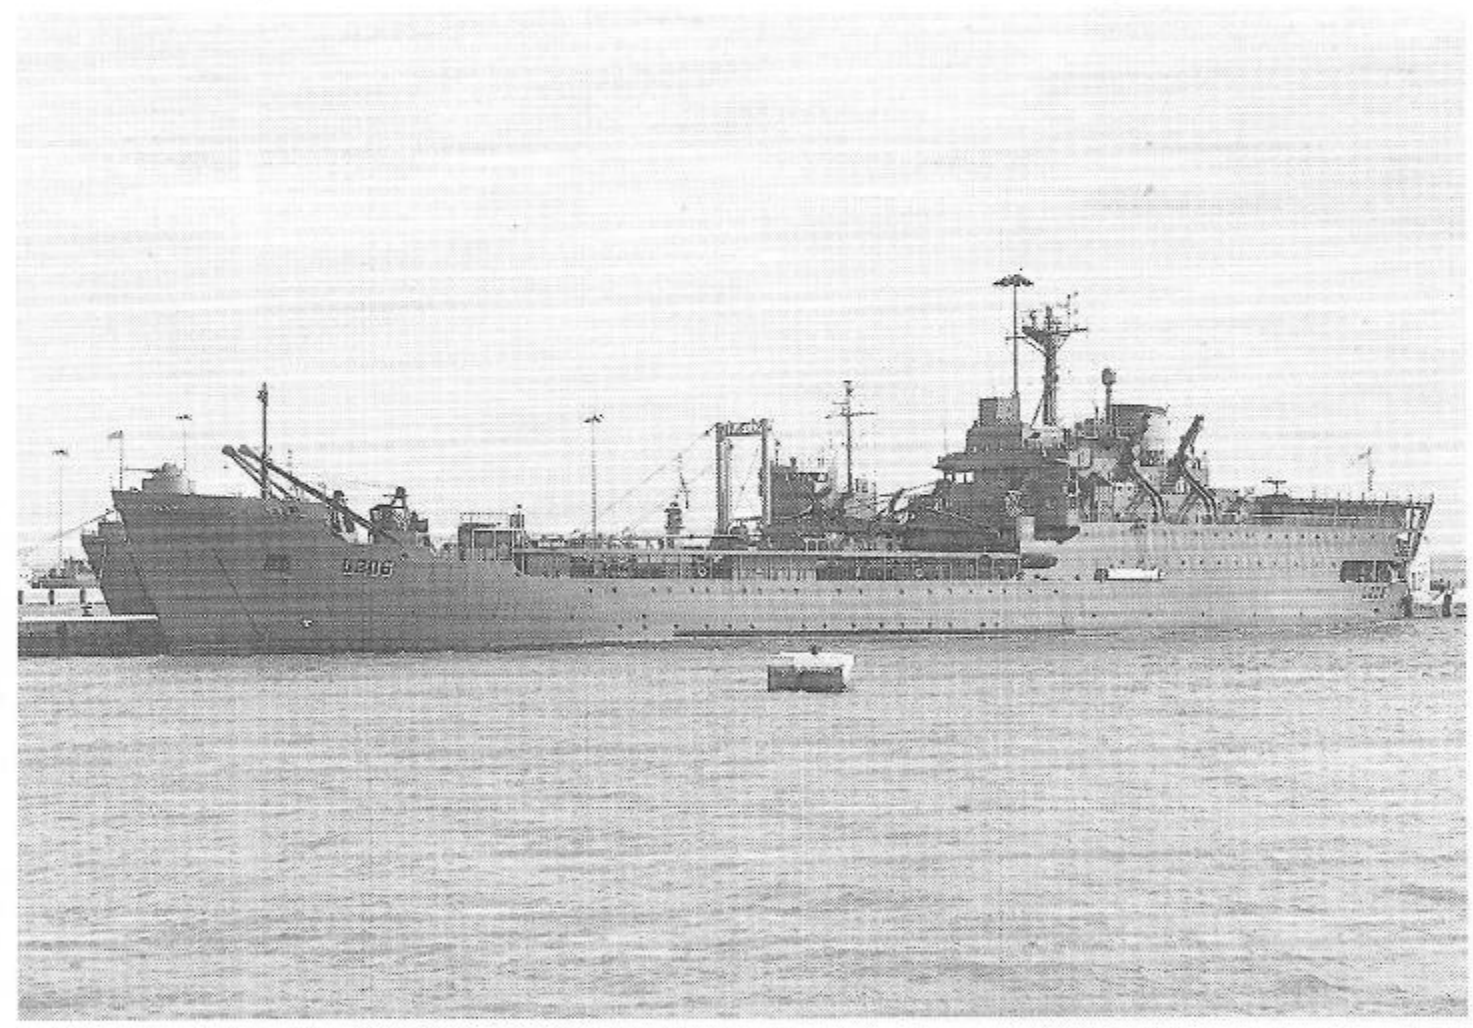
Specifications
System: Diesel
Main machinery: 2 Denny-Sulzer 12-cylinder 12MH51 diesels, 7.1 MW (9,520 hp)
Shafts: 2
Thruster: 1 bow thruster

FURTHER INFORMATION

Sir Lancelot was the first of the British post-war LSLs to be built, and thus, in effect, the prototype. As a result of experience with the ship, the design was recast, and the following five ships had substantial differences, being slightly larger and having different mechanical and general arrangements.

Sir Lancelot took part in the Falklands War but was paid off in 1989 and sold to a commercial company. Renamed *Lowland Lancer,* the ship operated initially as a commercial survey vessel, but then became an off-shore casino, operating out of Cape Town, South Africa. This project does not seem to have been too successful and the ship was soon back on the market and was bought by the Republic of Singapore Navy (RSN).

In Singapore, it has been extensively refitted, with upgraded accommodation and new armaments. Aside from its amphibious role, it is also used to train midshipmen on long cruises.



Perseverance *(L 206)*
(H & L van Ginderen Collection)

UK LSL (pre-SLEP)

GENERAL SPECIFICATIONS

Operator: United Kingdom

Class: LSL (pre-SLEP)

Built: 5
Active: 3

Displacement:
deadweight: 2,443 t
standard: 3,270 t
full load: 5,674 t

Dimensions
Length:
L 3027, L 3036: 126.02 m (413.5 ft) (oa)
L 3505: 134.43 m (441.1 ft)
Beam: 17.94 m (58.86 ft)
Draught
normal: 3.9 m (12.8 ft)
with tanks: 4.57 m (15 ft)

Speed: 17.25 kts

Range: 13,000 n miles at 15 kts; 9,800 n miles at 17 kts

Complement:
L3027, L3036: 51 including 18 officers
L3505: 53

SHIPS

SIR GERAINT (L 3027)

Builder	Alexander Stephen, Glasgow, UK
Laid down	Jun 1965
Launched	26 Jan 1967
Commissioned	12 Jul 1967

SIR PERCIVALE (L 3036)

Builder	Hawthorn Leslie, Hebburn-on-Tyne, UK
Laid down	Apr 1966
Launched	4 Oct 1967
Commissioned	23 Mar 1968

SIR TRISTRAM (L 3505)

Builder	Hawthorn Leslie, Hebburn-on-Tyne, UK
Laid down	Feb 1966
Launched	12 Dec 1966
Commissioned	14 Sep 1967
Reconstruction	1984-9 Oct 1985

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops
  normal: 337
  hard lying (dormitories): 470
  hard lying (maximum): 534
- Tank deck: 16 main battle tanks or 27—4 tonne vehicles (or equivalent)
- Vehicle deck: 34—4-tonne vehicle equivalents
- Petroleum, oil, lubricants: 120 tonnes
- Ammunition: 30 tonnes
- If no other cargo is carried, an LSL can transport 11 helicopters on the tank deck and nine on the vehicle deck

SHIP-SHORE LIFT

- Two MEXEFLOTE self-propelled pontoons (each MEXEFLOTE carried reduces vehicle deck capacity by seven 4-tonne vehicle equivalents).

AVIATION FACILITIES

Specifications
Flight deck: Large flight deck aft. Foredeck has landing spot
Hangar: No hangar, but has refuelling and re-arming facilities.
Helicopters: Can operate Gazelle, Lynx or Sea King from flight deck, and Gazelle and Lynx from foredeck

AMPHIBIOUS FACILITIES

- Two clamshell bow doors
- Internal bow ramp with 60 tonne weight classification

Sir Bedivere *(L 3004) in its original state* (UK MoD)

- Stern ramp with 60 tonne weight classification
- Bow and stern ramps can be connected to MEXEFLOTE rafts or causeways
- Full drive-through facilities
- One 20.32 tonne crane at after end of vehicle deck
- Two 4.32 tonne cranes at forward end of vehicle deck.
- Two ramps from tank deck to vehicle deck
  forward ramp: 14.55 × 3.96 m (47.75 × 13 ft)
  after ramp: 13.59 × 3.96 m (44.6 × 13.0 ft)
  gradient on both ramps is 1:3
  load limit on both ramps is 10 tonnes
- Bow opening 4.57 m (15 ft) wide by 5.41 m (17.75 ft) wide
- Stern opening is 4.57 m (15 ft) wide by 4.95 m (16.25 ft) high

WEAPONS SYSTEMS

GUNS

Oerlikon 20 mm

Two or four Oerlikon 20 mm manually operated mountings.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,739 ft/s)
Range
anti-surface: 1.5 km
anti-air: 1,150 m (3,773 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g

Mounting
Elevation: −15 to +90°
Total weight: 497 kg (1,096 lb) (including shield)

L7A1 7.62 mm machine guns

A variable number of L7A1 machine guns is carried, typically four, but operationally could be more. The L7A1 is a gas-operated weapon with a maximum practical rate of fire of 200 rds/min.

ELECTRONIC WARFARE SYSTEMS

DECOYS

Plessey Shield Tactical Decoy System

There are two Plessey Shield 12-barrelled decoy launchers for chaff. Shield is a microprocessor-controlled, fully automatic missile decoy system, which is designed to provide effective protection for various sizes of ship, including fast attack craft, corvettes, frigates and destroyers. On detecting a threat, Shield selects the most appropriate response from up to six million scenarios held in its EPROM memory, using data obtained from onboard sensors such as radar and ESM and then automatically deploys the pattern of decoys that will give the highest probability of success. GEC-Marconi chaff rockets are fitted with a variable fuze which allows the chaff to be dispersed at optimum positions along the trajectory. To counter threats with a dual-mode capability, both chaff and infra-red decoys can be deployed automatically. Shield offers four protection modes — confusion; distraction; seduction/breaklock; and seduction dump — and uses two types of decoy — chaff and infra-red — which may be used on their own, or in combination with each other.

The munition is the N8 rocket, which has a 7.5 kg (16.5 lb) payload of customised chaff to give equal performance against both horizontally and vertically polarised radars. The fuze is set electronically immediately before firing for the optimum chaff cloud. There is also an N5 Broad Band Chaff (BBC) rocket with a manually set fuze.

Chaff rockets carry an 8.5 kg (18.7 lb) payload and chaff deployment takes place at ranges of 50-2,500 m (164-8,202 ft) (with 0.25 second and 16 second fuze settings respectively) at a height of about 100 m (328 ft). The N6 IR round, which operates on the mortar principle, has seven submunitions which are deployed progressively further from the ship, beginning at a distance of 50-200 m (164-656 ft) and lasting for 1-15 seconds. These submunitions operate in the 3-5 µm and 8-13 µm bands.

Manufacturer/Contractor
GEC-Marconi Naval Systems, Addlestone, UK.

COMMAND AND CONTROL SYSTEMS

RADAR

Kelvin Hughes Type 1006

The Type 1006 has, for many years, been the standard I-band navigation radar for the British Royal Navy and many other navies. One ship may be fitted with the Racal-Decca 2690; performance is similar.

Specifications
Type 1006
Role: Navigation
Frequency: I-band (approximately 9,445 MHz)
Beam: 1 × 18°/0.75 × 18°
Peak power: 25 kW
Gain: 31 dB/34 dB
Pulsewidth: 0.8 or 0.25 µs/0.75 µs
PRF: 1,600/800 pps
Scan rate: 24 rpm
Typical range: 64 n miles

Manufacturer/Contractor
Kelvin Hughes Ltd, Hainault, Essex, UK.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Mirrlees National ten-cylinder 10-ALSSDM diesels, 7.01 MW (9,400 hp)
Shafts: 2
Thruster: 1 Brown/Voith-Schneider bow thruster, 400 hp

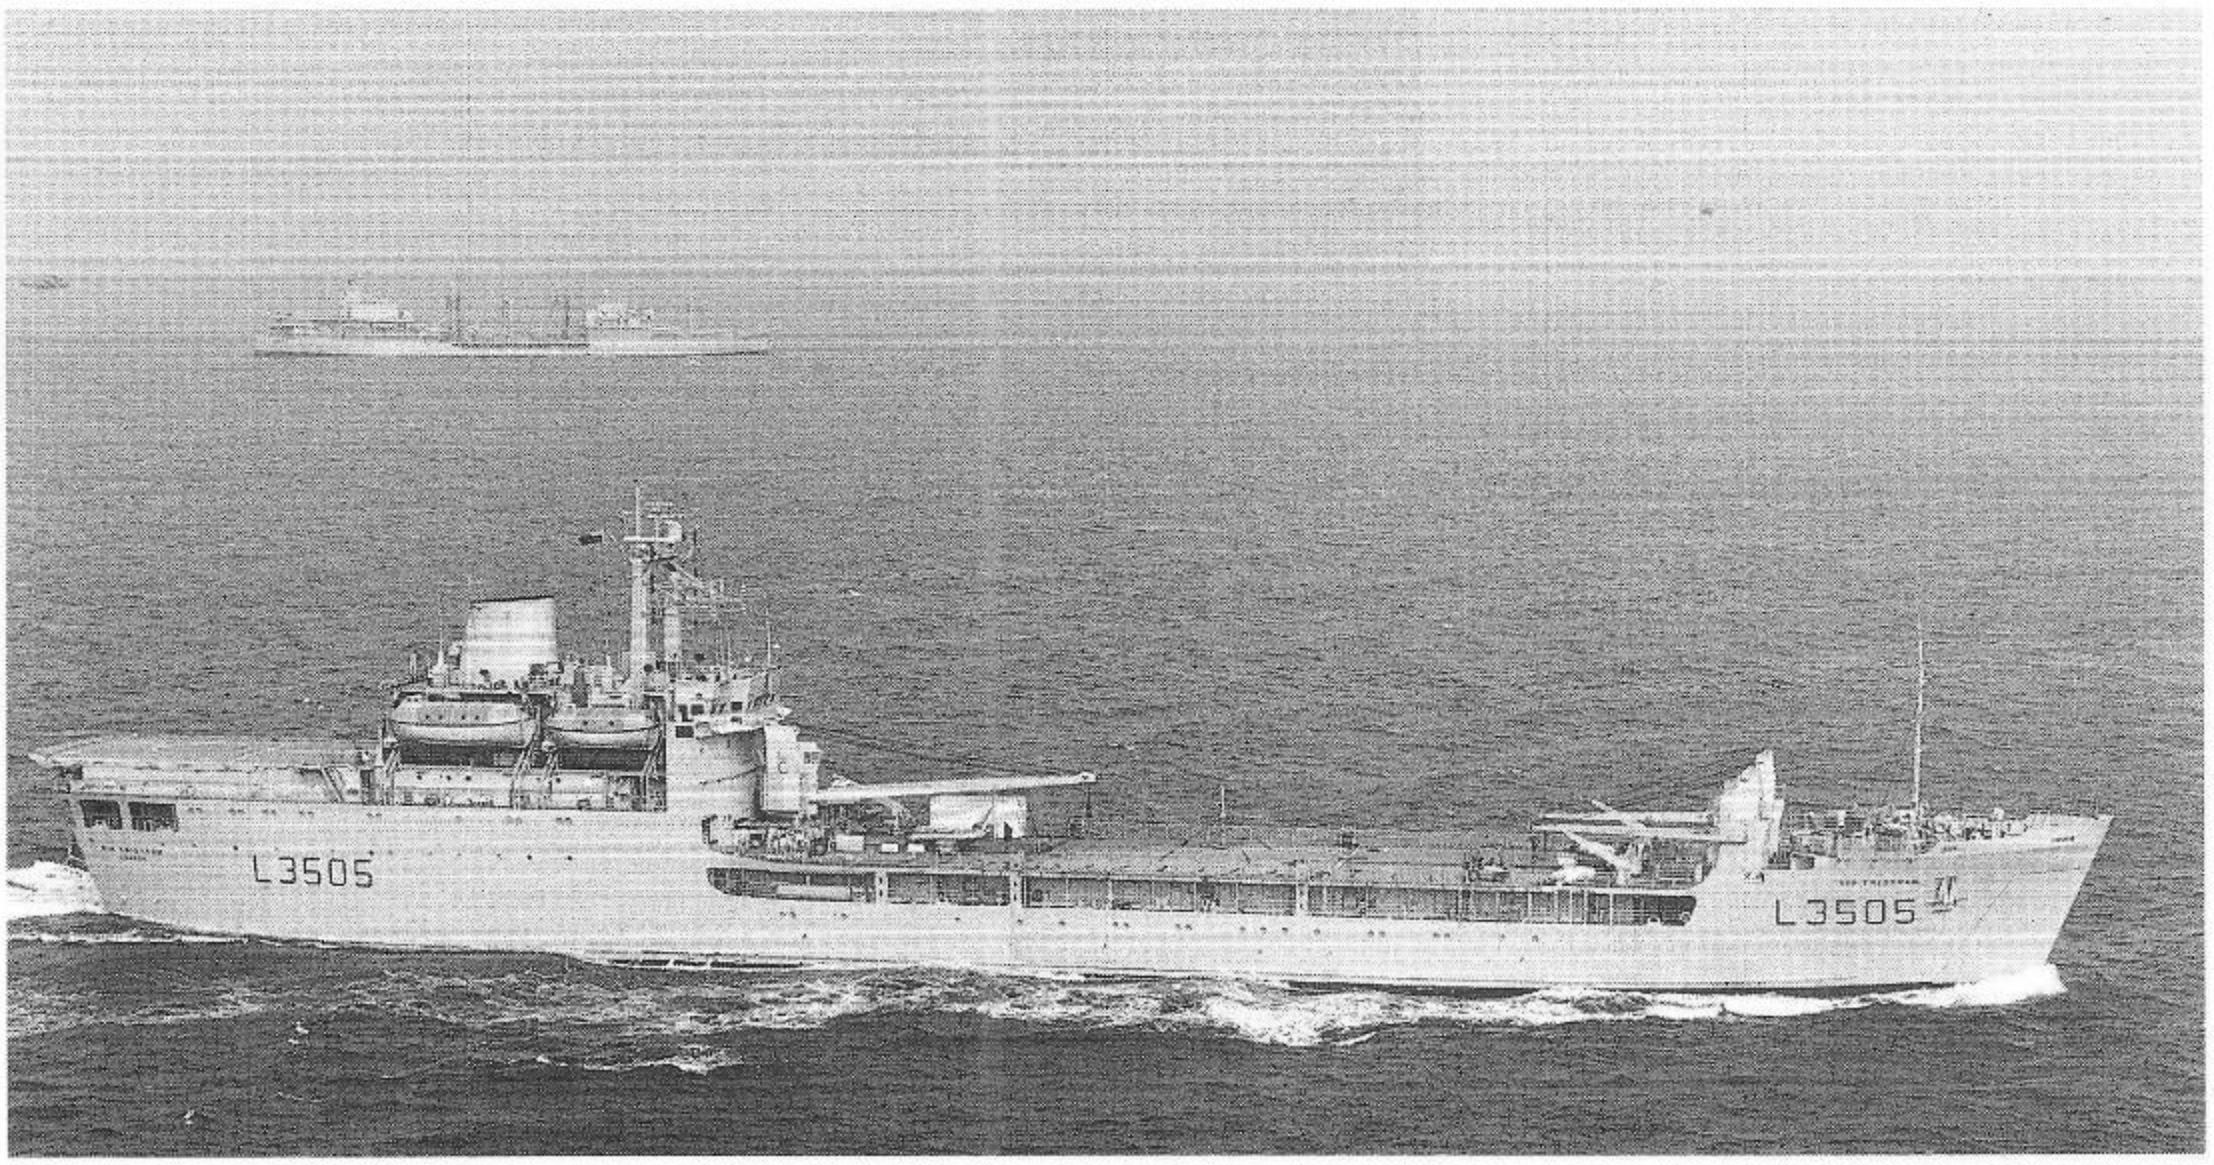
FURTHER INFORMATION

PROGRAMME

Five LSLs were built to the standard described in this entry. Of these, *Sir Galahad* (i) was so badly damaged that it had to be sunk, while *Sir Tristram's* damage was less severe, enabling it to be returned to the UK, where it was rebuilt. It was, however, rebuilt to the original design, with relatively minor changes, and not totally reconstructed, as is the case with *Sir Bedivere* (see next entry).

Sir Tristram

Although *Sir Tristram* (L 3505) survived the attack in the Falklands War, the ship still had to be transported back to the UK on a heavy-lift ship, where Tyne Shiprepairers was given a contract to repair and modify it. This included lengthening the hull by 8.8 m (29 ft), enlarging the flight deck to take Chinook helicopters, and installing a new bridge and a gantry mast. Other changes included replacing the aluminium superstructure with steel, installing new communications facilities, EMR and Satcom, new navigation systems and helicopter control radar. The work did not involve replacing the engines, which remain the original Mirrlees. This work, which was considerably less ambitious than the SLEP recently carried out on *Sir Bedivere,* was completed on 9 October 1985.



The rebuilt Sir Tristram. *The rebuilding was considerably less ambitious than the SLEP currently being carried out on* Sir Bedivere *but it did include lengthening the ship by 8.84 m (29 ft). This was not done in order to increase the capacity of the ship (although it did have that effect) but in order to counterbalance the additional weight of the new steel superstructure* (UK MoD)

UK LSL (SLEP[1])

GENERAL SPECIFICATION

Operator: United Kingdom

Class: UK LSL

Converted: 1
Active: 1
Planned: (see 'Further Information')

Displacement:
standard: 3,322 t
full load: 6,502 t

Dimensions:
Length: 140.0 m (459.3 ft) (oa)
Beam: 19.3 m (63.3 ft)
Draught: 4 m (13.1 ft)

Speed: 17 kts
Range: 8,000 n miles at 15 kts

Complement: 49, including 15 officers

Footnote: [1]SLEP — Service Life Extension Programme

SHIPS

SIR BEDIVERE (L 3004)

Builder	Hawthorn Leslie, Hebburn-on-Tyne, UK
Laid down	Oct 1965
Launched	20 Jul 1966
Commissioned	18 May 1967
SLEP	1994-Mar 1997

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops
  normal: 400
  hard lying: 534
- Main battle tanks: 18
- Vehicles: 34—4 tonne equivalents
- Petroleum, oil, lubricants: 120 tonnes
- Ammunition: 30 tonnes
- If no other cargo is carried, has capacity for 11 helicopters on the tank deck and nine on the vehicle deck

SHIP-SHORE LIFT

- Two MEXEFLOTE self-propelled pontoons (each MEXEFLOTE carried reduces vehicle deck capacity by seven 4 tonne equivalents).

AVIATION FACILITIES

Flight deck: Large flight deck aft. Foredeck has landing spot
Hangar: No hangar, but has refuelling and re-arming facilities
Helicopters: Can operate Gazelle, Lynx, Sea King and Chinook from flight deck, and Gazelle and Lynx from foredeck

Sir Bedivere *(L 3004) one of the UK's five LSLs* (UK MoD)

AMPHIBIOUS FACILITIES

- Two clamshell bow doors.
- Internal bow ramp with 60 tonne weight classification.
- Stern ramp with 60 tonne weight classification.
- Bow and stern ramps can be connected to MEXEFLOTE rafts or causeways.
- Full drive-through facilities.
- One Clarke Chapman 25 tonne crane at after end of vehicle deck.
- Two 4.32 tonne cranes at forward end of vehicle deck.
- Two ramps from tank deck to vehicle deck.
- Bow opening 4.57 m (15 ft) wide by 5.41 m (17.75 ft) high.
- Stern opening is 4.57 m (15 ft) wide by 4.95 m (16.25 ft) high.

WEAPONS SYSTEMS

GUNS

20 mm Oerlikon mountings

Four single GAM-BO1 20 mm mounts are fitted on the upper deck. GAM-BO1 uses a swivel fork with the side walls having the trunnion bearings. The cradle is made of light alloy and the weapon's working parts are enclosed in a protective case whose top opens to ease maintenance and installation. The sight, shoulder rests and back support strap are all attached to the sight bracket which is adjustable for height. Usually these mountings have an optical ring sight but they can also be fitted with a lead computing sight. The ammunition box with 200 rounds is attached to the front of the mounting and the belt is fed from the right side of the gun, with spent cartridge cases being ejected between the sidewalls of the cradle into a separate compartment, while the links are collected in a bag on the other side of the mounting.

Specifications

GAM-BO1
Elevation: 55°
Gun Model: KAA
Calibre: 20 mm
Length of barrel: 85 calibres
Effective range:
surface target: 2,500 m (2,700 yd)
aircraft: 1,200 m (4,000 ft)
Rate of fire: 1,000 rds/min
Round weight: 320-345 g
Projectile: 110-125 g

Manufacturers/Contractors

Royal Ordnance, UK.
Oerlikon Contraves AG, Defence (cannon)

L7A1 7.62 mm machine guns

A variable number of L7A1 machine guns carried, typically four, but operationally could be more. The L7A1 is a gas-operated weapon with a maximum practical rate of fire of 200 rds/min.

ELECTRONIC WARFARE SYSTEMS

DECOYS

Plessey Shield Tactical Decoy System

There are two Plessey Shield 12-barrelled decoy launchers for chaff. Shield is a microprocessor-controlled, fully automatic missile decoy system, which is designed to provide effective protection for various sizes of ship, including fast attack craft, corvettes, frigates and destroyers. On detecting a threat, Shield selects the most appropriate response from up to six million scenarios held in its EPROM memory, using data obtained from onboard sensors such as radar and ESM and then automatically deploys the pattern of decoys that will give the highest probability of success. GEC-Marconi chaff rockets are fitted with a variable fuze which allows the chaff to be dispersed at optimum positions along the trajectory. To counter threats with a dual-mode capability, both chaff and infra-red decoys can be deployed automatically. Shield offers four protection modes — confusion; distraction; seduction/breaklock; and seduction dump — and uses two types of decoy — chaff and infra-red — which may be used on their own, or in combination with each other.

The munition is the N8 rocket, which has a 7.5 kg (16.5 lb) payload of customised chaff to give equal performance against both horizontally and vertically polarised radars. The fuze is set electronically immediately before firing for the optimum chaff cloud. There is also an N5 Broad Band Chaff (BBC) rocket with a manually set fuze.

Chaff rockets carry an 8.5 kg (18.7 lb) payload and chaff deployment takes place at ranges of 50-2,500 m (164-8,202 ft) (with 0.25 second and 16 second fuze settings respectively) at a height of about 100 m (328 ft). The N6 IR round, which operates on the mortar principle, has seven submunitions which are deployed progressively further from the ship, beginning at a distance of 50-200 m (164-656 ft) and lasting for 1-15 seconds. These submunitions operate in the 3-5 µm and 8-13 µm bands.

Manufacturer/Contractor

GEC-Marconi Naval Systems, Addlestone, UK.

COMMAND AND CONTROL SYSTEMS

RADARS

Kelvin Hughes Type 1006

The Type 1006 has, for many years, been the standard I-band navigation radar for the British Royal Navy and many other navies. The Type 1007 is now supplementing the earlier equipment in the role. One ship may be fitted with the Racal-Decca 2690; performance is similar.

Specifications

Type 1006
Role: Navigation
Frequency: I-band (approx 9,445 MHz)
Beam: 1 × 18°/0.75 × 18°
Peak power: 25 kW
Gain: 31 dB/34 dB
Pulsewidth: 0.8 or 0.25 µs/0.75 µs
PRF: 1,600/800 pps
Scan rate: 24 rpm
Typical range: 64 n miles

Manufacturer/Contractor

Kelvin Hughes Ltd, Hainault, Essex, UK.

Kelvin Hughes Type 1007

One Kelvin Hughes Type 1007 is installed for use in aircraft control.

Specifications

Type 1007
Role: Carrier-control approach (CCA)
Frequency: I-band (9,410 MHz)
Beam: 1.0 × 18°/0.75 × 18°
Peak power: 25 kW
Gain: 31/33 dB
Pulsewidth: 0.08/0.3/0.8µs
PRF: 1,600/800/400 pps
Scan rate: 26 rpm
Range: 96 n miles

Manufacturer/Contractor

Kelvin Hughes Ltd, Hainault, Essex, UK.

PROPULSION

Specifications

System: Diesel
Main machinery: 2 Wärtsilä 12 SW280, 7.2 MW (9,840 hp) sustained
Shafts: 2
Thruster: 1 Brown/Voith-Schneider bow thruster, 720 kW (980 hp)

FURTHER INFORMATION

PROGRAMME

Sir Bedivere will complete an ambitious Service Life Extension Programme (SLEP) in March 1997. It remains undecided, however, whether funding can be found for the remaining two ships to be given similar treatment.

The SLEP involves the ship being cut in two at a point approximately half-way along the vehicle deck and a new 13 m (42.65 ft) section added. The forecastle is extended aft and some 40 per cent of the plating is replaced. In replacing the vehicle deck it has been replated and strengthened to enable Chinook (CH-47) helicopters to land. During preparations for this work on *Sir Bedivere* it was discovered that parts of the hull had deteriorated considerably more than had been expected and additional work (at additional expense) had to be authorised to make this good.

The original aluminium alloy superstructure has been totally removed and replaced by a steel structure, which includes a number of changes, of which the most important is that the flight deck has been lowered by one deck level. Other changes include new davits for LCVP Mk 4 and a new gantry-type mainmast.

The original Mirrlees diesel engines have been removed and will now be cannibalised for spares for the remaining engines in the 'un-SLEPed' LSLs. They have been replaced by Wärtsilä diesels, of the same model as used as cruise engines in the RNethN's 'Karel Doorman' class, the first time this maker's engines have been used in British naval vessels.

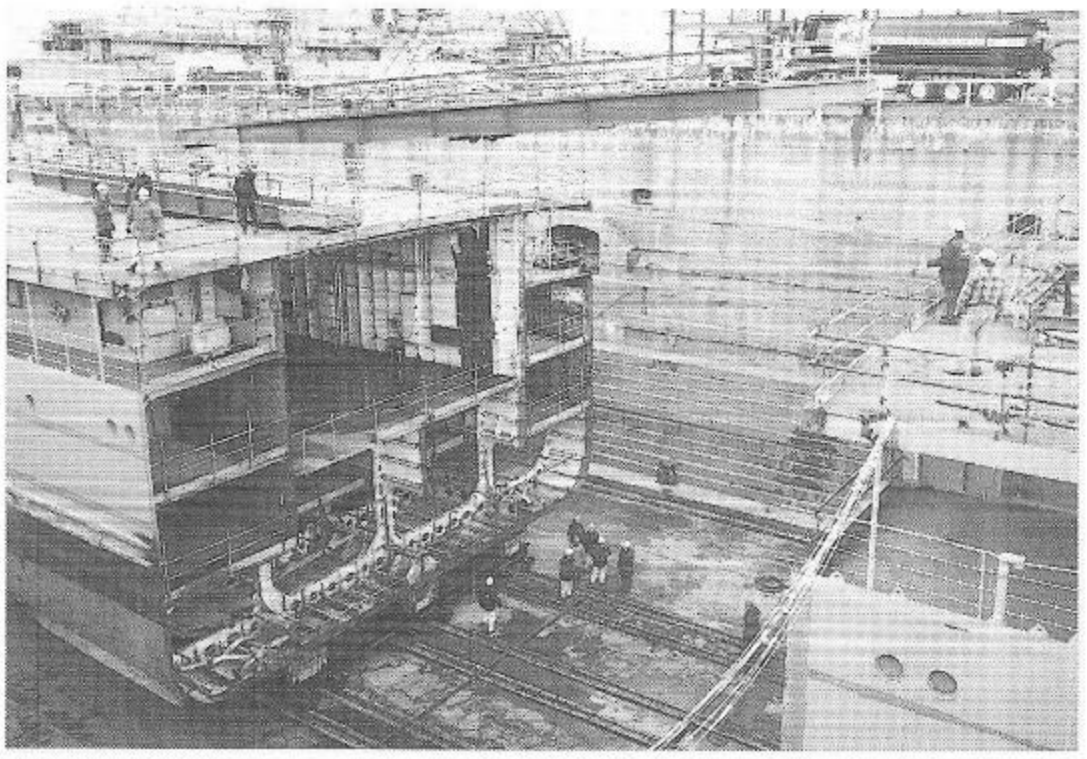
The two 8 tonne cranes forward have been refurbished, while the 20 tonne crane aft has been removed and replaced by a new 25 tonne crane. New davits have been installed on the superstructure to handle two LCVP Mk 4, making this ship the only one of the five LSLs to operate such craft.

Finally, four GAM-BO1 guns have been installed and an additional radar (Kelvin Hughes Type 1007) installed for more effective air control.

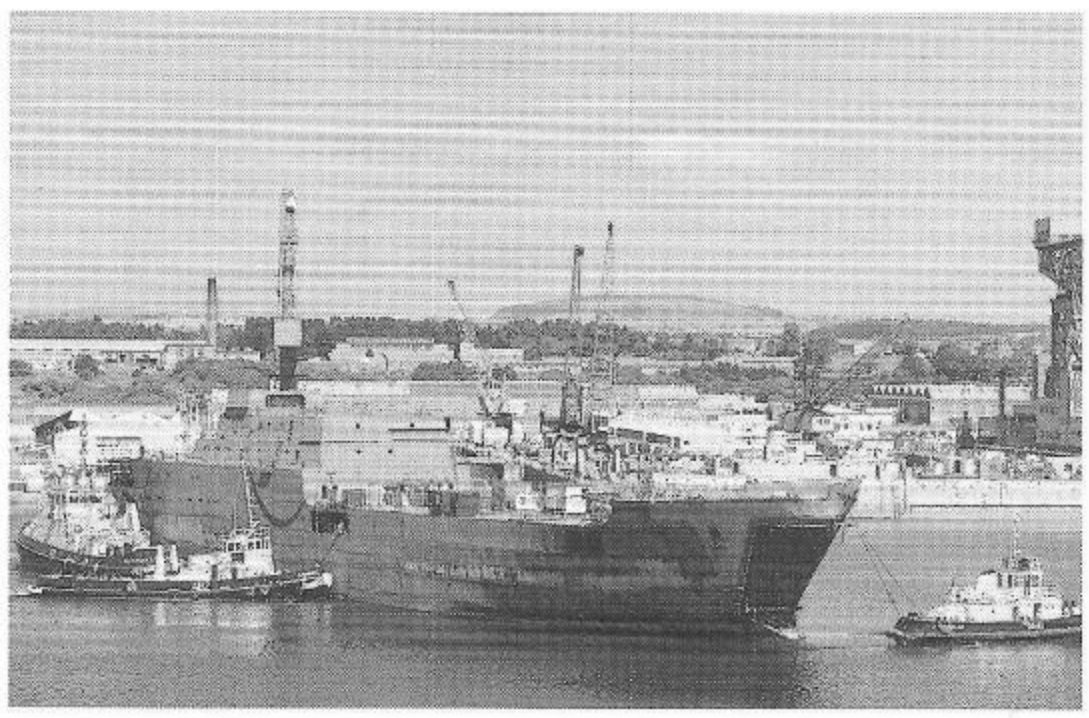
THE FUTURE

The SLEP gives *Sir Bedivere* an additional 15 years operational life, which will enable it to run on to 2011, at least.

If *Sir Geraint* and *Sir Percivale* are not SLEPed, however, their life expectancy cannot be more than 3 to 4 years, at most, which would result in both ships and *Sir Tristram* reaching the end of their operational lives at much the same time.



Sir Bedivere *cut in two in preparation for the insertion of the 13 m (42.65 ft) 'plug', allowing the size of the tank deck to be seen*



Sir Bedivere *was temporarily floated out of the dry-dock mid-way through the SLEP. Note that the clamshell bow doors are unchanged and that the flight deck has been lowered by one deck level*

TOBRUK (UK LSL)

GENERAL SPECIFICATIONS

Country of Origin: United Kingdom
Operator: Australia
Type: Heavy Lift Ship

Class: TOBRUK

Built: 1
Active: 1

Displacement:
standard: 3,300 t
full load: 5,700 t

Dimensions
Length: 127 m (417 ft)
Beam: 18.3 m (60 ft)
Draught: 4.9 m (16 ft)

Speed: 18 kts
Range: 8,000 n miles at 15 kts

Complement: 60 including 13 officers

SHIPS

TOBRUK (L 50)
Builder Carrington Slipways Pty, Tomago, Australia
Laid down 7 Feb 1978
Launched 1 Mar 1980
Commissioned 23 Apr 1981

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 350-500 troops
- Cargo: 1,300 tonnes
- Tanks: can embark a squadron of Leopard tanks (12-15 tanks) plus a number of wheeled vehicles and artillery, in addition to its troop lift

SHIP-SHORE LIFT

- Two LCVPs in davits
- Two LCM 8 carried on deck

AVIATION FACILITIES

Specifications
Flight deck: There is a large flight deck aft. There are two landing spots on the vehicle deck
Hangar: None
Helicopters: Up to 4 Sea Kings

AMPHIBIOUS FACILITIES

- Clamshell-type bow doors with vertical hinges
- Bow and stern ramps
- Fitted for side-carrying two NLE pontoons
- 70 tonne capacity derrick forward of the bridge
- Two 4.25 tonne cranes at forward end of vehicle deck

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60
There are two Bofors 40 mm/60 mountings on the forecastle

Specifications
Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,890 ft/s); 850 m/s (2,789 ft/s)
Ammunition: 2.4 kg (5.3 lb) (HCHE, PFHE), 2.5 kg (5.5 lb) (HE-T)

Range:
anti-surface: 5.25 n miles (9.8 km)
anti-air: 7,100 m (23,294 ft)
Rate of fire: 60 rds/min (practical)
Ammunition: 2.21 kg (4.9 lb)

Mounting
Traverse: 360° at 35°/s
Elevation: −5 to +90° at 45°/s
Crew: 3

M2HB 12.7 mm machine guns
Two M2HB are carried. M2HB is a selective short recoil automatic operation air-cooled weapon with a 1,143 mm (45 in) long barrel and eight right-hand grooves turning once every 381 mm (15 in).

Specifications
Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

Tobruk *(L 50) was built in Australia and commissioned in 1981. It is basically similar to the British original, but with a massive 70 tonne derrick before the bridge* (RAN)

COMMAND AND CONTROL SYSTEMS

RADARS

Kelvin Hughes Type 1006

Specifications
Type 1006
Role: Surface search
Frequency: I-band (approximately 9,445 MHz)
Beam: 1 × 18°/0.75 × 18°
Peak power: 25 kW
Gain: 31 dB/34 dB
Pulsewidth: 0.8 or 0.25 µs/0.75 µs
PRF: 1,600/800 pps
Scan rate: 24 rpm
Typical range: 64 n miles

Manufacturer/Contractor
Kelvin Hughes Ltd, Hainault, Essex, UK.

Racal-Decca RM 916

The navigation radar is a Racal-Decca RM 916, which is one of the Transar series of radars, using 30 or 41 cm (11.8 or 16 in) displays and 1.83 or 2.7 m (6.0 or 8.9 ft) antennas. It operates in the I-band.

Manufacturer/Contractor
Racal-Decca, UK.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Mirrlees Blackstone KDMR8 diesels, 7.2 MW (9,600 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

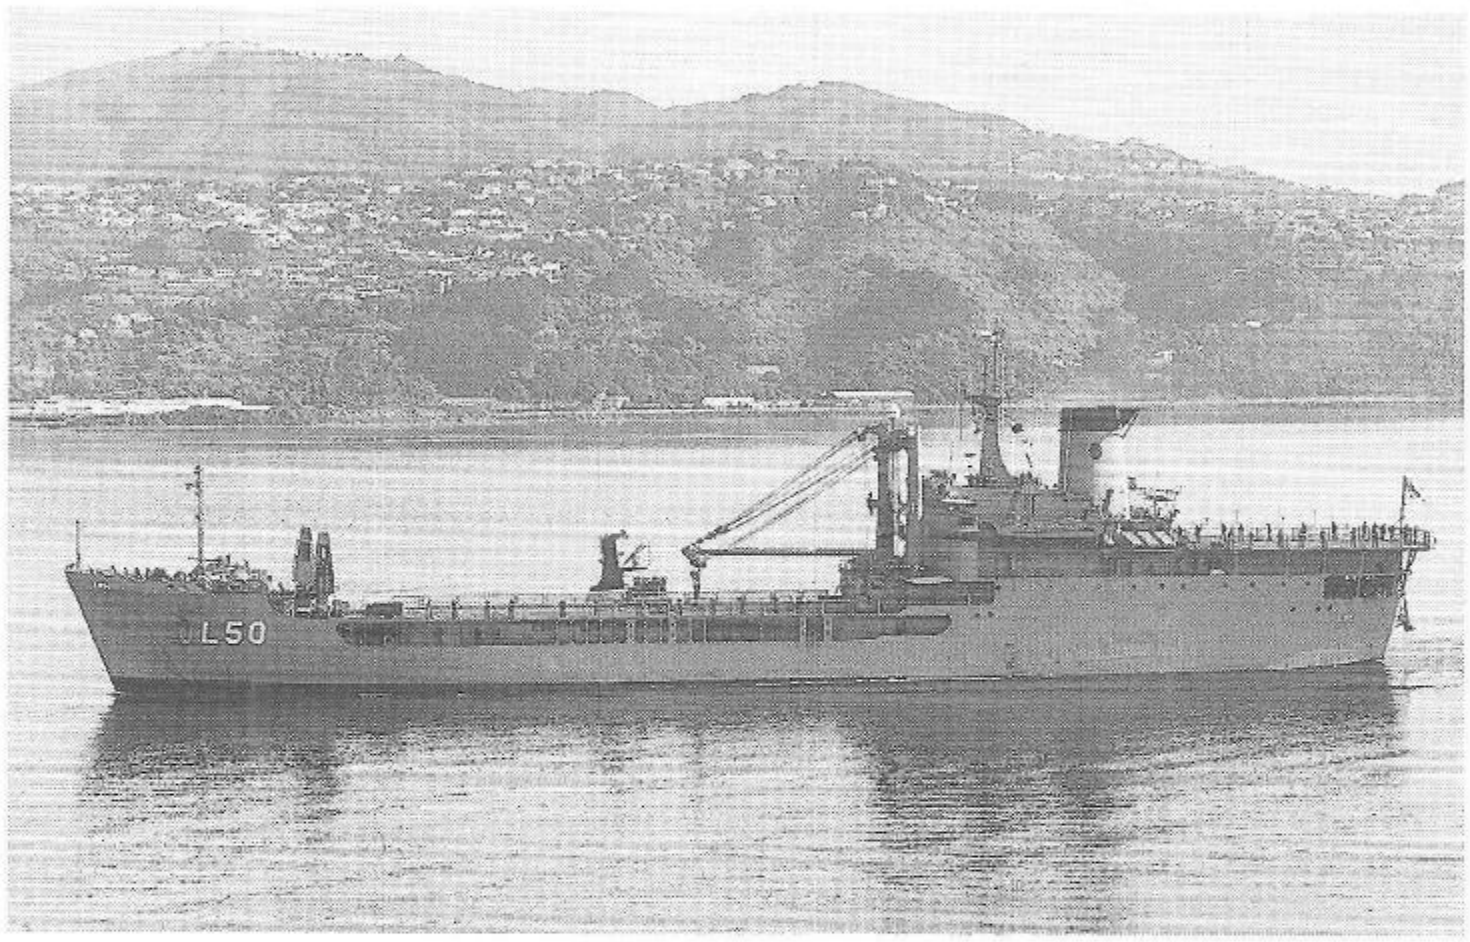
Tobruk was built in Australia some ten years after the British LSLs and the design was updated and modified slightly to meet Australian requirements. The major differences in the Australian ship are that it has a 70 tonne capacity derrick at the after end of the vehicle deck and it carries two LCVPs and two LCMs.

The ship also has minor hospital facilities.

THE FUTURE

Tobruk is due to be stricken in 1997, when it will be replaced by the two 'Newport' class LSTs purchased from the USA in 1994. Although these ships are larger and more capable than *Tobruk,* they are actually ten years older, but it is hoped to recoup some of the cost of acquiring and converting them by selling *Tobruk.*

Purchase of *Tobruk* has been given active consideration by the UK Royal Navy, as an alternative to refurbishing *Sir Geraint* or *Sir Percivale*. New Zealand and Singapore are also believed to have expressed interest in the ship.



The Australian LSL, Tobruk *(L 50), is due to be sold in 1997, with New Zealand, Singapore and the UK having shown interest* (H & L van Ginderen Collection)

SIR GALAHAD (ii)

GENERAL SPECIFICATIONS

Operator: United Kingdom

Class: SIR GALAHAD (II) (LSL)

Built: 1
Active: 1

Displacement:
deadweight: 3,055 t
full load: 8,585 t

Dimensions
Length: 140.5 m (461 ft)
Beam: 19.5 m (64 ft)
Draught: 4.3 m (14.1 ft)

Speed: 18 kts
Range: 13,000 n miles at 15 kts

Complement: 53

SHIPS

SIR GALAHAD (ii) (L 3005)
Builder Swan Hunter Shipbuilders, Wallsend-on-Tyne, UK

Laid down 12 May 1985
Launched 13 Dec 1986
Commissioned 25 Nov 1987

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops
- normal: 339
- hard lying: 524
- Main battle tanks: 18
- Vehicles: 20—4 tonne equivalents
- Ammunition
- Fuel
- Military stores

SHIP-SHORE LIFT

- Maximum of four MEXEFLOTE can be carried on the side of the ship.

AVIATION FACILITIES

Specifications
Flight deck: Large flight deck aft. One helicopter spot on vehicle deck
Hangar: None
Helicopter: 1 Westland Sea King HC 4

AMPHIBIOUS FACILITIES

- Bow and stern ramps, with a visor bow gate.
- One 25 tonne and three 8.6 tonne cranes.
- Internal ramp between tank deck and vehicle deck.

Sir Galahad (ii) *(L 3005) which was built to replace the ship of the same name, which was sunk after being severely damaged in the Falklands War. The new ship has a number of differences from the original design: it is longer, has a vertically opening bow door and a gantry-type mast* (Swan Hunter)

WEAPONS SYSTEMS

GUNS

Two Oerlikon 20 mm in GAM-BO3 mountings

The KAA gun is a single barrel, gas-operated, air-cooled, link-belt fed weapon with feeding from either side. The 1.856 m (6.0 ft) long barrel is of monobloc construction with cooling ribs and a muzzle brake. It weighs 28 kg (61.7 lb) and has 12 grooves with a right-hand angle rifling to 6.5° extending 1.7 m (5.6 ft). The complete weapon is 2.668 m (8.75 ft) long and weighs 90 kg (198 lb).

The GAM mounting is an unpowered light, compact design for use in a wide variety of vessels, but especially those involved in patrol operations. It is of the swivel fork type with the sidewalls having the trunnion bearings. The cradle is made of light alloy and the weapon's working parts are enclosed in a protective case whose top opens to ease maintenance and installation. The sight, shoulder rests and back support strap are all attached to the sight bracket which is adjustable for height. Usually these mountings have the RC35 optical ring sight but they can be fitted with the SLC 001 lightweight lead computing sight.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 85 calibres
Muzzle velocity: 1,050-1,150 m/s (3,445-3,773 ft/s)
Range
anti-surface: 1.7 km
anti-air: 1,700 m (5,577 ft)
Rate of fire: 900 m/s (2,953 ft/s)
Round weight: 320-345 g
Projectile: 110-125 g

Two 12.7 mm machine guns

The M2HB is a selective short recoil automatic operation air-cooled weapon with a 1,143 mm (45 in) long barrel and eight right-hand grooves turning once every 381 mm (15 in). Muzzle energy is 1,867 mkp and the weapon uses 110-round belts.

Specifications
Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

ELECTRONIC WARFARE SYSTEMS

DECOYS

Plessey Shield Tactical Decoy System

There are two Plessey Shield 12-barrelled decoy launchers for chaff. Shield is a microprocessor-controlled, fully automatic missile decoy system, which is designed to provide effective protection for various sizes of ship, including fast attack craft, corvettes, frigates and destroyers. On detecting a threat, Shield selects the most appropriate response from up to six million scenarios held in its EPROM memory, using data obtained from onboard sensors such as radar and ESM and then automatically deploys the pattern of decoys that will give the highest probability of success. GEC-Marconi chaff rockets are fitted with a variable fuze which allows the chaff to be dispersed at optimum positions along the trajectory. To counter threats with a dual-mode capability, both chaff and infra-red decoys can be deployed automatically. Shield offers four protection modes — confusion; distraction; seduction/breaklock; and seduction dump — and uses two types of decoy — chaff and infra-red — which may be used on their own, or in combination with each other.

The munition is the N8 rocket, which has a 7.5 kg (16.5 lb) payload of customised chaff to give equal performance against both horizontally and vertically polarised radars. The fuze is set electronically immediately before firing for the optimum chaff cloud. There is also an N5 Broad Band Chaff (BBC) rocket with a manually set fuze.

Chaff rockets carry an 8.5 kg (18.7 lb) payload and chaff deployment takes place at ranges of 50-2,500 m (164-8,202 ft) (with 0.25 second and 16 second fuze settings respectively) at a height of about 100 m (328 ft). The N6 IR round, which operates on the mortar principle, has seven submunitions which are deployed progressively further from the ship, beginning at a distance of 50-200 m (164-656 ft) and lasting for 1-15 seconds. These submunitions operate in the 3-5 µm and 8-13 µm bands.

Manufacturer/Contractor

GEC-Marconi Naval Systems, Addlestone, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Racal-Decca CANE data automation (Outfit DEB-1)

CANE is a fully distributed command and control system with stand-alone workstations, which evolved from the integration of navigation equipment; hence the name, Command And Navigation Equipment (CANE). CANE has a single-bus architecture, using a control application processor with intelligent input-output nodes, and using Coral 66 software language for all application codes, with Assembler code for device drivers. The system is based upon software-driven workstations (Tactical Command Consoles (TCC)), which can be augmented by an Automatic Chart Table and/or an Automatic Plotter. Multiconsole systems are linked by a fully deterministic, dual-redundant network based upon a Military Standard 1553B databus with the selection and degree of redundancy chosen by the customer.

Each TCC features a DS500 16-bit RISC (Reduced Instruction Set to Computer) processor with a typical memory of 1 Mbyte. Intelligent input-output is performed using VME-based subsystems with Motorola 68000 family processors. The PPI displays the raw radar data which can be combined with computer-generated synthetic video tactical, track, zone and navigation data together with multiple totes. CANE consoles include multiple radar tracking facilities involving primary and secondary returns.

Manufacturer/Contractor

Racal-Decca, UK.

RADAR

Kelvin Hughes Type 1007

The Type 1007 is the standard I-band navigation radar of the UK Royal Navy.

Specifications

Type 1007
Role: Surface search
Frequency: I-band (9,410 MHz)
Beam: 1.0 × 18°/0.75 × 18°
Peak power: 25 kW
Gain: 31/33 dB
Pulsewidth: 0.08/0.3/0.8 µs
PRF: 1,600/800/400 pps
Scan rate: 26 rpm
Range: 96 n miles

Manufacturer/Contractor

Kelvin Hughes Ltd, Hainault, Essex, UK.

PROPULSION

Specifications

System: Diesel
Main machinery: 2 Mirrlees Blackstone KMG Major diesels, 9.8 MW (13,130 hp)
Shafts: 2
Propellers: 2, controllable pitch

FURTHER INFORMATION

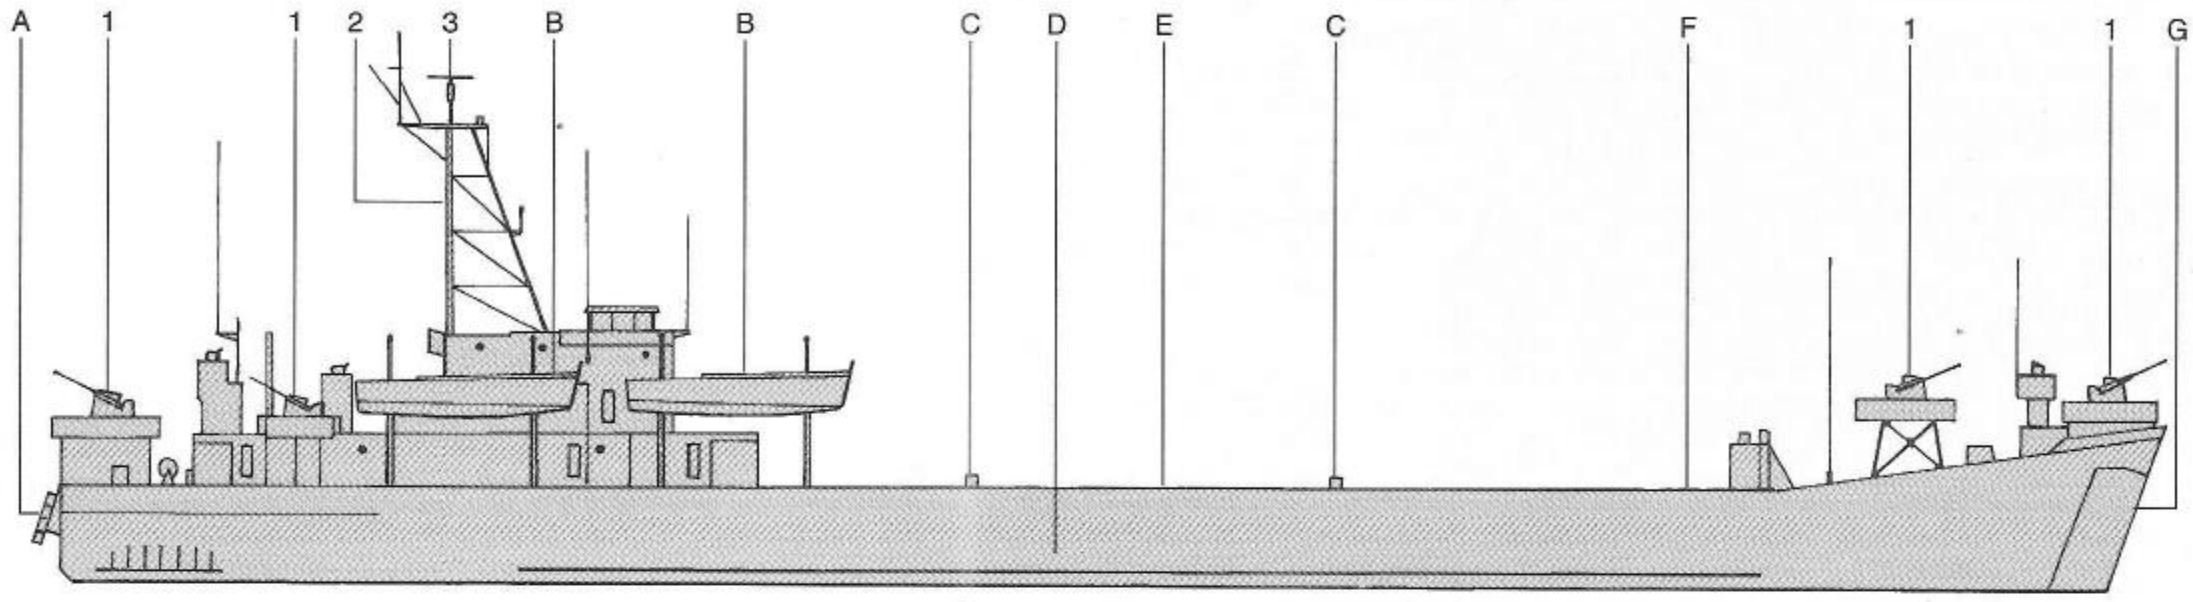
Sir Galahad (ii) (L 3005) was built as a replacement for the previous ship with the same name and pennant number, which was sunk as a war grave after incurring irreparable damage at Bluff Cove during the Falklands War of 1982. Because the new ship was built using special funds devoted to making good Falklands War losses the ship is a larger and more sophisticated ship than its predecessor.

Sir Galahad *carrying an army unit. Note the 105 mm light guns and Land Rovers on the vehicle deck and the MEXEFLOTE secured to the ship's side* (MoD UK)

The bow door on Sir Galahad *is unique among the LSLs* (Swan Hunter)

LST 1-1152 CLASS

OVERVIEW



LST 1-1152
Amphibious A *Kedge anchor* **B** *LCVP* **C** *Tank deck ventilation shafts* **D** *Tank deck* **E** *Vehicle deck* **F** *Elevator (LCT 1-541) or ramp (LCT 542-1152)* **G** *Clamshell doors with internal ramp*

General 1 *40 mm cannon* **2** *Tripod mast* **3** *Navigation-radar*
Note: There are many minor variations in weapons, number of davits, etc. This shows a typical LST 1-1152

A total of 1,052 tank landing ships (LSTs) was built between 1942 and 1945, all of them constructed in a rush, to a design that was intended to last for four years at most, with many built by companies with little or no experience of warship construction. This may seem an unpromising recipe for longevity, but over 60 remain in naval service in 1996 and there are others on civil registers, while many later designs are mere updates of the original LST.

The design of the LST had its origins in a British request to the United States early in the Second World War for a vessel capable of carrying some 20 tanks, each weighing 25 tonnes (then the weight of a main battle tank) from the US across the Atlantic and delivering them across a beach direct to a combat zone. The resulting design was prepared in a hurry and the ships were built in a host of small yards across the USA between 1942 and 1945. LST 294, for example, was constructed by the American Bridge Corporation at Ambridge, Pennsylvania, and was laid down on 11 September 1944, launched on 29 October 1944 and entered service on 8 January 1944, just 76 days later. The ship is still in service in 1997 as the Royal Thai Navy's *Aungthong* (711).

The type served in the US and allied navies during the Second World War and took part in the D-day landings in France while, in the Pacific, it was at the heart of all landings from 1943 onwards. It went on to serve in reducing numbers in the US Navy until the early 1970s.

NUMBERS AND SUB-CLASSES

1,152 LSTs were ordered for the US Navy during the Second World War, but only 1,052 were delivered, the missing 100 being accounted for by wartime cancellations: LST 85-116, 142-156, 182-196, 232-236, 248-260 and 296-300. Others in the main series never saw service as tank landing ships, but were converted during the completion stage of their construction for other duties, such as repair ships. Surprisingly, despite their front-line role, only 41 were lost during the war.

They all used essentially the same hull and engine design, although, with such a large class being built in many small yards, there were inevitable variations in equipment and armament. Officially, the most significant changes were introduced from LST 542 onwards, and the type is either designated collectively as the LST 1-1152 class, or separately as the LST 1-541 and LST 542-1152 classes.

Immediately after the war a large number of the LSTs were transferred to the reserve, and many were scrapped, though some returned to active service during the Korean War. The 158 remaining in the US Navy List on 1 July 1955 were given County or Parish names; although the unarmed 36 in the US-run but Japanese-manned Military Sea Transportation Service were not named.

Many LSTs were passed on to friendly governments, although in China and Vietnam some were captured from the original recipients. The Chinese and Vietnamese navies run LSTs to this day, as do 11 other navies.

DESIGN

The LST was a most important design, being the first amphibious warfare ship to employ the now-classic features of clamshell bow doors, cavernous tank deck, additional carrying capacity on the upper deck, and small island superstructure aft. The differences between the two groups were not great, the second group having a heavier battery, a 4,000 gallon per day water distillation plant, and other additions. These resulted in an increase in the deadweight of 133 t, reducing the payload for landing operations by a similar amount and on ocean-going voyages by 300 t. Another difference between earlier and later ships, but which was, in fact, introduced from LST 513 (with the sole exception of LST 531) was that the elevator between the main and tank decks was replaced by a ramp.

The upper deck could carry a maximum load of 350 t, consisting of trucks with a maximum individual weight of 10 t, or LVTs (landing vehicles, tracked) although these had to be mounted on baulks of timber to spread the load. Alternatively, a single LCT (landing craft, tank) Mk 5 or Mk 6 could be carried, either complete or in sections. In addition, a number of LCVPs (landing craft, vehicle/personnel) were carried on davits. Originally two davits were fitted but later this was increased to six, which required an increase of two officers and 16 men in the crew and a corresponding decrease in the numbers of passengers. Early experience showed that when an LCT Mk 5 or Mk 6 was carried on the main deck it was impossible to see forward from the bridge, so later ships had a raised conning position above the original pilot house.

The tank deck was 87.8 m (288 ft) long and 9.1 m (30 ft) wide, with an entrance 4.27 m (14 ft) high and 4.27 m (14 ft) wide, although the limiting height in the tank deck was 3.43 m (11 ft 3 in). This was designed to accommodate the heaviest tanks then known — the 25 tonne Sherman — although 40 tonne tanks were regularly carried later. The upper deck was accessed by an elevator 7.24 m (23.75 ft) long and 4.27 m (14 ft) wide in LST 1-512 or by a ramp (LST 513-1152).

The ship could unload over beaches with a gradient of 1:50 or could use sectional pontoons to form a causeway. These were carried lashed to the sides of the ship.

The only serious complaint against these ships was that they were too slow, rarely reaching their design speed of 10 knots, which gave rise to their ironic nickname of 'Large, Slow Targets'. On the other hand, their considerable cargo carrying capacity, voluminous hold, ability to beach where necessary and low operating costs have made the LSTs very popular with many navies and civil users, although the type has long since passed out of use with the US Navy.

In service in January 1997:

China	11	plus others in reserve and merchant service
Ecuador	1	
Greece	4	
Indonesia	1	plus 3 in reserve, 2 with Military Sealift Command
	1	Modified LST built 1961
South Korea	7	
Malaysia	2	
Mexico	3	
Philippines	7	
Singapore	2	
Taiwan	13	
	1	Converted to amphibious command ship
Thailand	5	
Turkey	2	Also used as minelayers
Vietnam	3	
Total	**63**	

SHAN (LST 1-1152)

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 200 approximately
- Tanks: 10-30, depending on size
- Total Payload

	LST 1-541	LST 542-1152
Beaching	599 t	377 t
Ocean-going	2,100 t	1,900 t

SHIP-SHORE LIFT

- LCVPs: two, four or six, depending on number of davits fitted

AVIATION FACILITIES

- Helicopter can land on foredeck, if it is not occupied by vehicles or landing craft

AMPHIBIOUS FACILITIES

- Twin, vertically hinged clamshell doors with internal ramp
- Tank deck: 87.8 × 91 m (288 × 30 ft)
- Upper (vehicle) deck:
  area — 500 m²
  maximum total load — 350 tons
  maximum individual load — 10 tons
- Access to upper deck:
  LST 1-512 — elevator: 7.24 × 4.27 m (23.75 × 14 ft)
  LST 513-1152 — ramp: 4.27 m (14 ft) wide
- Pontoons: two lashed to ship's sides

WEAPONS SYSTEMS

GUNS

US Navy 76 mm (3 in/50 calibre) guns

There are two single, open mountings, both aft.

Specifications
Gun
Calibre: 76.2 mm (3 in)
Length of barrel: 50 calibres
Muzzle velocity: 823 m/s (2,730 ft/s) (new); 808 m/s (2,651 ft/s) (mid-life)
Range: 7 n miles (13 km)
Altitude: 8,951 m (29,366 ft)
Ammunition: 10.9 kg (24.0 lb)

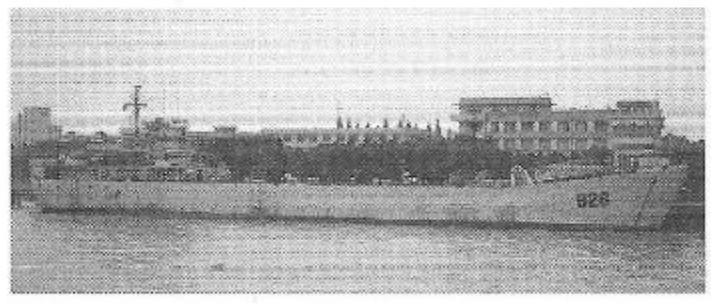
Mk 33 Mounting
Traverse: 360° at 30°/s
Elevation: −14/15 to +85° at 24°/s
Rate of fire: 100 rds/min

37 mm (W-11-M) Mountings

All ships carry Chinese 37 mm gun mountings in single and twin mountings. The number and location of the mountings varies between ships, although all seem to have a single mount in the extremity of the bow. This 62.8 calibre weapon has a flash suppressor and the barrels are enclosed in separate water jackets with exposed spring recuperators, and a hydraulic recoil buffer underneath the barrel. The loading mechanism consists of guides for ammunition, which is in five-round clips, the clips being automatically removed on the loading tray.

Specifications
W-11-M
Calibre: 37 mm
Length of barrel: 62.8 calibres
Muzzle velocity: 886 m/s (2,907 ft/s)
Traverse: 360° at 17°/s
Elevation: −10 to +85° at 13°/s
Rate of fire: 80 rds/min/barrel
Ammunition:
projectile: 0.732 kg (1.6 lb)
complete round: 1.42 kg (3.1 lb)
Range, anti-surface: 2 n miles (4 km)
Air defence: 3,000 m (9,842 ft)
Crew: 3

Ammunition (HE-T)
Projectile Weight: 708 g



'Shan' class LST 926 of the PLAN. All Chinese 'Shan' class ships were supplied by the US Navy to the Chinese Nationalists in 1945-49 and captured by the Communists in the civil war (Paul Beaver)

Explosive charge: 36 g (RDX/aluminium)
Muzzle velocity: 886 m/s (2,907 ft/s)

Rocket launchers

Some are reported to be armed with rocket launchers, but the type has not been identified.

MINES

All are capable of laying mines.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors GM 12-567A diesels, 1.32 MW (1,800 hp)
Shafts: 2

FURTHER INFORMATION

Reports suggest that at least 20 former US LSTs are in Chinese Navy service, with a further 11 in merchant service. Former US LSTs positively identified include the 1-541 series vessels LST 355 and LST 406, and the 542-1152 series vessels LST 589, LST 804, LST 805 and LST 1027, but there could be many more. Two LSTs were transferred to North Vietnam for use as tankers, while others are in the Chinese merchant service or are used as tenders. Shan is Chinese for 'mountain'.

DEPLOYMENT

Five (901-3, 905-6) are in the North Sea Fleet at Luda; six (921-6) in the East Sea Fleet at Shanghai; and two (351, 355) are in the South Sea Fleet at Guangzhou. Two of this total are in reserve.

HUALCOPO (LST 1-1152)

GENERAL SPECIFICATIONS

Country of Origin: USA
Operator: Ecuador
Type: LST 1-1152

Class: HUALCOPO

Purchased: 1
Active: 1

Displacement:
standard: 1,679 t
full load: 4,145 t

Dimensions
Length: 100 m (328 ft)
Beam: 15.3 m (50 ft)
Draught: 4.3 m (14 ft)

Speed: 11.6 kts
Range: 7,200 n miles at 10 kts

Complement: 119

SHIPS

HUALCOPO (TR61)

Builder	Chicago Bridge and Iron Co, Seneca, Illinois, USA	**Commissioned (US Navy)**	9 Jun 1945 ((LST 1146), later named *Summit County*)
		Transferred to reserve	16 Mar 1970
		Sold (Ecuador)	14 Feb 1977
		Recommissioned (Ecuador Navy)	Nov 1977

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 200
- Tanks: 10-30, depending on size
- Total payload:
  Beaching — 377 tonnes
  Ocean-going — 1,900 tonnes

SHIP-SHORE LIFT

- LCVPs: two

AVIATION FACILITIES

- Twin, vertically hinged clamshell doors with internal ramp
- Tank deck: 98.8 × 91 m (288 × 30 ft)
- Upper (vehicle), deck:
  area — 500 m²
  maximum total load — 350 tonnes
  maximum individual load — 10 tonnes
- Access to upper deck:

Pontoons: two lashed to ship's sides

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60

Eight Bofors 40 mm/60, in two twin mountings and four single mountings.

Specifications
Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,890 ft/s) (new gun); 850 m/s (2,789 ft/s (mid-life)
Range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,637 ft)
Rate of fire: 80 rds/min (practical); 160 rds/min: (cyclic) for water-cooled weapons
Ammunition: 2.21 kg (4.9 lb)

Mountings
Traverse: nominal 360° at 30°/s
Elevation: −15 to 85/90° at 24°/s
Crew:
twin mount: 4
quad mount: 11

Two Oerlikon 20 mm

There are two Oerlikon 20 mm cannon.

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,739 ft/s)
Range:
anti-surface: 1.5 km
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +55°
Traverse: 360°

Hualcopo *(TR 61). This was among the very last of the US Navy LST 1-1152 class to be completed and was originally intended for operations in the Arctic. The ice strengthening can be seen at the front of the bow doors and along the sides*

PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors GM 12-567A diesels, 1.32 MW (1,800 hp)
Shafts: 2

FURTHER INFORMATION

This ship served in a US Navy Arctic programme in the 1950s for which it was fitted with a strengthened bow; presumably it is still fitted. The Ecuadorean Navy is understood to have plans for a replacement, but no details have been announced.

SIROS (LST 1-1152)

GENERAL SPECIFICATIONS

Country of Origin: USA
Operator: Greece
Type: LST 1-1152

Class: SIROS

Purchased: 4
Active: 4

Displacement:
standard: 1,679 t
full load: 4,145 t

Dimensions
Length: 100 m (328 ft)
Beam: 15.3 m (50 ft)
Draught: 4.3 m (14 ft)

Speed: 11.6 kts
Range: 9,500 n miles at 9 kts

Complement: 93 including eight officers

SHIPS

Class 1-541

SIROS (L 144)
Builder Philadelphia Navy Yard, Philadelphia, USA
Commissioned (US Navy) 1 Feb 1943 (LST 325)
Transferred (Greece) 29 May 1964

RODOS (L 157)
Builder Newport News Shipbuilding, Newport News, Virginia
Commissioned (US Navy) 3 Dec 1942 ((LST 391), later named *Bowman County*)
Transferred (Greece) 9 Aug 1960

Class 542-1152

IKARIA (L 154)
Builder American Bridge Co, Ambridge, Pennsylvania, USA
Commissioned (US Navy) 14 Mar 1945 ((LST 1086), later named *Potter County*)
Transferred (Greece) 9 Aug 1960

KRITI (L 171)
Builder Bethlehem Steel Co, Hingham
Commissioned (US Navy) 1 May 1945 ((LST 1076), later named *Page County*)
Transferred (Greece) Mar 1971
Sold (Greece) 11 Jul 1978

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 200 approximately
- Tanks: 10-30, depending on size
- Total payload:

	LST 1-541	LST 542-1152
Beaching	500 tonnes	377 tonnes
Ocean-going	2,100 tonnes	1,900 tonnes

SHIP-SHORE LIFT

- LCVPs: two, four or six, depending on number of davits fitted

AVIATION FACILITIES

- Helicopter can land on foredeck, if not occupied by vehicles or landing craft

AMPHIBIOUS FACILITIES

- Twin, vertically hinged clamshell doors with internal ramp
- Tank deck: 87.8 × 91 m (288 × 30 ft)
- Upper (vehicle) deck:
  area — 500 m²
  maximum total load — 350 tonnes
  maximum individual load — 10 tonnes
- Access to upper deck:
  LST 1-512 — elevator: 7.24 × 4.27 m (23.75 × 14 ft)
  LST 513-1152 — ramp: 4.27 m (14 ft) wide
- Pontoons: two lashed to ship's sides

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60

***Siros, Ikaria, Kriti* only.** Eight Bofors 40 mm/60 in two twin and four single mountings.
***Rodos* only.** Six single, two twin Bofors 40mm/60.

Specifications

Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,890 ft/s) (new gun); 850 m/s (2,789 ft/s) (mid-life)
Range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,637 ft)

Rate of fire: 80 rds/min, (practical); 160 rds/min, (cyclic) for water-cooled weapons
Ammunition: 2.21 kg (4.9 lb)

Mountings
Traverse: Nominal 360° at 30°/s
Elevation: −15 to 85/90° at 24°/s
Crew:
twin mount: 4
quad mount: 11

Four Oerlikon 20 mm/two Rheinmetall 20 mm S 20

These LSTs are also armed with either four Oerlikon 20 mm or two Rheinmetall Rh-202 cannon.

	Oerlikon 20 mm	Rheinmetall Rh-202
Calibre	20 mm	20 mm
Length of barrel	70 calibres	85 calibres
Muzzle velocity	835 m/s (2,739 ft/s)	1,050-1,250 m/s (3,445-4,101 ft/s)
Range		
anti-surface	1.5 km	1 n miles (2,000 m)
anti-air	1,150 m (3,800 ft)	
Rate of fire	450 rds/min	800-1,000 rds/min

Projectile	122 g	122 g
Elevation	−15 to +55°	−10 to +55°
Traverse	360°	360°

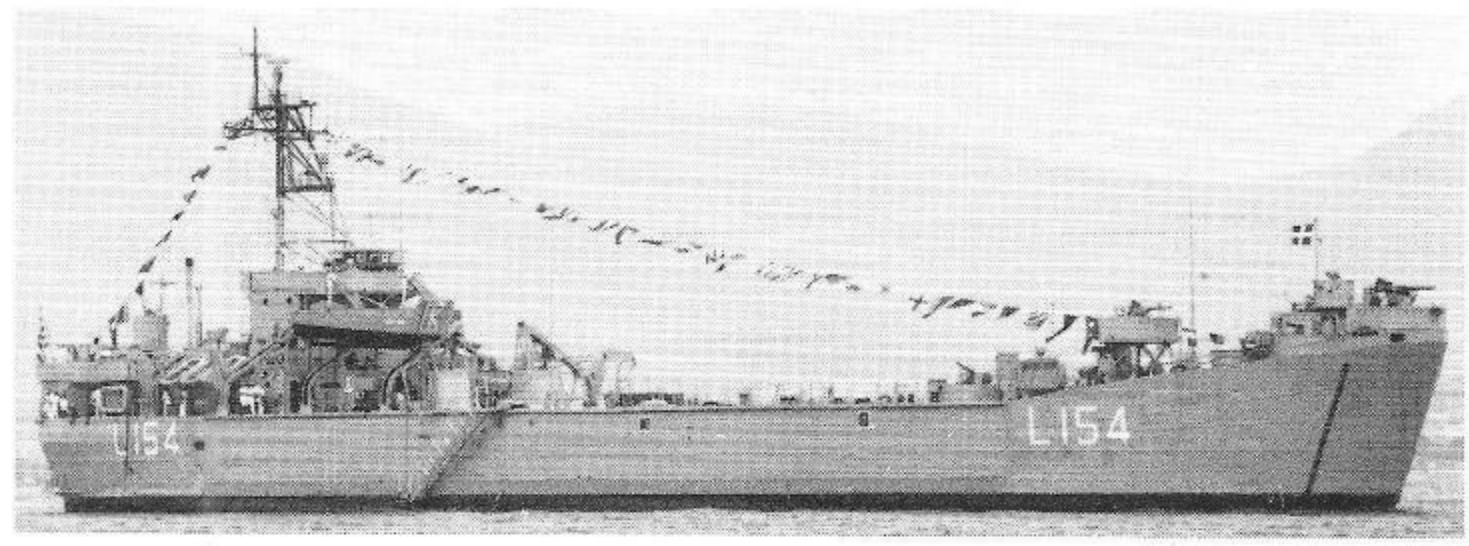
COMMAND AND CONTROL SYSTEMS

RADAR

Racal-Decca radar
There is one Racal-Decca navigation radar, model not known.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors GM 12-567A diesels, 1.32 MW (1,800 hp)
Shafts: 2



Ikaria *(L 154), the former* Potter County *(LST 1086), which transferred to the Hellenic Navy in 1960* (H & L van Ginderen Collection)

FURTHER INFORMATION

The Greek Navy has received a total of nine LSTs from the US Navy. Four were supplied in 1944 under Lease-Lend. These were followed by three LST 1541 class ships and two LST 542-1152 class.

The intention is that these ships should be replaced by the 'Jason' class, but the slow delivery of the Jasons suggests these old ships may have some life left in them.

US Navy (See Note 1)	Greek Navy	Date of transfer	Fate
LST 33	*Lesvos*	1944	Sunk, Bizerta, 1944
LST 35	*Lemnos*	1944	Stricken 1977
LST 36	*Samos*	1944	Stricken 1977
LST 37	*Khios*	1944	Stricken 1977
LST 325	*Syros* (L 144)	26 May 1964	Extant 1996
LST 389 *(Boone County)*	*Lesbos* (L 172)	9 Aug 1960	Stricken 1994
LST 391 *(Bowman County)*	*Rodos* (L 157)	9 Aug 1960	Extant 1996
LST 1076 *(Page County)*	*Kriti* (L 171)	Mar 1971 (Purchased 1978)	Extant 1996
LST 1086 *(Potter County)*	*Ikaria* (L 154)	9 Aug 1960	Extant 1966

Note
1. Some US Navy LSTs were given names.

TELUK BONE (LST 1-1152)

GENERAL SPECIFICATIONS

Country of Origin: USA
Operator: Indonesia
Type: LST 1-1152

Class: TELUK BONE

Acquired: 10
Active: 1

Displacement:
standard: 1,679 t

Traverse: Nominal 360° at 30° /s
Elevation: −15 to 85/90° at 24°/s
Crew:
twin mount: 4
quad mount: 11

COMMAND AND CONTROL SYSTEMS

RADAR

AN/SPS-53

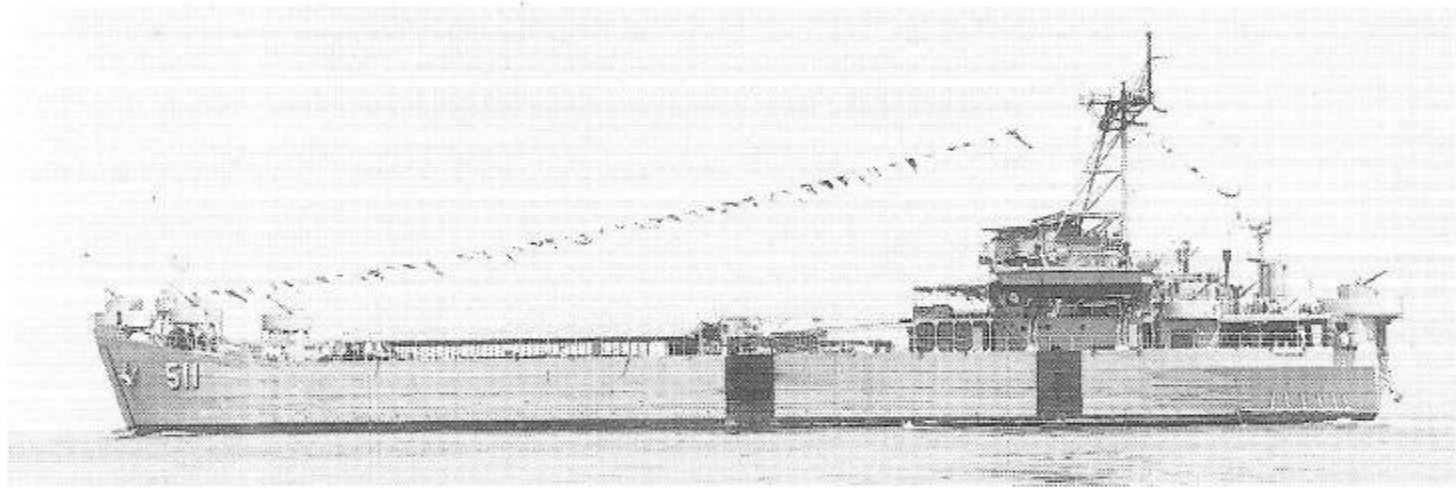
AN/SPS-53 is a Raytheon, I-band, high-resolution search radar which employs a 1.5 m (5.0 ft) slotted array antenna. SPS-53 radars are now to be found only in a few, mainly elderly, warships.

Specifications
AN/SPS-53E
Role: Surface search
Frequency: I band
Beam: 1.6 × 20°
Peak power: 40 kW
Gain: 30 dB
Pulsewidth: 0.5/1.0 µs
PRF: 750/1,500 pps
Scan rate: 15 rpm

Manufacturer/Contractor
Raytheon, USA.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors GM 12-567A diesels, 1.32 MW (1,800 hp)
Shafts: 2



Teluk Bone *(511), believed to be the last of the ex-US Navy LSTs still in service with the Indonesian Navy* (H & L van Ginderen Collection)

FURTHER INFORMATION

Indonesia has a particular requirement for amphibious vessels with a national territory composed entirely of islands and stretching over a vast distance. It has operated a fleet of ex-US Navy LSTs for many years, some being naval vessels and others being operated by the Indonesian Military Sealift Command. Most of these were obtained direct from the USA, but others have come from a number of sources, including one from the Liberian civil register:

These elderly and hard-used ships were in urgent need of replacement, which is why the Indonesians were so keen to buy the entire fleet of ex-DDR 'Frosch' class LSTs. With the arrival in Indonesia of the 'Frosch I' class from Germany, six of the ex-US Navy LSTs were deleted in 1995/96, although four of them are reported to be in reserve and being used as stores until they are scrapped.

USN No	Commissioned	Indonesian name	Transfer	Notes
LST 1128	9 Mar 1945	*Teluk Langsa* (501)		In reserve 1996
LST 616	29 May 1944	*Teluk Bajur* (502)	Jun 1961	Operated by Military Sealift Command
LST 652	1 Jan 1945	*Teluk Kau* (504)		In reserve 1996
LST 356 *(Bledsoe County)*	22 Dec 1942	*Teluk Tomini* (508)		1. Ex-merchant vessel. 2. Operated by Military Sealift Command
LST 678	30 Jun 1944	*Teluk Ratai* (509)		1. Ex-Liberian MV *Inagua Shipper.* 2. In reserve 1996
LST 839 *(Iredell County)*	6 Dec 1944	*Teluk Bone* (511)	Jun 1961	In service 1996

TELUK AMBOINA (MODIFIED LST 1-1152)

GENERAL SPECIFICATION

Country of Origin: USA
Country of Construction: Japan
Operator: Indonesia
Type: Modified LST 1-1152

Class: TELUK AMBOINA

Purchased: 1
Active: 1

Displacement:
standard: 2,416 t
full load: 4,267 t

Dimensions:
Length: 99.7 m (327 ft)
Beam: 15.3 m (50 ft)
Draught: 4.6 m (15 ft)

Speed: 13.1 kts
Range: 4,000 n miles at 13.1 kts

Complement: 88

SHIPS

TELUK AMBOINA (503)
Builder Sasebo Heavy Industries, Japan

Launched 17 Mar 1961
Commissioned Jun 1961

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 200 approximately
- Tanks: 10-30, depending on size
- Total payload:
  Beaching — 377 tonnes
  Ocean-going — 1,900 tonnes

SHIP-SHORE LIFT

- LCVPs: four

AVIATION FACILITIES

- Helicopter can land on foredeck, if not occupied by vehicles or landing craft

AMPHIBIOUS FACILITIES

- Twin, vertically hinged clamshell doors with internal ramp
- Tank deck: 87.8 × 91 m (288 × 30 ft)
- Upper (vehicle) deck:
  area — 500 m²
  maximum total load — 350 tonnes
  maximum individual load — 10 tonnes
- Access to upper deck:
  LST 513-1152 — ramp: 4.27 m (14 ft) wide
- Pontoons: two lashed to ship's sides
- Crane: 30 tonne capacity

WEAPONS SYSTEMS

GUNS

Six 37 mm/63 guns

Russian-designed 70K and W-11-M guns and mountings have been installed in several Indonesian LSTs in recent years. The 37 mm/ 62.8 calibre weapon is an air-cooled, single mounting with an enclosed spring recuperator, while in the twin mounting the barrels are enclosed in separate water jackets with exposed spring recuperators.

Specifications
Calibre: 37 mm
Length of barrel: 62.8 calibres
Muzzle velocity: 880 m/s (2,887 ft/s)
Traverse: 360°
Elevation: −10 to +85°
Traverse speed: 20°/s
Elevation speed: 15°/s
Rate of fire: 80 rds/min/barrel
Ammunition (projectile): 0.732 kg (1.6 lb)

Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 3,000 m (9,842 ft)
Crew: 6

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MAN V6V 22/30 diesels, 2.52 MW (3,425 hp)
Shafts: 2

FURTHER INFORMATION

Teluk Amboina was built in Japan as war reparations for Indonesia and was launched in 1961. It is an almost identical copy of the US Navy LST 542 type, but with minor differences in dimensions and displacement, and with more powerful engines, although with only marginal improvement in performance. A 30-tonnes crane has been installed forward of the bridge. After some years of service with the navy it now serves with the Military Sealift Command, but would be available to the navy in war.

Teluk Amboina *(503) was built in Japan in 1960-61 as war reparations and is virtually identical with the US LST 542-1152 design, but with improved engines* (H & L van Ginderen Collection)

BI BONG (LST 1-1152)

GENERAL SPECIFICATIONS

Country of Origin: USA
Operator: Republic of Korea

Class: 1-541 and 542-1152 LST

Active: 7

Displacement:
standard: 1,679 t
full load: 4,145 t

Dimensions
Length: 100 m (328 ft)
Beam: 15.3 m (50 ft)
Draught: 4.3 m (14 ft)

Speed: 11.6 kts
Complement: 80

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 200 approximately
- Tanks: 10-30, depending on size
- Total payload:

	LST 1-591	LST 542-1152
Beaching	500 tonnes	377 tonnes
Ocean-going	2,100 tonnes	1,900 tonnes

SHIP-SHORE LIFT

- LCVPs: two, four or six, depending on number of davits fitted

AVIATION FACILITIES

- Helicopter can land on foredeck, if not occupied by vehicles or landing craft

AMPHIBIOUS FACILITIES

- Twin, vertically hinged clamshell doors with internal ramp
- Tank deck: 87.8 × 91 m (288 × 30 ft)
- Upper (vehicle) deck:
  area — 500 m²
  maximum total load — 350 tonnes
  maximum individual load — 10 tonnes
- Access to upper deck:
  LST 1-512 — elevator: 7.24 × 4.27 m (23.75 × 14 ft)
  LST 513-1152 — ramp: 4.27 m (14 ft) wide
- Pontoons: two lashed to ship's sides

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60

Eight Bofors 40 mm/60 in two twin and one quad mounting.

Specifications
Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,890 ft/s)(new gun); 850 m/s (2,789 ft/s) (mid-life)
Range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,638 ft)
Rate of fire: 80 rds/min, (practical); 160 rds/min; (cyclic) for water-cooled weapons
Ammunition: 2.21 kg (4.9 lb)

Mountings
Traverse: nominal 360° at 30°/s
Elevation: −15 to 85/90° at 24°/s
Crew:
twin mount: 4
quad mount: 11

Two Oerlikon 20 mm

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,739 ft/s)
Range:
anti-surface: 1.5 km
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min

Wee Bong *(LST 676). Seven of these LSTs remain in service with the RoK Navy.*

Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +55°
Traverse: 360°

PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors GM 12-567A diesels, 1.32 MW (1,800 hp)
Shafts: 2

FURTHER INFORMATION

All these ships were transferred to the RoK Navy between 1955 and 1959, as shown:

US Navy (See Note 1)	Korean Navy (See Note 2)	Date of transfer (See Note 3)	Fate
LST 120		1955-58	Stricken
LST 213		1955-58	Stricken
LST 218	*Bi Bong* (LST 673)	May 1955	In service 1996
LST 227	*Duk Bong* (LST 672)	Mar 1955	Grounded, stricken - 1989
LST 288 *(Berkshire County)*	*Kae Bong* (LST 675)	Mar 1956	In service 1996
LST 343	*Dan Yang*	1955-58	Stricken
LST 378		1955-58	Stricken
LST 380		1955-58	Stricken
LST 388	*Ryong Pi*	1955-58	Stricken
LST 491	*An Tong*	1955-58	Wrecked Jan 1952
LST 536		1955-58	Stricken
LST 594		1955-58	Stricken
LST 595	*Chon Po*	1955-58	Stricken
LST 608	*Ulsan*	1955-58	Stricken
LST 624		1955-58	Stricken
LST 659	*Ryong Hwa*	1955-58	Stricken
LST 805	*Lyung Wha*	1955-58	Stricken
LST 849 *(Johnson County)*	*Wee Bong* (LST 676)	Jan 1959	In service 1996
LST 853 *(Kane County)*	*Su Yong* (LST 677)	Dec 1958	In service 1996
LST 900 *(Lynn County)*	*Buk Han* (LST 678)	Dec 1958	In service 1996
LST 1010	*Un Bong* (LST 671)	Feb 1955	In service 1996
LST 1080 *(Pender County)*	*Hwa San* (LST 679)	Oct 1958	In service 1996

Notes
1. Some US Navy LSTs were given names.
2. Not all Korean designations of the earlier ships have been identified.
3. Where a definite transfer date has not been identified it is given as '1955-58'

The intention is that these ships should be replaced by the Korean-designed and built 'Alligator' class.

SRI BANGGI (LST 1-1152)

GENERAL SPECIFICATIONS

Country of Origin: USA
Operator: Malaysia
Type: LST 1-1152

Class: SRI BANGGI

Purchased: 3
Active: 2

Displacement:
standard: 1,679 t
full load: 4,145 t

Dimensions
Length: 100 m (328 ft)
Beam: 15.3 m (50 ft)
Draught: 4.3 m (14 ft)

Speed: 11.6 kts
Complement: 128, including 11 officers

SHIPS

SRI BANGGI (A 1501)
Builder Missouri Valley Bridge & Iron Co, Indiana, USA
Commissioned (US Navy) 30 Nov 1944 ((LST 824), later named *Henry County*)
Transferred (Malaysia) 1 Aug 1974
Purchased (Malaysia) 7 Oct 1976

RAJA JAROM (A 1502)
Builder Chicago Bridge & Iron, Seneca, Illinois, USA
Commissioned (US Navy) 19 Feb 1945 ((LST 1123), later named *Sedgewick County*)
Transferred (Malaysia) 1 Aug 1974
Purchased (Malaysia) 7 Oct 1976

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 200 approximately
- Tanks: 10-30, depending on size
- Total payload:
  LST 542-1152
  Beaching — 377 tonnes
  Ocean-going — 1,900 tonnes

SHIP-SHORE LIFT

- LCVPs: two

AVIATION FACILITIES

- Helicopter can land on foredeck, if not occupied by vehicles or landing craft

AMPHIBIOUS FACILITIES

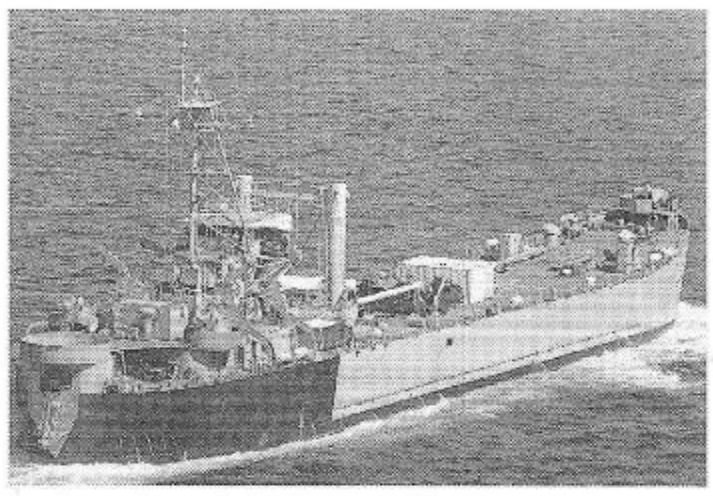
- Twin, vertically hinged clamshell doors with internal ramp
- Tank deck: 87.8 × 91 m (288 × 30 ft)
- Upper (vehicle) deck:
  area — 500 m²
  maximum total load — 350 tonnes
  maximum individual load — 10 tonnes
- Access to upper deck
  LST 513-1152 — ramp: 4.27 m (14 ft) wide
- Pontoons: two lashed to ship's sides
- Two large derricks have been fitted at the after end of the upper deck
- Kedge anchor

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60

Four Bofors 40 mm/60 in one twin and two single mountings. These guns are being progressively reduced: at one stage, these ships had two twin mountings and four singles; then two singles were removed, and more recently one twin.



Raja Jarom *(1502). Note the derricks immediately before the bridge and the empty gun position on the stern* (92 Wing RAAF)

Specifications
Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,890 ft/s) (new gun); 850 m/s (2,789 ft/s) (mid-life)
Range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,638 ft)
Rate of fire: 80 rds/min, (practical); 160 rds/min, (cyclic) for water-cooled weapons
Ammunition: 2.21 kg (4.9 lb)

Mountings
Traverse: Nominal 360° at 30°/s
Elevation: −15 to 85/90° at 24°/s
Crew:
twin mount: 4
quad mount: 11

RADARS

Raytheon AN/SPS-21C

***Sri Banggi* only.** The Raytheon AN/SPS-21 is an elderly surface search radar operating in the G/H band, with a nominal range of 12 n miles (22 km).

Manufacturer/Contractor
Raythoen, USA.

Sperry AN/SPS-53

***Raja Jarom* only.** The SPS-53 employs a 1.5 m (5.0 ft) slotted array antenna and has a 40 kW peak power.

Specifications
AN/SPS-53E
Role: Surface search
Band: I
Beam: 1.6 × 20°
Peak power: 40 kW
Gain: 30 dB
Pulsewidth: 0.5/1.0 µs
PRF: 750/1500 pps
Scan rate: 15 rpm

Manufacturer/Contractor
Sperry, USA.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 GM 12-567A diesels, 1.32 MW (1,800 hp)
Shafts: 2

FURTHER INFORMATION

The Royal Malaysian Navy (RMN) purchased three LSTs from the US Navy, of which one, the former *Hunterdon County* (LST 838), was operated as *Sri Langkawi* (A 1500) but was stricken in the 1980s. The two remaining LSTs are employed principally on harbour duties as depots for small craft, but retain the capability to be used as amphibious warfare ships, if necessary.

RIO PANUCO (LST 1-1152)

GENERAL SPECIFICATIONS

Country of Origin: USA
Operator: Mexico
Type: LST 1-1152

Class: RIO PANUCO

Purchased: 3
Active: 3

Displacement
full load: 4,145 t

Dimensions
Length: 100 m (328 ft)
Beam: 15.3 m (50 ft)
Draught: 4.3 m (14 ft)

Speed: 11 kts
Range: 6,000 n miles at 11 kts

Complement: 250

SHIPS

RIO PANUCO (A 01)	
Builder	Bethlehem Steel, Hingham, Massachusetts, USA
Commissioned (US Navy)	8 May 1945 ((LST 1077), later named *Park County*)
Transferred (Mexico)	10 Sep 1971
Purchased (Mexico)	12 Jul 1978

RIO PAPALOAPAN (A 02)	
Builder	Chicago Bridge & Iron Co, Seneca, Illinois, USA
Commissioned (US Navy)	31 Mar 1944 ((LST 602), later named *Clearwater County*)
Transferred (Mexico)	17 Jun 1972

RIO GRIJALVA (A 03)	
Builder	American Bridge Co, Ambridge, Pennsylvania, USA
Commissioned (US Navy)	27 June 1945 ((LST 1095), later *Megara* (ARVA 6)
Purchased (Mexico)	10 Oct 1973

AMPHIBIOUS CAPABILITIES

PROPULSION

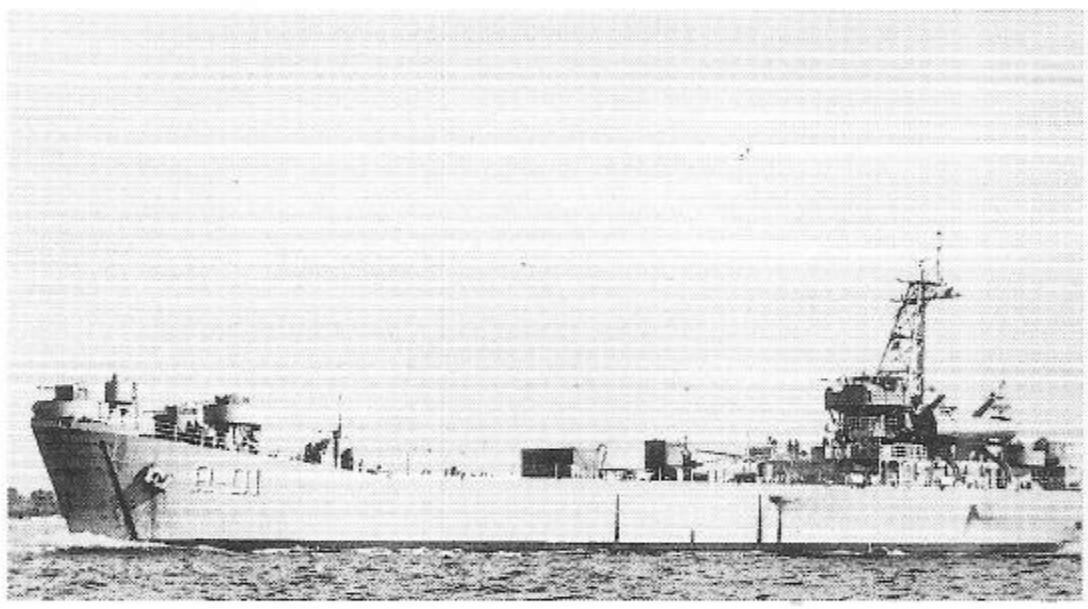
Specifications

System: Diesel
Main machinery: 2 General Motors GM 12-567A diesels, 1.34 MW (1,800 hp)
Shafts: 2

FURTHER INFORMATION

All three are classified as auxiliaries, although they retain their amphibious capabilities. All three ships are used primarily for search and rescue and for disaster relief, and the original intention was that they should have been paid off when the two new auxiliaries, *Rio Usumacinta* and *Rio Coatzacoalcos* were commissioned, but that was more than 10 years ago.

One of the three former US Navy LSTs, *Rio Grijalva* (A 03), actually belonged to a small subgroup which was converted during construction to specialised Aircraft Repair Vessels (Aircraft). This particular ship originally bore the name *Megara* (ARVA 6).



Rio Panuco *(A-01) is one of three ex-US Navy LSTs still operated by the Mexican Navy* (H & L van Ginderen Collection)

Rio Grijalva *(A-03) is still in service, having started as LST 1095 in 1945 then being converted to a repair ship (*Megara *(ARVA 6) and then sold to Mexico as* Vicente Guerrero *(A-05) in 1973, before taking on its present name and pennant number* (H & L van Ginderen Collection)

LAGUNA (LST 1-1152)

GENERAL SPECIFICATIONS

Country of Origin: USA
Operator: Philippines
Type: 1-1152 (LST)

Class: LAGUNA

Active: 7

Displacement:
standard: 1,646 t
full load: 4,145 t

Dimensions
Length: 100 m (328 ft)
Beam: 15.3 m (50 ft)
Draught: 4.3 m (14 ft)

Speed: 10 kts

Complement: 60-110

SHIPS

Class 1-541

LAGUNA (LT 501)
Commissioned (US Navy) 3 Nov 1943 (LST 230)
Transferred (Philippines) 1976
Recommissioned 8 Aug 1978

SOUTH COTABATO (LT 87)
Commissioned (US Navy) 28 Feb 1944 ((LST 529), later named *Cayuga County*)
Transferred (Philippines) 1976

Class 542-1152

ZAMBOANGA DEL SUR (LT 86)
Commissioned (US Navy) 3 Feb 1945 ((LST 975), later named *Marion County*)
Transferred to Philippines 17 Nov 1975

LANAO DEL NORTE (LT 504)
Commissioned (US Navy) 29 May 1944 (LST 566)
Transferred (Philippines) 1976
Recommissioned 8 Aug 1978

BENGUET (LT 507)
Commissioned (US Navy) 10 May 1944 ((LST 692), later named *Davies County*)
Transferred (Philippines) 1976
Recommissioned 18 Oct 1978

SIERRA MADRE (LT 57) (ex *Dumagat*, AL 57)
Commissioned (US Navy) 14 Jan 1944 ((LST 821), later named *Harnett County*)
Transferred (South Vietnam) 1970 as *My Tho*
Bought by Philippines 5 Apr 1976

KALINGA APAYAO (LT 516) (ex-AE 516)
Commissioned (US Navy) 28 Aug 1944 ((LST 786), later named *Garrett County*)
Transferred (South Vietnam) 1970 (*Can Tho*)
Purchased (Philippines) 5 Apr 1976

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 200 approximately
- Tanks: 10-30, depending on size
- Total payload:

	LST 1-591	LST 542-1152
Beaching	500 tonnes	377 tonnes
Ocean-going	2,100 tonnes	1,900 tonnes

SHIP-SHORE LIFT

- LCVPs: two, four or six, depending on number of davits fitted

AVIATION FACILITIES

- Helicopter can land on foredeck, if not occupied by vehicles or landing craft

AMPHIBIOUS FACILITIES

- Twin, vertically hinged clamshell doors with internal ramp
- Tank deck: 87.8 × 91 m (288 × 30 ft)
- Upper (vehicle) deck:
  area — 500 m²
  maximum total load — 350 tonnes
  maximum individual load — 10 tonnes
- Access to upper deck
  LST 1-512 — elevator: 7.24 × 4.27 m (23.75 × 14 ft)
  LST 513-1152 — ramp: 4.27 m (14 ft) wide
- Pontoons: two lashed to ship's sides

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60

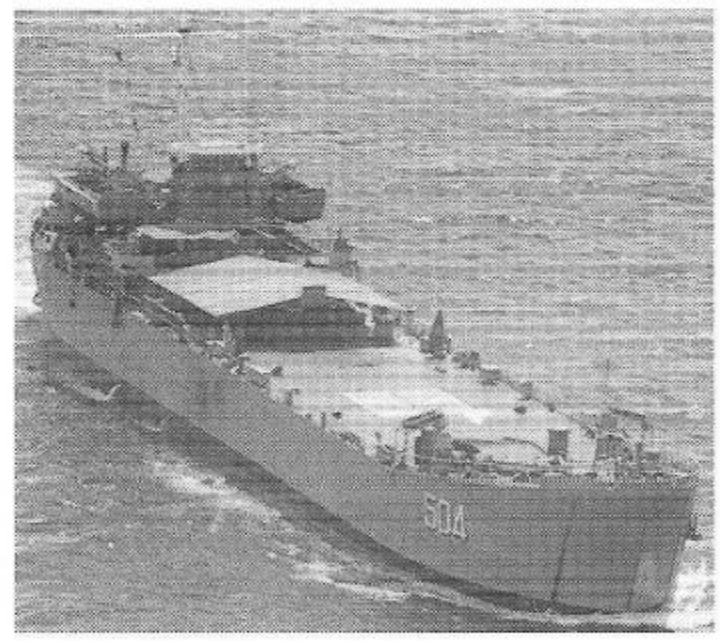
Six Bofors 40 mm/60 in two twin and two single mountings, but may vary between ships.

Specifications
Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,890 ft/s) (new gun); 850 m/s (2,789 ft/s) (mid-life)
Range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,638 ft)
Rate of fire: 80 rds/min, (practical); 160 rds/min, (cyclic) for water-cooled weapons
Ammunition: 2.21 kg (4.9 lb)

Mountings
Traverse: Nominal 360° at 30°/s
Elevation: −15 to 85/90° at 24°/s
Crew:
twin mount: 4
quad mount: 11

Four Oerlikon 20 mm guns (in refitted ships).

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,739 ft/s)
Range:
anti-surface: 1.5 km
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +55°
Traverse: 360°



Lanao del Norte *(LT 504). Note that all gun mounts have been cleared from the bow area* (Philippines Navy)

Specifications
System: Diesel
Main machinery: 2 GM 12-567A diesels, delivering 1.32 MW (1,800 hp)
Shafts: 2

FURTHER INFORMATION

Some 29 (possibly more) LSTs have been acquired by the Philippines Navy from a variety of sources. Some came direct from the US Navy, while others have come from the JMSDF and South Korean Navy, and a number of South Vietnamese ships were acquired when they brought escapees to the Philippines following the collapse of that country in 1976. Some have been refurbished in the Philippines, while Japanese shipyards refitted a number in the late 1970s, the work including replacement of the frames and plating, new or refurbished engines and electrics, and the provision of four Oerlikon 20 mm guns. All of the latter can be distinguished by their 500-series pennant numbers.

The surviving ships are classed as auxiliary transports (hence their LT pennant numbers) and are used for general cargo work, but they retain their amphibious capabilities.

US Navy	Philippine Navy (See Note 1)	Transfer date	Remarks	Fate
LST 47	*Tarlac* (LT 500)	1976	Refitted in Japan late 1970s	Scrapped ?
LST 75	*Cutabato*	1948	US Navy	Scrapped
LST 222	*Mindoro Occidental* (LT 93)	1972		Scrapped ?
LST 230	*Laguna* (LT 501)		Refitted in Japan late 1970s	In service 1996
LST 287	*Samar Oriental* (LT 902)	1976		Scrapped ?
LST 491	*Lanao del Sur* (LT 503)	1976	Refitted in Japan late 1970s	Scrapped ?
LST 488	*Surigao del Norte* (LT 94)	1972	S Korea	Scrapped

- Pontoons: two lashed to ship's sides
- Cranes:
  Excellence: two large derricks
  Intrepid: single crane

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

SIMBAD close in weapons system

These LSTs both carry two twin SIMBAD launchers. SIMBAD *(Systeme Integre de Mistral Bitube d'Auto-Defense)* is a French Navy CIWS now being installed, where it is simply replacing the Oerlikon 20 mm guns in the existing mounting. SIMBAD is one of the elements in the *Amelioration de l'Auto-defense Anti-Missile* (Anti-Missile Self-Defence Improvement) programme and is based on the high-velocity Mistral missile, which contains a SAT two-colour (3-5 µm infra-red and ultraviolet) seeker under IR-transparent magnesium fluoride panels. The seeker has a field of view of ±38° and is cooled concurrently with gyro run-up, in approximately 2 seconds. The whole system has a reaction time of as little as 5 seconds and the missile leaves its launch tube with a velocity of 40 m/s (131 ft/s) accelerating rapidly to its maximum speed of Mach 2.5.

SIMBAD is manually operated, with two missile launcher-containers. When the target is designated the operator tracks it, selects a missile and activates the battery/coolant unit to cool the seeker and warm up the missile, while the prelaunch electronics box uses the seeker to determine whether or not the target is within range. If the answer is positive the seeker locks on and the operator receives an audio signal allowing him to launch the missile. If, for some reason, the firing has to be postponed the missile system automatically compensates minor aiming errors and remains ready for launch.

Specifications

Mistral Missile
Length: 1.81 m (5.9 ft)
Diameter: 9.2 cm (3.6 in)
Wing span: 1.9 cm (0.7 in)
Weight: 18.4 kg (40 lb)
Speed: Mach 2.6
Range: 700 m to 5 km
Warhead: HE-1 kg (2.2 lb): tungsten balls — 1.95 kg (4.3 lb)
Booster: 2 SNPE rocket motors

Manufacturer/Contractor

Matra Defense, France.

Bofors 40 mm/60

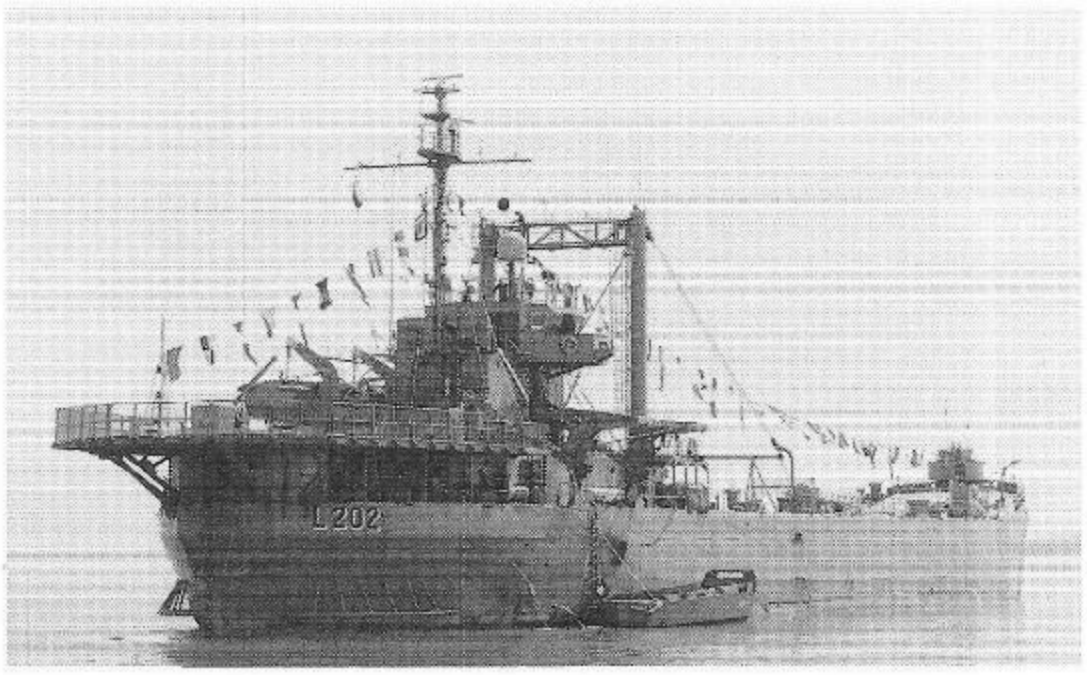
The two ships in service each have one Bofors mounted in the bows.

Specifications

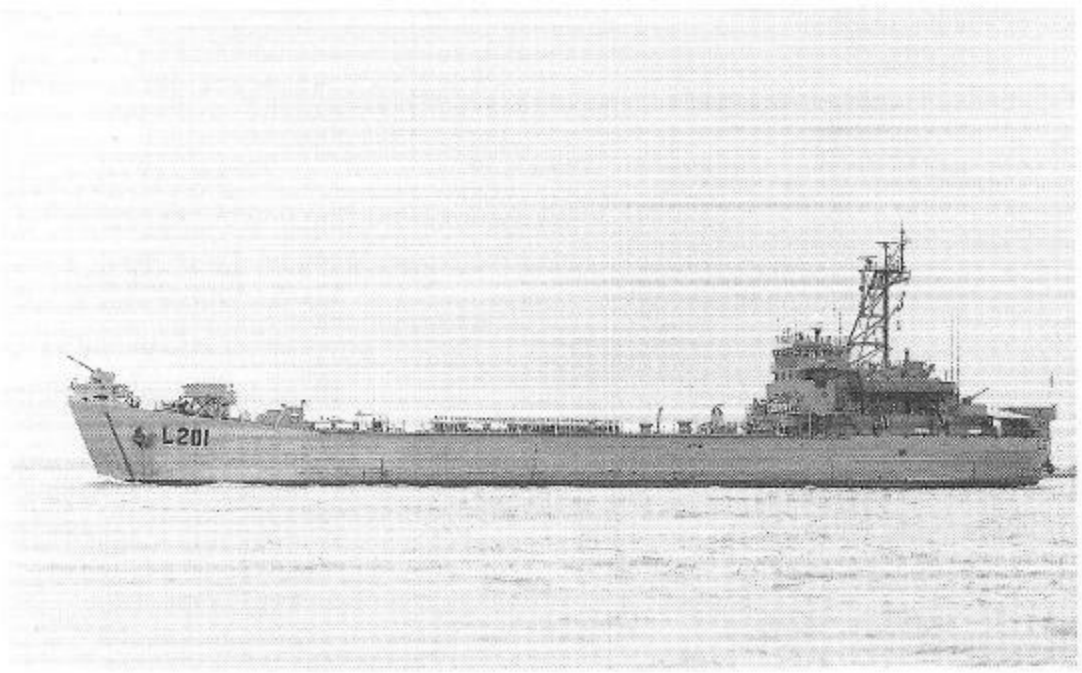
Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,889 ft/s) (new gun); 850 m/s (2,788 ft/s) (mid-life)
Range:
  anti-surface: 5.5 n miles (10 km)
  anti-air: 6,900 m (22,632 ft)
Rate of fire:
  practical: 80 rds/min
  cyclic for water-cooled weapons: 160 rds/min
Ammunition weight: 2.21 kg (4.8 lb)

M2HB 12.7 mm machine guns

Six M2HB 12.7 mm machine guns are carried. The



Excellence *(L 202) is the only known example of an ex-US Navy LSL fitted with a stern flight deck* (G Torremans)



Endurance *(L 201) is one of three LSLs in reserve at Tuas* (H & L van Ginderen Collection)

M2HB is a selective short recoil automatic operation weapon with a 1,143 mm long barrel and eight right-hand grooves turning once every 381 mm. Muzzle energy is 1,867 mkp and the weapon uses 110-round belts.

Specifications
M2HB
Calibre: 12.7 mm
Length of barrel: 90 calibres
Gun weight: 38.1 kg (84 lb)

Muzzle velocity: 893 m/s (2,929 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU diesels, 1.34 MW (1,800 hp)
Shafts: 2

FURTHER INFORMATION

In all, Singapore has purchased nine LSTs from the US Navy.

The sixth vessel, the former US Navy LST 623, was called *Perseverance* and numbered L 206; both name and number have now been taken by the 'Sir Lancelot' class LSL acquired from the British Navy, via a South African commercial concern, in 1992. The former LST *Perseverance* is being cannibalised for spares.

Note:
1. These three ships were purchased with two others, but were immediately resold on the commercial market. The reasons for, and the arrangements under which this deal was transacted, are not known.
2. The name and number of this ship were removed when it was stricken and allocated to the ex-British 'Sir Lancelot' class LSL when it was commissioned into the Republic of Singapore Navy in 1994.

US Navy	Singapore Navy	Date of transfer	Remarks
LST 117 (Note 1)	Did not enter service	June 1974	Sold commercially
LST 276 (Note 1)	Did not enter service	June 1974	Sold commercially
LST 532 (Note 1)	Did not enter service	June 1974	Sold commercially
LST 613	*Persistence* (L 205)	Purchased — 4 June 1976	In reserve
LST 623	*Perseverance* (L 206) (Note 2)	Purchased — 4 June 1976	Stricken — used for spares
LST 629	*Excellence* (L 202)	Purchased — 4 June 1976	In service 1996
LST 649	*Resolution* (L 204)	Purchased — 4 June 1976	In reserve
LST 759	*Intrepid* (L 203)	Purchased — 4 June 1976	In service 1996
LST 836 *(Holmes County)*	*Endurance* (L 201)	Lent by USN — 1 July 1971 Purchased — 5 December 1975	In reserve

MODERNISATION

The two ships still in service have been modernised, with new electrics and communications, an enclosed bridge and updated command facilities. *Excellence* (L 202) has had a goalpost derrick fitted forward of the bridge, while *Intrepid* (L 202) has a large crane. *Excellence* also has a large helicopter flight deck which extends well beyond the stern. Both have been re-engined and are now powered by MTU diesels.

DEPLOYMENT

Both ships are used as command ships and in support of the army. In peacetime they are used to transport army units on overseas exercises. *Excellence* is also used for occasional training cruises. The three ships in reserve could be returned to service in an emergency.

CHUNG HAI (LST 1-1152)

Complement: 100-125

SHIPS

CHUNG KUANG (216)
Commissioned (US Navy) 14 Dec 1943 (LST 503)
Transferred (Taiwan) Jun 1960

CHUNG SUO (217)
Commissioned (US Navy) 7 Jan 1943 ((LST 400) named *Bradley County*)
Transferred (Taiwan) Sep 1958

Class 542-1152

CHUNG HAI (201)
Commissioned (US Navy) 29 Jul 1944 (LST 755)
Transferred (Taiwan) Apr 1946

CHUNG HSING (204)
Commissioned (US Navy) 5 May 1944 (LST 557)
Transferred (Taiwan) Mar 1946

CHUNG CHIEN (205)
Commissioned (US Navy) 12 May 1944 (LST 716)
Transferred (Taiwan) Jun 1946

CHUNG SHUN (208) (ex-624)
Commissioned (US Navy) 10 May 1944 (LST 732)
Transferred (Taiwan) Mar 1946

CHUNG YUNG (210) (ex-657)
Commissioned (US Navy) 26 Jun 1944 (LST 574)
Transferred (Taiwan) Mar 1959

CHUNG CHUAN (221) (ex-651)
Commissioned (US Navy) 18 Sep 1944 (LST 1030)
Transferred (Taiwan) Feb 1948

CHUNG FU (223)
Commissioned (US Navy) 11 Dec 1944 ((LST 840) later named *Iron County*)
Transferred (Taiwan) Jul 1958

CHUNG CHIH (226)
Commissioned (US Navy) 6 May 1945 ((LST 1091) named *Sagadahoc County*)
Transferred (Taiwan) Oct 1958

CHUNG MING (227)
Commissioned (US Navy) 13 May 1945 ((LST 1152) named *Sweetwater County*)
Transferred (Taiwan) Oct 1958

CHUNG PANG (230)
Commissioned (US Navy) 15 Jul 1944 (LST 587)
Transferred (Taiwan) Sep 1958

CHUNG YEH (231)
Commissioned (US Navy) 28 May 1945 ((LST 1144) named *Sublette County*)
Transferred (Taiwan) Sep 1961

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 200 approximately
- Tanks: 10-30, depending on size
- Total payload:

	LST 1-591	LST 542-1152
Beaching	500 tonnes	377 tonnes
Ocean-going	2,100 tonnes	1,900 tonnes

SHIP-SHORE LIFT

- LCVPs: Two, four or six, depending on number of davits fitted

AVIATION FACILITIES

- Helicopter can land on foredeck, if not occupied by vehicles or landing craft

AMPHIBIOUS FACILITIES

- Twin, vertically hinged clamshell doors with internal ramp
- Tank deck: 87.8 × 91 m (288 × 30 ft)
- Upper (vehicle) deck:
  area: 500 m²
  maximum total load: 350 tonnes
  maximum individual load: 10 tonnes
- Access to upper deck:
  LST 1-512 — elevator: 7.24 × 4.27 m (23.75 × 14 ft)
  LST 513-1152 — ramp: 4.27 m (14 ft) wide
- Pontoons: Two lashed to ship's sides

WEAPONS SYSTEMS

GUNS

Up to 10 Bofors 40 mm/60 in twin and single mountings

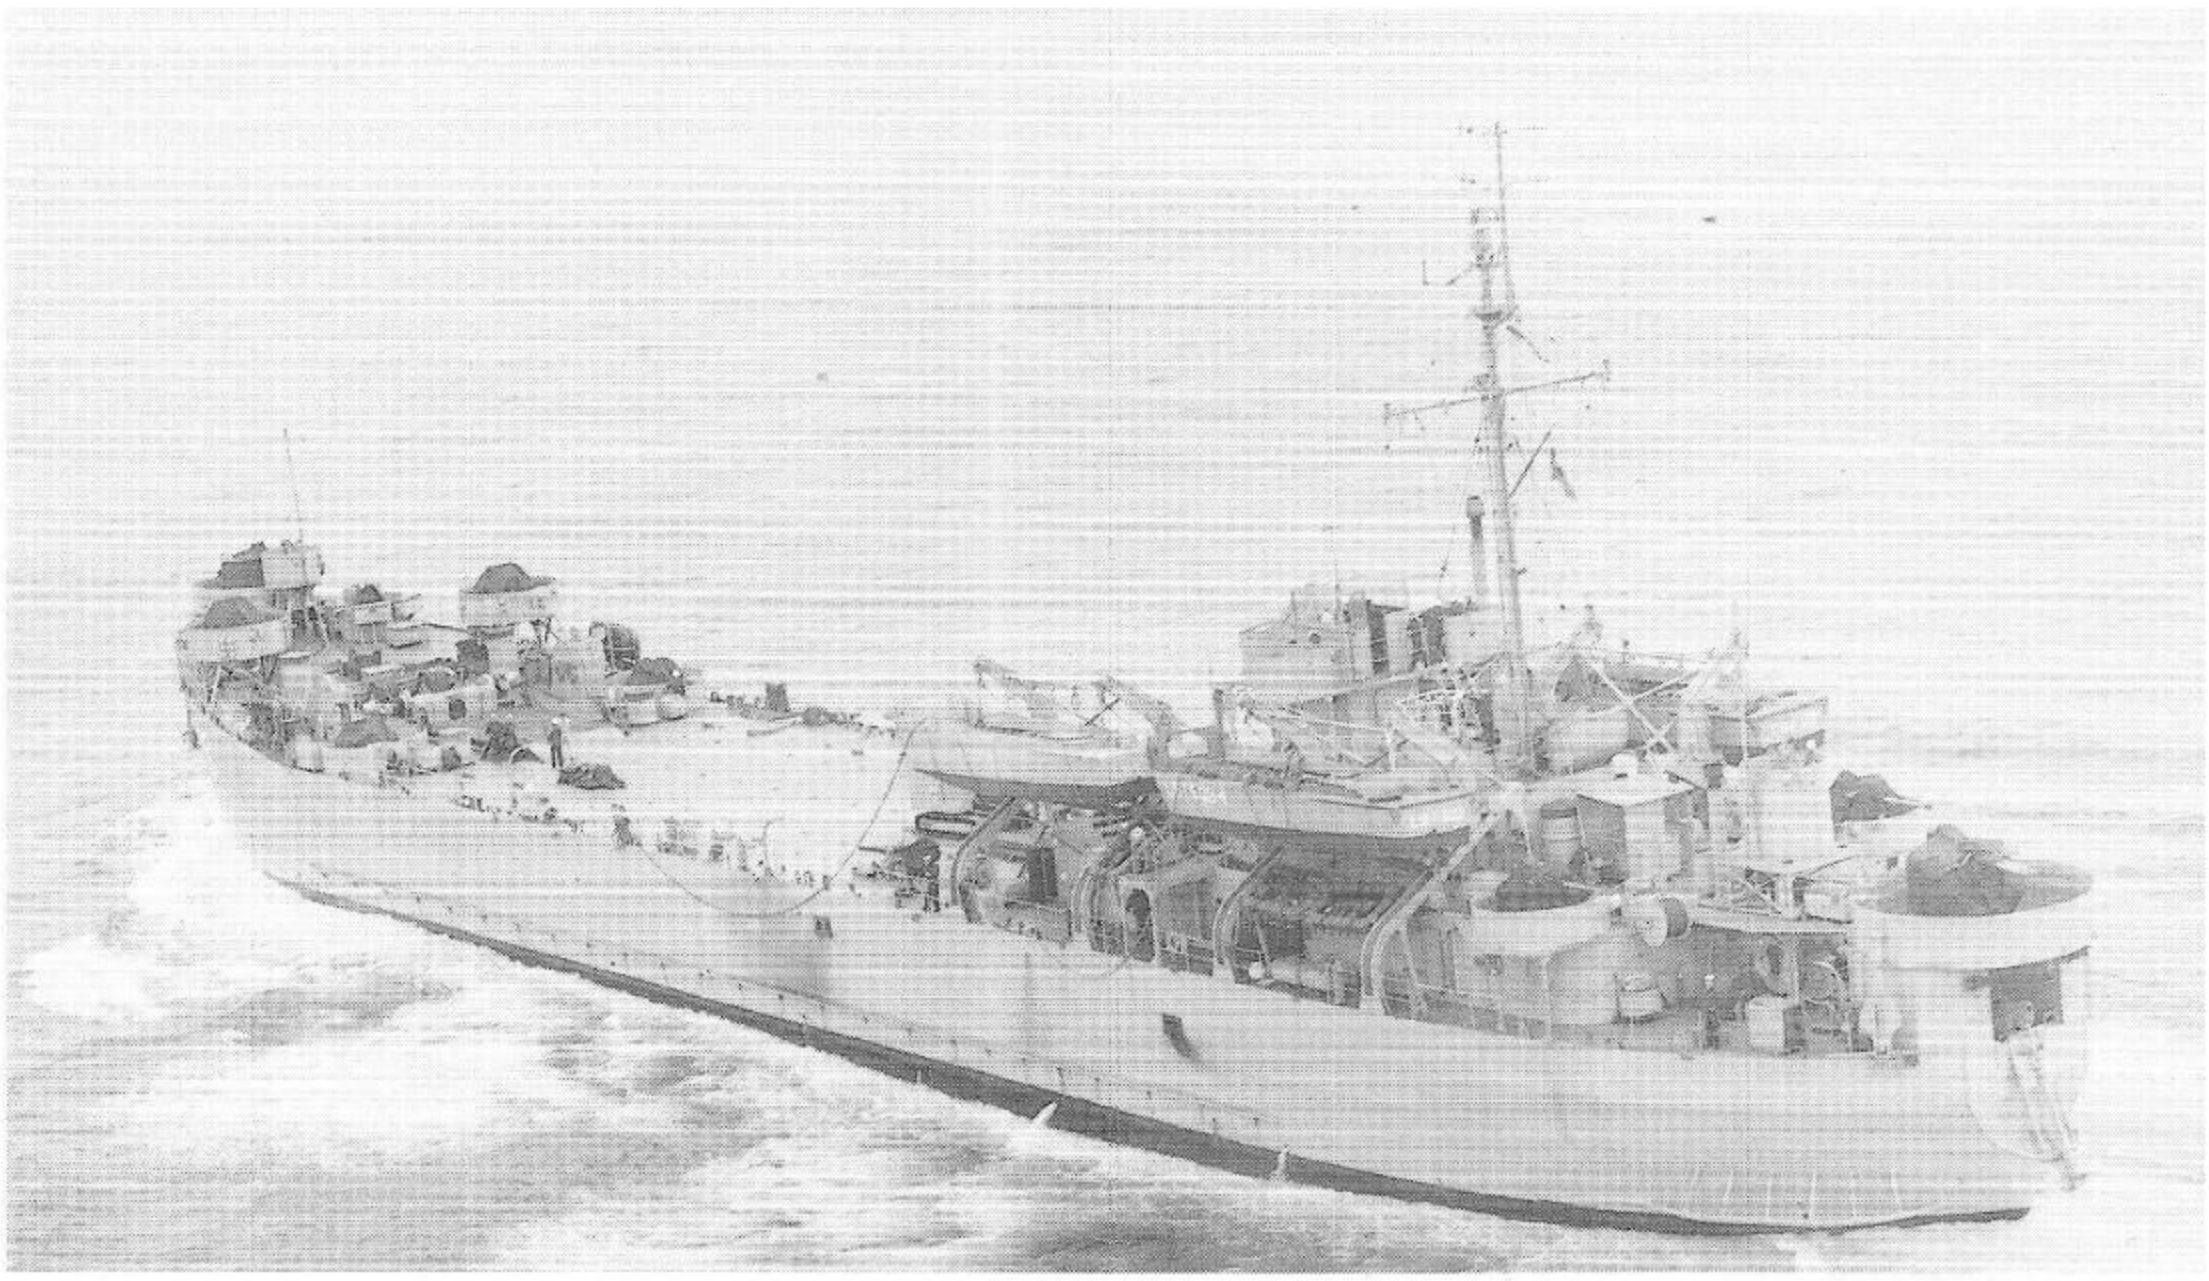
Some vessels have two twin and six single mountings, others have fewer. Where ships are fitted with two ex-US Navy 3 in/50 calibre guns, they have three twin mountings of Bofors 40 mm/60s.

Specifications
Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,890 ft/s) (new gun); 850 m/s (2,788 ft/s) (mid-life)
Range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,632 ft)
Rate of fire:
(practical): 80 rds/min
(cyclic) for water-cooled weapons: 160 rds/min
Ammunition weight: 2.21 kg (4.8 lb)

Two US Navy 3 in (76 mm)/50 calibre guns (on some ships)

Specifications
Gun
Calibre: 76.2 mm (3 in)
Length of barrel: 50 calibres
Muzzle velocity: 823 m/s (2,700 ft/s) (new); 808 m/s (2,650 ft/s) (mid-life)
Range:
anti-surface: 7 n miles (13 km)
anti-air: 8,951 m (29,367 ft)
Ammunition weight: 10.9 kg (24 lb)

Mk 33 Mounting
Traverse: 360 at 30°/s
Elevation: −14 to +85 at 24°/s
Rate of fire: 100 rds/min



Chung Kuang *(216) showing all the characteristics of the classic LST: doors and weapons forward; long, closed tank deck; and machinery, superstructure and the remaining weapons aft. Note the LCVPs on davits; numbers vary between two and six* (H & L van Ginderen Collection)

Several Oerlikon 20 mm in twin or single mountings

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,738 ft/s)
Range:
anti-surface: 1.5 km (0.8 n miles)
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +55°
Traverse: 360°

COMMAND AND CONTROL SYSTEMS

RADARS

Navigation: US SO 1, 2 or 8; I-Band

PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors GM 12-567A diesels, 1.32 MW (1,800 hp)
Shafts: 2

FURTHER INFORMATION

The RoC Navy has received at least 29 ex-US Navy LSTs of various types and at differing times, the initial ships being received during the civil war against the Communists in the late 1940s, at least some of which are still in service with the PLAN as the 'Shan' class. A complete tally of the Taiwanese ships is difficult, mainly because the RoC Navy has, in some cases, allocated the same name to a succession of similar vessels and on at least two occasions, has changed pennant numbers between ships. The complete situation is believed to be:

Notes:
1. In the US Navy, names were allocated to some LSTs only.
2. The Taiwanese ships were originally allocated numbers in the 200-series, but these were changed to the 600 series. Recently, however, the original numbers were returned and are still in current use.

Four other LSTs were received from the United States, which were later converted for other duties. *Chung Shi,* the former US Navy LST 735 *(Dukes County)* was converted in 1964 to be a flagship with the name *Kao Hsiung* (AGC 1). It is still operational (see following entry).

US Navy number/name (Note 1)	Taiwanese name/numbers (Note 2)	Transfer date	Remarks/Fate
LST 279 *(Berkeley County)*	*Chung Chie* (218)	Jun 1960	Stricken 1978
LST 330	*Chung Yu* (215)		Stricken
LST 400 *(Bradley County)*	*Chung Suo* (217, 667)	Sep 1958	In service 1996
LST 503	*Chung Kuang* (216, 616)	Jun 1960	In service 1996
LST 520	*Chung Shu* (228, 642)	Sep 1958	Stricken 1993
LST 535	*Chung Wan* (224, 654)	Sep 1958	Stricken 1993
LST 537	*Chung Ting* (203, 673)	Mar 1946	Stricken 1993
LST 557	*Chung Hsing* (204, 684)	Mar 1946	In service 1996
LST 574	*Chung Yung* (210, 657)	Mar 1959	In service 1996
LST 578	*Chung Pang* (230, 629)	Sep 1958	In service 1996
LST 716	*Chung Chien* (205, 679)	Jun 1946	In service 1996
LST 732	*Chung Shun* (208, 624)	Mar 1946	In service 1996
LST 755	*Chung Hai* (201)	Apr 1946	In service 1996
LST 840 *(Iron County)*	*Chung Fung* (223, 619)	Jul 1958	In service 1996
LST 859 *(Lafayette County)*	*Chung Cheng* (224, 676)	Aug 1958	Stricken 1989
LST 993	*Chung Hsun* (208)		Stricken
LST 945	*Chung Kung* (213)		Stricken
LST 1017	*Chung Chi* (206, 626)	Dec 1946	Stricken 1993
LST 1030	*Chung Chuan* (221, 651)	Feb 1948	In service 1996
LST 1033	*Chung Sheng* (222, 686)	Dec 1947	Stricken
LST 1050	*Chung Lien* (209, 691)	Jan 1947	Stricken 1993
LST 1075	*Chung Cheng* (207)		Stricken
LST 1091 *(Sagadahoc County)*	*Chung Chih* (226, 655)	Oct 1958	In service 1996
LST 1110 *(San Bernadino County)*	*Chung Chiang* (225, 635)	Aug 1958	Stricken 1993
LST 1144 *(Sublette County)*	*Chung Yeh* (231, 699)	Sep 1961	In service 1996
LST 1152 *(Sweetwater County)*	*Chung Ming* (227, 681)	Oct 1958	In service 1996

REPAIR SHIPS

Three LSTs have been used as repair ships. The first started life as US Navy LST 455, but was converted during construction to become a repair ship, as *Achilles* (ARL 41). It was transferred to Taiwan in the late 1940s and was grounded and abandoned as a burned-out hulk in 1949, although it was later salvaged and refitted by the Communist Chinese. *Chung Chuan* (202), the former US Navy LST 1013, was converted to a repair ship ARL 335 to replace the lost ARL 41 and later stricken.

A third vessel, *Sung Shan,* started life as US Navy LST 490, but was modified during construction, and was completed as landing craft repair ship, *Agenor* (ARL 3). It was transferred to France in 1951 for service in Indo-China, then returned to the US and finally transferred to Taiwan in 1957, where it was numbered, first, A 336, and later A 236.

MODERNISATION

All of the class have been extensively refitted in Taiwan, with changed armaments and new engines.

OPERATIONAL

The intention is that these ships should be retired as more of the 'Wan An' and 'Wu Kang' attack transport ships are commissioned.

KAO HSIUNG (LST 1-1152)

GENERAL SPECIFICATIONS

Country of Origin: USA
Operator: Taiwan
Type: LST 1-1152

Class: KAO HSIUNG

Converted: 1
Active: 1

Displacement:
standard: 1,679 t
full load: 4,145 t

Dimensions
Length: 100 m (328 ft)
Beam: 15.3 m (50 ft)
Draught: 4.3 m (14 ft)

Speed: 11.6 kts
Range: 11,200 n miles at 10 kts

Complement: 195

SHIPS

KAO HSIUNG (LCC 1)

Builder Dravo Corporation, Neville Island, Pennsylvania, USA

Launched 11 Mar 1944
Commissioned (US Navy) 26 Apr 1944 ((LST 735) later named *Dukes County*)

Transferred (Taiwan) May 1957 ((LST 219) (later 663) *Chung Hai*)

Purchased (Taiwan) Nov 1974

AMPHIBIOUS CAPABILITIES

Retains bow doors in working order. LCVP davits have been removed.

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60
Ten Bofors 40 mm/60 on five twin Mk 1 mountings.

Specifications
Calibre: 40 mm

Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,889 ft/s) (new gun); 850 m/s (2,788 ft/s) (mid-life)
Range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,632 ft)

Rate of fire:
(practical): 80 rds/min
(cyclic) for water-cooled weapons: 160 rds/min
Ammunition weight: 2.21 kg (4.8 lb)

COMMAND AND CONTROL SYSTEMS

RADARS

Air search: RCA SPS-12 using D-Band
Long since replaced in US Navy service.

Specifications
Beam: 30 × 3
Peak power: 500 kW
Gain: 25 dB
Pulsewidth: 4/1 ms
PRF: 300-600 pps
Scan rate: 2.5-15 rpm

Raytheon SPS-10
The surface search radar is the Raytheon SPS-10.

Specifications
Band: G/H (4 to 8 GHz)
Beam: 1.5 × 16
Peak power: 500 kW
Gain: 30 dB
Pulsewidth: 0.25/1.3 ms
PRF: 625-650 pps
Scan rate: 15 rpm

PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors GM 12-567A diesels, 1.34 MW (1,800 hp)
Shafts: 2

FURTHER INFORMATION

This ship served as a conventional LST for seven years after the transfer from the US Navy, but in 1964 it was converted to a flagship for amphibious operations, renamed and redesignated as AGC, since changed to Command and Control Ship (LCC). The conversion included installation of a lattice mast above the bridge structure, a tripod mast, modified bridge levels to accommodate the flag officer and his staff and four cylindrical antenna mountings on the main deck. It retains some of its amphibious capabilities.

AUNGTHONG (LST 1-1152)

GENERAL SPECIFICATIONS

Country of Origin: USA
Operator: Thailand

Class: 1-541 and 542-1152 (LST)

Purchased: 5
Active: 5

Displacement:
standard: 1,679 t
full load: 3,698 t (1-541 class); 4,145 t (542-1152 class)

Dimensions
Length: 100 m (328 ft)
Beam: 15.3 m (50 ft)

Draught: 4.3 m (14 ft)

Speed: 11.5 kts
Range: 9,500 n miles at 9 kts

Complement: 80 (157 at war)

SHIPS

Class 1-541

AUNGTHONG (711)

Builder	American Bridge Co, Ambridge, Pennsylvania, USA
Commissioned (US Navy)	8 Jan 1944 (LST 294)
Transferred (Thailand)	1950s (date not known)

Class 542-1152

CHANG (712)

Builder	Dravo Corporation, Pittsburgh, Pennsylvania, USA
Laid down	15 Oct 1944
Launched	25 Nov 1944
Commissioned (US Navy)	29 Dec 1944 ((LST 898) later named *Lincoln County*)
Transferred (Thailand)	Aug 1962

PANGAN (713)

Builder	Chicago Bridge & Iron Co, Seneca, Illinois, USA
Commissioned (US Navy)	7 Apr 1945 ((LST 1134) later named *Stark County*)
Transferred (Thailand)	16 May 1966

LANTA (714)

Builder	Chicago Bridge & Iron Co, Seneca, Illinois, USA
Commissioned (US Navy)	9 May 1945 ((LST 1141) later named *Stone County*)
Transferred (Thailand)	12 Mar 1970
Purchased (Thailand)	1 Mar 1979

PRATHONG (715)

Builder	Jefferson Bridging & Machinery Co, Indiana, USA
Commissioned (US Navy)	13 Sep 1944 ((LST 722) later named *Dodge County*)
Transferred (Thailand)	17 Dec 1975

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 200 approximately
- Tanks: 10-30, depending on size
- Total payload:

	LST 1-591	LST 542-1152
Beaching	500 tonnes	377 tonnes
Ocean-going	2,100 tonnes	1,900 tonnes

SHIP-SHORE LIFT

- LCVPs: Two, four or six, depending on number of davits fitted

AVIATION

- Helicopter can land on foredeck, if not occupied by vehicles or landing craft

AMPHIBIOUS FACILITIES

- Twin, vertically hinged clamshell doors with internal ramp
- Tank deck: 87.8 × 91 m (288 × 30 ft)
- Upper (vehicle) deck:
  area: 500 m²
  maximum total load: 350 tonnes
  maximum individual load: 10 tonnes
- Access to upper deck:
  LST 1-512 — elevator: 7.24 × 4.27 m (23.75 × 14 ft)
  LST 513-1152 — ramp: 4.27 m (14 ft) wide
- Pontoons: Two lashed to ship's sides
- Kedge anchor
- *Lanta, Prathong, Chang.* Mobile crane on tank deck; 10 tonne capacity

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60

Eight Bofors 40 mm/60 two twin and four single mountings, can be mounted, but do not seem always to be carried.

Specifications
Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,889 ft/s) (new gun); 850 m/s (2,788 ft/s) (mid-life)
Range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,632 ft)
Rate of fire:
(practical): 80 rds/min
(cyclic) for water-cooled weapons: 160 rds/min
Ammunition weight: 2.21 kg (4.8 lb)

Oerlikon 20 mm/80

Two Oerlikon 20 mm/80 in all except Chang (2).

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,738 ft/s)
Range:
anti-surface: 0.8 n miles (1.5 km)
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +90

12.7 mm machine guns

***Chang* only.** Two M2HB 12.7 mm machine guns. The M2HB is a selective short recoil automatic operation weapon with a 1,143 mm long barrel and eight right-hand grooves turning once every 381 mm. Muzzle energy is 1,867 mkp and the weapon uses 110-round belts.

Specifications
Calibre: 12.7 mm
Length of barrel: 90 calibres
Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,929 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Two Mk 51 gun fire-control systems. Two optical systems.

RADAR

Racal-Decca 1229

The navigation radar is the Racal-Decca Type 1229, with an output of 20 kW. It is equipped with a 2.7 m (8.85 ft) antenna and operates in the I/J-band.

Specifications
Role: Navigation
Band: I/J
Beam: 1.3 × 30°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25/1.0 µs
PRF: 1,300/650 pps
Scan rate: 25 rpm

Manufacturer/Contractor
Racal Decca.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors GM 12-567A diesels, 1.34 MW (1,800 hp)
Shafts: 2

FURTHER INFORMATION

The Royal Thai Navy has five LSTs which were transferred from the US Navy at irregular intervals between the 1950s and 1975. One ship, *Aungthong* was paid off in 1987 but has been brought back into service. *Chang* was one of a number of LSTs given a reinforced bow and waterline during construction for possible service in the Arctic.

Pangan *(713) (prior to renumbering). Note the 10-tonne crane normally carried by RTN LSTs*

BAYRAKTAR (LST 1-1152)

GENERAL SPECIFICATIONS

Country of Origin: USA
Operator: Turkey
Type: LST 1-1152

Class: BAYRAKTAR

Active: 2

Displacement:
standard: 1,679 t
full load: 4,145 t (542-1152 class)

Dimensions
Length: 100 m (328 ft)
Beam: 15.3 m (50 ft)
Draught: 4.3 m (14 ft)

Speed: 11 kts
Range: 15,000 n miles at 9 kts

Complement: 125, including 12 officers

SHIPS

BAYRAKTAR (N[L] 120) (ex-N 111)		**Recommissioned**	6 Feb 1964	**Transferred (West Germany)**	1961 (*Bochum* (A 1404))
Builder	Missouri Valley, Evansville, Indiana, USA	**Decommissioned**	28 Sep 1971	**Converted to minelayer**	1962-64
Commissioned (US Navy)	26 Jan 1945 ((LST 1101) later named *Saline County)*	**Transferred (Turkey)**	12 Dec 1976	**Recommissioned**	14 Apr 1964
Transferred (West Germany)	1961 (*Bottrop* (A 1402))	**SANCAKTAR** (N[L] 121)		**Transferred (Turkey)**	13 Dec 1972
Converted to minelayer	1962-1964	**Builder**	American Bridge, Ambridge, USA		
		Commissioned (US Navy)	14 Mar 1945 ((LST 1089) later named *Rice County*)		

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 200 approximately
- Tanks: 10-30, depending on size
- Total payload:
  Beaching 377 tonnes
  Ocean-going 1,900 tonnes

SHIP-SHORE LIFT

- LCVPs: six

AVIATION FACILITIES

- Helicopter can land on foredeck, if not occupied by vehicles or landing craft

AMPHIBIOUS FACILITIES

- Twin, vertically hinged clamshell doors with internal ramp
- Tank deck: 87.8 × 91 m (288 × 30 ft)
- Upper (vehicle) deck:
  area: 500 m²
  maximum total load: 350 tonnes
  maximum individual load: 10 tonnes
- Access to upper deck:
  ramp: 4.27 m (14 ft) wide
- Pontoons: Two lashed to ship's sides
- Stern kedge anchor

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60

Six Bofors 40 mm/60 in two twin and two single mountings.

Specifications
Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,889 ft/s) (new gun); 850 m/s (2,788 ft/s) (mid-life)
Range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,632 ft)
Rate of fire:
(practical): 80 rds/min
(cyclic) for water-cooled weapons: 160 rds/min
Ammunition weight: 2.21 kg (4.8 lb)

MINES

Four rails.

COMMAND AND CONTROL SYSTEMS

RADAR

Kelvin Hughes 14/9

These ships have the widely used Kelvin Hughes 14/9 navigation radar, operating in the I-band.

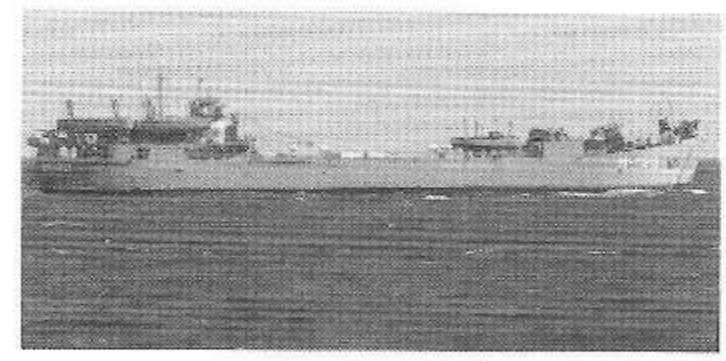
PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors GM 12-567A diesels, 1.34 MW (1,800 hp)
Shafts: 2

FURTHER INFORMATION

These two ships were part of a group of seven LSTs purchased by the Federal German Navy (FGN) from the USA in 1961. Three of these were then taken in hand for conversion to minelayers, the work involving welding the bow doors together, removing the bow ramp, and installing minelaying gear. Work on one ship was suspended (and the ship later sold for scrap) but two were completed as *Bochum* (N 120) and *Bottrup* (N 121) and they served in this role with the FGN from 1964 to 1971.

They were then decommissioned, refitted as LSTs and transferred to Turkey. They served as LSTs for a few years, but were then once again outfitted for the minelaying role, in which they still serve.



Bayraktar *(N^{L} 120) is a dual-role ship being fitted for both minelaying and for amphibious transport* (Turkish Navy)

QUI NONH (LST 1-1152)

GENERAL SPECIFICATIONS

Country of Origin: USA
Operator: Vietnam
Type: LST 1-1152

Class: QUI NONH

Active: 3

Displacement:
full load: 3,698 t (1-541 class); 4,145 t (542-1152 class)

Dimensions
Length: 100 m (328 ft)
Beam: 15.3 m (50 ft)
Draught: 4.3 m (14 ft)

Speed: 11 kts
Range: 6,000 n miles at 10 kts

Complement: 110

SHIPS

Class 1-541

QUI NONH (HQ 501)

Builder	Jeffersonville B & M Co, Jeffersonville, Indiana, USA
Launched	23 Nov 1943
Commissioned (US Navy)	8 Jan 1944 ((LST 509) later named *Bullock County*)
Transferred (South Vietnam)	1 Apr 1970
Captured (North Vietnam)	1975/76

Class 542-1152

VUNG TAU (HQ 503)

Builder	Chicago Bridge & Iron Co, Seneca, Illinois, USA
Launched	14 Mar 1944
Commissioned (US Navy)	15 May 1944 ((LST 603) later named *Cochino County*)
Transferred (South Vietnam)	Jul 1969
Captured (North Vietnam)	1975/76

DA NANG (HQ 505)

Builder	Bethlehem Steel Co, Hingham, Massachusetts, USA
Launched	15 Aug 1944
Commissioned (US Navy)	9 Sep 1944 ((LST 938) later named *Maricopa County*)
Transferred (South Vietnam)	Jul 1962
Captured (North Vietnam)	1975/76

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 200 approximately
- Tanks: 10-30, depending on size
- Total payload:

	LST 1-591	LST 542-1152
Beaching	500 tonnes	377 tonnes
Ocean-going	2,100 tonnes	1,900 tonnes

SHIP-SHORE LIFT

- LCVPs: Two, four or six, depending on number of davits fitted

AVIATION FACILITIES

- Helicopter can land on foredeck, if not occupied by vehicles or landing craft

AMPHIBIOUS FACILITIES

- Twin, vertically hinged clamshell doors with internal ramp
- Tank deck: 87.8 × 91 m (288 × 30 ft)
- Upper (vehicle) deck:
  area: 500 m²
  maximum total load: 350 tonnes
  maximum individual load: 10 tonnes
- Access to upper deck:
  LST 1-512 – elevator: 7.24 × 4.27 m (23.75 × 14 ft)
  LST 513-1152 – ramp: 4.27 m (14 ft) wide
- Pontoons: Two lashed to ship's sides

WEAPONS SYSTEMS

GUNS

Four 37 mm/63 cannon

There are four 37 mm/63 cannon. These are probably Russian-supplied weapons, with a 62.8 calibre weapon in an open, locally controlled mount.

Specifications
Calibre: 37 mm
Length of barrel: 62.8 calibres
Muzzle velocity: 880 m/s (2,886 ft/s)

Traverse: 360° at 20°/s
Elevation: −10 to +85° at 15°/s
Rate of fire: 80 rds/min/barrel
Ammunition (projectile): 0.732 kg
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 3,000 m (9,840 ft)
Crew: 6

Qui Nonh *(HQ 501), one of three ex-US Navy LSTs seized by North Vietnamese forces in 1975 and impressed into the Vietnamese Navy* (T Hollingsbee)

COMMAND AND CONTROL SYSTEMS

RADAR

There may be a navigational radar; type unknown.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors GM 12-567A diesels, 1.34 MW (1,800 hp)
Shafts: 2

FURTHER INFORMATION

During the Vietnam War, six LSTs were supplied by the USA to the navy of South Vietnam, which served until that country's collapse. Two escaped to the Philippines, where they were eventually absorbed into the Philippines Navy, while the other four were captured by the North Vietnamese Army as it overran the south. One of those has been discarded, possibly for use as a source of spares, but the remaining three are still in service, albeit they are reported to be in a poor state.

The six LSTs supplied to South Vietnam and their fate are shown below:

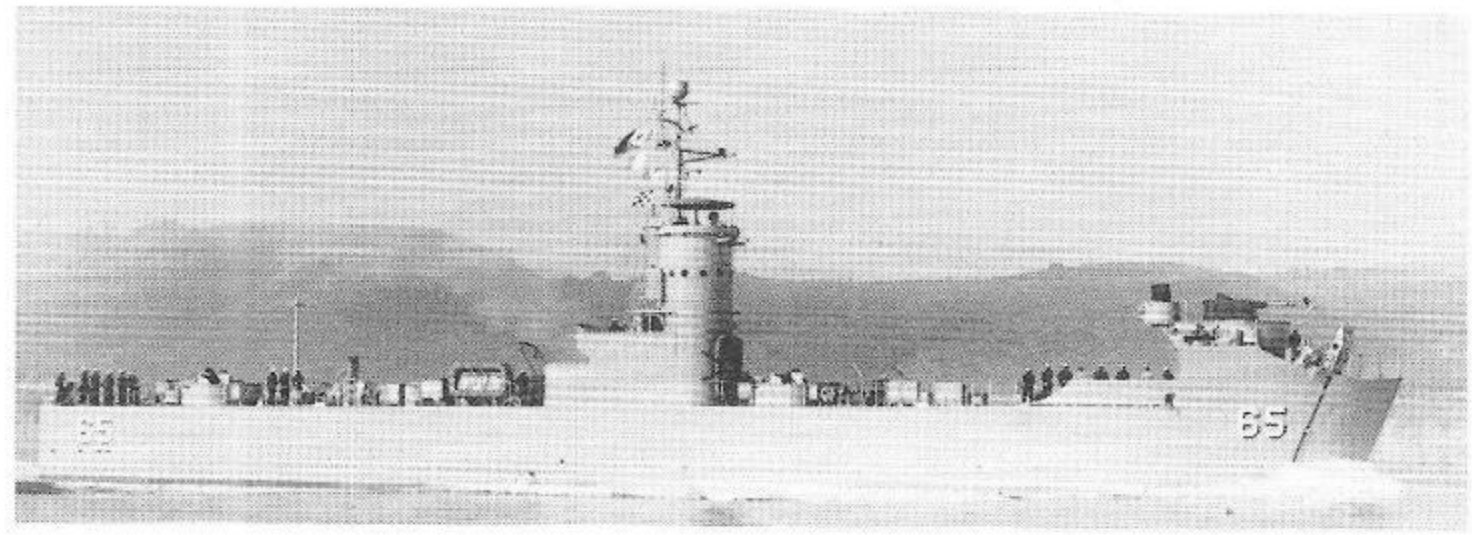
USN	Transferred to South Vietnam		Fate at fall of South Vietnam		Current status
	Name (number)	Date of transfer	Event	Disposal	
LST 975 *(Marion County)*	*Cam Ranh* (HQ 500)	1962	Escaped to Philippines	Philippines Navy *Zamboanga del Sur* (LT 86)	In service
LST 938 *(Maricopa County)*	*Da Nang* (HQ 501)	1962	Captured by North Vietnam	Vietnamese Navy HQ 505	In service
LST 529 *(Cayuga County)*	*Thi Ngai* (HQ 502)	1963	Escaped to Philippines	Philippines Navy *South Cotabato* (LT 87)	In service
LST 603 *(Cochino County)*	*Vung Tau* (HQ 503)	1969	Captured by North Vietnam	Vietnamese Navy HQ 503	In service
LST 509 *(Bullock County)*	*Qui Nonh* (HQ 504)	1970	Captured by North Vietnam	Vietnamese Navy HQ 501	In service
LST 484 *(Jerome County)*	*Hua Trang* (HQ 505)	1970	To North Vietnam	Believed scrapped	–

LSM 1

OVERVIEW

Like the Class 1-1152 tank landing ships, the 'LSM 1' medium landing ships are survivors of a class built in the hundreds during the Second World War. The design was a combination of the LSTs and the stern-loading LCT Mk 6 landing craft, and was originally designated the LCT Mk 7. The ships were designed to work with the ocean-going LCI(L)s, carrying five medium or three heavy tanks, or six LVTs, or nine DUKWs, to a maximum load of 165 tonnes to maintain the landing draught. The tank deck ran the length of the ship, but did not have a stern gate; the Ro-Ro idea was to come later. They would also hold 48 troops, including two officers, while the bulk of the troops, 200 at a time, travelled in the LCI(L)s. In their original form, they carried one 40 mm and four 20 mm mounts (or sometimes just six 20 mm). The mounts were in pairs, one on each side at bow and stern especially high at the bow to overcome the ramp, with another pair just in front of the small bridge with the starboard mounting further forward than the port one. The ships had minimal armour-plating around the guns, the conning station and on the sides of the pilothouse.

Like the LSTs, they were built to varying standards by shipyards, heavy engineering works and other companies across the USA, many of them with little experience of shipbuilding. Some of the LSMs were converted during wartime to serve as rocket ships (LSM (R) for support of amphibious forces in the Mediterranean. 525 LSMs were completed, and another 59 were converted to LSM(R).



The classic LSM 1, instantly recognisable by its unique tall, circular bridge. It also has a long, open tank deck and clamshell bow doors (H & L van Ginderen Collection)

The survivors from World War Two faded rather more quickly from the scene than the LSTs because their size made them less amenable to conversion to cargo carrying. Relatively few of them survived in the US Navy fleet for more than a few years, though some saw service in Korea in the early 1950s and a small number lasted long enough to be given names in 1955.

Many found their way into foreign navies, but their numbers have been steadily decreasing over the past decade and there are now just 15 known survivors, with a further two on non-amphibious duties: one is on mine-laying duties: for the Turkish Navy, the other, a gift from Argentina in 1982, is operated as an auxiliary by the navy of Paraguay, a country without a seaboard.

IPOPLOIARHOS ROUSSEN (LSM 1)

GENERAL SPECIFICATIONS

Country of Origin: USA
Operator: Greece
Type: LSM 1

Class: IPOPLOIARHOS ROUSSEN

Displacement:
beaching: 754 t
full load: 1,112 t

Dimensions
Length: 62.1 m (203.5 ft)
Beam: 10.4 m (34.2 ft)
Draught: 2.5 m (8.3 ft)
Beaching draught: 1.1 m (3.5 ft) forward; 2.2 m (7 ft) aft

Speed: 13.2 kts
Range: 4,900 n miles at 12 kts

Complement: 60

SHIPS

IPOPLOIARHOS ROUSSEN (L 164)
Builder Charleston Navy Yard, Charleston, USA
Commissioned (US Navy) 13 Aug 1945 (LSM 399)
Transferred to Greece 3 Nov 1958

IPOPLOIARHOS KRYSTALIDIS (L 165)
Builder Brown Shipbuilding, Houston, Texas, USA
Commissioned (US Navy) 7 Dec 1945 (LSM 541)
Transferred to Greece 30 Oct 1958

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 48 (two officers, 46 men)
- Vehicles: 5 light tanks or 6 LVT
- Max payload: 165 tonnes

SHIP-SHORE LIFT

- None, unless LVT embarked.

AMPHIBIOUS FACILITIES

- Clamshell doors and internal ramp 4.27 m (14 ft) wide
- Tank deck 43.6 × 5.5 m (143 × 18 ft) (unobstructed)
- Kedge anchor at stern

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60

Two 40 mm/60 automatic cannon in a single twin mounting for air defence roles which may also be used to engage surface targets. Although described as a 60 calibre weapon it is, in fact, a 56.25 calibre gun.

Specifications
Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,889 ft/s) (new gun); 850 m/s (2,788 ft/s) (mid-life)
Range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,632 ft)
Rate of fire: 60 rds/min (practical), 120 rds/min (cyclic)
Ammunition weight: 2.21 kg (4.8 lb)

Oerlikon 20 mm cannon

Eight Oerlikon 20 mm cannon.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,738 ft/s)
Range:
anti-surface: 0.8 n miles (1.5 km)
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g

Mounting
Elevation: −15 to +90°
Total weight: 497 kg (1,095 lb) (including shield)

COMMAND AND CONTROL SYSTEMS

RADAR

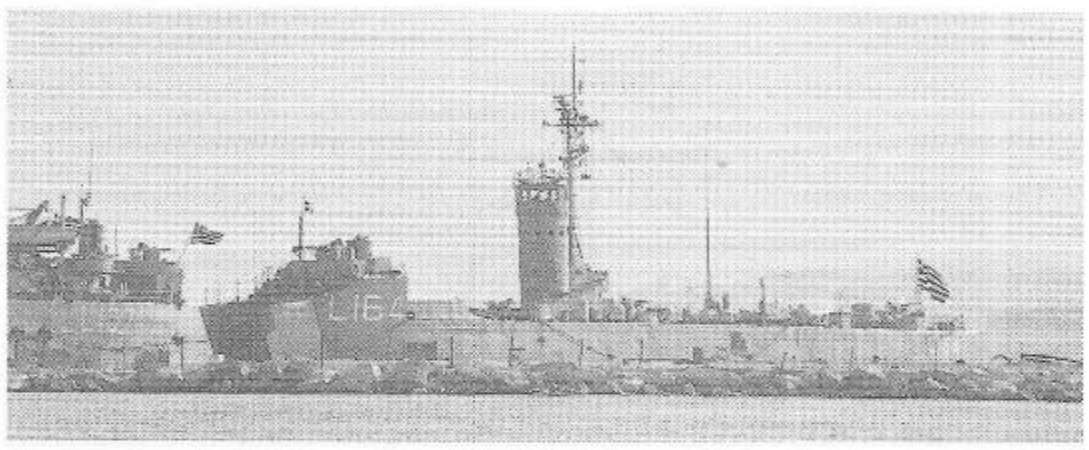
Racal-Decca
One Racal-Decca, I-band, navigation radar is carried; type unknown.

PROPULSION

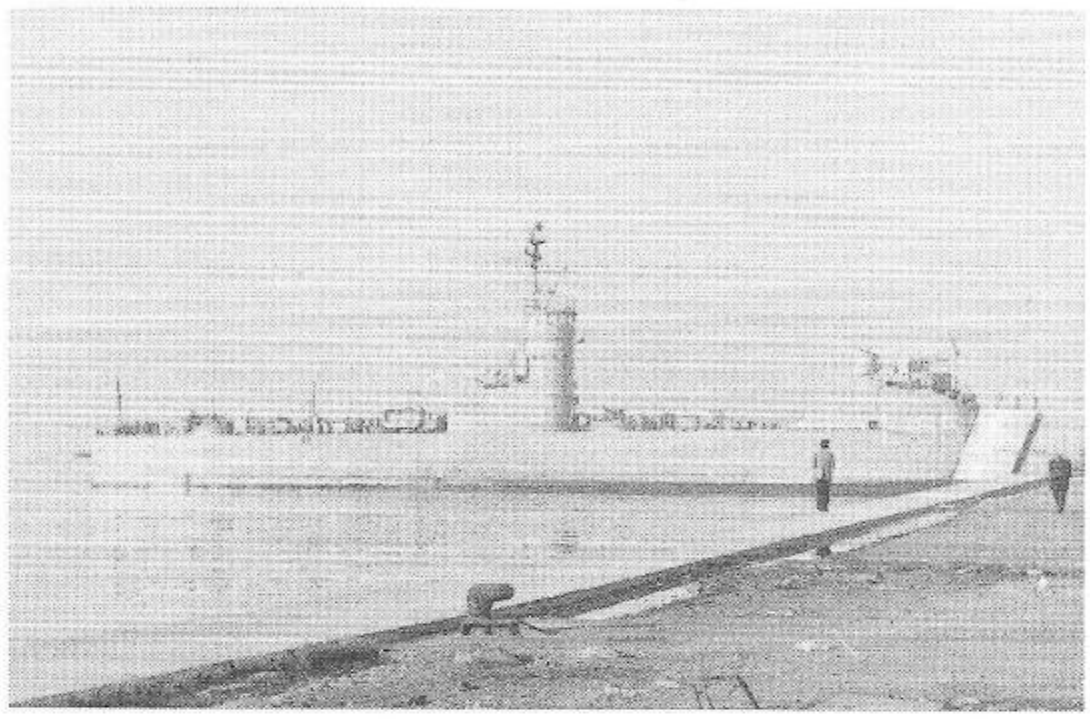
Specifications
System: Diesel
Main machinery:
***Ipoploiarhos Roussen* (L 164) only:** 2 General Motors GM 16-278A diesels, 2.24 kW (3,000 hp)
***Ipoploiarhos Krystalidis* (L 165) only:** 2 Fairbanks-Morse 38D8-⅛-10 diesels, 2.64 MW (3,540 hp) sustained
Shafts: 2

FURTHER INFORMATION

These are the last two survivors of a group of six handed over in two separate ceremonies in Autumn 1958. All were named after wartime Greek naval heroes. (Note: *ipoploiarhos* = lieutenant).



Ipoploiarhos Roussen *(L 164) is one of the two remaining LSM 1s in the Hellenic Navy. The unique cylindrical conning tower was designed to enable the bridge staff to see over the guns on the forecastle* (H & L van Ginderen Collection)



Ipoploiarhos Krystalidis *(L 165) (now stricken) showing the large bow doors* (H & L van Ginderen Collection)

KO MUN

GENERAL SPECIFICATIONS

Country of Origin: USA
Operator: Korea, South
Type: LSM 1

Class: KO MUN

Acquired:
Active: 7

Displacement:
beaching: 754 t
full load: 1,112 t

Dimensions
Length: 62.1 m (203.5 ft)
Beam: 10.4 m (34.2 ft)
Draught: 2.5 m (8.3 ft)

Beaching draught: 1.1 m (3.5 ft) forward; 2.2 m (7 ft) aft

Speed: 13.2 kts
Range: 4,900 n miles at 12 kts

Complement: 75

SHIPS

KO MUN (LSM 655)
Builder Brown Shipbuilding, Houston, Texas, USA
Commissioned (US Navy) 1 Jul 1944 as LSM 30
Transferred on lease (South Korea) 1956
Purchased 15 Nov 1974

Shafts: 2

FURTHER INFORMATION

The Republic of China Navy (RoCN) has received 16 LSMs from the US Navy, some as early as 1946. Four now survive and of the other 12 one was hit by artillery fire from mainland China in 1958 and had to be beached on Quemoy Island and abandoned, and the remainder were stricken in the early 1970s.

It appears that, as with other RoCN vessels, some names and numbers have been changed over the years, resulting in some confusion.

The remaining four ships have been extensively rebuilt in Taiwan and have several unique features including a square bridge, which has replaced the characteristic round pilothouse.

KUT (LSM)

GENERAL SPECIFICATIONS

FURTHER INFORMATION

Three LSMs have been transferred to the Royal Thai Navy (RTN); two in October 1946 and the third in May 1962. *Phai* (ex-LSM 333) was stricken in 1990 but two are still in service.

TERREBONNE PARISH

OVERVIEW

The first US Navy post-war LSTs were just two ships: *Talbot County* (LST 1153) and *Tallahatchie County* (LST 1154), which were commissioned in 1947 and 1949, respectively. They offered greater comforts and increased cargo-carrying capacity, but were driven by Westinghouse steam turbines, and their operational lives were relatively short. They were followed by the very similar, but diesel-powered, 'Terrebonne Parish' class, of which 15 were launched between 1952 and 1954.

Like LSTs 1153 and 1154, the 'Terrebonne Parish' class had extra cargo/troop-carrying capacity, a powered vehicle turntable, greater capacity ramps, hydraulic bow doors, and carried side-slung pontoon causeways. The class still, however, failed to reach the required amphibious squadron speed of 20 kts, and although it achieved a respectable 15 years' service as a front-line ship in the US Navy, it was rapidly overtaken in terms of both speed and capacity. By the early 1970s, virtually the whole class had been relegated to more general cargo carrying duties from which many of them were sold into foreign navies and seven are still operational.

Ship	Pennant Number	Launched	Fate	New name	Fate
Terrebonne Parish	LST 1156	1952	1971 – to Spain	*Velasco* (L 11)	1994 – stricken

GUNS

US Navy 76 mm (3 in)/50 guns

There are three twin, open mountings: two on the forecastle and one above the stern, aft. The weapons use 50 calibre Mk 22 barrels in the Mk 33 twin-barrel mounting, and can be either under local or remote control. Each mount has a Mk 51 Mod 5 gun fire-control system.

Specifications

Gun
Calibre: 76.2 mm (3 in)
Length of barrel: 50 calibres
Muzzle velocity: 823 m/s (2,700 ft/s) (new); 808 m/s (2,651 ft/s) (mid-life)
Range: 7 n miles (13 km)
Altitude: 8,951 m (29,367 ft)
Ammunition: 10.9 kg (24.0 lb)

Mk 33 Mounting
Traverse: 360° at 30°/s
Elevation: −14/15 to +85° at 24°/s
Rate of fire: 100 rds/min

Rheinmetall Rh-20 20 mm cannon

These ships mount three Rheinmetall Rh-202 20 mm cannon.

Specifications

Calibre: 20 mm
Length of barrel: 85 calibres
Muzzle velocity: 1,050-1,250 m/s (3,445 – 4,101 ft/s)
Traverse: 360°
Elevation: −10 to +55°
Crew: 1-2
Range: 1 n mile (1.85 km)
Rate of fire: 800-1000 rds/min

Manufacturer/Contractor
Rheinmetall, Germany.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Mk 63 Gun Fire Control System (GFCS)

There are two Mk 63 GFCS, which consist of an antenna assembly fitted to the gun mounting, a manned Mk 29 optical sight and below-decks equipment. The radar is the Mk 34.

RADARS

Raytheon AN/SPS-10

The surface search radar is the Raytheon AN/SPS-10 G/H-band (4 to 8 GHz) radar which was introduced into US Navy service during late 1953.

Manufacturer/Contractor
Raytheon, USA.

Mk 34

The Mk 34 I/J-band radar is the search/tracking element of the Mk 63 GFCS. It has a 76.2 cm (30 in) dish which elevates between −15 and +85° and produces a 3 × 3° spiral scan beam for target acquisition and a 0.75° conical scan beam for target tracking. Range against large air targets is approximately 13.5 n miles (25 km) with an accuracy of 200 m (656 ft) in bearing and 2.25° in elevation. Peak power is 35 kW and pulse duration is 0.3 µs with a PRF of 1,800 pps.

Racal-Decca

There is one Racal-Decca, I-band navigational radar.

PROPULSION

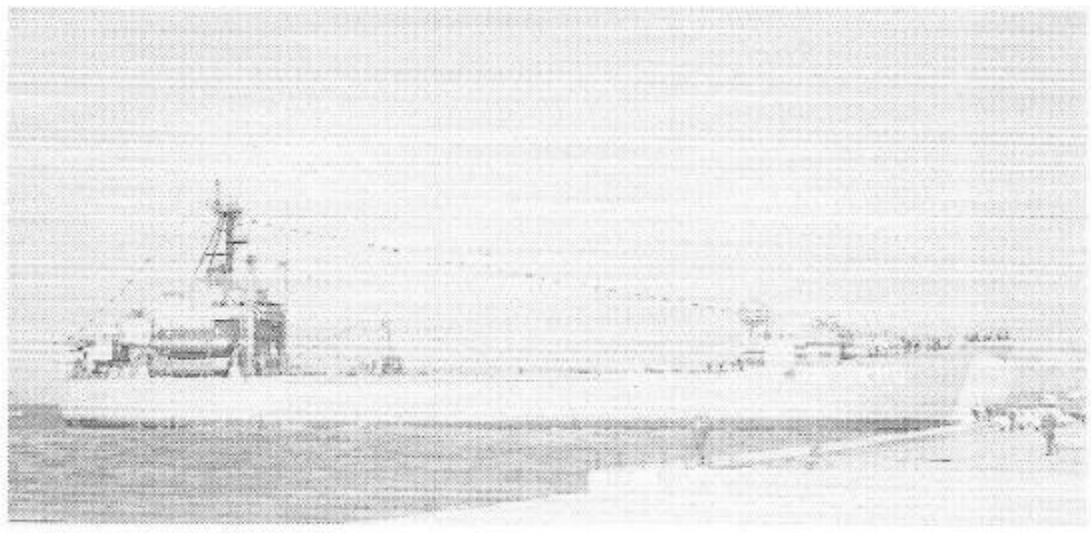
Specifications

System: Diesel
Main machinery: 4 General Motors GM 16-278A diesels, 4.48 MW (6,000 hp)
Shafts: 2
Propellers: Controllable pitch

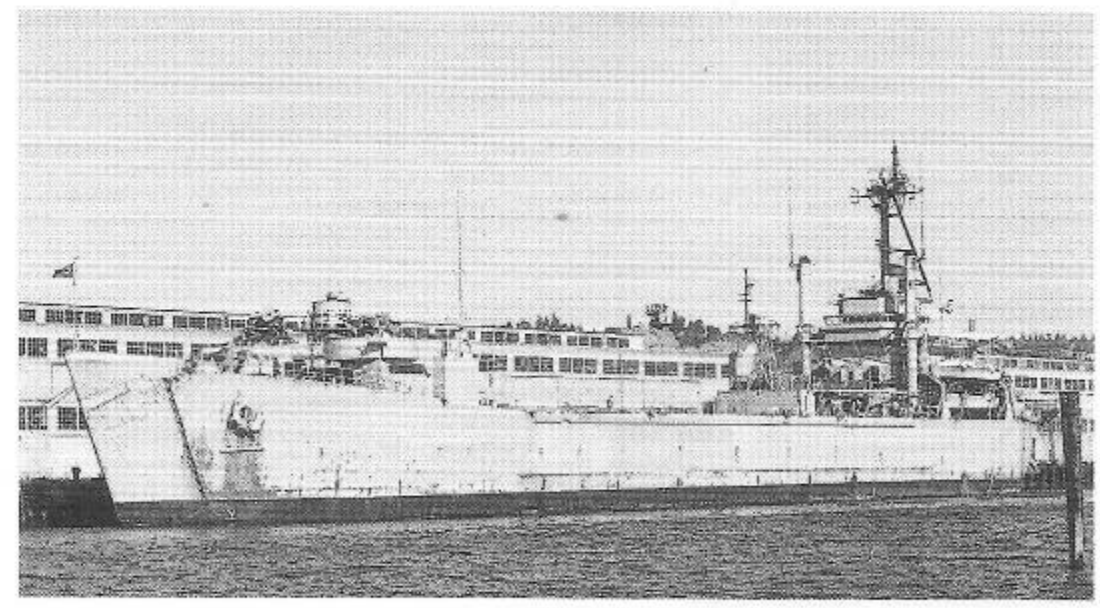
FURTHER INFORMATION

These two ships were purchased on 17 March 1977 and were modernised following arrival in Greece. It was originally intended to buy a further two, but this did not happen.

The Greek Navy is taking delivery, very slowly, of its own 'Jason' class of LSTs, but the intention is that the Jasons should replace the '1-1152' class LSTs before the Terrebonne Parish ships. These two ships, therefore, appear to have several more years of service ahead of them.



Kos *(L116) was formerly the US Navy's* Whitfield County *(LST 1169) and was transferred to the Hellenic Navy in March 1977* (H & L van Ginderen Collection)



Turkish LST Serdar *(L402)* (H & L van Ginderen Collection)

GUNS

Bofors 40 mm/60

There are three quadruple 40 mm Bofors Mk 2 mountings. The Mk 2 mounting has two pairs of guns 1.524 m (5.0 ft) apart, with a 7.5 hp training motor on the right-hand side of the mounting at the trainer's feet and a 5 hp elevation motor at the feet of the gunlayer who also controls the operation of both pairs of guns. The guns are also slaved in elevation. There is a US Mk 51 Mod 2 optical gun fire-control system with each mounting.

Specifications
Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,890 ft/s) (new gun); 850 m/s (2,789 ft/s) (mid-life)
Range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,637 ft)
Rate of fire: 80 rds/min (practical); 160 rds/min (cyclic) for water-cooled weapons
Ammunition: 2.21 kg (4.9 lb)

Mountings
Traverse: Nominal 360° at 30° /s
Elevation: −15 to 85/90° at 24°/s
Crew:

Shafts: 2

FURTHER INFORMATION

All four ships were taken out of commission by the US Navy in 1972 and were transferred to Military Sealift Command, for which they were disarmed. They were then put into reserve for a short period before being leased to Peru. They were refurbished by Todd Shipyard, San Francisco, USA, prior to delivery, but the US weapons were not restored and the weapons now mounted were fitted after they arrived in Peru.

The four ships were acquired from the USA in 1984 on a five year lease, which was extended for a further five years in 1989 and for yet another five years in 1994. Three ships remain operational, while the fourth, *Pisco* (DT 142) (ex-*Waldo County* (LST 1163)), is now being used as a source of spares to keep the other three going.

DE SOTO COUNTY

OVERVIEW

This was the first class of LSTs to be built for the US Navy after the end of the Second World War. They were larger and slightly faster than the wartime LSTs — despite more than twice the horsepower — and were considered the 'ultimate' in terms of conventional LST design with the traditional clamshell bow door configuration. The impression of luxury extended to air conditioning in the crew's quarters and the accommodation for troops. The speed achieved — 17 knots, still well short of the required 20 knots — was the result of using six diesel engines; initially, six Nordburgs, then the first four of the class were refitted with Fairbanks-Morse diesels, and the others with Cooper Bessemer engines, all giving 14,400 hp and 17.5 knots.

It had been planned to build sixteen ships, but the contract for the second group was never let, while the contract for the second ship in the first series was cancelled. Thus, the 'De Soto' class was just seven strong.

Increasing demands for higher speeds for faster deployment of troops meant that the working lives of the 'De Soto County' class ships were among the shortest of all US Navy amphibious craft. From the first launch in 1956 to the placing of the whole class into reserve took fewer than 16 years.

Six of the seven were transferred to foreign navies: two went to Italy, two to Greece, and one each to Brazil and Mexico. All have been scrapped except for the one Brazilian ship. The one that remained in US service was converted to a tender for 'Asheville' class patrol boats in the Mediterranean but was stricken in 1977.

There was, however, a surprising post-script to the De Soto County story when, more than a decade after the launch of the last US ship of the class, a modified version of the same design was produced for the Argentine Navy by the AFNE yard at Santiago. The *Cabo San Antonio* then took a further decade to be commissioned, but achieved its place in history when it carried the main Argentine assault force that invaded the Falkland (Malvinas) Islands in 1982. Though at sea in 1994, it is now thought to be non-operational.

CABO SAN ANTONIO (DE SOTO COUNTY)

GENERAL SPECIFICATIONS

Country of Origin: USA
Operator: Argentina

Main machinery: 6 diesels, 10.2 MW (13,700 hp)
Shafts: 2

FURTHER INFORMATION

The differences between the *Cabo San Antonio* and the original US-built De Soto County design are very small. The Argentine ship is more heavily armed and there are two 60 tonnes Stülcken heavy-lift cranes immediately forward of the superstructure (although the other surviving vessel in the class, the Brazilian *Duque de Caxias*, has also had this lifting gear fitted.)

Cabo San Antonio was the main unit in the amphibious task force taking part in Operation Rosario, the Argentine invasion of the Falkland Islands on 2 April 1982. The ship is based at Puerto Belgrano and although seen at sea in 1994 may well now be non-operational.

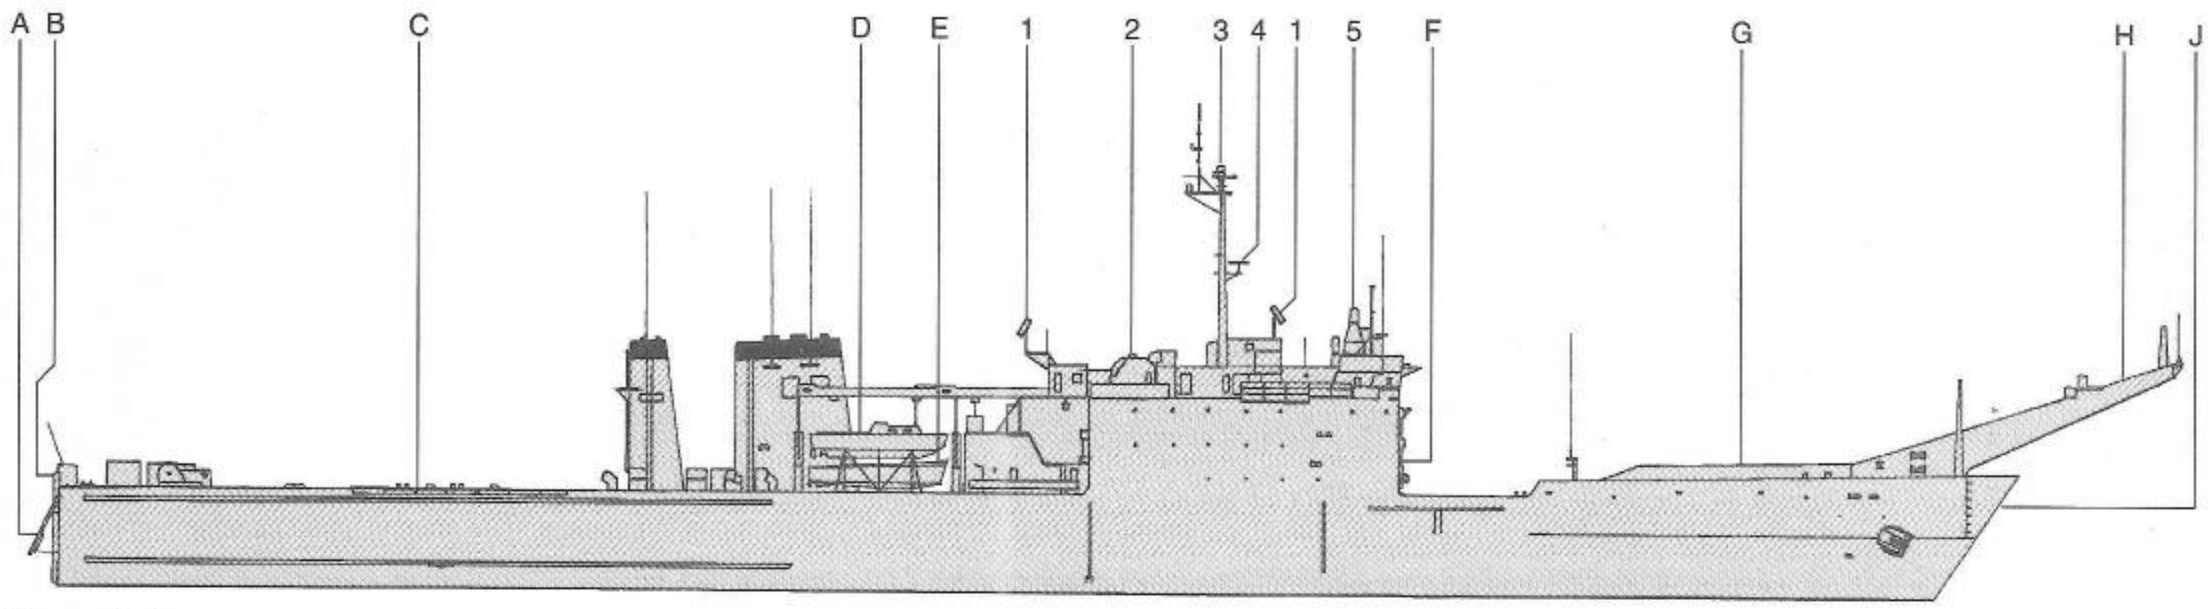
NEWPORT

OVERVIEW



Newport class
Amphibious A *Kedge anchor* **B** *Stern door* **C** *Flight deck* **D** *LCPL* **E** *LCVP* **F** *Passageway to rear deck* **G** *Aluminium alloy landing ramp* **H** *Derrick arms ('horns')* **J** *Opening bow sections*

General 1 *WSC-3 Satcom antenna* **2** *US Navy twin 76 mm (3 in) gun (removed in most)* **3** *Raytheon AN/SPS-67(V) surface search radar* **4** *Canadian-Marconi LN-66 navigation radar* **5** *Hughes Mk 15 Phalanx 20 mm CIWS*

The US Navy's post-Second World War aim of achieving an amphibious task force speed of 20 knots was finally achieved with the 'Newport' class LSTs. The offloading capability of these ships was, however, only achieved by replacing the classic tank landing ship's clamshell bow doors by a unique arrangement, which achieved a pointed bow but at the expense of considerable complexity, in which the bows are dominated by two large derrick arms (usually known as 'horns'). On beaching, two small clamshell doors at the top of the bows fold back, and the derrick arms are then used to swing a 40-tonnes 34 m (112 ft) long aluminium ramp forward and on to the beach.

Other new features included an internal ramp just forward of the superstructure which allows vehicles to go down to the tank deck, which has a total area of 5,300 m² (19,000 sq ft). On the main deck, vehicles can drive from one end of the ship to the other through an opening in the superstructure, and a 9.1 m (30 ft) diameter turntable with a capacity of 75 tonnes at either end allows them to be turned without needing to reverse. On the tank deck, there is a stern gate which allows loading and unloading of amphibious tractors into the water, on to landing craft or on to a pier.

A total of 20 was built, all being launched in a four-year period from the beginning of 1968 to the end of 1971. The first three were built at the Philadelphia Naval Shipyard, the remaining 17 at National Steel and Shipbuilding at San Diego in California. A further seven were planned for the 1971 fiscal year, but were deferred and then cancelled. The usual US Navy practice of naming LSTs after counties or parishes was suspended for the first 13 of the class, which were named after towns, but was resumed for the final seven.

The Newports have proved particularly durable and popular, and 14 ships of the 17 still in the active fleet in 1991 were employed in the Gulf War. Further, when the Department of Defense decided to dispose of them there has been no shortage of enthusiastic potential buyers from around the world. The US Congress, however, has been keen to retain a basic capability, at least until the new generation of LPD ships is available, even going to the extent of holding up delivery of some of the ships to their new owners, until a Sentate vote on 7 August 1994 allowed the sales to proceed.

So, two remain in service in the US Navy, and a further four are in a 'reduced operating status', which means they could be ready for service within 180 days.

As originally constituted, the class was:

Ship Name	Ship No	Laid down	Launched	Commissioned	Fate
Newport	LST 1179	1 Nov 1966	3 Feb 1968	7 Jun 1969	Decommissioned 1992
Manitowoc	LST 1180	1 Feb 1967	4 Jun 1969	24 Jan 1970	Earmarked for Taiwan, 1996

Length: 159.2 m (522.3 ft)
Beam: 21.2 m (69.5 ft)
Draught: 5.3 m aft (17.5 ft)

Speed: 20 kts
Range: 2,500 n miles at 14 kts

Complement: 257 including 13 officers

SHIPS

FREDERICK (LST 1184)

Builder	National Steel & Shipbuilding, San Diego, California, USA
Laid down	13 Apr 1968
Launched	8 Mar 1969
Commissioned	11 Apr 1970

LA MOURE COUNTY (LST 1194)

Builder	National Steel & Shipbuilding, San Diego, California, USA
Laid down	22 May 1970
Launched	13 Feb 1971
Commissioned	18 Dec 1971

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 400 including 20 officers
- Cargo:
  Port to port — 2,000 tonnes
  Beaching — 500 tonnes

- Vehicles: Sample loads
  Tank deck
  23 AAV-7A1 APG, or
  29 M60 main battle tanks, or
  41—2.5 ton truck equivalents
  Upper deck:
  29—2.5 tonne truck equivalents

SHIP-SHORE LIFT

- LCVP: three
- LCP: one

AVIATION FACILITIES

Flight Deck: 15.65 × 15.46 m (51.4 × 51 ft) (242 m²) (2,621 sq ft)
Hangar: None
Helicopters: CH-46 or UH-1
Possible aircraft types include UH-14 Aerospatiale AS 332F1 Super Puma/AS 532 Cougar; UH-12 Aerospatiale AS 350B/350BA Ecureuil; UH-13 Aerospatiale AS 355F2 Ecureuil 2 or UH-6B Bell JetRanger III

AMPHIBIOUS FACILITIES

- Aluminium ramp 34 m (111.5 ft) long (75 tonne capacity)
- Stern door
- Four pontoon sections can be carried lashed to ship's sides
- Two 75 tonne capacity turntables in tank deck
- Cranes: two 10 tonne capacity

WEAPONS SYSTEMS

GUNS

Hughes Mk 15 CIWS Phalanx

Close in weapon system developed to provide fast reaction to submarine-launched anti-ship missiles. It is a 'closed loop' system, which tracks both the target and the stream of rounds, and consists of the Mk 16 weapon group, the Mk 339 local and Mk 340 remote-control panels as well as a remote indicator panel.

The weapons group is based on a barbette assembly with electronics enclosure to the rear. The group takes up 5.5 m² (59.2 sq ft) space on deck and is on a 150 mm (6 in) thick platform. The gun is a six-barrelled 20 mm M61A1 Vulcan capable of extremely high firing rates. Original Block 0 systems installed in the early 1980s are gradually to be uprated to Block 1. Fitted to US Navy Newports from early 1980s onwards.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 53 calibres
Muzzle velocity: 1,030 m/s (3,379 ft/s)
Rate of fire:
Block 0; Block 1 Baseline 0: 3,000 rds/min
Block 1 Baseline 1: 4,500 rds/min
Range (effective, horizontal): 0.75 n miles (1.47 km)

Mounting:
Weight:
Block 0: 5.42 t
Block 1: 6.18 t
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

COMMAND AND CONTROL SYSTEMS

COMMUNICATIONS AND DATALINKS

Satcom: SSR-1 receiver, WSC-3 transceiver (uhf)

RADARS

Raytheon AN/SPS-67(V)1

The AN/SPS-67(V)1 is a solid-state G/H-band equipment designed to replace the 30-year old AN/SPS-10 surface search radar. The antenna of the older radar is retained as an interim measure but will be replaced eventually.

Performance of the SPS-67 is improved through the addition of a very narrow pulse mode for better navigation and improved resolution of small targets at short ranges. Long and medium modes are used in open sea for detection of long- and medium-range targets. Performance is further improved by a digital video clutter suppressor and an interference suppressor.

Specifications
Frequency: G-band (5.4-5.8 GHz)
Azimuth beamwidth: 1.5°
Elevation beamwidth: 12°-67(V)1; 31°-67(V)2 & 3
Pulsewidth: 0.1; 0.25; 1.0 µs
Peak power: 280 kW
Scan period: 4 s-67(V)1; 2/4 s-67(V)2 & 3
Instrumented range: 104 km
Track initiation: Automatic
Track file size: 128 (expandable)
MTBF: >600 h

Manufacturer/Contractor
Raytheon, USA.

Canadian Marconi LN-66

***Frederick* (LST 1184) only.** Designed for the short-range navigation role the 12 kW set consists of a 0.9 m (3.0 ft) radome, 1.5 or 2.4 m (4.9 or 7.9 ft) antenna, a solid-state transmitter/receiver, 25 cm (9.8 in) display, and a true bearing unit.

Specifications
Frequency: I-band (9,375 +-30 MHz)
Peak power: 12 kW
Rotation speed: 22 ±2.2 rpm
Pulsewidth: 0.5; 0.9 µs
PRF: 800/1,250; 2,500 Hz
Weight:
antenna: 9.7 kg (21.4 lb)
transmitter/receiver: 13.4 kg (29.5 lb)
display: 22.9 kg (50.5 lb)

Manufacturer/Contractor
Canadian Marconi Company, Kanata, Ontario, Canada.

Raytheon CRP 3100 Pathfinder

***La Moure County* only.** The AN/SPS-64 Mariners Pathfinder radar is a surface search and navigation radar

with raster scan bright display indicators, supplied in I/J-band (9,375-9,420 MHz) or E/F-band (3,030 MHz) versions with a choice of relative, true motion and collision avoidance displays. Plan position indicator displays of 30 cm (11.8 in) and 41 cm (16 in) are the basic configuration.

Specifications
Frequency range: I-band (9,375 ±25 MHz)
Peak power: 10, 25 and 50 kW
Range: 18.3 m-118.5 km
Pulsewidth: 0.06, 0.5, 1 µs
PRF: 3,600, 1,800, 900 pps

Manufacturer/Contractor
Raytheon Marine Company, Hudson, New Hampshire, USA.

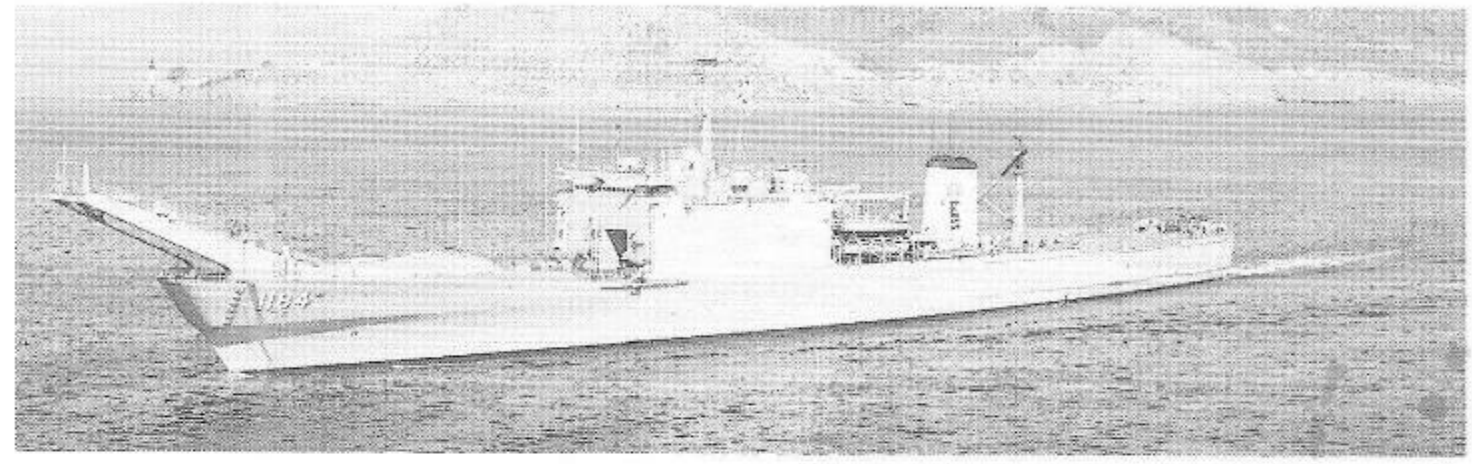
PROPULSION

Specifications
System: Diesel
Main machinery: 6 ALCO 16-251 diesels, 12.3 MW (16,500 hp) sustained

Shafts: 2
Propellers: Controllabe pitch
Bow thruster: 1—800 bhp bow thruster

FURTHER INFORMATION

Only two of this class remain in operational service with the US Navy: *Frederick* (LST 1184) is based at San Diego and *La Moure County* (LST 1194) at Little Creek, Virginia. Four others, *Fresno* (LST 1182), *Tuscaloosa* (LST 1187), *Boulder* (LST 1190) and *Racine* (LST 1191) are in reduced operating status and could be made ready within 180 days.



Frederick *(LST 1184) is one of two 'Newport' class LSTs remaining in full operational service with the US Navy* (US Navy)

Operator: Australia
Type: Newport (LST)

Class: KANIMBLA

Purchased: 2
Active: 2

Displacement:
standard: 5,054 t
full load: 8,585 t

Dimensions
Length: 159.2 m (522.3 ft)
Beam: 21.2 m (69.5 ft)
Draught: 5.3 m aft (17.5 ft); 3.5 m forward (11.5 ft)

Speed: 20 kts
Range: 14,000 n miles at 15 kts

Complement: 180, including 12 officers

SHIPS

KANIMBLA (L 51)

Builder	National Steel & Shipbuilding, San Diego, California, USA
Laid down	24 May 1969
Launched	7 Feb 1970
Commissioned (US Navy)	23 Jan 1971 (*Saginaw* (LST 1,188))
Sold (Australia)	25 Aug 1994
Recommissioned (RAN)	29 Aug 1994

MANOORA (L 52)

Builder	National Steel & Shipbuilding, San Diego, California, USA
Laid down	28 Mar 1970
Launched	19 Dec 1970
Commissioned (US Navy)	16 Oct 1971 (*Fairfax County* (LST 1193))
Sold to Australia	27 Sep 1994
Recommissioned	25 Nov 1994

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 450 including 25 officers
- Cargo: 2,000 tonnes
- Vehicles:
  Tank deck — 29 main battle tanks or equivalent
  upper deck — available only if not being used for LCMs or helicopter

SHIP-SHORE LIFT

- Two LCM 8 on foredeck
- Two 7.2 m (23.6 ft) RHIB

AVIATION FACILITIES

- Flight deck: New flight deck aft 48 × 21 m (158 × 69 ft)
- Flight deck: Flight deck forward available only if LCMs or vehicles not carried.
- Hangar: New shelter at after end of superstructure to accommodate four SH-60 Black Hawk helicopters
- Helicopters: Four SH-60 or SH-3

AMPHIBIOUS FACILITIES

- Stern gate
- New entry port and ramp on starboard side to enable vehicles to embark/disembark from jetty into tank deck (possible)
- Elevator between aft flight deck and No 3 Deck cargo spaces (possible)

Note: Bow ramp and horns are removed

WEAPONS SYSTEMS

Hughes Mk 15 CIWS Phalanx
Fitted for but not with.

COMMAND AND CONTROL SYSTEMS

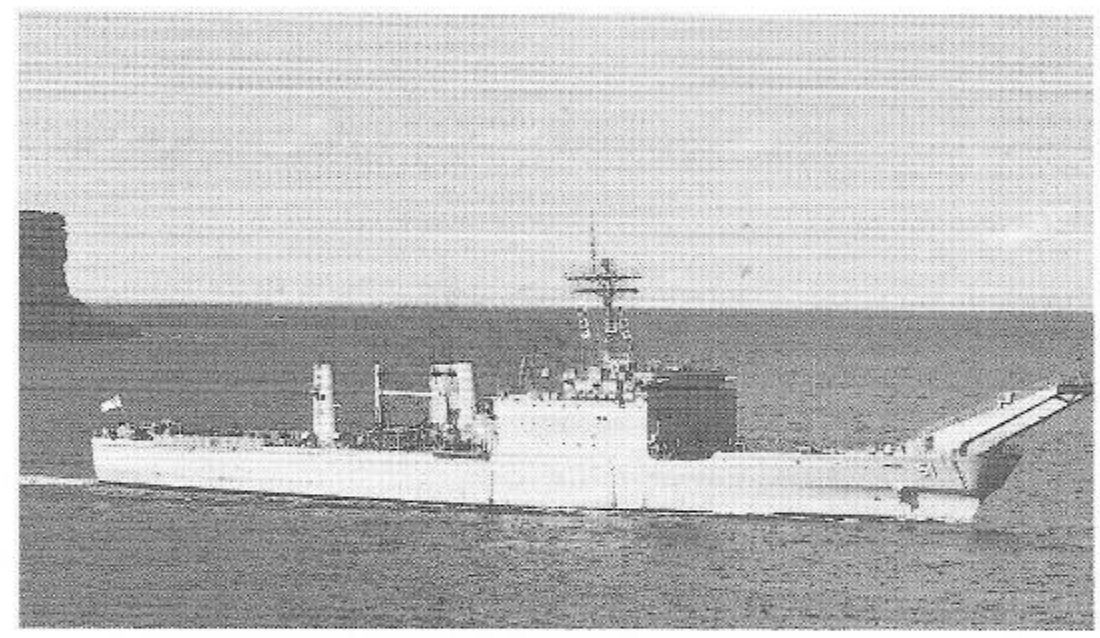
RADARS

Kelvin Hughes 1007
As part of the work being carried out in Australia the AN/SPS-10 and AN/SPS-64 radars have been removed and replaced by a Kelvin Hughes Type 1007 radar, with an integrated IFF system.

Specifications
Role: Navigation/surface search
Band: H/I (9,410 MHz)
Beam: 1.0 × 18°/0.75 × 18°
Peak power: 25 kW
Pulsewidth: 0.08/0.3/0.8 µs
PRF: 1,600/800/400 pps
Scan rate: 26 rpm

Manufacturer/Contractor
Kelvin Hughes, UK.

Kanimbla *(L 51) and* Manoora *(L 52) in Australia in 1994 before the first round of modifications. Note the Hughes Mk 15 CIWS and WSC-3 satellite antennas* (H & L van Ginderen Collection)



Kanimbla *(L 51) after initial modifications. The Mk 15 CIWS and US satellite antennas have been removed, but more fundamental modifications are to follow* (H & L van Ginderen Collection)

PROPULSION

Specifications
System: Diesel
Main machinery: 6 ALCO 16-251 diesels, 12.3 MW (16,500 hp) sustained
Shafts: 2
Propellers: Controllable pitch
Bow thruster: 1—800 bhp bow thruster

FURTHER INFORMATION

PROGRAMME

These two ships were acquired as outright purchases from the US Navy in 1994 to replace the LSL *Tobruk* and the training ship *Jervis Bay* (the latter is a converted ro-ro cargo ship.) It is intended to sell *Tobruk* to help finance the conversion of these ships, although a buyer has yet to be found.

CONVERSION

These ships have been acquired to provide a combination of amphibious transport for the Australian Army and training ships for the RAN, designated THSS. The ships will be able to accommodate and operate up to four Army UH-60 Black Hawks or naval SH-3 Sea King helicopters. In addition, the flight decks are designed to be strong enough to handle Army CH-47 Chinook helicopters. The ships will also will carry two LCM 8 and two RIBs. The work involves establishing a third landing spot forward, with a hangar, the removal of the characteristic 'horns' and the installation, for the training role, of a classroom and improved medical facilities.

The work to be done on the ship was put out to tender in the form of 'Capability Packages' (CP). Tenderers were required to cost the CPs to determine how many can be fulfilled within the existing price ceiling and time allowance, and how those put off until later would be completed. There are 14 CPs in all, of which priority is being allotted to CPs 0, 1, 2 and 8:

CP 0. Replace existing radars with Kelvin Hughes KH 1007, remove the derrick arms and ramp machinery, remove existing ships boats and lifting gear and replace by two 7.3 m (24 ft) RIBs and davits.
CP 1. Fit forward flight deck and two helicopter spots aft.
CP 2. Increase aviation fuel storage and modify existing onboard fuel system to cope with the new flight deck arrangements.
CP 3. Provide a helicopter hangar for four UH-60 aircraft, with minimal maintenance facilities.
CP 4. Provide medical facilities, including initial wound surgery and a small hospital.
CP 5. Install 70 tonnes crane on foredeck to enable LCM 8s to be launched and recovered in Sea State 2.
CP 6. Provide three dual-use compartments for employment as training facilities when the ship is in the training role and as Joint Force HQ in the amphibious role.
CP 7. No details available.
CP 8. Modify accommodation to enable mixed-gender crewing, expand eating areas and install 650 bunks (450 of which are for the embarked force).
CP 9. Install an elevator to allow movement of vehicles, helicopters and cargo between the aft flight deck and

the hold on No 3 Deck. CP 9 would also include the provision of multi-use compartments in the hangar which would reduce the number of helicopters to three.

CP 10. Install a side door and ramp from No 3 Deck to enable troops and vehicles to embark/disembark from a jetty.

CP 11. Replace existing ship's boilers and install additional water production plant.

CP 12. Revise the sewage system to meet new international and national standards.

CP 13. Obtain, configure and install a basic command, control and communications fit to support a Joint Force headquarters.

CP 14. Install a training bridge.

The conversion has been politically controversial, and though the contract for the conversion was provisionally awarded to the Forgacs Shipbuilding yard at Newcastle, New South Wales, early in 1996, it was delayed until after the Australian general election and not signed by the new government until May 1996.

In the mean time, investigation of the condition of the two ships revealed that additional and essential work will be needed, which will raise the conversion costs from $55 million to an estimated $75-85 million. Cost had already been a factor in decisions not to fit a vehicle lift aft or a side door, though both these features are to be designed into the conversion for possible retrofitting.

MATTOSO MAIA (NEWPORT)

Propellers: Controllable pitch
Bow thruster: 800 bhp bow thruster

SIDI MOHAMMED BEN ABDALLAH (NEWPORT)

GENERAL SPECIFICATIONS

Country of Origin: USA
Operator: Morocco
Type: Newport (LST)

Class: SIDI MOHAMMED BEN ABDALLAH

Grant aid: 1
Active: 1

Displacement:
standard: 5,054 t
full load: 8,450 t

Dimensions
Length: 159.2 m (522.3 ft)
Beam: 21.2 m (69.5 ft)
Draught: 5.3 m aft (17.5 ft)

Speed: 20 kts
Range: 2,500 n miles at 14 kts

Complement: 257 including 13 officers

SHIPS

SIDI MOHAMMED BEN ABDALLAH (407)

Builder	National Steel & Shipbuilding, San Diego, California, USA
Laid down	13 Feb 1971
Launched	4 Dec 1971
Commissioned (US Navy)	5 Aug 1972 (*Bristol County* (LST 1198))
Transferred (Morocco)	16 Aug 1994

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 400 including 20 officers
- Cargo:
  Port to port — 2,000 tonnes
  Beaching — 500 tonnes

- Vehicles: Sample loads
  Tank deck
  23 AAV-7A1 APG, or
  29 M60 main battle tanks, or
  41—2.5 ton truck equivalents
  Upper deck:
  29—2.5 tonne truck equivalents

SHIP-SHORE LIFT

- LCVP: three
- LCP: one

AVIATION FACILITIES

Flight Deck: 15.65 × 15.46 m (51.4 × 51 ft) (242 m²) (2,621 sq ft)
Hangar: None
Helicopters: There are currently no helicopters operational with the Moroccan Navy

AMPHIBIOUS FACILITIES

- Aluminium ramp 34 m (111.5 ft) long (75 tonne capacity)
- Stern door
- Four pontoon sections can be carried lashed to ship's sides
- Two 75 tonne capacity turntables in tank deck
- Cranes: two 10 tonne capacity

WEAPONS SYSTEMS

GUNS

Hughes Mk 15 CIWS Phalanx

One Mk 15 CIWS is installed on the bridge roof. The weapons group is based on a barbette assembly with electronics enclosure to the rear. The gun is a six-barrelled 20 mm M61A1 Vulcan capable of very high firing rates.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 53 calibres
Muzzle velocity: 1,030 m/s (3,379)
Rate of fire:
Block 0; Block 1 Baseline 0: 3,000 rds/min
Block 1 Baseline 1: 4,500 rds/min
Range (effective, horizontal): 0.75 n miles (1.47 km)
Mounting:
Weight:
Block 0: 5.42 t
Block 1: 6.18 t
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

COMMAND AND CONTROL SYSTEMS

RADARS

Raytheon AN/SPS-67

Specifications
Frequency: G-band (5.4-5.8 GHz)
Azimuth beamwidth: 1.5°
Elevation beamwidth: 12°
Pulsewidth: 0.1; 0.25; 1.0 µs
Peak power: 280 kW
Scan period: 4 s
Instrumented range: 104 km

Manufacturer/Contractor
Raytheon, USA.

Canadian Marconi LN-66

Specifications
Frequency: I-band (9,375 ±30 MHz)
Peak power: 12 kW
Rotation speed: 22 ±10%
Pulsewidth: 0.5; 0.9 µs
PRF: 800/1,250; 2,500 Hz

Manufacturer/Contractor
Canadian Marconi Company, Kanata, Ontario, Canada.

PROPULSION

Specification
System: Diesel
Main machinery: 6 ALCO 16-251 diesels, 12.3 MW (16,500 hp) sustained
Shafts: 2
Propellers: Controllable pitch
Bow thruster: 800 bhp bow thruster

FURTHER INFORMATION

The ship was handed over to the Moroccan Navy in 1994 and by late 1995 was reported to be non-operational.

Pulse repetition frequency: 625-660 pps

Manufacturer/Contractor
Raytheon, USA.

Raytheon CRP 3100 Pathfinder

Specifications
Role: Navigation
Frequency range: I-band (9,375 ±25 MHz)
Peak power: 50 kW
Range: 118.5 km
Pulsewidth: 0.06, 0.5, 1 µs
PRF: 3,600, 1,800, 900 pps

Manufacturer/Contractor
Raytheon, USA.

PROPULSION

Specifications
System: Steam
Main machinery: 2 Babcock & Wilcox boilers, 40.8 kg/cm² (580 psi); 2 General Electric turbines, 17.9 MW (24,000 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

The 'Thomaston' class was the US Navy's first post-war LSD design and among the first amphibious vessels to meet the criterion for a 20 knots speed. Eight ships were built between 1953 and 1957, all by Ingalls Shipbuilding of Pascagoula, Mississippi, and named after historic American sites:

Ship	No	Launched	Commissioned	Withdrawn
Thomaston	LSD 28	9 Feb 1954	17 Sep 1954	Decommissioned 1984
Plymouth Rock	LSD 29	7 May 1954	24 Jan 1955	Decommissioned 1983
Fort Snelling	LSD 30	16 Jul 1954	24 Jan 1955	Decommissioned 1984
Point Defiance	LSD 31	28 Sep 1954	31 Mar 1955	Decommissioned 1983
Spiegel Grove	LSD 32	10 Nov 1955	8 Jun 1956	Decommissioned 1989
Alamo	LSD 33	20 Jan 1956	24 Aug 1956	Transferred to Brazil
Hermitage	LSD 34	12 Jun 1956	17 Dec 1956	Transferred to Brazil
Monticello	LSD 35	10 Aug 1956	29 Mar 1957	Decommissioned 1985

These ships were popular with the US Marine Corps, which resisted their retirement vigorously and though they were replaced across the 1980s by the 'Whidbey Island' class, several of them lingered in reserve for some years after being decommissioned. Finally, as shown in the table, two were transferred to Brazil and the remainder scrapped.

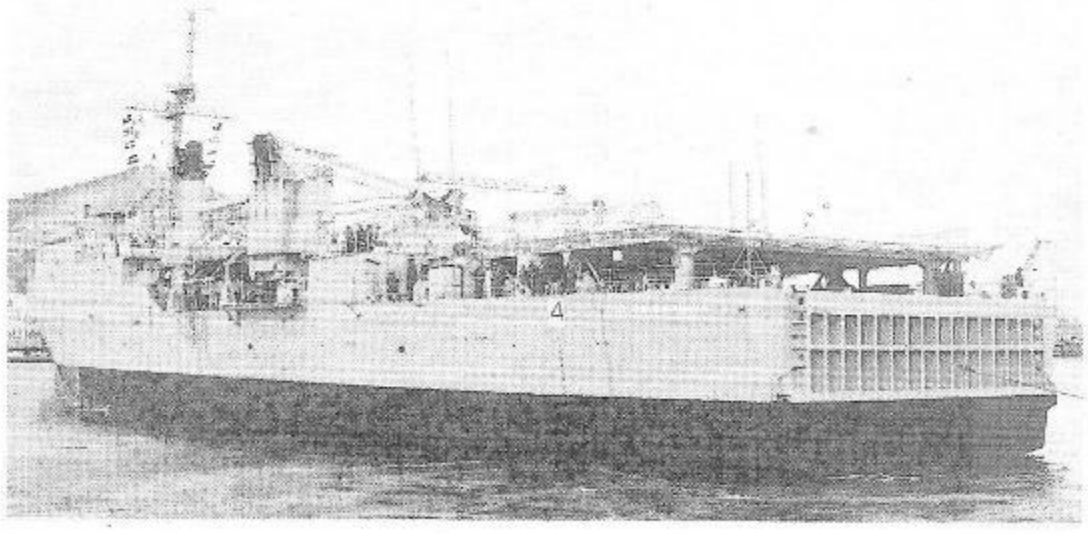
For Brazil, the two ships came as a welcome bonus, as it had been intending to build its own 4,500 tonne LST; instead, the two Thomastons were acquired, initially on five year leases.

DESIGN

The 'Thomaston' class was a distinct improvement on the wartime LSDs, being larger and more seaworthy, with a much larger docking well which could accommodate three LCUs. There is a vehicle deck, but this lacks direct access to the docking well.

The 'Thomaston' class was originally armed with 16 US Navy 76 mm (3 in)/50 calibre guns in eight Mk 33 twin mountings, which were progressively reduced to 12, and then to six. Phalanx CIWS and SRBOC chaff launchers were installed during their US Navy service, but were removed from these ships before the transfer to Brazil. Other items such as the AN/SPS-6 air search radar and the satellite communications equipment (OE-82 antenna, SSR-1 receiver and WSC-3 transceiver) were also removed before the transfer.

The first four of the class had a full load displacement of 11,450 tonnes; the final four had full load displacement of 12,345 tonnes.



Rio de Janeiro *(G 31) is one of two ex-US Navy 'Thomaston' class LSDs serving with the Brazilian Navy. Note the stern gate and the helicopter flight deck which is formed from removable panels* (H & L van Ginderen Collection)

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- 366 troops, including 18 officers
- Total vehicle storage space, 1,394 m² (15,800 sq ft)
- Upper deck: one LCM 6 on deck; two LCPLs and one LCVP on davits. A further 15 LVT tractors can be stowed on a mezzanine deck

SHIP-SHORE LIFT

- Dock: three LCUs or four LCACs or 18 LCM 6 or nine LCM 8 or 52 LVTs

AMPHIBIOUS FACILITIES

- Docking well 131.1 × 15.2 m (430 × 50 ft)
- Two 50 tonnes capacity cranes

AVIATION FACILITIES

Specifications
Flight deck: Aft, constructed from removable panels
Hangar: None
Aviation fuel: 90 tonnes

WEAPONS SYSTEMS

GUNS

Hughes Mk 15 CIWS Phalanx
Two Mk 15 CIWS are installed, one on the bridge roof, the other atop the superstructure abaft the mast. The weapons group is based on a barbette assembly with electronics enclosure to the rear. The gun is a six-barrelled 20 mm M61A1 Vulcan capable of very high firing rates. Original Block 0 systems installed in the early 1980s are gradually to be uprated to Block 1.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 53 calibres
Muzzle velocity: 1,030 m/s (3,379 ft/s)
Rate of fire:
Block 0; Block 1 Baseline 0: 3,000 rds/min
Block 1 Baseline 1: 4,500 rds/min
Range (effective, horizontal): 0.75 n miles (1.47 km)
Mounting:
Weight:
Block 0: 5.42 t
Block 1: 6.18 t
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

25 mm Mk 38 automatic cannon (Sea Snake)
There are two single Mk 88 mountings for Mk 38 25 mm cannon (Sea Snake). The Mk 88 mounting is replacing

20 mm mountings in many US Navy warships and is designed to engage surface and shore targets in low- and mid-intensity operational environments at ranges up to 1.33 n miles (2.5 km). The M-242 is a single barrel, externally powered weapon which incorporates a rotating bolt mechanism driven by a chain drive. The weapon has been designed to allow the barrel to recoil separately from the receiver, which reduces the available travel as the bolt also has to move, the travelling distance being 12.7 mm. The Mk 38 can fire single shots or 175 rds/min and features twin shoulder braces and an optical Aimpoint sight. The weapon weighs 110.5 kg (243 lb) and is 2.74 m (9.0 ft) long, 0.32 m (1.0 ft) wide and 0.37 m (1.2 ft) high while the barrel is 2.30 m (7.5 ft) long. The peak recoil force is 4,536 kg (10,000 lb) in the naval version but with a McDonnell Douglas muzzle brake modification and recoil damper this can be reduced to 2,721.5 kg (6,001 lb). The barrel life is in excess of 13,000 rounds while the demonstrated reliability of the weapon is 22,000 rounds between stoppages.

Specifications

Calibre: 25 mm
Length of barrel: 81 calibres
Muzzle velocity: 1,100 m/s (3,609 ft/s)
Traverse: 300°
Elevation: −20 to +55°
Weight: 596.5 kg (1,315 lb) (loaded)
Crew: 1 (often supported by a spotter)
Range: 1.33 n miles (2.47 km)
Rate of fire: 175 rds/min (max)
Ammunition: 184 g HEI-T

M2HB 12.7 mm machine guns

Six M2HB 12.7 mm machine guns are carried. The M2HB is a selective short recoil automatic operation weapon with a 1,143 mm (45 in) long barrel and eight right-hand grooves turning once every 381 mm. Muzzle energy is 1,867 mkp and the weapon uses 110-round belts.

Specifications

M2HB
Calibre: 12.7 mm
Length of barrel: 190 calibres
Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

Fort Fisher *(LSD 40) in 1978, showing the original armament which included twin 76 mm (3 in) guns, and no Phalanx CIWS* (US Navy/PH2 P J Salesi)

Fort Fisher *(LSD 40) in October 1996 with 76 mm guns removed* (H & L van Ginderen Collection)

Shafts: 2

FURTHER INFORMATION

PROGRAMME

The five-strong 'Anchorage' class was a product of the amphibious programme of the 1960s. The 'Thomaston' class Landing Ships, Dock (LSD), had been built in the 1950s and the two 'Raleigh' and 'Austin' classes, which were designed and built in parallel, reflected changing views of the nature of amphibious operations within the US military.

The designation of the 'Austin' class as 'amphibious transport, dock (LPD)' was significant and indicated a change in emphasis from the traditional 'mother ship' role of the LSDs to the rapid deployment of amphibious task forces, with a ship which carried a 'balanced load'. The LPD concept was, however, ahead of its time, and the ordering of the five 'Anchorage' class ships was recognition that there was still a role for the traditional LSD to carry landing craft to an assault area, and that the Austins had not entirely met all the requirements of amphibious forces. In addition, the speed of the amphibious task forces had been set at 20 knots, a figure which the ageing Second World War vessels still in service could not meet.

DESIGN

The Anchorage design was a development of the Thomaston (LSD 28) design, but with a longer hull, which allowed a 9 m (30 ft) increase in the length of the docking well. As a result the well can accommodate three LCUs or nine LCM 8 or, as an alternative, 50 LVTP 7s. There is a 'mezzanine deck' amidships, above the docking well, for vehicles, which are removed using the two 50 tonnes cranes.

DEPLOYMENT

Four of the class were involved in the Gulf War of 1991.

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- 930 troops (840 in LPD 7-13)

SHIP-SHORE LIFT

- Four LCPL/LCVP plus nine LCM6s or four LCM8s, or two LCACs, or 20 LVTs plus 3,900 tonnes cargo

AVIATION FACILITIES

Specifications
Flight deck:
Hangar: 19.5 m (64 ft) long × 7.3 m (24 ft) wide. Telescopic section adds a further 4.9 m (16 ft) in length
Helicopter: Up to 6 CH-46D/E Sea Knight
Typical operational load: 1 SH-60 Seahawk; 2 CH-46 Sea Knight; 2 UH-1 Twin Huey, 4 AH-1 Sea Cobras (plus one patrol boat armed with 20 mm guns)

AMPHIBIOUS FACILITIES

- Docking well 120.1 × 15.2 m (394 × 50 ft)
- Cranes: one 30 tonne; six 4 tonne
- Elevator: 9.15 tonne
- Vehicle parking: 1,379 m² (14,844 sq ft)
- Ammunition for landing force: 1,540 m³ (54,384 cu ft)

WEAPONS SYSTEMS

GUNS

Hughes Mk 15 CIWS Phalanx

There are two Mk 15 CIWS; one is forward of the bridge, the other atop the superstructure, immediately abaft the mast.

The CIWS was developed to provide fast reaction to submarine-launched anti-ship missiles and is a 'closed loop' system, tracking both the target and the stream of rounds, and constantly seeking to reduce the difference between the two. It consists of the Mk 16 weapon group, the Mk 339 local and Mk 340 remote-control panels as well as a remote indicator panel. The weapons group is based on a barbette assembly with electronics enclosure to the rear. The gun is a six-barrelled 20 mm M61A1 Vulcan capable of extremely high firing rates. Original Block 0 systems installed in the early 1980s are gradually being uprated to Block 1.

Specifications

Gun
Calibre: 20 mm
Length of barrel: 53 calibres
Muzzle velocity: 1,030 m/s (3,379 ft/s)
Rate of fire:
Block 0; Block 1 Baseline 0: 3,000 rds/min
Block 1 Baseline 1: 4,500 rds/min
Range (effective, horizontal): 0.75 n miles (1.47 km)
Mounting:
Weight (Block 0): 5.42 t; (Block 1): 6.18 t
Traverse: 310° at 126° /s
Elevation: −25 to +85° at 92° /s

25 mm Mk 38 automatic cannon (Sea Snake)

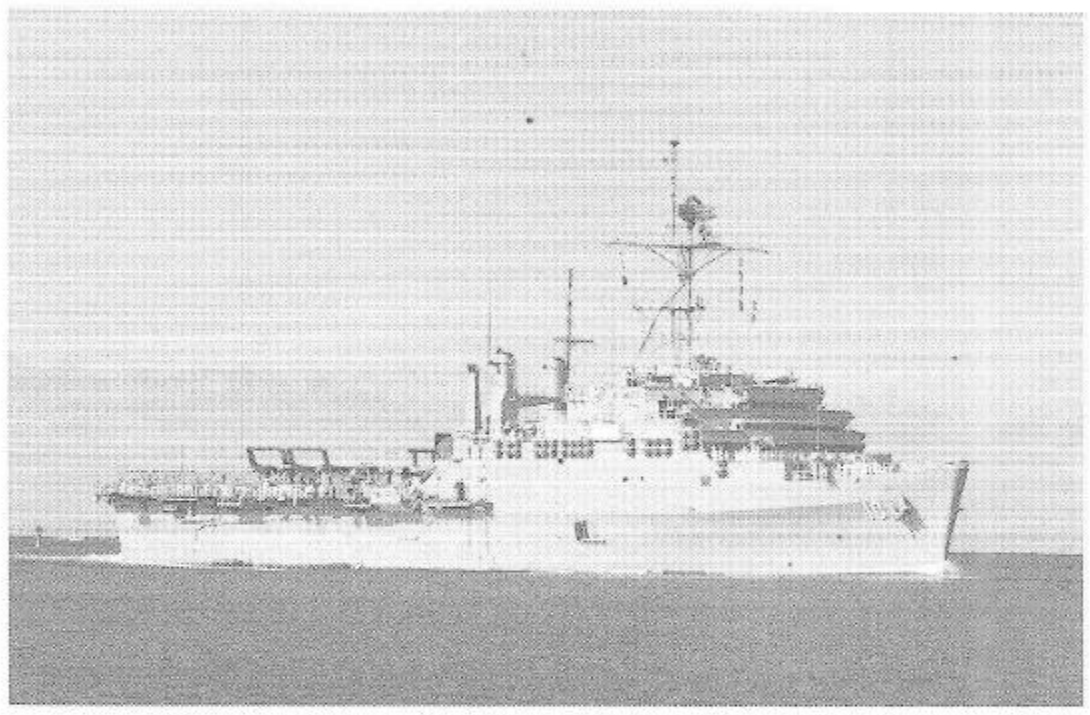
There are two single Mk 88 mountings for Mk 38 25 mm cannon (Sea Snake). The Mk 88 mounting is replacing 20 mm mountings in many US Navy warships and is designed to engage surface and shore targets in low- and mid-intensity operational environments at ranges up to 1.33 n miles (2.5 km). The M-242 is a single barrel, externally powered weapon which incorporates a rotating bolt mechanism driven by a chain drive. The weapon has been designed to allow the barrel to recoil separately from the receiver, which reduces the available travel as the bolt also has to move, the travelling distance being 12.7 mm. The Mk 38 can fire single shots or 175 rds/min and features twin shoulder braces and an optical Aimpoint sight. The weapon weighs 110.5 kg (243 lb) and is 2.74 m (9 ft) long, 0.32 m (1.0 ft) wide and 0.37 m (1.2 ft) high while the barrel is 2.30 m (7.5 ft) long. The peak recoil force is 4,536 kg (10,001 lb) in the naval version but with a McDonnell Douglas muzzle brake modification and recoil damper this can be reduced to 2,721.5 kg (6,001 lb). The barrel life is in excess of 13,000 rounds while the demonstrated reliability of the weapon is 22,000 rounds between stoppages.

Specifications
Calibre: 25 mm
Length of barrel: 81 calibres
Muzzle velocity: 1,100 m/s (3,609 ft/s)
Traverse: 300°
Elevation: −20 to +55°
Weight: 596.5 kg (1,315 lb) (loaded)
Crew: 1 (often supported by a spotter)
Range: 1.33 n miles (2.47 km)
Rate of fire: 175 rds/min (max)
Ammunition: 184 g HEI-T

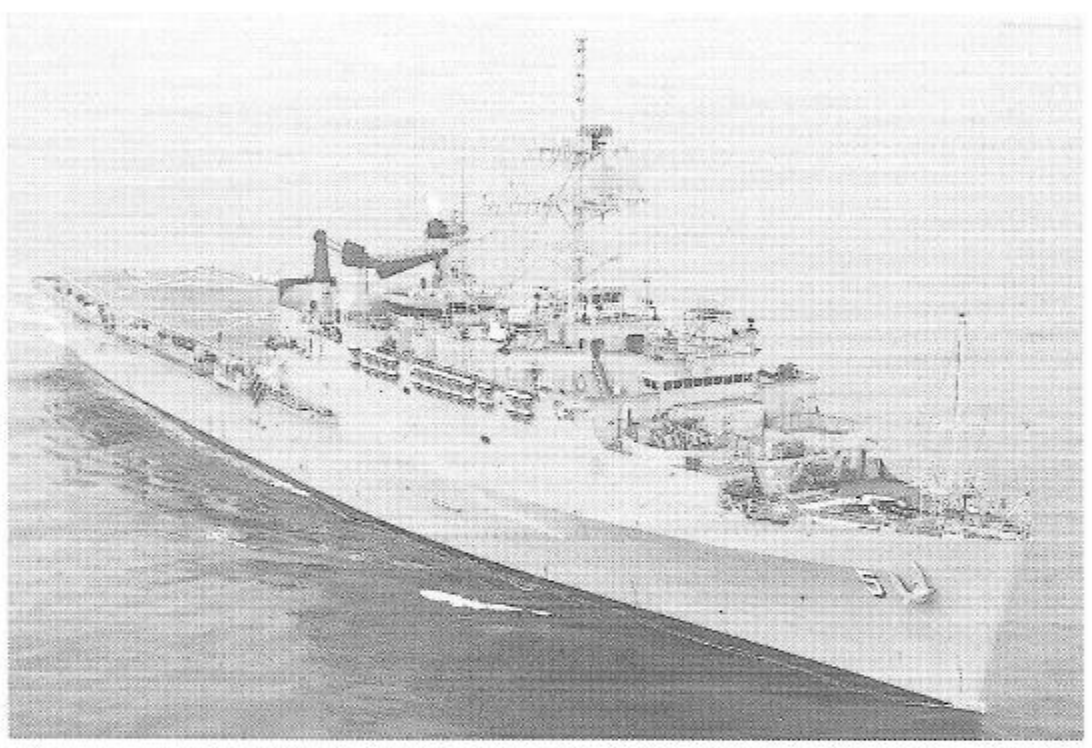
12.7 mm machine guns

Eight M2HB 12.7 mm machine guns are carried. The M2HB is a selective short recoil automatic operation weapon with a 1,143 mm (45 in) long barrel and eight right-hand grooves turning once every 381 mm.

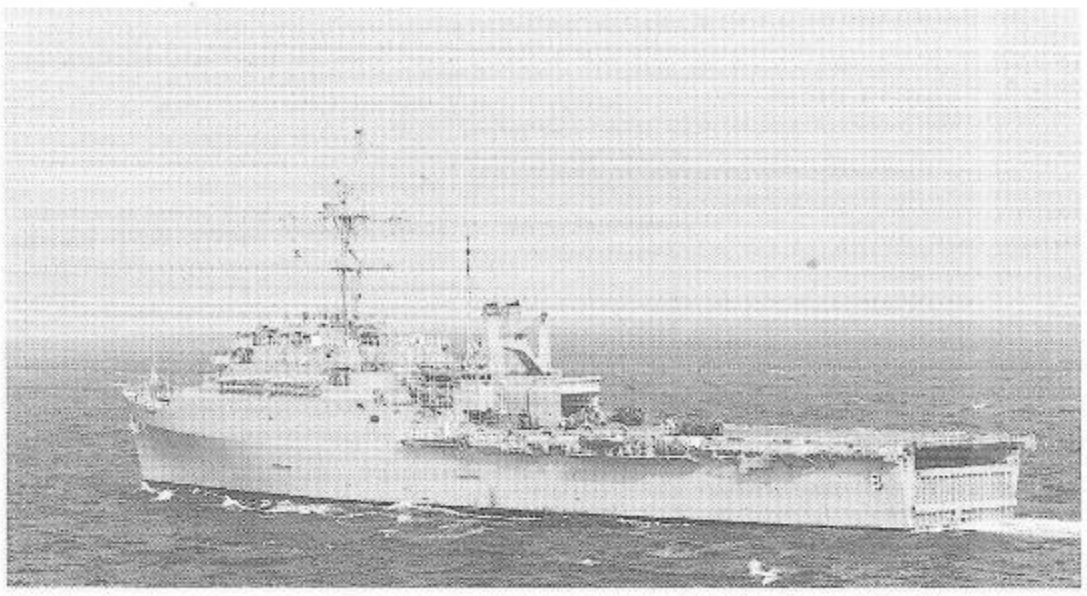
Specifications
M2HB
Calibre: 12.7 mm
Length of barrel: 190 calibres
Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)



Juneau *(LPD 10). Note the second bridge level for the flag staff, a feature of LPD 7 to LPD 13 only. The ship is transporting a US Marine Corps aviation unit including a number of Rockwell OV-10 Bronco twin-engined aircraft, all of which are returning to the USA from Operation Desert Storm* (US Navy/OS2 J Bouvia)



Ogden *(LPD 5). This is one of the 'non-flag' ships and does not have a second bridge level. Note also that at the time of this picture (1987) the twin 76 mm/60 was still mounted just forward of the bridge, but the Phalanx Mk 15 CIWS had yet to be installed* (US Navy/PH2 Grzezdzinski)



Dubuque *(LPD 8) about to commence an underway replenishment. The telescopic hangar gives shelter for maintenance operations only and is not intended to accommodate helicopters* (US Navy/Cdr A J Dooley)

Nashville *(LPD 13)* (US Navy)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

AN/SLQ-32(V)1 intercept

The AN/SLQ-32(V)1 is an ESM system, giving radar warning on B to J-bands.

Manufacturer/Contractor
Raytheon, Electromagnetic System Division, Goleta, California, USA.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher

There are four Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) systems consisting of launcher, launcher control, power supplies, ready

service lockers and munitions. The Mk 137 launcher has six 130 mm (5 in) fixed tubes arranged in parallel rows at angles of 45 and 60°. The firing circuits use electromagnetic induction to initiate the propelling charges in the cartridges. The prime cartridge is the Mk 182 Torch with chaff payload.

Specifications
Launcher dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Launcher weight: 173 kg (381 lb)
Mk 182 cartridge dimensions: 1,209 × 130 mm (47.5 × 5 in)
Cartridge weight: 22.7 kg (50 lb)

Specifications
System: Steam
Main machinery: 2 Foster Wheeler boilers (Babcock & Wilcox in *Ogden* (LPD 5) and *Shreveport* (LPD 12)); 42.3 kg/cm² (600 psi); 467°C; 2 De Laval turbines, 18 MW (24,000 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

The 'Austin' class was developed from the three-strong 'Raleigh' class, which was intended to follow the earlier LSDs but offer more troop and cargo carrying capacity, along with a smaller well deck. Unlike the Raleighs, the Austins had a single helicopter hangar.

Seven of the class (LPD 7 to LPD 13) were fitted for use as amphibious squadron (PhibRon) flagships. Their troop capacity is reduced from 930 to 840 troops and they have an additional bridge level.

One of these, *Coronado* (LPD 11), has spent many years as a fleet flagship and is not likely ever to use her amphibious capability. The intended 13th of the class, LPD 16, was deferred in 1966 and cancelled in 1969 in favour of the LHA programme, which explains why numbering of the new 'LPD' class, which will replace the 'Austin' class, starts with LPD 17.

The 12th member of the class, *Coronado* (LPD 11), was converted to become a fleet flagship in 1980 and has since served as locum flagship in the Middle East and the Pacific. Though *Coronado* retains amphibious capability, it is not intended that she should be used for duties other than flagship service, and her number has been changed to AGF 11. The intended 13th was never built.

DESIGN

The major change from the previous 'Raleigh' class was the insertion of a 15.2 m (50 ft) hull section at the forward end of the docking well. This additional space enabled a large telescopic hangar to be included and also increased cargo capacity from 2,000 to 3,900 tonnes. First of class, *Austin* (LPD4) does not have a hangar.

LPD 7 to LPD 13 (both inclusive) are required to serve as amphibious squadron flagships and have an additional bridge level to serve the relevant flag staff.

FUTURE

A proposed SLEP was cancelled in 1987 but all are to be kept in service beyond 2000.

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- 450 troops

SHIP-SHORE LIFT

- **Whidbey Island** 4 LCAC or 21 LCM 6 or 3 LCU. 2 LCPL
- **Harpers Ferry** 2 LCAC or 9 LCM6 or 1 LCU. 2 LCPL

AVIATION FACILITIES

Whidbey Island
- 141 m³ (5,000 cu ft) marine cargo
- 1,161 m² (12,500 sq ft) for vehicles (including four preloaded LCACs in the well deck)
- Aviation fuel: 90 tonnes

Harper's Ferry
- 1,914 m³ (67,600 cu ft) marine cargo
- 1,877 m² (20,200 sq ft) for vehicles (including two or three preloaded LCACs in the well deck
- aviation fuel: 90 tonnes

AMPHIBIOUS FACILITIES

- Well deck. 134.1 × 15.2 m (440 × 50 ft) (shorter in *Harper's Ferry*)
- Cranes. 1 × 60 t; 1 × 20 t
  Whidbey Island: 1 × 60 tonnes; 1 × 20 tonnes
  Harper's Ferry: 1 × 60 tonnes.

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

General Dynamics/Hughes RIM-116A RAM close in system

Whidbey Island (LSD 41), *Ashland* (LSD 48). One RAM launcher was fitted in *Whidbey Island* (LSD 41) for SSDS trials in 1993 and in *Ashland* (LSD 48) in 1996. It will be fitted in all ships of the class in due course. The Rolling-Airframe Missile (RAM) is a lightweight, close in, quick reaction, anti-missile defence system, the RIM-116 missile being based on the Sidewinder air-to-air missile, but with significant modifications, enabling it to be used as a fire-and-forget system. There is an infra-red, terminal guidance seeker in the nose (taken from the Stinger man-portable surface-to-air missile), behind which is a new dual-mode passive radio frequency seeker for mid-course guidance. Most of the rear of the missile is based upon Sidewinder components. Missiles are stored in sealed launcher-containers which are manually loaded into the 21-cell Mk 49 RAM Standard Launchers.

Radar and electro-optical sensors provide details of target location, distance and speed, while the ship's ESM system inputs data on the target's radar frequency, as well as correlating radar data on location. On launch, the missile is spun-up by a rifling band as it is driven down the launch tube and then, as it leaves the launcher, the four tail fins deploy which maintains the spin. Aerodynamic control is provided by the two canard surfaces, which also deploy after launch. The autopilot and control system maintain the initial line of sight course towards the target and then the RF seeker is activated and, once this acquires the target, it takes control of the guidance system and makes the appropriate course alterations. The IR seeker is also activated and when a sufficient signal-to-noise ratio is achieved, this takes over guidance control for the terminal phase. The missile is capable of manoeuvres up to 20 *g* in any direction. The system can only be fired automatically at the moment, but manual control will become possible with Block 2 missiles.

Harper's Ferry *(LSD 49), lead ship of four 'cargo variants' of the basic Whidbey Island design. External indications are the forward Mk 15 CIWS is on the roof of the forecastle deckhouse, the forward WSC-3 antenna is on the bridge roof, the after Mk 15 CIWS is atop a square deckhouse, and there is only one crane* (H & L van Ginderen Collection)

Comstock *(LSD 45) immediately before commissioning. Note the two Mk 15 CIWS on the top of the superstructure, and the two 'dustbin' satcom antennas, one on the roof of the forecastle deckhouse, the second at the after end of the main superstructure* (US Navy)

Specifications

Mk 49 RAM Standard launcher
Traverse: 360°
Elevation: −25 to +80°
Turning circle: 3.27 m (10.7 ft)

RIM-116 missile
Length: 2.79 m (9.1 ft)
Diameter: 12.7 cm (5 in)
Wing span: 43.4 cm (17.1 in)
Weight: 73.6 kg (162 lb)
Speed: Mach 2
Range: 5.17 n miles (9.6 km)
Warhead: 9.09 kg (20 lb) fragmentation blast WDU-17B
Motor: Hercules/Aerojet Mk 36 solid propellant rocket

Manufacturer/Contractor

General Dynamics/Hughes Missile Systems, USA.

GUNS

Hughes Mk 15 CIWS Phalanx

Two Mk 15 CIWS are installed, one on the bridge roof, the other on the hangar roof. The weapons group is based on a barbette assembly with electronics enclosure to the rear.

The gun is a six-barrelled 20 mm M61A1 Vulcan capable of very high firing rates. Original Block 0 systems installed in the early 1980s will gradually be uprated to Block 1.

Specifications

Gun
Calibre: 20 mm
Length of barrel: 53 calibres
Muzzle velocity: 1,030 m/s (3,379 ft/s)
Rate of fire:
Block 0; Block 1 Baseline 0: 3,000 rds/min
Block 1 Baseline 1: 4,500 rds/min
Range (effective, horizontal): 0.75 n miles (1.47 km)

Mounting:
Weight (Block 0): 5.42 t; (Block 1): 6.18 t
Traverse: 310° at 126° /s
Elevation: −25 to +85° at 92° /s

25 mm Mk 38 automatic cannon (Sea Snake)

There are two single Mk 88 mountings for Mk 38 25 mm cannon (Sea Snake). The Mk 88 mounting is replacing 20 mm mountings in many US Navy warships and is designed to engage surface and shore targets in low- and mid-intensity operational environments at ranges up to 1.33 n miles (2.5 km). The M-242 is a single barrel, externally powered weapon which incorporates a rotating bolt mechanism driven by a chain drive. The weapon has been designed to allow the barrel to recoil separately from the receiver, which reduces the available travel as the bolt also has to move, the travelling distance being 12.7 mm. The Mk 38 can fire single

shots or 175 rds/min and features twin shoulder braces and an optical Aimpoint sight. The weapon weighs 110.5 kg (243.6 lb) and is 2.74 m (9.0 ft) long, 0.32 m (1.0 ft) wide and 0.37 m (1.2 ft) high while the barrel is 2.30 m (7.5 ft) long. The peak recoil force is 4,536 kg (10,000 lb) in the naval version but with a McDonnell Douglas muzzle brake modification and recoil damper this can be reduced to 2721.5 kg (6,001 lb). The barrel life is in excess of 13,000 rounds while the demonstrated reliability of the weapon is 22,000 rounds between stoppages.

Specifications

Calibre: 25 mm
Length of barrel: 81 calibres
Muzzle velocity: 1,100 m/s (3,609 ft/s)
Traverse: 300°
Elevation: −20 to +55°
Weight: 596.5 kg (loaded) (1,315 lb)
Crew: 1 (often supported by a spotter)
Range: 1.33 n miles (2.47 km)
Rate of fire: 175 rds/min (max)
Ammunition: 184 g HEI-T

12.7 mm machine guns

Eight M2HB 12.7 mm machine guns are carried. The M2HB is a selective short recoil automatic operation weapon with a 1,143 mm (45 in) long barrel and eight right-hand grooves turning once every 381 mm. Muzzle energy is 1,867 mkp and the weapon uses 110-round belts.

Specifications

M2HB
Calibre: 12.7 mm
Length of barrel: 190 calibres
Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

AN/SLQ-32(V)1 or (V)2

These ships are reported to carry AN/SLQ-32(V)1 or (V)2 radar intercept sets only and not the additional ECM suite to enable signals to be jammed or decoyed.

The AN/SLQ-32(V)1 version is designed to detect all radio frequency signals in Band 3 at all azimuths, covering potential enemy radar-guided anti-ship missiles and their associated supporting radars. This provides alert facilities to an attack on the ship and also allows for the control of the Mk 36 chaff rocket system carried by the ship.

AN/SLQ-32(V)2 adds two receiving subsystems. Two Band 2 direction-finding receivers and arrays and lenses each covering 90° are added to each of the port and starboard antenna assemblies, and a Band 2 semi-omni-antenna covering 180° is added to each assembly. Four small Band 1 spiral antennas are located on a yard-arm (port and starboard) to cover 360°. As well as the necessary extra electronics needed to handle the increased input data, the AN/UYK-19 computer remains the same as in the (V)1 version apart from having an additional 16 k of storage capacity.

Manufacturer/Contractor

Raytheon Company, Electromagnetic Systems Division, Goleta, California, USA

AN/SLQ-49 chaff buoys

AN/SLQ-49 is the US Navy version of the British 'Replica' system, also known as 'Rubber Duck'. This is a rapidly deployed, passive naval decoy which presents a ship-like image to the radar seeker of an incoming anti-ship missile. The equipment consists of a launcher and a pair of liferaft-type containers, each housing one octahedral-shaped radar reflector. The two reflecting bodies start to inflate as they leave the ship and once in the water they are linked to each other by a 5 m (16 ft) line with one of the container lids acting as a sea-anchor to ensure that they remain apart. The distance between the opposite tips of the decoy is approximately 2.5 m (8.2 ft) and it contains metal-coated nylon mesh curtains, which are suspended from aluminium alloy tubes.

Manufacturer/Contractor

Irvin, Letchworth, UK.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher

There are four Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) systems consisting of launcher, launcher control, power supplies, ready service lockers and munitions. The Mk 137 launcher has six 130 mm (5 in) fixed tubes arranged in parallel rows at angles of 45 and 60°. The firing circuits use electromagnetic induction to initiate the propelling charges in the cartridges. The prime cartridge is the Mk 182 Torch with chaff payload.

Specifications

Launcher dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Launcher weight: 173 kg (381 lb)
Mk 182 cartridge dimensions: 1,209 × 130 mm (47.5 × 5 in)
Cartridge weight: 22.7 kg (50 lb)

AN/SLQ-25 Nixie torpedo decoy

AN/SLQ-25 Nixie is a solid-state, modular design, electroacoustic, countermeasures decoy system used to protect the ship from acoustic homing torpedoes. It consists of a remote-control unit which activates, deactivates and monitors (through an oscilloscope) the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming and recovering the towed bodies (which are stored on racks attached to the winch), a coaxial switching unit which selects the appropriate cable or load, and towed bodies. The towed body converts the electrical signals to acoustic signals and projects them.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Ship Self-Defense System (SSDS)

***Whidbey Island* (LSD 41) *Ashland* (LSD 48) only.** The prototype Quick Reaction Combat System/Ship Self-Defense System (QRCS/SSDS) was installed and successfully demonstrated in *Whidbey Island* (LSD 41) in 1993, using Raytheon AN/SPS-49 long-range 2D air search radar, a prototype Spar AN/SAR-8 infra-red search and track device, and AN/SLQ-32 electronic warfare system as the sensors. The SLQ-32 also controlled the SRBOC chaff/infra-red launcher as the 'soft kill' element of the system, while the 'hard kill' elements were the ship's two Mk 15 Phalanx CIWS and the Mk 116 RAM surface-to-air missile (which was also installed for the trials). All elements were linked by an FDDI/Safenet fibre optic local area network through access units and supervised by two Hughes workstations. The SPS-49 gave early warning of threats and with the SLQ-32 provided track data which was supplemented by the SAR-8 and Phalanx radars.

Following the successful trial in *Whidbey Island,* SSDS has been installed in a second ship, *Ashland* (LSD 48) and will be fitted in all other ships in due course.

AVIATION

AVIATION FACILITIES

Specifications
Flight deck:
Hangar: No hangar, but refuelling and rearming facilities.
Helicopters: 2 CH-53 Sea Stallion

Comstock *(LSD 45). Note the large stern gate giving access to the 134.1 × 15.2 m (440 × 50 ft) docking well and the large flight deck which, unlike previous LSDs, is fixed. There is no hangar but there are full refuelling and rearming facilities* (US Navy)

PROPULSION

Specifications
System: Diesel
Main machinery: 4 Colt SEMT-Pielstick 16 PC2.5 V 400 diesels, 27.5 MW (37,440 hp) sustained

Shafts: 2
Propellers: Controllable pitch

FURTHER INFORMATION

DESIGN

The original plan was the subject of considerable friction between the Carter Administration and Congress in the late 1970s, with the president trying to delay the project until a naval reassessment of its amphibious requirements had been completed. At one stage, the plan was for a class of six ships to replace the 'Thomaston' class LSDs, but greater clarification in the 1980s of the likely future shape of amphibious warfare eventually led to the construction of eight, with a further four 'cargo variants' (LSD-CV) being built as the 'Harper's Ferry' class.

The Whidbey Island and Harper's Ferry ships will form one third of the basic amphibious fleet envisaged for the first decade of the 21st century

The design is based on that of the earlier 'Anchorage' class, but with a number of significant improvements. The large flight deck extends to the stern and is strong enough to handle the Marine Corps' CH-53Es. The docking well is the same width as earlier LSDs but is 3 m (9.8 ft) longer, enabling four LCACs to be accommodated.

These were the first US Navy amphibious ships to be powered by diesels rather than steam propulsion plants.

The cargo variant of the 'Whidbey Island' class has relatively minor differences in equipment and structure. The Harper's Ferry ships have additional air conditioning and pipework and a changed hull structure; the forward Phalanx is lower down and there is only one crane. The extra cargo space has been achieved at the expense of the well deck, which is shorter.

MODERNISATION

It is planned to install ACDS in due course, and all ships will receive SSDS by 2002, following the successful trials in *Whidbey Island.* One of the class is to be fitted with the new High Frequency Surface Wave radar in FY97, which is designed to give over-the-horizon detection of incoming missiles.

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

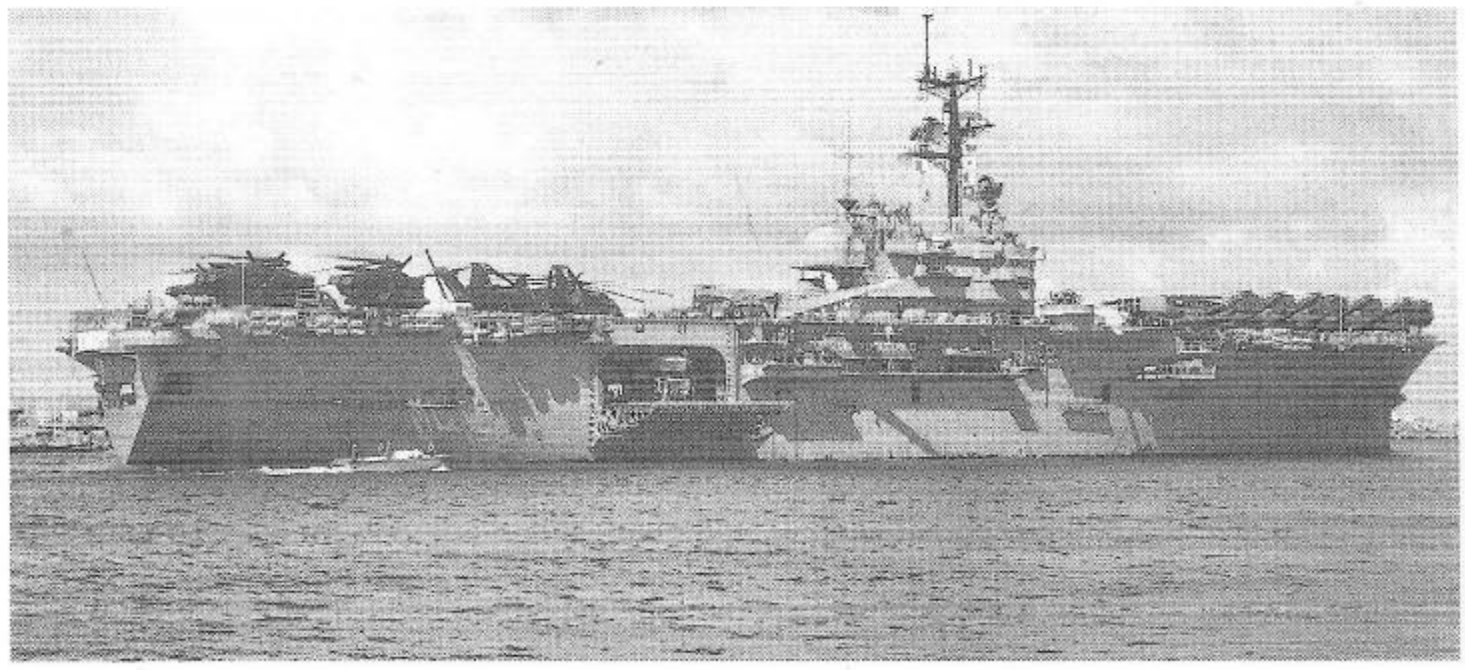
- Marine Corps battalion landing team, plus its support equipment, guns and vehicles, plus a reinforced squadron of transport helicopters and support personnel. 1,562 troops (including 158 officers); 1,500 tonnes of aviation fuel.

SHIP-SHORE LIFT

- Two LCPLs

AVIATION FACILITIES

Specifications
Flight deck: 183.7 × 31.7 m (602.3 × 104 ft)
Hangar: 70 m (230 ft) long. Accommodates 11 CH-53 or 19 CH-46
Aircraft: 20 CH-46D/E Sea Knight or 11 CH-53D/E Sea Stallions or 4 AV-8B Harriers
Max activity level: Simultaneous take-off/landing of up to 7 CH-46 Sea Knight or 4 CH-53 Sea Stallions



Tripoli *(LPH 10)* (Jane's/H M Steele)

AMPHIBIOUS FACILITIES

- Two deck-edge elevators, each 15.24 × 10.36 m (50 × 34 ft). Capacity: LPH 2-3, LPH 11-12 — 22.7 tonnes (22.32 tons); LPH 7, LPH 9-10 — 19.95 tonnes (19.6 tons)
- Hangar; 70 m (230 ft) long
- Two stores elevators
- Vehicle parking 517 m² (5,565 sq ft)
- One crane; 18.3 tonne (18 ton) capacity
- Medical facilities include two operating theatres and 155 beds

WEAPONS SYSTEMS

GUNS

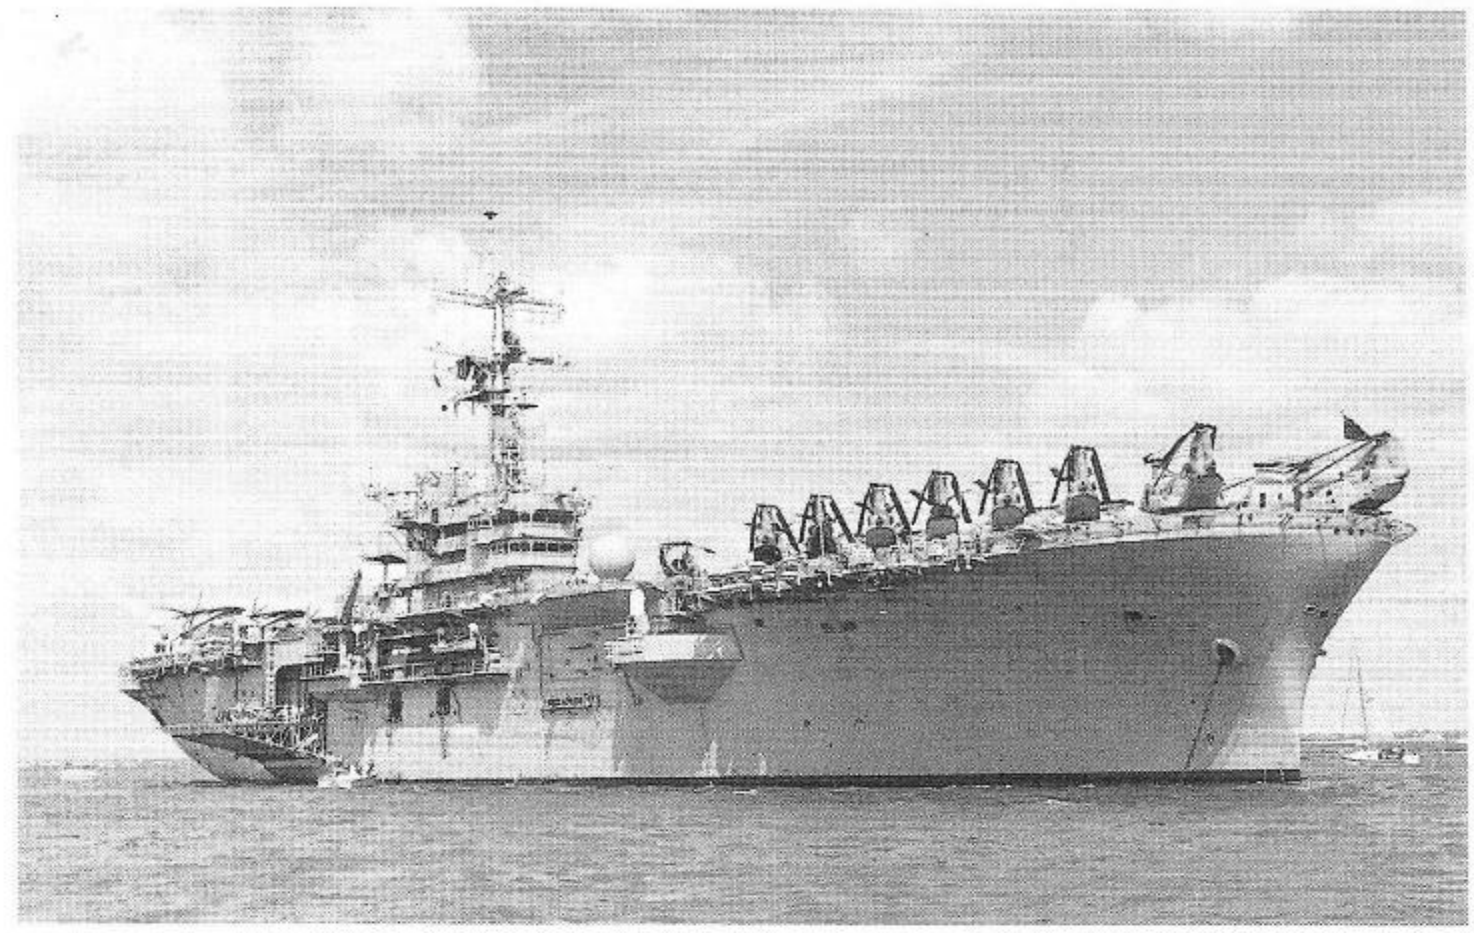
Hughes Mk 15 CIWS Phalanx

There are two Mk 15 CIWS: one is on a sponson on the starboard side forward, the other on another sponson on the port quarter. This CIWS was developed to provide fast reaction to submarine-launched anti-ship missiles and operates on a 'closed loop' system, tracking both the target and the stream of rounds, and seeking constantly to reduce the difference between the two. The gun is a six-barrelled 20 mm M61A1 Vulcan with extremely high firing rates.

Specifications

Gun
Calibre: 20 mm
Length of barrel: 53 calibres
Muzzle velocity: 1,030 m/s (3,379 ft/s)
Rate of fire (Block 0): 3,000 rds/min
Range (effective, horizontal): 0.75 n miles (1.47 km)

Mounting
Weight (Block 0): 5.42 t
Traverse: 310°
Elevation: −25 to +85°
Training speed: 126°/s
Elevation speed: 92°/s



Guam *(LPH 9) the first of the two surviving 'Iwo Jima' class ships. Note the Mk 15 Phalanx CIWS on the sponson and the large radome for a satcom antenna on the flight deck above it. Abaft the island the ship's crane is recovering an LCPL*

M2HB 12.7 mm machine guns

Up to eight M2HB are carried. This is a selective short recoil automatic operation weapon with a 1,143 mm long barrel.

Specifications
Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

Carrier Controlled Approach (CCA): SPN-35A and SPN-43B

AN/SPN-35 is a carrier approach radar set providing precise range, altitude and heading information to guide both fixed-wing aircraft and helicopters along the final approach to the carrier deck. Aircraft are accepted from the surveillance radar systems and then controlled by the SPN-35 to a final transition point from which the recovery is made. SPN-35 is mounted on a gyrostabilised platform that keeps the radar level and accurately aligned to the horizon at all times.

AN/SPN-43 is used to marshal aircraft prior to their negotiating final landings and is mounted on top of a stabilised platform that automatically compensates for the pitch and roll of the ship. SPN-43 detects aircraft at distances up to 93 km and provides tracking data allowing the radar operator to control and transition the aircraft into the final approach area for carrier recovery. Operational frequency is 3.5 to 3.7 GHz, with a peak power output of 850 kW.

Manufacturer/Contractor

ITT Gilfillan, Van Nuys, California, USA.

FURTHER INFORMATION

PROGRAMME

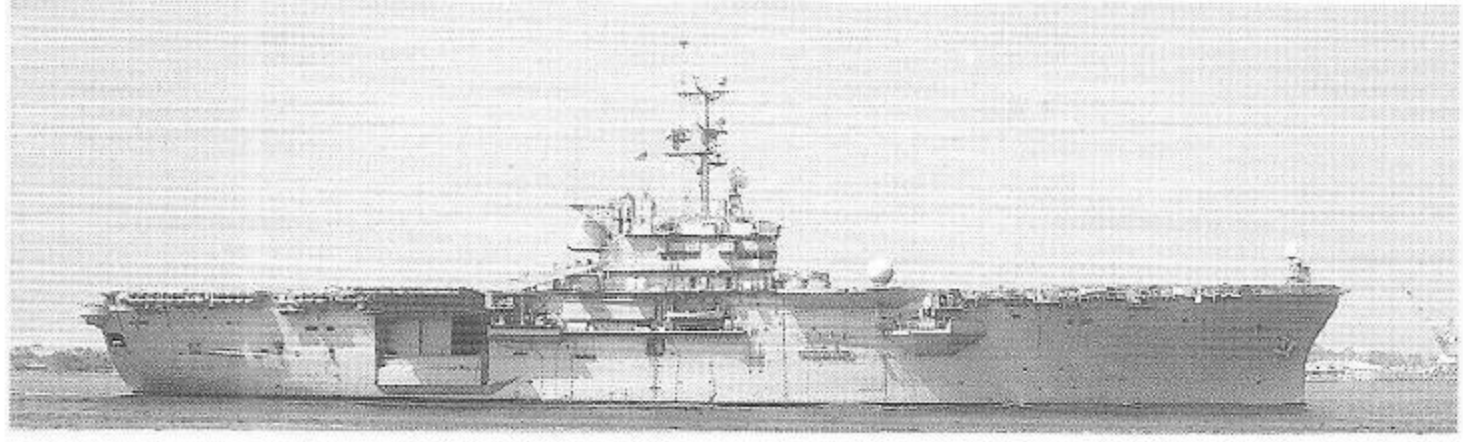
When commissioned in 1961, *Iwo Jima* was claimed to be the world's first amphibious assault ship designed to accommodate and operate helicopters. It was the ship that the Marine Corps of the 1950s had wanted to overcome the perceived threat posed by nuclear weapons to concentrations of landing ships and landing craft carrying out an opposed landing.

The 'Iwo Jima' class eventually totalled seven ships: The seven Iwo Jima ships all survived into the 1990s and several saw service in the Gulf War of 1991, where *Tripoli* (LPH 10) was badly damaged by a mine. They are now being paid off at a rate of about one a year, and only two survive in their original role, though *Inchon*, the last of the class, has recently finished an expensive conversion to a Mine Countermeasures Command Control and Support (MCS) ship role.

Name	Builder	Commissioned	Fate
Iwo Jima (LPH 2)	Puget Sound	26 Aug 1961	Decommissioned 1993
Okinawa (LPH 3)	Philadelphia	14 Apr 1962	Decommissioned 1993 following collision
Guadalcanal (LPH 7)	Philadelphia	20 Jul 1963	Decommissioned 1994
Guam (LPH 9)	Philadelphia	16 Jan 1965	Still in service 1996
Tripoli (LPH 10)	Ingalls	6 Aug 1966	Decommissioned 1995
New Orleans (LPH 11)	Philadelphia	16 Nov 1968	Still in service 1996
Inchon (LPH 12)	Ingalls	20 Jun 1970	Converted to MCS 1994-1996

DESIGN

The class served primarily as helicopter carriers, not having the facilities to handle fixed-wing aircraft until the later generations of Harriers, and also having very limited capacity for landing craft. In some quarters, these factors were deemed to make the vessels of limited usefulness; certainly, as the threat of nuclear attack on invading troops failed to materialise, US amphibious forces required other forms of support and transport alongside the helicopter carriers. The replacements for the 'Iwo Jima' class, the 'Wasp' class ships now being delivered, are noticeably more flexible in their potential roles.



New Orleans *(LPH 77) in June 1996, one of two remaining 'Iwo Jima' class LPHs. Note the very high freeboard and the large, folding deck-edge elevator. The object in the bows is not fitted in all ships of the class* (H & L van Ginderen Collection)

MODIFICATIONS

The ships were modified to enable them to handle AV-8B Harriers as well as helicopters. The whole class has been used over many years for airborne minesweeping operations as well as more conventional amphibious roles. All of the class had extensive medical facilities: operating room, X-ray room, hospital ward, isolation ward, laboratory, pharmacy, dental operating room and medical storerooms.

These ships originally carried four twin 3 in/50 Mk 33 mountings, but they have since been removed. They were also equipped at one stage with GMLS Mk 25 Mod 1 octuple launchers carrying up to 16 Sea Sparrow surface-to-air missiles, but these, too, were removed.

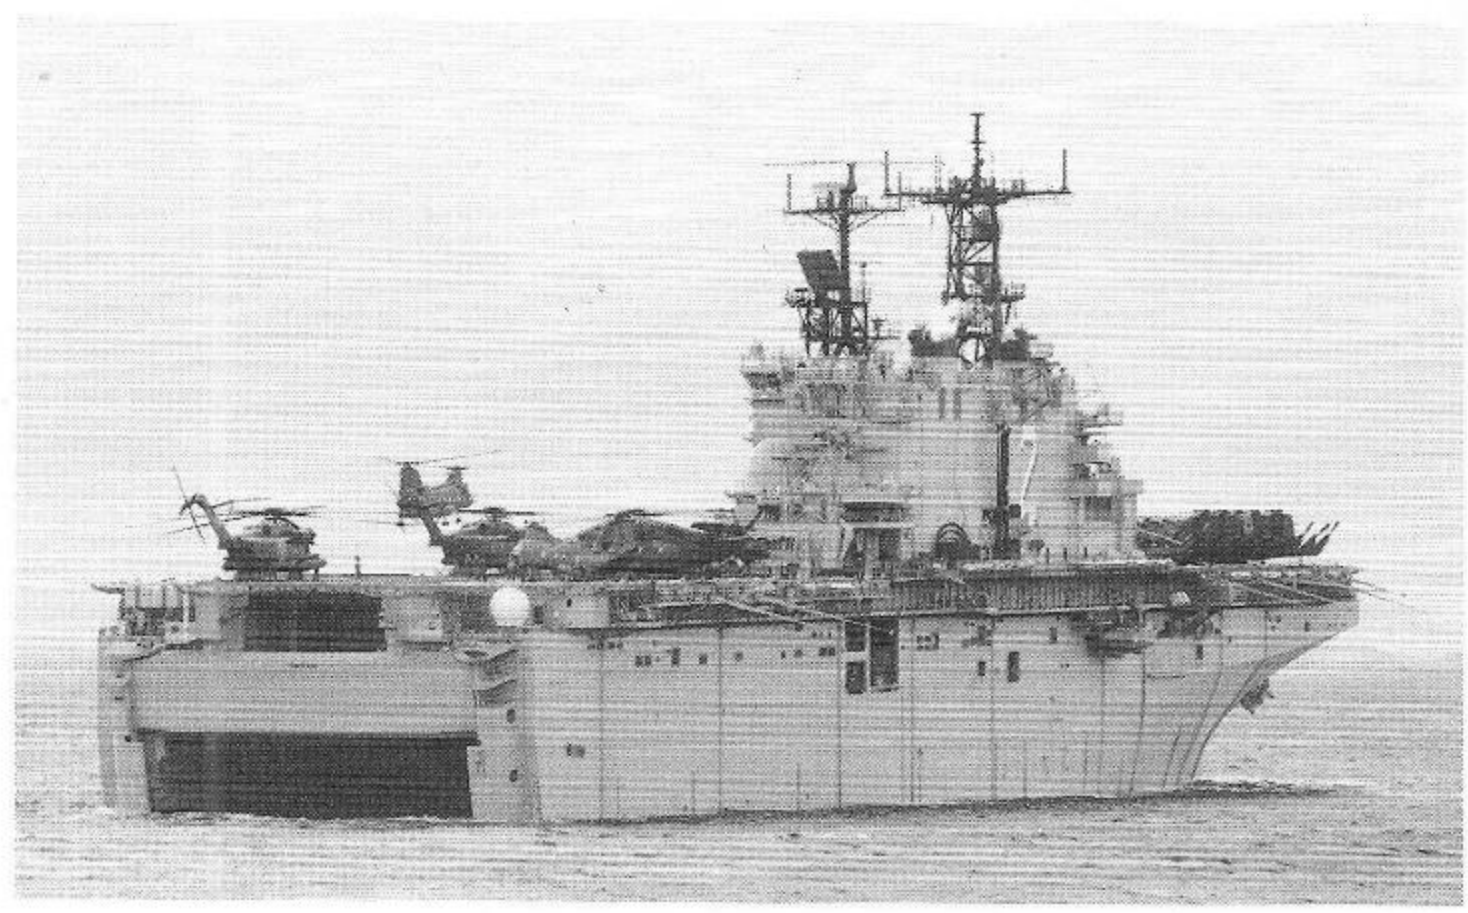
  2 LCU and two LCM 8 or
  17 LCM 6 or 45 LVT tractors or
  1 LCAC
- 4 LCPL on davits

AVIATION FACILITIES

Specifications
Flight deck: 254 × 42 m (834 × 131 ft). Areas occupied by island, centreline elevator and four weapons 'cut-outs' are not available.
Hangar: 81.6 × 23.7 × 6.5 m (268 × 78 × 20 ft)



Saipan *(LHA 2), ballasted down and with vertical-opening stern gate raised to enable landing craft to enter and leave the docking well* (US Navy)

Aircraft:
Maximum either 19 CH-53D Sea Stallion or 26 CH-46 D/E Sea Knight
Typically, nine CH-53D or 12 CH-46 plus six AV-8B Harriers

AMPHIBIOUS FACILITIES

- Docking well 81.6 × 23.7 m (268 × 78 ft).
- Lifting stern gate.
- Elevators
  - Port side; 18.14 tonnes (17.8 tons) (15.24 × 10.4 m (50 × 34 ft)
  - Stern; 36.2 tonnes (35.6 tons) (18.3 × 11.0 m (60 × 35 ft)
- Centreline elevator at after end of flight deck.
- Loading system includes elevators which bring palletised loads from cargo/equipment holds, and 11 monorail cars to distribute to individual landing craft.
- Two after elevators bring loads from holds to the hangar, where they are transferred to transporters and taken via a ramp to the flight deck for loading onto or under helicopters.
- Internal ramps connect vehicle decks to each other and to the docking well area.
- 1,200 tonnes of aviation fuel.

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

In a modernisation programme completed in 1991, the two GMLS Mk 25 Sea Sparrow launchers were removed and replaced by two Vulcan Phalanx CIWSs. Subsequently, RAM launchers were fitted to all of the class between 1993 and 1995.

RIM-116A Block 1 RAM close in system with Mk 49 launchers

There are two 21-cell Mk 49 launchers for the Rolling-Airframe Missile (RAM): one is on the bridge roof offset to port, the other at the after end of the flight deck on the starboard side. RAM is a lightweight, close in, quick reaction, anti-missile defence system, the RIM-116 missile being based on the Sidewinder air-to-air missile, but with significant modifications, enabling it to be used as a fire-and-forget system. There is an infra-red, terminal guidance seeker in the nose (taken from the Stinger man-portable surface-to-air missile), behind which is a new dual-mode passive radio frequency seeker for mid-course guidance. Most of the rear of the missile is based upon Sidewinder components. Missiles are stored in sealed launcher-containers, which are manually loaded into the 21-cell Mk 49 RAM Standard Launchers.

Radar and electro-optical sensors provide details of target location, distance and speed, while the ship's ESM system inputs data on the target's radar frequency, as well as correlating radar data on location. On launch, the missile is spun-up by a rifling band as it is driven down the launch tube, and then as it leaves the launcher the four tail fins deploy which maintains the spin. Aerodynamic control is provided by the two canard surfaces, which also deploy after launch. The autopilot and control system maintain the initial line of sight course towards the target and then the RF seeker is activated and once this acquires the target it takes control of the guidance system and makes the appropriate course alterations. The IR seeker is also activated and when a sufficient signal-to-noise ratio is achieved this takes over guidance control for the terminal phase. The missile is capable of manoeuvres up to 20 *g* in any direction. The system can only be fired automatically at the moment, but manual control will become possible with Block 2 missiles.

Specifications

Mk 49 RAM Standard launcher
Traverse: 360°
Elevation: −25 to +80°
Turning circle: 3.27 m (10.73 ft)

RIM-116 Block 1 missile
Length: 2.79 m (9.15 ft)
Diameter: 12.7 cm (5 in)
Wing span: 43.4 cm (17.1 in)
Weight: 73.6 kg (162.25 lb)
Speed: Mach 2
Range: 5.17 n miles (9.6 km)
Warhead: 9.09 kg (20.0 lb) fragmentation/blast WDU-17B
Motor: Hercules/Aerojet Mk 36 solid propellant rocket

Manufacturer/Contractor

RAM Systems GmbH, D-85521 Riemerling, Germany.

GUNS

Mk 45 Mod 1 single 127 mm (5 in) L/54 gun mounting

There are two United Defense single 127 mm (5 in) Mk 45 Mod 1 mounts, mounted on small platforms cut out of the flight deck at the forward port and starboard corners of the flight deck. The gun fires semi-fixed ammunition with point detonating, proximity (variable time or infra-red), mechanical time and electronically set fuzes. The theoretical rate of fire is 20 rds/min and a gun crew of six is required, all below decks, of which four are ammunition handlers. The Mod 1 incorporates a number of improvements over the Mod 0, including the ability to change the type of ammunition under remote control and electronic fuze setting.

Specifications

Calibre: 127 mm (5 in)
Length of barrel: 54 calibres
Muzzle velocity: 807.72 m/s (2,650 ft/s) (new barrel), 762 m/s (2,500 ft/s) (mid-life)
Crew: 6 (1 mount captain, 1 panel operator, 4 ammunition handlers)
Traverse: 340° at 30°/s
Elevation: −15 to +65° at 20°/s
Range:
anti-ship: 12.39 n miles (23 km)
anti-air: 15,000 m (49,000 ft)
Rate of fire: 16-20 rds/min
Ammunition weight: 31.75 kg (70 lb) (projectile)

Manufacturer/Contractor

United Defense, Armament Systems Division, Minneapolis, Minnesota, USA.

Hughes Mk 15 CIWS Phalanx

There are two Mk 15 CIWS: one is on a platform before the bridge, the other on a small platform cut out of the after port corner of the flight deck. This CIWS was developed to provide fast reaction to submarine-launched anti-ship missiles and operates on a 'closed loop' system, tracking both the target and the stream of rounds, and seeking constantly to reduce the difference between the two. The gun is a six-barrelled 20 mm M61A1 Vulcan with extremely high firing rates.

Specifications

Gun
Calibre: 20 mm
Length of barrel: 53 calibres
Muzzle velocity: 1,030 m/s (3,379 ft/s)
Rate of fire (Block 0): 3,000 rds/min
Range (effective, horizontal): 0.75 n miles (1.47 km)

Mounting
Weight (Block 0): 5.42 t

Manufacturer/Contractor

Hughes Missile Systems, Tucson, Arizona, USA.

25 mm Mk 38 Mod 0 automatic cannon (Sea Snake)

There are six single Mk 88 mountings for Mk 38 Mod 0 25 mm cannon (Sea Snake). The Mk 88 mounting is replacing 20 mm mountings in many US Navy warships and is designed to engage surface and shore targets in low- and mid-intensity operational environments at ranges up to 1.33 n miles (2.5 km). The M-242 is a single barrel, externally powered weapon which incorporates a rotating bolt mechanism driven by a chain drive. The weapon has been designed to allow the barrel to recoil separately from the receiver, which reduces the available travel as the bolt also has to move, the travelling distance being 12.7 mm. The Mk 38 can fire single shots or 175 rds/min and features twin shoulder braces and an optical Aimpoint sight. The barrel life is in excess of 13,000 rounds while the demonstrated reliability of the weapon is 22,000 rounds between stoppages.

Specifications

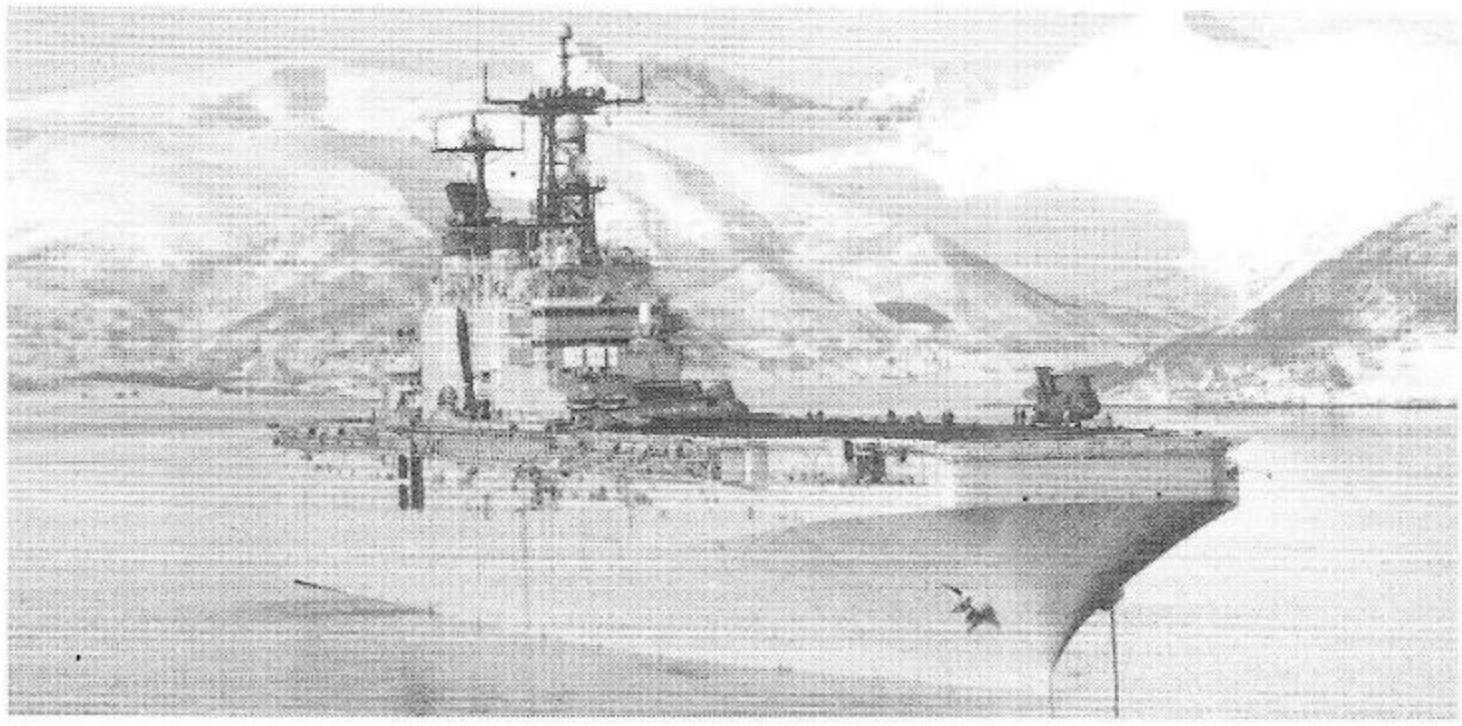
Calibre: 25 mm
Length of barrel: 81 calibres
Muzzle velocity: 1,100 m/s (3,609 ft/s)
Traverse: 300°
Elevation: −20 to +55°
Weight: 596.5 kg (1,315 lb) (loaded)
Crew: 1 (often supported by a spotter)
Range: 1.33 n miles (2.47 km)
Rate of fire: 175 rds/min (max)

Eight 12.7 mm machine guns

The M2HB is a selective short recoil automatic operation weapon using 110-round belts.

Specifications

Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)



Nassau *(LHA 4) anchored in a Norwegian fjord. During the Cold War one of the prime missions of these ships was to transport US Marine Corps units to defend NATO's northern flank from Warsaw Pact attack* (US Navy)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

AN/SLQ-32(V)3

The AN/SLQ-32(V)3 ESM system gives radar warning on B to J-bands and jamming/deception on H to J-bands. The (V)3 system covers Bands 1, 2 and 3. The jammer has a maximum radiated power of 1 MW and is capable of forming 64 beams on either side of the ship, with jamming modes including range gate pull off (RGPO) and azimuth gate pull off (AGPO).

Manufacturer/Contractor

Raytheon, Electromagnetic System Division, Goleta, California, USA.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher

There are four Mk 36 SRBOC launchers firing IR flares and chaff to 2.2 n miles (4 km). The Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) system consists of launcher, launcher control, power supplies, ready service lockers and munitions. The Mk 137 launcher has six 130 mm fixed tubes arranged in parallel rows at angles of 45 and 60°. The firing circuits use electromagnetic induction to initiate the propelling charges in the cartridges. The prime cartridge is the Mk 182 Torch with chaff payload.

Specifications

Launcher dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Launcher weight: 173 kg (381 lb)
Mk 182 cartridge dimensions: 1,209 × 130 mm (47.6 × 5 in)
Cartridge weight: 22.7 kg (50 lb)

AN/SLQ-25 Nixie acoustic torpedo decoy system

The AN/SLQ-25 Nixie is a solid-state, modular design electroacoustic countermeasures decoy system used to protect various classes of ships from acoustic homing torpedoes. It consists of a remote-control unit which can activate, deactivate and monitor (through an oscilloscope) the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming and recovering the towed bodies (which are stored on racks attached to the winch), a coaxial switching unit which selects the appropriate cable or load, and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body and either a deck edge tow chock or two fleet angle compensators (below-deck installations only). Total weight of the system with the RL-272 winch is 2.75 tonnes.

NATO Sea Gnat

NATO Sea Gnat is a long-range chaff/infra-red (IR) decoy launching system for NATO warships and consists of a control unit, a launcher with 130 mm (5 in) tubes and munitions. The control unit provides for the launching of the most effective combination of rounds for distraction and centroid/seduction given the type, speed and direction of the threat, the ship's speed and heading as well as wind direction and speed. There are three types of round:

Mk 214 RF seduction
Mk 216 RF distraction
Mk 218 IR seduction

Manufacturers/Contractors

Thorn EMI/AB Precision Ltd, UK (control unit).
Hunting Engineering, UK (launchers).
Chemring Ltd, UK (munitions).

AN/SLQ-49 chaff buoys

AN/SLQ-49 is the US Navy version of the British 'Replica' system, also known as 'Rubber Duck.' This is a rapidly deployed, passive naval decoy which presents a ship-like image to the radar seeker of an incoming anti-ship missile. The equipment consists of a launcher and a pair of liferaft-type containers, each housing one octahedral-shaped radar reflector. The two reflecting bodies start to inflate as they leave the ship and, once in the water, they are linked to each other by a 5 m (16 ft) line with one of the container lids acting as a sea-anchor to ensure that they remain apart. The distance between the opposite tips of the decoy is approximately 2.5 m (8.2 ft) and it contains metal-coated nylon mesh curtains, which are suspended from aluminium-alloy tubes.

Manufacturer/Contractor

Irvin, Letchworth, UK.

AN/SSQ-95(V) active electronic buoy (AEB)

AN/SSQ-95(V) is a ship- or air-launched expendable buoy operating in I/J-bands (8 to 20 GHz), which is released into the ocean where it operates against hostile radar systems. The system components are a receiver, a travelling wave tube transmitter, deployable transmit/receive antenna, power supplies, a programmable digital processor, a seawater-activated battery and a built-in-test facility. The AN/SSQ-95(V) is provided in a self-contained A-size sonobuoy package with a weight of 17.3 kg (38.14 lb) and dimensions of 914 × 124 mm (36 × 4.9 in). The buoy has a high sea state survivability and is reusable.

Manufacturer/Contractor

Litton Applied Technology, San Jose, California, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Advanced Combat Direction System (ACDS) ACDS Block 0

The Advanced Combat Direction System (NTDS/ACDS) is an enhanced version of the Naval Tactical Data System (NTDS), which interfaces with the Mk 23 TAS. The Block 0 version with two AN/UYK-43B processors was installed in the 'Tarawa' class in 1996 and features software modules similar to those in the original NTDS, with a software package containing a database of approximately 1 million lines of code with an additional dedicated package specific to the host ship. The Block 0 system also features improvements in the Link 11 (TADIL A) interface, interfaces to new weapon and sensor systems as well as the replacement of the Hughes Video Signal Simulator (VSS) by the Republic Electronics AN/USQ-93 Radar Environmental Simulator System (RESS). Like NTDS, ACDS Block 0 provides Link 4A (TADIL C), Link 11 (TADIL A) and Link 14 communications.

Manufacturers/Contractors

Unisys, McLean, Virginia, USA (computers).
Hughes Aircraft Company, Los Angeles, California, USA (displays).
Rockwell International (Collins Avionics/Communications Division), Cedar Rapids, Indiana, USA (communications).

WEAPONS CONTROL

Mk 86 Mod 4 Gun Fire Control System

The Mk 86 GFCS assists in the control of direct and indirect naval gun fire support and also assists in the engagement of both surface and air targets. It has a mainframe architecture using CMS-2 software language and consists of a computer system, a display system and up to three sensors. It also accepts data from ACDS.

Mk 86 Mod 4 uses the AN/UYK-7 32-bit computer with a memory of 256,000 words and speed of 667 Kops, and can track 120 targets. The display system consists of a Control Officer's Console (COC) and two other consoles. The COC is used to energise radars and has a PPI display, data readouts and various controls including a rollerball. With it the operator can acquire and monitor up to four surface targets and assign them to the other consoles.

The primary sensors are the AN/SPQ-9A and AN/SPG-60 fire-control radars for surface and air engagements respectively, as well as a remotely operated electro-optic tracker known as the Remote Optical Sight (ROS) of which there are usually two. Another electro-optical tracker (also designated an ROS) is attached to the AN/SPG-60 antenna mounting. Both radars are subject to improvement.

Peleliu *(LHA 5) in June 1996. This class of five ships incorporated the perceived lessons of the Korean and Vietnam Wars.* Peleliu *was originally named* Da Nang *but was renamed when the North Vietnamese conquered South Vietnam* (H & L van Ginderen Collection)

Notes:
1. TAS Mk 23 was removed when Sea Sparrow was replaced by RAM.
2. Ships have one of these two sets.

ITT Gilfillan AN/SPN-35A
AN/SPN-35A is an aircraft carrier approach radar set that provides precise range, altitude and heading information to guide fixed-wing aircraft and helicopters along the final approach to the carrier deck. Aircraft accepted from the surveillance radar systems are marshalled and controlled by the AN/SPN-35A to a final transition point from which the recovery is made. The AN/SPN-35A antenna is mounted on a gyrostabilised platform that keeps the radar level and accurately aligned to the horizon at all times.

ITT Gilfillan AN/SPN-43B
AN/SPN-43B is part of the US Navy carrier air traffic control centre, its function being to bring aircraft in to the point at which they commence landing. Mounted on top of a stabilised platform that automatically compensates for the pitch and roll of the ship, AN/SPN-43B detects aircraft at distances up to 50 n miles (93 km). It provides tracking data that allows the radar operator to control and direct the aircraft into the final approach area for carrier recovery. Operational frequency is 3.5 to 3.7 GHz, with a peak power output of 850 kW.

Manufacturer/Contractor
ITT Gilfillan, Van Nuys, California, USA.

Lockheed AN/SPG-60
AN/SPG-60 is a monopulse, I-band pulse Doppler tracking radar forming part of the Mk 86 Gun Fire Control System. It is used for acquiring and tracking air targets to ranges of about 60 n miles (111 km), tracking being either automatic or manually aided. The radar's search-to-acquire capability is computer directed, and it accepts two- or three-dimensional target designation co-ordinates in digital or synchro format from either the AN/SPQ-9 radar (also part of the Mk 86 GFCS) or other shipboard search radars and tactical data systems. The antenna is stabilised. Peak output power is given as 5.5 kW.

Acquisition is automatic with the radar performing its programmed scan search pattern about the designated point under computer control. The computer resolves the problems of blind range and range rates inherent in Doppler radars, as well as range ambiguity. The computer also automatically controls and calibrates receiver gain and monopulse channel balance.

Manufacturer/Contractor
Lockheed Martin (Sanders), Nashua, New Hampshire, USA.

Lockheed AN/SPQ-9A
AN/SPQ-9A is a high-resolution, Track-While-Scan (TWS), pulse compression, I-band naval radar. Together with the AN/SPG-60 it forms the main sensor element of the Mk 86 fire-control system and provides detection and tracking facilities within a range of 20 n miles (37 km). The radar antenna provides surface search and air cover up to 610 m (2,000 ft) against low-flying aircraft and tracking helicopters. A separate transmitter/receiver interrogates, receives, and decodes replies from transponders such as the AN/TPN-7, AN/TPN-16, or AN/UPN-32. The surface search antenna is mounted on a stabilised platform and protected by a radome.

AN/SPQ-9A has a high scanning rotation rate, giving a one second data rate. Real-time signal and data processing permit detection, acquisition, and simultaneous tracking of multiple targets. The basic capacity of the complete Mk 86 SPQ-9A system is four targets, and TWS is expandable to more than 100 targets. The radar operates in any one of five selectable frequency ranges, with pulse-to-pulse frequency agility as an additional countermeasure to jamming and natural clutter. This feature also permits a number of radars to operate without mutual interference.

Specifications
Frequency: I-band (8-10 GHz)
Power output: 1.2 kW peak
PRF: 3,000 pps
Scan rate: 60 rpm
Range: 137 m to 37 km

Manufacturer/Contractor
Lockheed Martin (Sanders), Nashua, New Hampshire, USA.

Shafts: 2
Thruster: 1 bow thruster, 670 kW (900 hp)

FURTHER INFORMATION

Ordered during the late 1960s, the 'Tarawa' class is the epitome of the change in thinking on amphibious warfare that took place as a result of the lessons of the Korean War and what appeared at the time to be the lessons of the Indochina War. In the 1950s amphibious planners were concerned with speed — setting a speed of advance of 20 knots for an amphibious task group — and arrival over the beaches of a mass of troops and equipment. The outcome was these very large ships designed very much for helicopters, but still retaining most of the more traditional amphibious ship attributes. One major exception, of course, is that the 'Tarawa' class totally lacks any ability to land troops and equipment directly onto the beach.

Thus, there is a very large flight deck, combined with a large docking well, which can handle landing craft up to LCU size, and a complex, automated cargo-handling system of conveyors and elevators. In addition, some of the available space is devoted to extensive command and control facilities. Finally, the problem of keeping the troops occupied and fit during lengthy transits or standoffs is addressed by the provision of training and acclimatisation facilities.

There were originally intended to be nine ships in this class, but only five were ever built. At one time, there were moves to convert one into a light carrier, but these came to naught. By the mid-1980s, amphibious warfare policy was becoming a little clearer, and the Tarawa programme was halted in favour of the slightly bigger, more up-to-date 'Wasp' class. These ships will remain, however, an essential part of the US Navy's amphibious fleet for the first decade of the 21st century, and if there is any slippage in the LPD 17 programme, then the oldest of the class is likely to see its 40th birthday still in service.

DESIGN

The large size of these ships is a result of the need to accommodate both a hangar for the helicopters and a docking well for the landing craft. Both are the same size, being 81.6 m (268 ft) long and 23.7 m (78 ft) wide, with hangar, which is directly above the docking well, having 6.5 m (20 ft) overhead clearance to enable it to accommodate the largest helicopters.

The docking well accommodates up to four LCUs, each of which can carry three main battle tanks (M60 or M1) or 150 tonnes of cargo. Two LCM 6 are stowed on the flight deck immediately aft of the island and are handled by a large crane.

Some 200 vehicles can be embarked. The large island accommodates three command organisations together with the appropriate staffs and command, control and communications (C^3) facilities. These comprise the ship's own command organisation, the Commander Amphibious Task Group and the Commander Landing Force.

Launched Jan 1999
Commissioned May 2000

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops: 1,870
- Cargo capacity: 2,862 m³ (101,000 cu ft) total
- Vehicle stowage: 566 m³ (20,000 cu ft) to accommodate vehicles. Typical vehicle load:
  5 M1 tanks
  25 light armoured vehicles
  8 M198 guns
  68 trucks
  10 logistics vehicles

SHIP-SHORE LIFT

- Docking well
  12 LCM 6s or
  3 LCACs
- 4 LCPL on davits

AMPHIBIOUS FACILITIES

- Docking well 81.4 × 15.2 m (267 × 50 ft)
- Cargo handling: Six 3.66 × 7.62 m (12 × 25 ft) elevators move cargo from holds. Pallets then transferred to nine 9.75 m (32 ft) monorail trains which carry 2,721 kg (6,000 lb) each and deliver materials to the well deck at 183 m/min (6.8 mph).
- Aviation fuel: 1,232 tonnes
- Hospital facilities:
  6 fully equipped operating theatres
  4 dental surgeries
  hospital wards with 600 beds

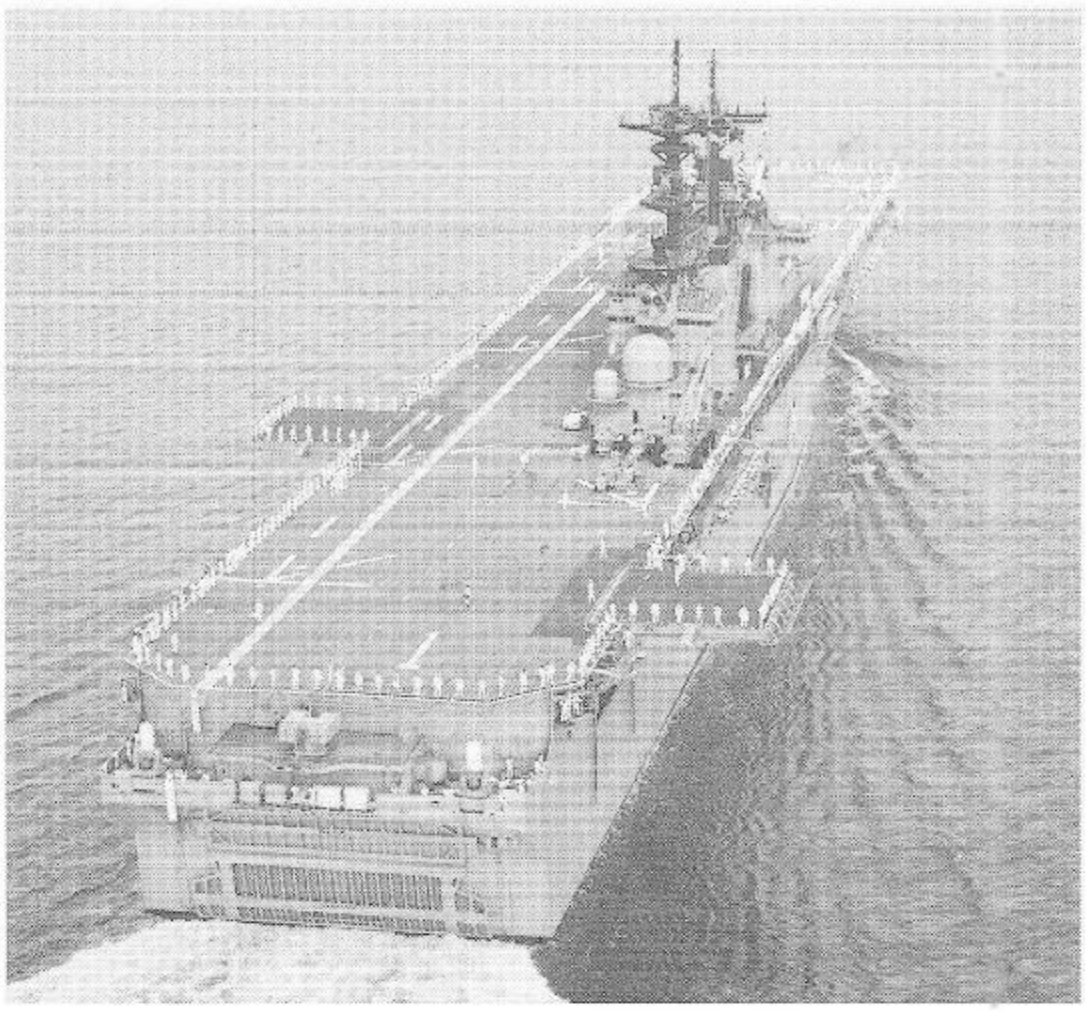
WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

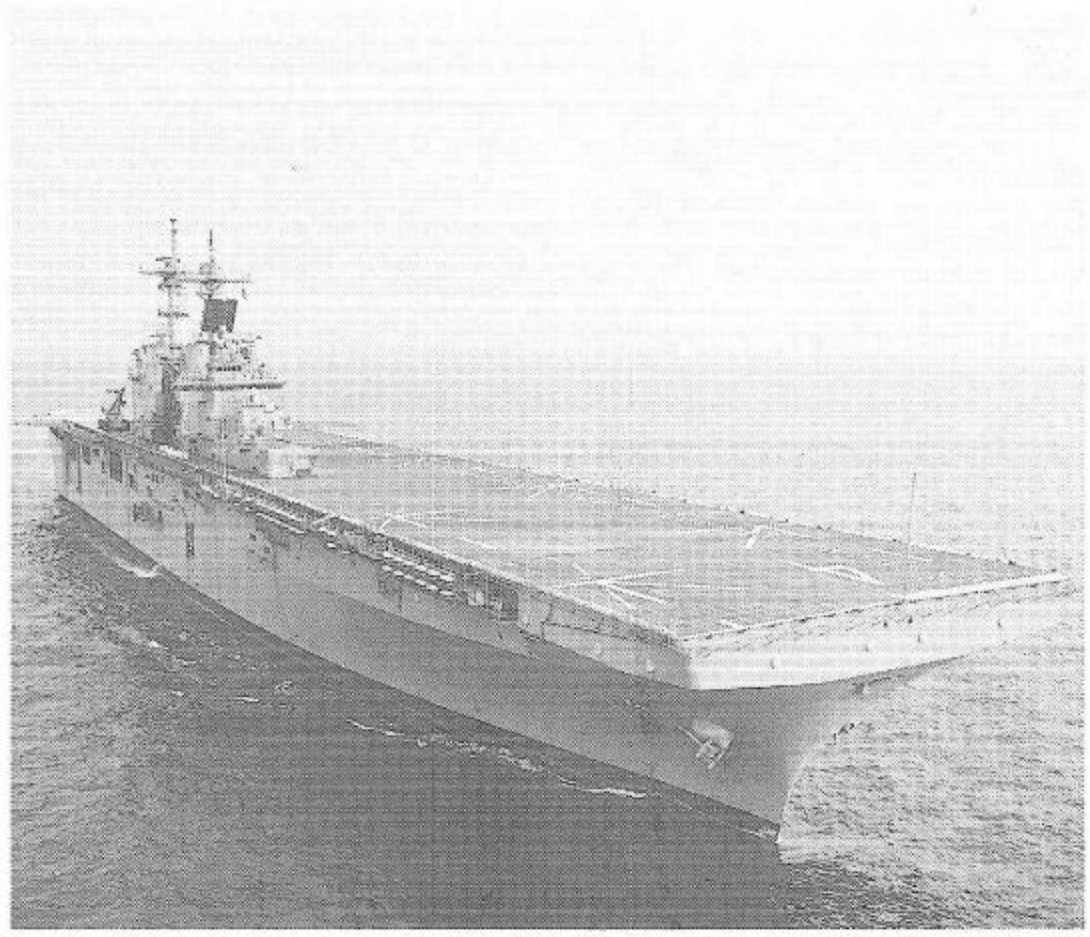
Raytheon Sea Sparrow point-defence missile system

Two GMLS Mk 29 octuple launchers are installed: one is on a small platform before the island, the other centrally on the transom, just below the edge of the flight deck. Each magazine contains 16 RIM-7 Sea Sparrow missiles. The system is fully automatic from target acquisition to interception. The Sea Sparrow missile, although based upon the air-to-air Sparrow, has been enhanced for launching from ships, and has a 38.6 kg (85 lb) blast fragmentation warhead and a dual-purpose proximity impact fuze.

Specifications
Missile (RIM-7P/R)
Length: 3.66 m (12.0 ft)
Diameter: 0.20 m (0.65 ft)
Wing span: 1.02 m (3.35 ft)
Weight: 231.5 kg (510.4 lb)
Speed: Mach 1



A stern shot of Wasp *(LHD 1) shows the after end in more detail. Note the two Mk 15 CIWS and the eight-cell launcher for Sea Sparrow SAM on the transom platform, below which is the full-width stern gate* (US Navy)



Boxer *(LHD 4), fourth in a class of seven LHDs being built for the US Navy. These are the largest amphibious warfare ships ever built and are virtually the same size as the new French nuclear carrier,* Charles de Gaulle. *Note that, in comparison with the 'Tarawa' class, there are no 'cut-outs' in the bows to accommodate weapons in order to maximise flight deck area* (Ingalls)

Range: 8 n miles (14.5 km)
Guidance: Semi-active radar

Launcher (Mk 29)
Training limits: 360°
Elevation limits: −5 to +85°
Firing rate: 3 missiles/min

Manufacturer/Contractor
Raytheon Company Equipment Division.

GUNS

Hughes Mk 15 CIWS Phalanx
There are three Mk 15 CIWS: two are on the sponson at the stern, the third immediately forward of the bridge.

This CIWS was developed to provide fast reaction to submarine-launched anti-ship missiles and operates on a 'closed loop' system, tracking both the target and the stream of rounds, and seeking constantly to reduce the difference between the two. The gun is a six-barrelled 20 mm M61A1 Vulcan with extremely high firing rates.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 53 calibres
Muzzle velocity: 1,030 m/s (3,379 ft/s)
Rate of fire (Block 0): 3,000 rds/min
Range (effective, horizontal): 0.75 n miles (1.47 km)

Mounting
Weight (Block 0): 5.42 t
Traverse: 310°
Elevation: −25 to +85°
Training speed: 126°/s
Elevation speed: 92°/s

12.7 mm machine guns
Eight M2HB machine guns are carried. This is a selective short recoil automatic operation air-cooled weapon with a 1,143 mm long barrel using 110-round belts.

Specifications
Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

ELECTRONIC WARFARE SYSTEMS

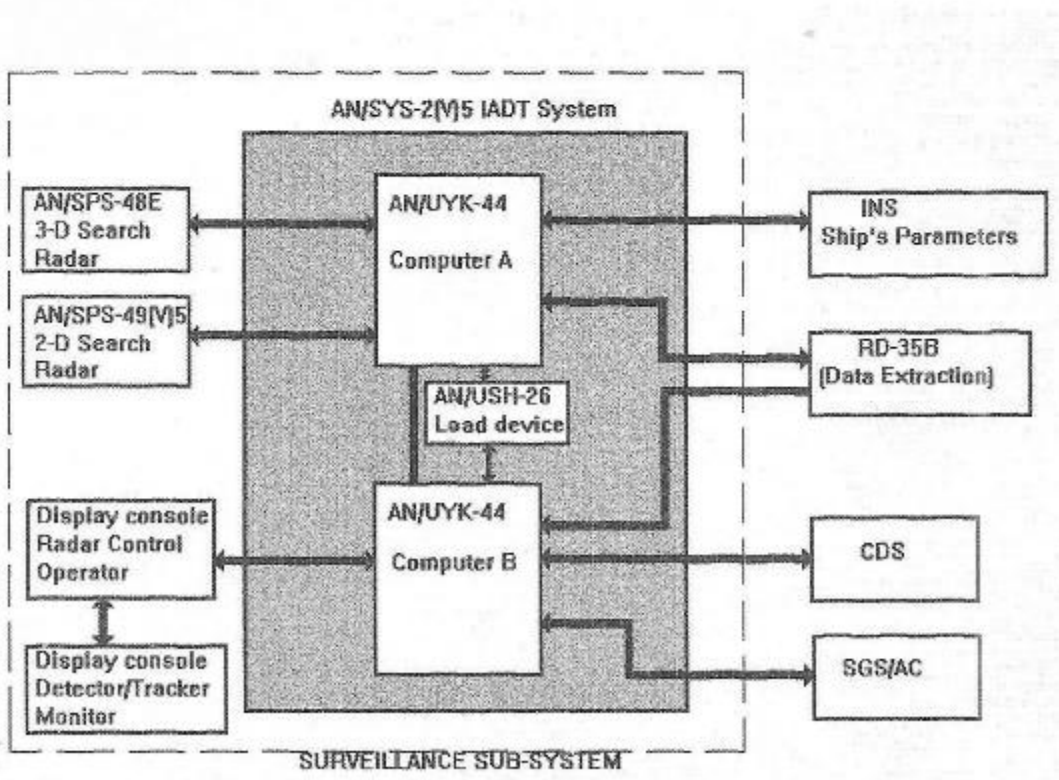
ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

Raytheon AN/SLQ-32(V)3
The AN/SLQ-32(V)3 ESM system gives radar warning on B to J-bands and jamming/deception on H to J-bands. The (V)3 system covers Bands 1, 2 and 3. The jammer has a maximum radiated power of 1 MW and is capable of forming 64 beams on either side of the ship, with jamming modes including range gate pull off (RGPO) and azimuth gate pull off (AGPO).

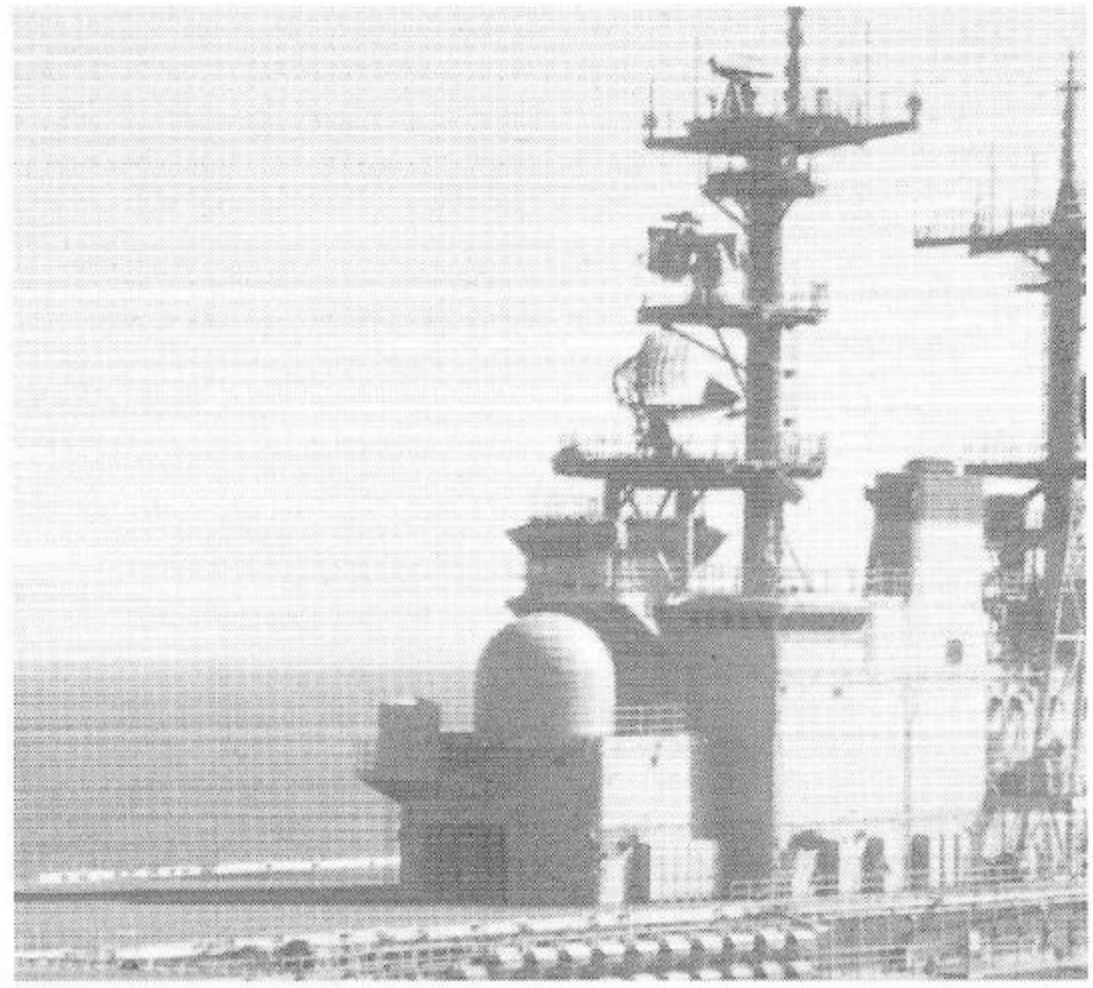
Manufacturer/Contractor
Raytheon, Electromagnetic System Division, Goleta, California, USA.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher
There are four Mk 36 SRBOC launchers firing IR flares and chaff to 2.2 n miles (4 km). The Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) system consists of launcher, launcher control, power supplies,



AN/SYS-2(V)5 IADT system



AN/SPN-35A is based in the large radome at the after end of the superstructure (Ingalls)

ready service lockers and munitions. The Mk 137 launcher has six 130 mm fixed tubes arranged in parallel rows at angles of 45 and 60°. The firing circuits use electromagnetic induction to initiate the propelling charges in the cartridges. The prime cartridge is the Mk 182 Torch with chaff payload.

Specifications
Launcher dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Launcher weight: 173 kg (381 lb)
Mk 182 cartridge dimensions: 1,209 × 130 mm (47.6 × 5 in)
Cartridge weight: 22.7 kg (50 lb)
Four Loral Hycor SRBOC six-barrelled fixed Mk 36; infra-red flares and chaff to 2.2 n miles (4 km)

Manufacturer/Contractor
Loral Hycor, USA.

AN/SLQ-25 Nixie acoustic torpedo decoy system

The AN/SLQ-25 Nixie is a solid-state, modular design electroacoustic countermeasures decoy system used to protect various classes of ships from acoustic homing torpedoes. It consists of a remote-control unit which can activate, deactivate and monitor (through an oscilloscope) the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming and recovering the towed bodies (which are stored on racks attached to the winch), a coaxial switching unit which selects the appropriate cable or load, and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body and either a deck edge tow chock or two fleet angle compensators (below-deck installations only). Total weight of the system with the RL-272 winch is 2.75 tonnes.

NATO Sea Gnat

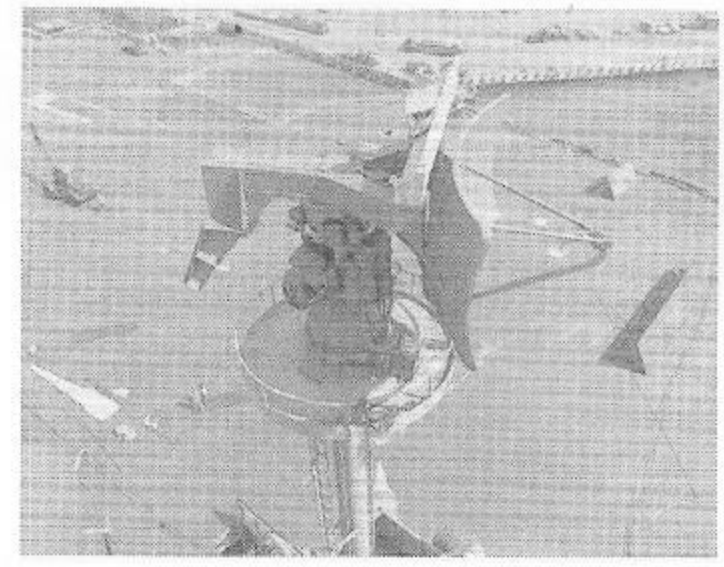
NATO Sea Gnat is a long-range chaff/infra-red (IR) decoy launching system for NATO warships and consists of a control unit, a launcher with 130 mm (5 in) tubes and munitions. The control unit provides for the launching of the most effective combination of rounds for distraction and centroid/seduction given the type, speed and direction of the threat, the ship's speed and heading as well as wind direction and speed. There are three types of round:

Mk 214 RF seduction
Mk 216 RF distraction
Mk 218 IR seduction

Manufacturers/Contractors
Thorn EMI/AB Precision Ltd, UK (control unit).
Hunting Engineering, UK (launchers).
Chemring Ltd, UK (munitions).

AN/SLQ-49 chaff buoys

AN/SLQ-49 is the US Navy version of the British 'Replica' system, also known as 'Rubber Duck.' This is a rapidly deployed, passive naval decoy which presents a ship-like image to the radar seeker of an incoming anti-ship missile. The equipment consists of a launcher and a pair of liferaft-type containers, each housing one octahedral-shaped radar reflector. The two reflecting bodies start to inflate as they leave the ship and, once in the water, they are linked to each other by a 5 m (16 ft) line with one of the container lids acting as a sea-anchor to ensure that they remain apart. The distance between the opposite tips of the decoy is approximately 2.5 m (8.2 ft) and it contains metal-coated nylon mesh curtains, which are suspended from aluminium-alloy tubes.



The antenna for AN/SPN-43 carrier control approach radar

Manufacturer/Contractor
Irvin, Letchworth, UK.

AN/SSQ-95(V) active electronic buoy (AEB)

AN/SSQ-95(V) is a ship- or air-launched expendable buoy operating in I/J-bands (8 to 20 GHz), which is released into the ocean where it operates against hostile radar systems. The system components are a receiver, a travelling wave tube transmitter, deployable transmit/receive antenna, power supplies, a programmable digital processor, a seawater-activated battery and a built-in-test facility. The AN/SSQ-95(V) is provided in a self-contained A-size sonobuoy package with a weight of 17.3 kg (38.14 lb) and dimensions of 914 × 124 mm (36 × 4.9 in). The buoy has a high sea state survivability, and is reusable.

Manufacturer/Contractor
Litton Applied Technology, San Jose, California, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Advanced Combat Direction System (ACDS) Block 0

All ships less *Wasp* (LHD 1). The Advanced Combat Direction System (ACDS), an enhanced version of the Naval Tactical Data System (NTDS) was installed in these ships in 1996/97. ACDS is a tactical data handling and target designation system which interfaces with the Mk 23 TAS. The Block 0 version with two AN/UYK-43B processors (which was also installed in the 'Tarawa' class in 1996) features software modules similar to those in the original NTDS, with a software package containing a database of approximately 1 million lines of code with an additional dedicated package specific to the host ship. The Block 0 system also features improvements in the Link 11 (TADIL A) interface, interfaces to new weapon and sensor systems as well as the replacement of the Hughes Video Signal Simulator (VSS) by the Republic Electronics AN/USQ-93 Radar Environmental Simulator System (RESS). Like NTDS, ACDS Block 0 provides Link 4A (TADIL C), Link 11 (TADIL A) and Link 14 communications.

Manufacturers/Contractors
Unisys, McLean, Virginia, USA (computers).
Hughes Aircraft Company, Los Angeles, California, USA (displays).
Rockwell International (Collins Avionics/Communications Division), Cedar Rapids, Indiana, USA (communications).

ACDS Block 1 Level 2

***Wasp* (LHD 1) only.** One ship in the class is fitted with ACDS Block 1 Level 2, having received this more advanced system as part of a demonstrator programme. ACDS Block 1, introduces Link 16, increases track capacity significantly and has automatic identification and decision aids, while featuring new command, communications, control and information interfaces. A Level 0 engineering demonstrator was installed in USS *Constellation* (CV 64) in January 1994 and completed tests in the Summer of 1994. ACDS Block 1 Level 1 software was initially tested in USS *Constellation* and by the Spring of 1995 was at an advanced stage of development. The Level 2 software was under development in 1995 and was scheduled to support Co-operative Engagement Capability (CEC) in USS *Dwight D Eisenhower* (CVN 69) and 'Wasp' (LHD 1) class amphibious assault ships from June 1996. Plans for an ACDS Block 2 have been abandoned.

In ACDS Block 1, initially designed for aircraft carriers or 'Wasp' (LHD 1) class amphibious assault ships, the system will receive sensor data from radars/IFF, the Mk 23 TAS, the AN/SLQ-32 electronic warfare suite, the navigation system and anti-submarine warfare module (in aircraft carriers). It has two UYK-43 and one TAC-3 nodes. A Link 16 interface is added to help identify not only ship classes but also individual ships and submarines by collating historical tracking data. A third UYK-43B is added as the Command and Control processor (C2P) with the USQ-69 display system. The C2P will receive data through Links 4A, 11 and 16. The ACDS will also receive external data through the Joint Maritime Command Information System (JMCIS), formerly known as the Naval Tactical Command System-Afloat (NTCS-A) using the TAC-3 workstation.

Block 1 Level 1 augments combat direction system processing. This will provide the basis of systems which *may be extended to eight tightly coupled and 248* loosely coupled computer nodes. There will be a two-way open architecture interface to JMCIS with automatic electronic warfare correlation. The Block 1 Level 2 system adds amphibious modes to the capability and will feature AN/UYQ-70 workstations and X-Windows software. The Block 1 Level 3 system will rehost processing to COTS processors and will feature improved software capabilities including enhanced X-Windows. This will be the first system capable of interacting with SSDS.

WEAPONS CONTROL

Mk 91 Missile Fire-Control System

Two Mk 91 MFCS. The Mk 91 is a fully or semi-automatic system for the Sea Sparrow system, covering the entire engagement from target acquisition to interception, with either one (Mod 2) or two (Mod 3) fire-control radar sets (Mk 95). The Mk 91 fire-control system is a mainframe system using an NFT (Norsk Forsvarsteknologi) Mk 157 digital computer with integral system evaluation and trainer (SEAT). The computer performs all the necessary calculations, stores data and is responsible for data distribution. The tracker-illuminator consists of a Mk 78 radar director with separate transmitting and receiving antennas, a director controller (Mk 106) and a low-light TV camera (Mk 6) with 2.4 × 2.4 and 10 × 10 fields of view. The Mk 78 director weighs 1.56 tonnes while the below-decks equipment weighs 4.14 tonnes (single director system) or 7.19 tonnes (double director system). The radar is believed to operate in the I-band and directs the missile to fly a lead angle course to the intercept point which allows Sea Sparrow-equipped ships not only to protect themselves but also other vessels in the immediate *vicinity*.

The signal data converter acts as the interface between the computer and its peripheral equipment. Signals received through the tracker's receive antenna are processed by the signal data processor which provides data on the target's location and course. This data is monitored at the Mk 83 radar console while the firing officer's Mk 86 console is used to monitor and control the engagement.

Because of its I-band frequency the Mk 91 will detect sea-skimming missiles sooner than lower-frequency search radars. Thus the system can be fully autonomous conducting search, detection and engagement automatically. It can also accept outside designations from radar, EW or optic sources. Radar data from the director is then processed in the signal data processor to provide range and angle tracking data.

This data is passed to the firing officer's console from where prelaunch data and firing commands are relayed to the Mk 29 trainable launcher and missile. The launcher then trains in azimuth to the intercept point

and in superelevation to optimum angle to maximise missile kinetic energy. If the correct azimuth is blocked by the ship's superstructure, the launcher trains to the nearest clear azimuth and the missile is commanded to 'fly around the corner' to the direct path to the intercept. The missile upon launch flies a proportional navigation path (lead angle intercept) directly to intercept point in a lofted trajectory to maximise energy and minimise image effects.

Manufacturer/Contractor
Raytheon Company Equipment Division, USA.

SYS-2(V)3 IADT
SYS-2 increases the number of air and surface targets which may be detected and tracked by radar in all types of electronic environments. The system accepts contacts from each radar, seeks potential targets, correlates the data by comparing all the sensors' returns and then produces a single file of valid tracks while avoiding duplication. The data are then fed to the ship's command and weapon control systems.

Each system consists of two 16-bit Paramax computers (AN/UYK-20 or AN/UYK-44) and two display consoles. In later systems 32-bit digital microprocessors are added to improve sensor data fusion. The SYS-1 system uses either the AN/UYK-20 or AN/UYK-20A while SYS-2 uses the AN/UYK-44 which is capable of 900 Kops. Supplementary processors are the Motorola 68020, the INMOS Transputer (801/5) and the Intel i860 RISC. The UYK-20 and UYK-44 use Ultra-16 Assembly language and Ada is planned for SYS-2. The transputer uses OCCAM software language.

In most systems one computer is used to interface with the sensors and the inertial navigation system while the other supports the display consoles and interfaces with the combat direction system, and fire/weapon control systems. In SYS-2 the two computers are linked by an AN/USH-26 signal data recorder/reproducer.

Wasp (LHD-1) has the (V)3 system with SPS-49/52 air search radars while the remainder of class has the (V)5 system and SPS-48/49 air search radars.

ITT Gilfillan AN/SPN-35A
AN/SPN-35A is an aircraft carrier approach radar set that provides precise range, altitude and heading information to guide fixed-wing aircraft and helicopters along the final approach to the carrier deck. Aircraft accepted from the surveillance radar systems are marshalled and controlled by the AN/SPN-35A to a final transition point from which the recovery is made. The AN/SPN-35A antenna is mounted on a gyrostabilised platform that keeps the radar level and accurately aligned to the horizon at all times.

ITT Gilfillan AN/SPN-43B
AN/SPN-43B is part of the US Navy carrier air traffic control centre, its function being to bring aircraft in to the point at which they commence landing. Mounted on top of a stabilised platform that automatically compensates for the pitch and roll of the ship, AN/SPN-43B detects aircraft at distances up to 50 n miles (93 km). It provides tracking data that allows the radar operator to control and transition the aircraft into the final approach area for carrier recovery. Operational frequency is 3.5 to 3.7 GHz, with a peak power output of 850 kW.

Manufacturer/Contractor
ITT Gilfillan, Van Nuys, California, USA.

Textron AN/SPN-46(V)
AN/SPN-46(V) will be installed soon in all these ships. AN/SPN-46(V) was developed in the early 1980s for simultaneous and automatic control of two aircraft during final approach and landing. The system is a precision dual-band automatic acquisition/tracking radar and aircraft skin tracking with Mode I, II and III operational capabilities. There are four groups of equipment: the radar/ship motion sensor subsystem, the central computer, the display, and ancillary equipment. Designed primarily as a navigation aid for use during CASE III recovery periods, the system offers three modes of operation. Mode I is a closed-loop hands-off automatic landing mode, Mode II is an instrument landing system approach where position data is presented on the aircraft display, and Mode III which is a carrier-controlled talk-down approach.

Specifications
Frequencies: K-band (33.2 ±0.2 GHz); I-band (9,310 ±35 MHz)
Peak power: 50 kW
Pulsewidth: 0.2 µs
PRF: 2,000 pps
Automatic search: 1° elevation; 25° azimuth; 366 m (12,001 ft) range
Scan rate: 12 scans/min
Radar coverage: ±150° azimuth; +30 to −15° elevation

Manufacturer/Contractor
Textron Defense Systems, Wilmington, Massachusetts, USA.

Mk 95
There are two Mk 95 tracker-illuminators, which are part of the Mk 91 MFCS. The Mk 95 tracker-illuminator consists of a Mk 78 radar director with separate transmitting and receiving antennas, a director controller (Mk 106) and a low-light TV camera (Mk 6) with 2.4 × 2.4° and 10 × 10° fields of view. The I-band radar directs the missile to fly a lead angle course to the intercept point allowing Sea Sparrow-equipped ships to protect both themselves and other ships in company.

AVIATION

AVIATION FACILITIES

Specifications
Flight deck: 249.6 × 32.3 m (819 × 106 ft). Nine helicopter landing spots. Flight deck is covered with HY100 steel.
Hangar: 98 × 26 × 6.4 m (322 × 85 × 21 ft)
Elevators: 2—15.24 × 13.7 m (50 × 45 ft) deck-edge aircraft elevators, one to starboard and aft of the island superstructure, and one to port amidships. Both fold for Panama Canal transits. Weight limit 34,020 kg (75,000 lb).
Aircraft:
30 CH-46E Sea Knight helicopters, plus 6-8 AV-8B Harrier II

20 AV-8B Harrier II plus 4-6 SH-60B Seahawk in secondary role.

Can also support AH-1W SuperCobra, CH-53E Super Stallion, CH-53D Sea Stallion, UH-1N Twin Huey, AH-1T Sea Cobra and SH-60B Seahawk helicopters.

PROPULSION

Specifications
System: Steam-turbines
Main machinery: 2 Combustion Engineering boilers, 42.3 kg/cm² (600 psi), 482°C; 2 Westinghouse turbines, 52.2 MW (70,000 hp)

Shafts: 2
Auxiliary power: 16,500 kW

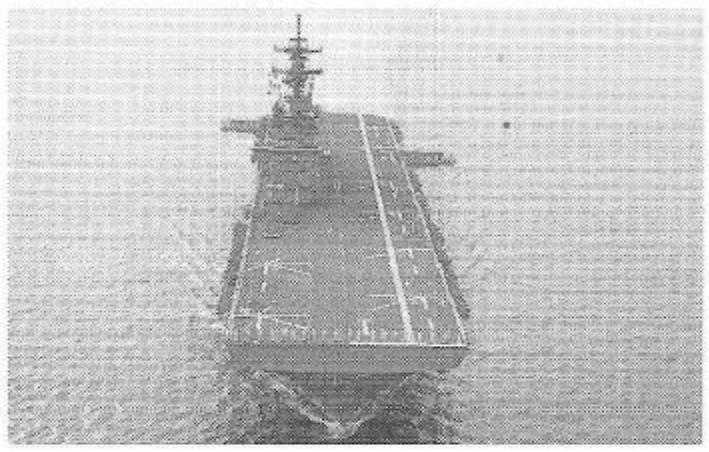
FURTHER INFORMATION

PROGRAMME

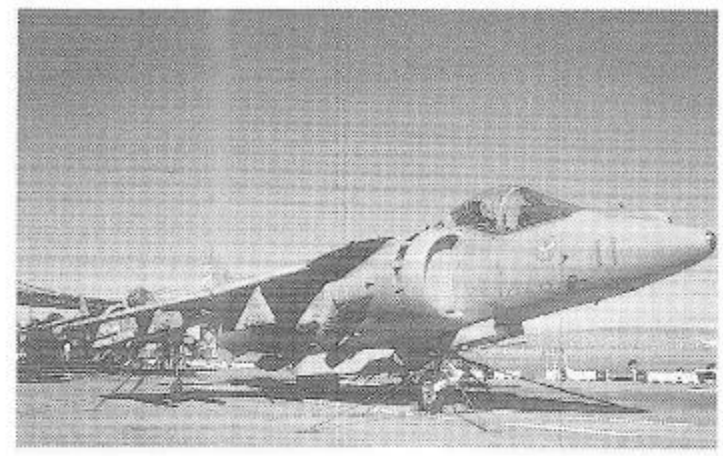
The 'Wasp' class has suffered from the vacillations which seem to have become an inseparable part of US defence planning, with the result that 15 years after the development contract, there are still only four ships in service, with a further three in varying stages of construction. The currently planned total of seven ships is, however, larger than seemed likely at some stages in the past.

DESIGN

A basic factor in the design is that the ship has two roles. The first is to serve as an amphibious landing ship, but the second is to serve as a Sea Control Ship, with an air wing consisting of 20 AV-8B Harrier II and six SH-60B Seahawk ASW helicopters.



An aerial picture of Wasp *(LHD 1) shows that the flight deck is rectangular in shape, with the two deck-edge elevators well clear and only the 'island' taking up space which would otherwise be allocated to flying operations* (US Navy)



AV-8B Harrier aboard Boxer *(LHD 4)*

The design is a slightly larger version of the 'Tarawa' class LHA, retaining the advantages of the earlier design but with a number of new ideas, including enhanced survivability.

Thus, most of the command and communications facilities have been moved from the island down into the hull in order to enhance their survivability, while also enabling the superstructure to be lowered by two deck levels and reducing the area it occupies on the flight deck. In addition, the flight deck surface is constructed from HY100 steel, the same as that used for the pressure hulls of nuclear submarines.

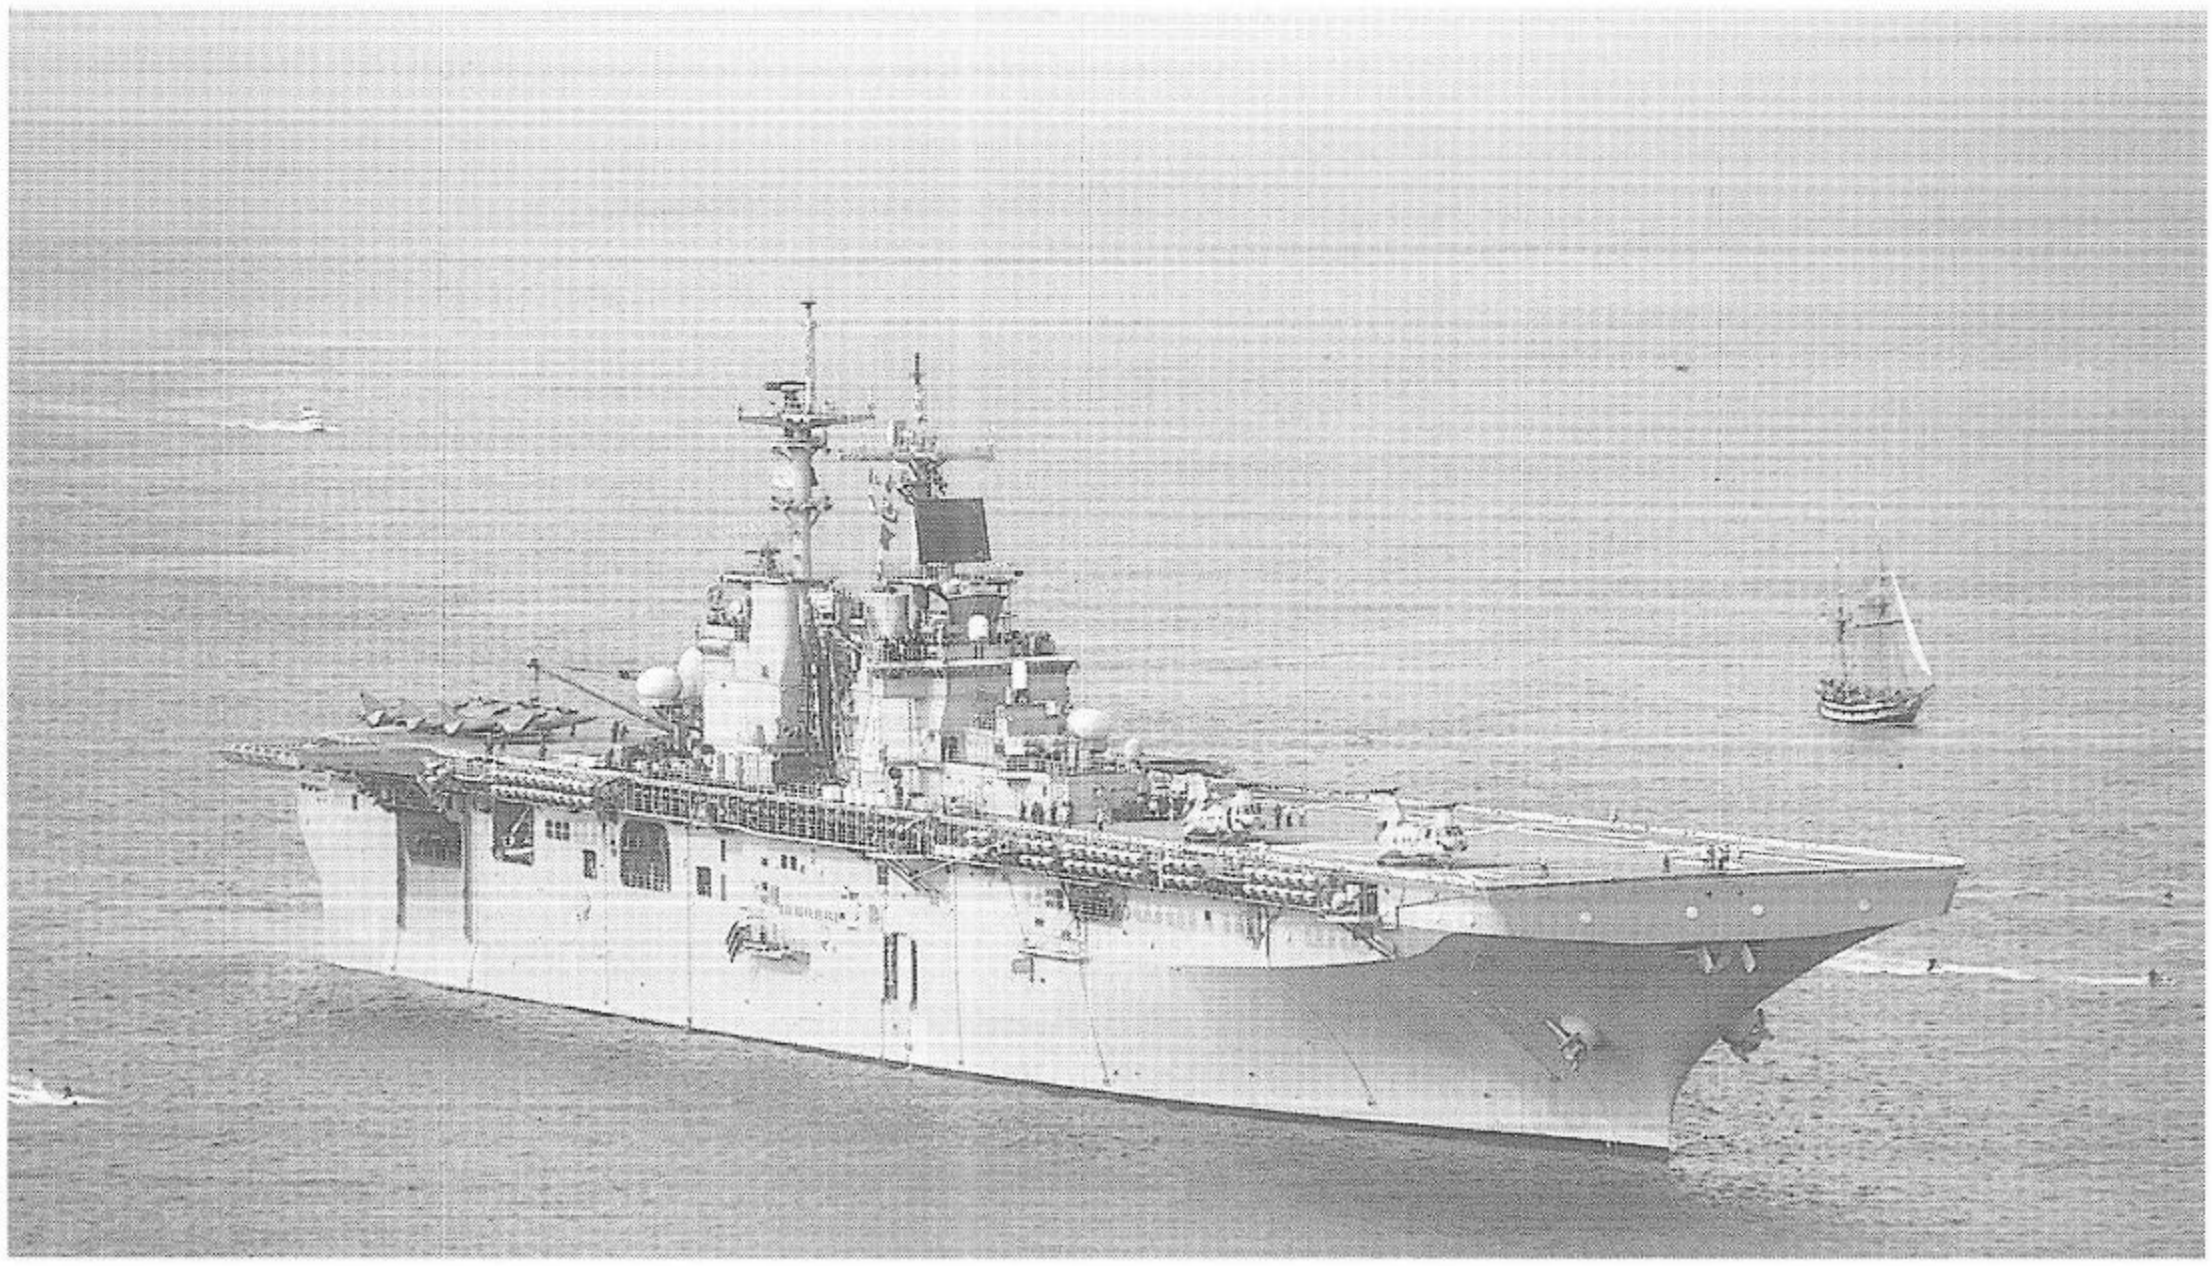
There is a large bulb at the foot of the stem to enhance sea-keeping, which was planned at one point to be installed in the 'Tarawa' class, but was cancelled due to lack of funding. The stern gate design has also been changed from the rising type in the Tarawa to a more conventional lower hinged type as in the LPDs.

Major efforts have been made to maximise the area of flight deck available for aircraft use. Thus, the footprint of the island has been reduced and both deck-edge elevators are completely clear of the flight deck. In the 'Tarawa' class the stern elevator, which is inset into the after end of the flight deck has an effect on

Boxer *(LHD 4) showing the flight deck, deck-edge lifts and five AV-8B Harriers*

operations out of proportion to its actual size. In addition, the weapons which occupied 'cut-outs' in the four corners of the Tarawa flight deck have been moved (and the 127 mm guns deleted), enabling the areas to be restored to flying operations. Consideration was given to installing a ski jump to enhance the payload capability of the AV-8B Harrier II, but this was rejected as it would have reduced the number of helicopter 'spots.'

Somewhat surprisingly, these ships are powered by steam turbines. Consideration was given to powering at least the later units by gas-turbines, but this has been rejected, again on cost grounds.



Boxer *(LHD 4) in October 1996. Aft are three AV-8B Harrier IIs which is one of the types the 'Wasp' class was designed to operate. Consideration was given to installing a ski jump, but it was rejected on the grounds it would reduce the number of helicopter landing spots* (H & L van Ginderen Collection)

GENERAL SPECIFICATIONS

Operator: USA
Type: LPD 17 Amphibious Transport Docks (LPD)

Class: SAN ANTONIO

Active: 0
Proposed: 12

Displacement:
full load: 25,300 tonnes

Dimensions
Length: 208.4 m (683.7 ft) (oa); 200 m (656 ft) (pp)
Beam: 31.9 m (104.7 ft)
Draught: 7 m (23 ft)

Speed: 22 kts (sustained)

Complement: 493, including 34 officers

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- Troops
- 2,323 m² (25,000 sq ft) of deck space for vehicles
- 708 m³ (25,000 cu ft) of cargo space below decks

SHIP-SHORE LIFT

- Two LCACs

AVIATION FACILITIES

Specifications
Flight deck: Landing for 2 CH-53E or 4 AH/UH-1s or 4 CH-46, or 2 MV-22.
Hangar: Full facilities for 1 CH-53E Sea Stallion, or 2 CH-46 Sea Knight, or 1 V-22 Osprey, or 3 UH/AH-1s

	Ship's crew	Marines (normal)	Totals (normal)	Surge	Maximum
Officers	34	66	100	10	110
CPO/SNCO	30	41	71	6	77

TOTALS	**493**	**704**	**1,197**	**91**	**1,288**

AMPHIBIOUS FACILITIES

- Three vehicle decks, 2,323 m² (25,000 sq ft)
- Two cargo/ammunition magazines, 708 m³ (25,000 cu ft)
- Cargo fuel, JP-5, 1,190 m³ (42,000 cu ft)
- Cargo fuel, MOGAS, 38 m³ (1,342 cu ft)
- No beaching capability
- No heavy over-the-side lift capability
- Well deck and stern gate arrangements similar to 'Wasp' class
- Crane for support of boat operations
- Hospital facilities
  Four operating theatres (two medical, two dental)
  24 bed ward
  100 casualty overflow beds

WEAPONS SYSTEMS

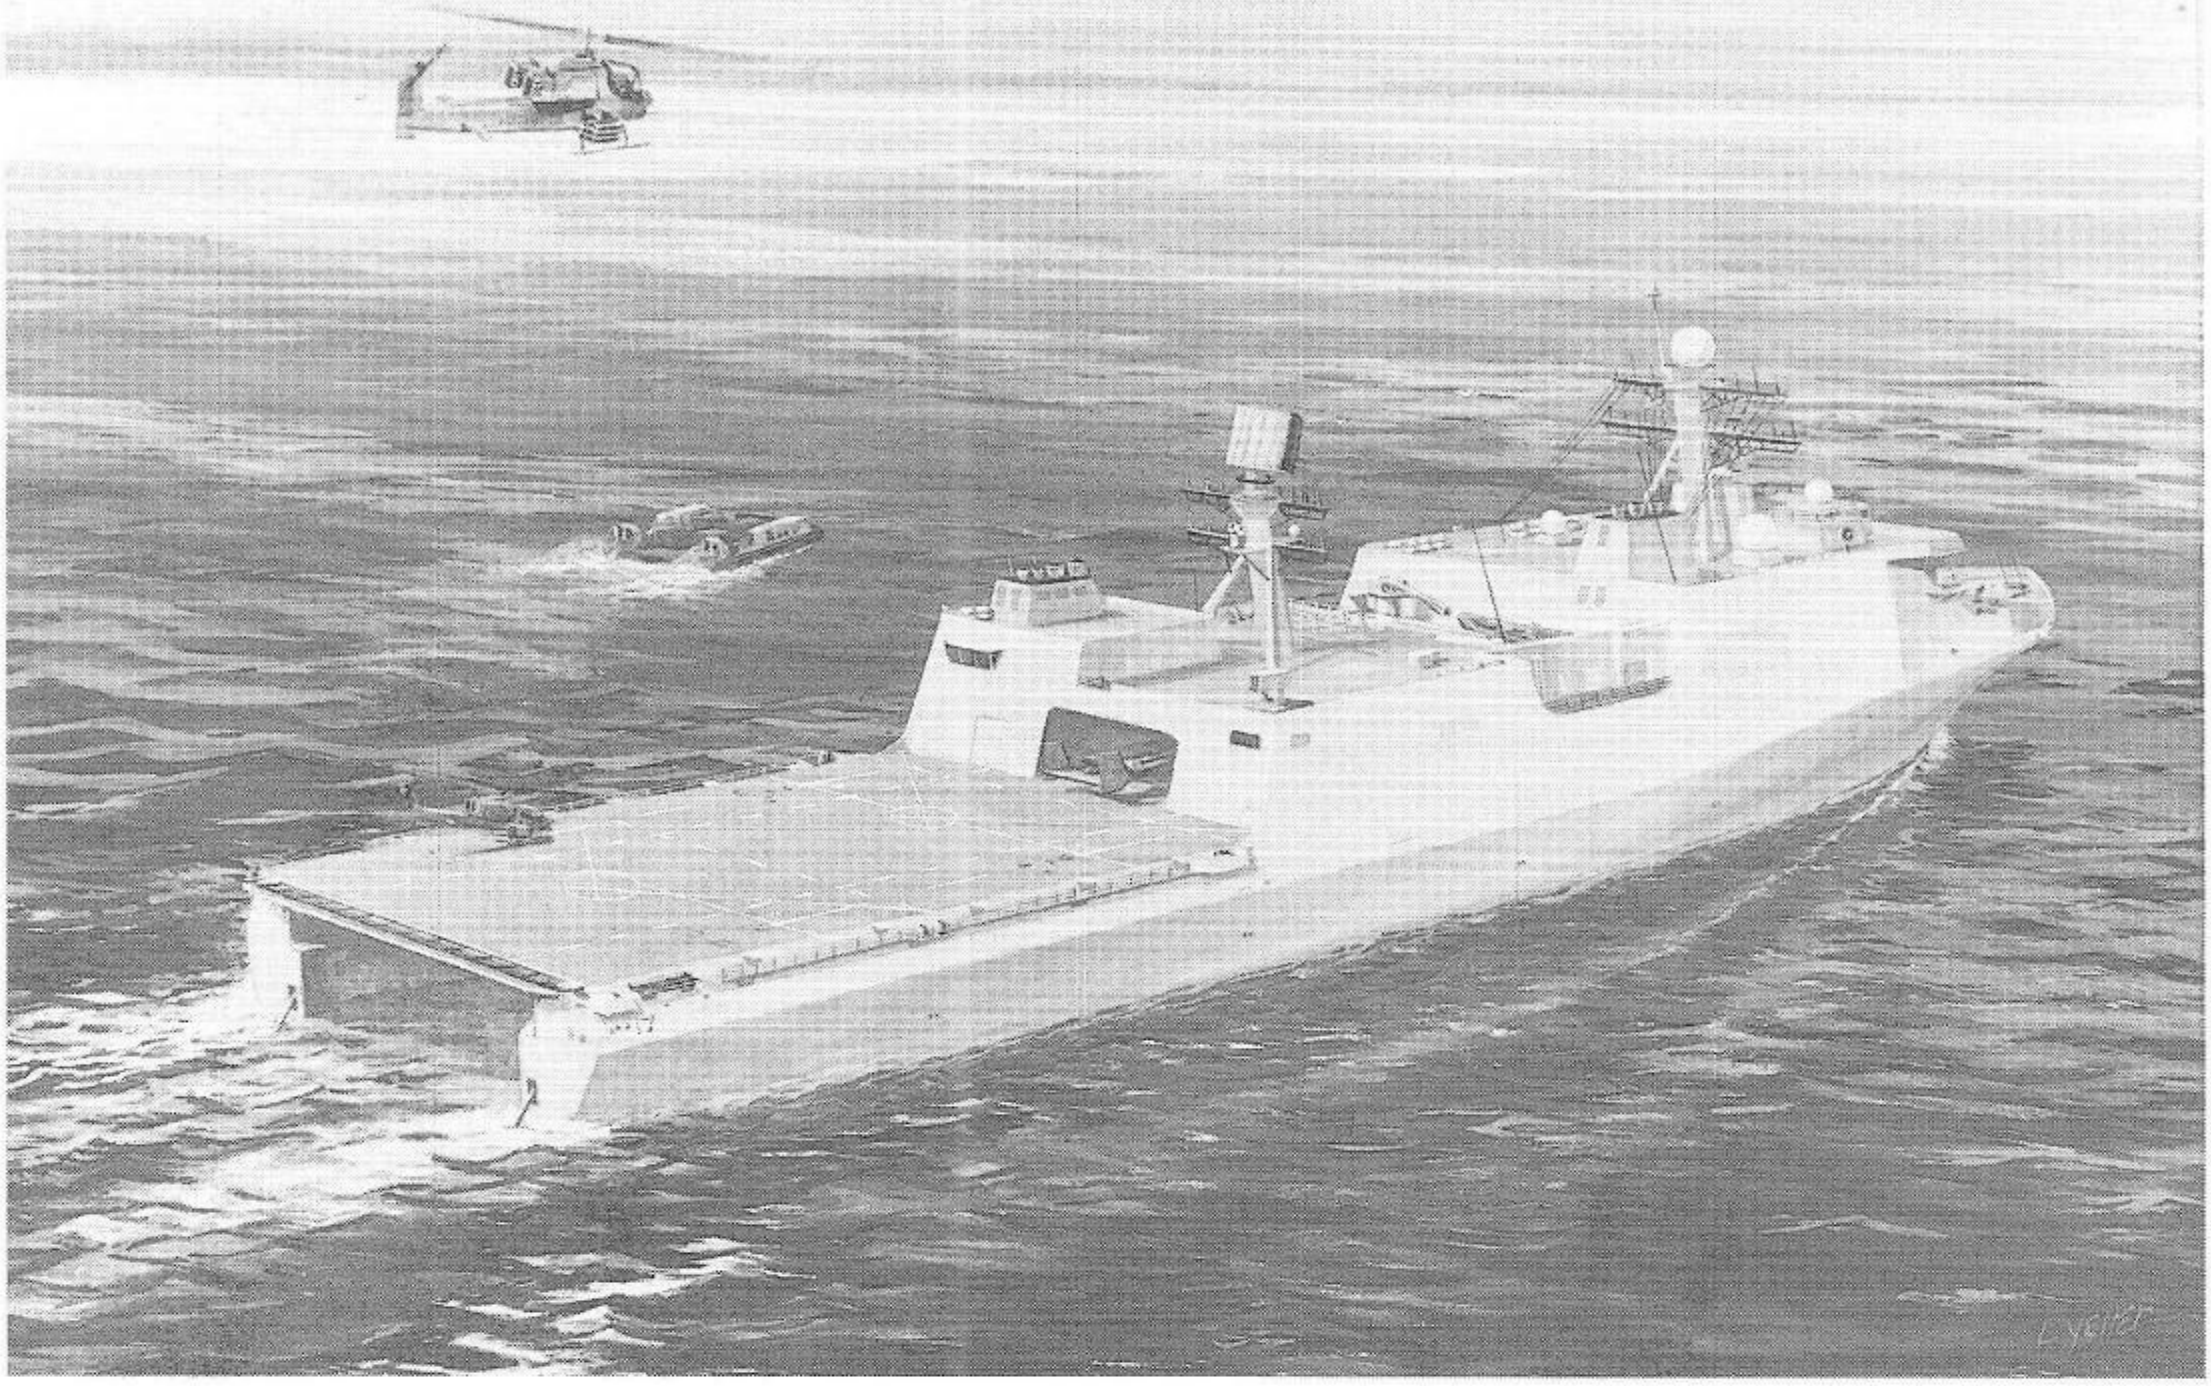
SURFACE-TO-AIR MISSILES (SAM)

Evolved Sea Sparrow Missile System (ESSMS)/RIM-7RTC point defence system

LPD 17 will be armed with the Evolved Sea Sparrow Missile System (ESSMS), a developed version of the Mk 57 NATO Sea Sparrow Missile System (NSSMS), with the RIM-7RTC missile. RIM-7P, which succeeded the RIM-7M missile on the production lines in 1991, has a Missile-Borne Computer (MBC), which controls overall missile performance and links the major missile subsystems. The missile also has an improved low-altitude guidance mode and enhanced subclutter performance against very low-altitude targets. Other features include a 38.6 kg (85.1 lb) warhead with new fuze for low-altitude use, a command uplink, sample data homing and multiple target designation. The RIM-7R is similar, but in addition has a dual-mode semi-active radar and infra-red seeker.

ESSM (RIM-7RTC) will have many of the features of RIM-7P and RIM-7R, including the same guidance system, but with a new autopilot and a larger rocket motor. It will be wingless and with tail control as well as integral thrust vector control both for vertical launch and to double the manoeuvrability. The system is fully compatible with the GMVLS Mk 41, but since each cell was dimensioned to house a Tomahawk missile a special module has been developed which accommodates four Sea Sparrows in a single vertical launch cell. These are known as 'quad packs'.

Targets are detected by the ship's radar and designated through the combat information centre and the tracker system then traverses onto the relevant bearing and elevation, while radar data from the director is processed in the signal data processor to provide range and angle tracking data. The data is then passed to the firing officer's console which passes prelaunch data and the firing command to the missile which is then launched. The missile lifts to a height of approximately 4 m (13 ft) and then begins to pitch over in the correct



Artist's impression of San Antonio *(LPD 17). Note the large flight deck, hangar and stern well* (Ingalls)

azimuth to the intercept point, controlled by the jet Vector Control, which is then jettisoned (approximately 2 seconds after lift-off). The missile follows a proportional guidance path directly to the intercept point.

Specifications

RIM-7P/R
Length: 3.66 m (12.0 ft)
Diameter: 20.3 cm (8 in)
Wing span: 1.02 m (3.3 ft)
Weight: 231.5 kg (510 lb)
Speed: Mach 1
Range: 8 n miles (14.5 km)
Guidance: Semi-active radar

Manufacturers/Contractors

Raytheon Company, Equipment Division (prime system).
Raytheon Company, Missile Systems Division (prime missile).
Hughes Missile Systems (second missile source).

RIM-116A RAM close in system

Two Mk 31 Mod 0 launchers for the Rolling-Airframe Missile (RAM) system are being installed: one will be immediately forward of the bridge, the other at the after, starboard corner of the hangar. The RIM-116 missile is based on the Sidewinder air-to-air missile, but with significant modifications, enabling it to be used as a fire-and-forget system. There is an infra-red, terminal guidance seeker in the nose (taken from the Stinger man-portable surface-to-air missile), behind which is a new dual-mode passive radio frequency seeker for mid-course guidance. Most of the rear of the missile is based upon Sidewinder components. Missiles are stored in sealed launcher-containers and are manually loaded into the 21-cell Mk 49 RAM Standard Launcher, which is mounted on the same base as that used by the Phalanx and retains that system's elevation and train drive assemblies.

Radar and electro-optical sensors provide details of target location, distance and speed, while the ship's ESM system inputs data on the target's radar frequency, as well as correlating radar data on location. On launch, the missile is spun-up by a rifling band as it is driven down the launch tube, and then as it leaves the launcher the four tail fins deploy which maintain the spin. Aerodynamic control is provided by the two canard surfaces, which also deploy after launch. The autopilot and control system maintain the initial line of sight course towards the target and then the RF seeker is activated and, once this acquires the target, it takes control of the guidance system and makes the appropriate course alterations. The IR seeker is also activated and when a sufficient signal-to-noise ratio is achieved this takes over guidance control for the terminal phase. The missile is capable of manoeuvres up to 20 *g* in any direction.

Specifications

Mk 49 RAM Standard launcher
Traverse: 360°
Elevation: −25 to +80°
Turning circle: 3.27 m (10.73 ft)

RIM-116 missile
Length: 2.79 m (9.15 ft)
Diameter: 12.7 cm (5 in)
Wing span: 43.4 cm (17.1 in)
Weight: 73.6 kg (162.25 lb)
Speed: Mach 2
Range: 5.17 n miles (9.6 km)
Warhead: 9.09 kg (20 lb) fragmentation blast (WDU-17B)
Motor: Hercules/Aerojet Mk 36 solid propellant rocket

Manufacturer/Contractor

Hughes Missile Systems, Tucson, Arizona, USA.

MISSILE LAUNCHER

GMVLS Mk 41 Mod 0

The LPD 17 will be fitted with two eight-cell Mk 41 Mod 0 Guided Missile Vertical Launch Systems (GMVLS) inset in the foredeck, which will be used for Evolved Sea Sparrow Missile (ESSM) which will also be deployed, with each GMVLS tube accommodating four of the new missiles. Total of 64 missiles.

GUNS

Hughes Mk 15 CIWS Phalanx

Two Mk 15 CIWS will be mounted, one on the bridge roof, the other aft on the hangar roof. The weapons group is based on a barbette assembly with electronics enclosure to the rear. The group takes up 5.5 m² space on deck and is on a 150 mm (5 in) thick platform. The gun is a six-barrelled 20 mm M61A1 Vulcan capable of extremely high firing rates. Original Block 0 systems installed in the early 1980s are gradually to be uprated to Block 1.

Specifications

Gun
Calibre: 20 mm
Length of barrel: 53 calibres
Muzzle velocity: 1,030 m/s (3,379 ft/s)
Rate of fire:
Block 0; Block 1 Baseline 0: 3,000 rds/min
Block 1 Baseline 1: 4,500 rds/min
Range (effective, horizontal): 0.75 n miles (1.47 km)

Mounting:
Weight:
(Block 0): 5.42 t
(Block 1): 6.18 t
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

Manufacturer/Contractor

Hughes Missile Systems, Tucson, Arizona, USA.

25 mm Mk 38 Mod 0 automatic cannon (Sea Snake)

There will also be three single Mk 88 mountings for Mk 38 Mod 0 25 mm cannon (Sea Snake). The Mk 88 mounting is replacing 20 mm mountings in many US Navy warships and is designed to engage surface and shore targets in low- and mid-intensity operational environments at ranges up to 1.33 n miles (2.5 km). The M-242 is a single barrel, externally powered weapon which incorporates a rotating bolt mechanism driven by a chain drive. The weapon has been designed to allow the barrel to recoil separately from the receiver, which reduces the available travel as the bolt also has to move, the travelling distance being 12.7 mm. The Mk 38 can fire single shots or 175 rds/min and features twin shoulder braces and an optical Aimpoint sight. The weapon weighs 110.5 kg (243.6 lb) and is 2.74 m (9.0 ft) long, 0.32 m (1.05 ft) wide and 0.37 m (1.2 ft) high while the barrel is 2.30 m (7.5 ft) long. The peak recoil force is 4,536 kg (10,0001 lb) in the naval version but with a McDonnell Douglas muzzle brake modification and recoil damper this can be reduced to 2721.5 kg (6,000 lb). The barrel life is in excess of

13,000 rounds while the demonstrated reliability of the weapon is 22,000 rounds between stoppages.

Specifications
Calibre: 25 mm
Length of barrel: 81 calibres
Muzzle velocity: 1,100 m/s (3,609 ft/s)
Traverse: 300°
Elevation: −20 to +55°
Weight: 596.5 kg (1,315 lb) (loaded)
Crew: 1 (often supported by a spotter)
Range: 1.33 n miles (2.47 km)
Rate of fire: 175 rds/min (max)
Ammunition: 184 g HEI-T

Mk 26 Mod 17 12.7 mm machine guns
Four Mk 26 Mod 17 machine guns will be carried. This is a selective-fire, short-recoil, automatic weapon with a 1,143 mm long barrel.

Specifications
Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

AN/SLQ-32A(V)3 intercept and jammer
The AN/SLQ-32A(V)3 is a combined ESM and ECM system, giving radar warning on B to J-bands to give jamming and deception on H to J-bands. The jammer has a maximum radiated power of 1 MW and is capable of forming 64 beams on either side of the ship, with jamming modes including range gate pull off (RGPO) and azimuth gate pull off (AGPO).

Manufacturer/Contractor
Raytheon, Electromagnetic System Division, Goleta, California, USA.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher
Four Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) systems are mounted, consisting of launcher, launcher control, power supplies, ready service lockers and munitions. The Mk 137 launcher has six 130 mm fixed tubes arranged in parallel rows at angles of 45 and 60°. The firing circuits use electromagnetic induction to initiate the propelling charges in the cartridges. The prime cartridge is the Mk 182 Torch with chaff payload.

Specifications
Launcher dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Launcher weight: 173 kg (381 lb)
Mk 182 cartridge dimensions: 1,209 × 130 mm (47.6 × 5 in)
Cartridge weight: 22.7 kg (50 lb)

AN/SLQ-25A Nixie
AN/SLQ-25A Nixie is a solid-state, modular design electroacoustic countermeasures decoy system used to protect various classes of ships from acoustic homing torpedoes. It consists of a remote-control unit which can activate, deactivate and monitor (through an oscilloscope) the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming and recovering the towed bodies (which are stored on racks attached to the winch), a coaxial switching unit which selects the appropriate cable or load, and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummy loads for testing the amplifier without streaming a towed body and either a deck edge tow chock or two CSL27 fleet angle compensators. Total weight of the system with the RL-272 winch is 2.75 tonnes.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

AN/SYQ-20 Advanced Combat Direction System Block 1 Level 3 (ACDS)
AN/SYQ-20 ACDS is an enhanced version of the widely used Naval Tactical Data System (NTDS) tactical data handling and target designation system, which interfaces with the Mk 23 TAS. The LPD-17 will have ACDS Block 1 with three AN/UYK-43B processors, featuring software modules similar to those in the original NTDS, with a software package containing a database of approximately 1 million lines of code with an additional dedicated package specific to the host ship. The Block 1 system also features a Link 11 (TADIL A) interface, as well as interfaces to Link 16 and Naval Tactical Command System-Afloat (NTCS-A). There are also interfaces to new weapon and sensor systems. As with NTDS, ACDS Block 1 provides Link 4A (TADIL C), Link 11 (TADIL A) and Link 14 communications. The Link 16 facility will use the Unisys AN/USQ-69 data terminal.

ACDS Block 1 Level 1 system will augment combat direction system processing, providing the basis of systems which may be extended to eight tightly coupled and 248 loosely coupled computer nodes. There will be a two-way open architecture interface to JMCIS with automatic electronic warfare correlation. The Block 1 Level 2 system adds amphibious modes to the capability and will feature AN/UYQ-70 workstations and X-Windows software. The Block 1 Level 3 system will rehost processing to COTS processors and will feature improved software capabilities including enhanced X-Windows. This will be the first system capable of interacting with SSDS.

Manufacturer/Contractor
Unisys, McLean, Virginia, USA (computers).
Hughes Aircraft Company, Los Angeles, California, USA (displays).
Rockwell International (Collins Avionics/Communications Division), Cedar Rapids, Indiana, USA (computers).

Ship Self-Defense System (SSDS) Mk 1
LPD-17 will be the first class to have SSDS Mk 1 installed during build. A prototype Quick Reaction Combat System/Ship Self-Defense System (SSDS) was installed and successfully demonstrated in *Whidbey Island* (LSD 41) in 1993, using Raytheon AN/SPS-49 long-range 2D air search radar, a prototype Spar AN/SAR-8 infra-red search and track device, and AN/SLQ-32 electronic warfare system as the sensors. The SLQ-32 also controlled the SRBOC chaff/infra-red launcher as the 'soft kill' element of the system, while the 'hard kill' elements were the ship's two Mk 15 Phalanx CIWS and the Mk 116 RAM surface-to-air missile. All elements were linked by an FDDI/Safenet fibre optic local area network through access units and supervised by two Hughes workstations. The SPS-49 gave early warning of threats and with the SLQ-32 provided track data which was supplemented by the SAR-8 and Phalanx radars. The operational system in LPD 17 will continue to use the FDDI-Safenet LAN and the advanced display, and will retain the SLQ-32 and Mk 36 SRBOC, the Phalanx and the RAM.

RADARS

	AN/SPS-48E	AN/SPS-67(V)3	AN/SPS-64(V)9	AN/SPQ-91
Manufacturer	ITT	Westinghouse Norden	Raytheon	Lockheed
Role	3D air search	Surface search	Navigation	Mk 86 FCS
Band	E/F	G (5.4-5.8 GHz)	I	I/J
Beam	1.5 × 1.6°	1.5 × 31°	1.9 × 22°	1.35 × 3°
Peak power	2,200 kW	280 kW	20 kW	1.2 kW
Gain	38.5 dB		28 dB	37 dB
Pulsewidth	3 µs	0.1; 0.25; 1.0 µs	0.06/0.5/1.0 µs	0.3-16 µs
PRF	1,250-2,000 pps		3,600/1,800/900 pps	3,000 pps
Scan rate	7.5/15 rpm		33 rpm	60 rpm

WEAPONS CONTROL

Mk 91 Mod 3 Fire-Control System (FCS)
The Mk 91 Mod 3 is a two-channel FCS for the NATO Sea Sparrow Missile System (NSSMS). Mk 91 is fully automatic from target acquisition to interception and in the Mod 3 version has two Mk 95 fire-control radar sets. Mk 91 FCS is a mainframe system using an NFT Mk 157 digital computer which performs all necessary calculations, stores data and is responsible for data distribution. The tracker-illuminator consists of a Mk 78 radar director with separate transmitting and receiving antennas, a director controller (Mk 106) and a low-light TV camera (Mk 6) with 2.4 × 2.4° and 10 × 10° fields of view. The radar is believed to operate in the I-band and directs the missile to fly a lead angle course to the intercept point, allowing Sea Sparrow-equipped ships to protect both themselves and other vessels in the immediate vicinity. Inboard equipment includes a Mk 73 continuous wave illuminator transmitter, a signal data processor (Mk 17), a signal data converter (Mk 80) and a director controller (Mk 106). There is a radar set console (Mk 83), with Bell Aerospace low-light television monitor and a firing officer's console (Mk 86). The Mod 3 system has two radar directors, two transmitter-receivers, two signal data processors and two radar consoles.

Using I-band frequencies enables the Mk 91 to detect sea-skimming missiles sooner than lower-frequency search radars and it can thus be fully autonomous, conducting search, detection and engagement automatically. It can also accept outside designations

from radar, EW or optic sources. Radar data from the director is then processed in the signal data processor to provide range and angle tracking data. This data is passed to the firing officer's console from where pre-launch data and firing commands are relayed to the Mk 29 trainable launcher and missile, which trains in azimuth to the intercept point and in superelevation to optimum angle to maximise missile kinetic energy. If the correct azimuth is blocked by the ship's superstructure, the launcher trains to the nearest clear azimuth and the missile is commanded to 'fly around the corner' to the direct path to the intercept. On launch, the missile flies a proportional navigation path (lead angle intercept) directly to intercept point in a lofted trajectory to maximise energy and minimise image effects.

Manufacturer/Contractor

Raytheon Company Equipment Division.

PROPULSION

Specifications

System: Diesel

Main machinery: 4 medium-speed, turbocharged marine diesels, 29.84 MW (40,000 hp)

Shafts: 2

Propellers: 2, fixed pitch

Ship's services: Five — 2,500 kW, marine diesel generator sets

FURTHER INFORMATION

PROGRAMME

The LPD 17 programme is very ambitious, intending to replace no fewer than four classes of amphibious vessel: the 'Austin' class LPD 4s; the 'Newport' class LST tank landing ships; the 'Anchorage' LSD 36s; and the 'Charleston' amphibious cargo ship LKAs. In practice, of course, it is not that clear cut. The Charlestons have already gone into reserve or 'reduced operational status'; while the 'Newport' class has been reduced to two full-time in-service ships, with a few more in semi-retirement and the majority already sold or leased to foreign navies. The cargo-carrying duties of the LKAs, plus some of the troop- and equipment-carrying duties of the 'Anchorage' class LSDs, will naturally fall to the 'Whidbey Island' LSDs and their cargo-carrying version, the 'Harpers Ferry' class (LSD-CV).

The LPD-17 class, which is planned to number 12 ships by 2008, is an important class of ship for the US Navy. Its arrival will complete the process begun many years ago, and pursued with haphazard decisiveness, of reducing to about a third the original number of amphibious ships, standardising the ship types, and restoring the amphibious capability of moving troops and equipment into hostile territory.

The programme passed Milestone 0 at the start of FY91 and the preliminary design work was completed in FY94. Award of the contract for the lead ship was issued in December 1996 and the ship, to be named *San Antonio*, is expected to enter service in 2004. Current estimates of costs are approximately US$640 billion for the lead ship, with the remaining eleven making up a programme worth many billions of dollars. Two groups of shipbuilders lined up to bid for the entire class but the winner was Avondale Industries of New Orleans, with team members General Dynamics/Bath Iron Works; General Motors/Hughes Aircraft; and Intergraph.

DESIGN

A significant feature of the LPD-17 is that it will carry a much heavier armament than has been customary in past amphibious warfare vessels. This is because it is expected to operate in an increasingly hostile littoral environment where it will need its own defences against air attack — and particularly from cruise missiles. Thus, it will have a substantial sensor suite, including AN/SPS-48E 3D air search radar, AN/SPQ-9B horizon search radar, and the AN/SPS-67(V)3, whose performance will be enhanced by the Ship Self-Defense System (SSDS) and the Co-operative Engagement Capability. Defensive weapons will include Evolved Sea Sparrow launched from a Mk 41 Vertical Launch System (VLS), two RAM launchers and three Mk 15 Vulcan Phalanx CIWS.

The hull and superstructure are made of steel, and all exposed surfaces are sloped and shaped to reduce the radar cross-section (RCS), while as many items as possible have been moved inside the superstructure or concealed, as far as is possible. Sharp corners have been smoothed, radar 'pockets' eliminated, masts raked, and infra-red hot spots cooled. The ship has also been designed with 'producibility' in mind, in order to simplify construction and reduce costs.

LPD-17 will not have all the attributes of the classes it is replacing. There is, for instance, no over-the-side lift capability, nor can the ship offload over a beach.

One of the features of the requirement is that it must be capable of passing through the Panama Canal.

A 'rough study sketch' of LPD 17 by Bath Iron Works (Bath Iron Works)

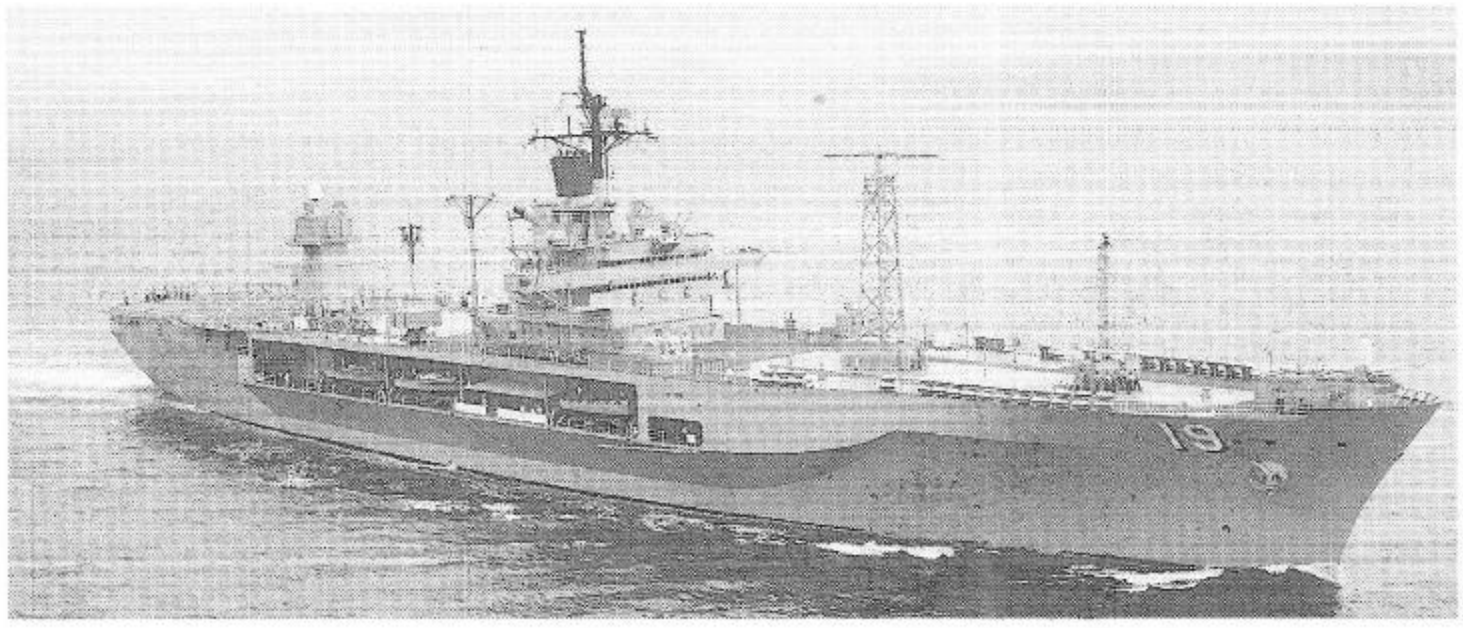
Commissioned 16 Jan 1971

WEAPONS SYSTEMS

GUNS

Hughes Mk 15 CIWS Phalanx

Sole armament are two Mk 15 CIWS. This CIWS was developed to provide fast reaction to submarine-launched anti-ship missiles and operates on a 'closed loop' system, tracking both the target and the stream of rounds, and seeking constantly to reduce the difference between the two. The gun is a six-barrelled 20 mm M61A1 Vulcan with extremely high firing rates.



Specifications
Gun
Calibre: 20 mm
Length of barrel: 53 calibres
Muzzle velocity: 1,030 m/s (3,379 ft/s)
Rate of fire (Block 0): 3,000 rds/min
Range (effective, horizontal): 0.75 n miles (1.47 km)

Mounting
Weight (Block 0): 5.42 t
Traverse: 310°
Elevation: −25 to +85°
Training speed: 126°/s
Elevation speed: 92°/s

Blue Ridge *(LCC19), flagship of Commander Seventh Fleet in 1992. Note that at this stage the armament included two Mk 15 CIWS (one is out of sight on the stern sponson), two twin 76 mm (3 in) forward of the bridge and two BPDMS launchers. The 76 mm guns and missile launcher have since been removed* (US Navy/Ensign J Hilton)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES/ ELECTRONIC COUNTERMEASURES (ESM/ECM)

AN/SLQ-32(V)3 intercept and jammer

The AN/SLQ-32(V)3 is a combined ESM and ECM system, the receive element giving radar warning on B to J-bands, while the countermeasures element gives jamming and deception on H to J-bands. The jammer has a maximum radiated power of 1 MW and is capable of forming 64 beams on either side of the ship, with jamming modes including range gate pull off (RGPO) and azimuth gate pull off (AGPO).

Manufacturer/Contractor

Notes
1. There are also two Mk 51 radars for the Sea Sparrow fire-control system. These remain installed even though the missile launchers have been disembarked.
2. Depends on antenna
3. TAS = Target Acquisition System

AVIATION

Specifications

Flight deck: There is a large flight deck at the stern
Hangar: There is no hangar (and thus no maintenance capability), but there are refuelling facilities

Helicopters: 2 light /utility liaison/transport helicopters can be embarked, but normally there is only 1

PROPULSION

Specifications

System: Steam
Main machinery: 2 Foster Wheeler boilers, 42.3 kg/cm² (600 psi); 467°C; 1 General Electric steam-turbine; 16.4 MW (22,000 hp)
Shaft: 1

FURTHER INFORMATION

PROGRAMME

These two ships were designed to provide command facilities for the amphibious elements of the Atlantic and Pacific Fleets, with the space, communications and facilities required for the naval, marine and air commanders and their staffs, a total of 200 officers and 500 enlisted men in addition to the ship's crew.

It was originally intended that there would be six of these ships, and there was another plan to build a third as a combined fleet and amphibious command ship. In the event, only two were built, and the extra command facilities offered by other ships, such as the 'Tarawa' class LHAs has proved an adequate substitute.

DESIGN

The start point for the design was the 'Iwo Jima' class LPH, but this was very considerably modified to meet the new role. The hull is 8.5 m (27.9 ft) longer than the 'Iwo Jima' class and the space previously occupied by the hangar was converted to house command centres, offices and extra accommodation, as well as the considerable extra communications and electronic facilities. Two large sponsons were added on either side of the ship to house the ship's boats and two LCPLs. The upper deck is given over almost entirely to communications arrays of various types, a wide, but somewhat short superstructure, and a helicopter flight deck aft.

The ships' role is dependent almost completely on good communications and the upper deck is largely devoted to an 'antenna farm', with a host of different arrays. The communications arrays are changed frequently, reflecting new requirements or replacement systems coming into service.

DESIGNATION

These ships were originally designated Amphibious Force Flagships (AGC), but were redesignated Amphibious Command Ships (LCC) on 1 Jan 1969.

MODERNISATION

Both ships were modernised in 1987. The work included removing the two twin 76 mm (3 in) gun mountings (there was no associated gun fire-control system to be removed). The launchers for the Sea Sparrow missile system (which had been added in 1974) were disembarked, although the onboard mountings have been retained and the launchers could be refitted, if required; the associated Mk 115 MFCS remains installed, although unused. The Mk 23 TAS radar was fitted after the modernisation.

DEPLOYMENT

Blue Ridge (LCC 19) is the Seventh Fleet flagship based at Yokosuka, Japan. *Mount Whitney* (LCC 20) is the flagship of the Second Fleet, based at Norfolk, Virginia. *Blue Ridge* is one of only two amphibious ships in the US Navy, the other is the 'Tarawa' class ship *Saipan*, to have its own Internet site.

Mount Whitney *(LCC20) in October 1996. The log periodic antenna has been removed from the lattice tower on the foredeck, there are some unusual twin domes on the bridge roof, there is a new 'light bulb shaped' radome atop the after tower. The latter appears very similar to the Signaal satellite radomes now found on many Dutch frigates* (H & L van Ginderen Collection)

Mount Whitney *(LCC20) in July 1994. There is an SH-3 Sea King on the flight deck; the ship offers landing and refuelling facility but has no hangar* (US Navy/PH2 J Sokolowski)

MINOR US LANDING CRAFT

LCU 2000

(LCU = Landing Craft, Utility)

GENERAL SPECIFICATIONS

Built: 35
Active: 14
Reserve: 12
Prepositioned: 8
Training: 1

Displacement:
full load: 1,102 t

Dimensions
Length: 53 m (173.8 ft)
Beam: 12.8 m (42 ft)
Draught: 2.6 m (8.5 ft)

Speed: 11.5 kts
Range: 4,500 n miles at 11.5 kts

Complement: 13 including two officers

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- 350 tonnes

COMMAND AND CONTROL SYSTEMS

RADARS

2 Raytheon SPS-64; I-Band

PROPULSION

Specifications
2 Cummins KTA50-M diesels, 1.87 MW sustained, 2 shafts; bow thruster

FURTHER INFORMATION

These US Army large landing craft were the first to be built to an army specification. Lockheed won the order for 25, with an option on a further 15, on 11 June 1986; in the event only 35 were built, with the first completed by Moss Point Marine in February 1990. Of the 35 built, 14 are active, 12 are in reserve, eight are prepositioned and one is used for training.

LCV 2006 of the US Army (Giorgio Arra)

LCU 1600

(LCU = Landing Craft, Utility)

GENERAL SPECIFICATIONS

Built: 67
Active: 51 (US Navy — 38; US Army — 13)

Displacement:
full load: 375 (437 t LCU 1680, 1681)

Dimensions
Length: 41.1 m (134.9 ft)
Beam: 8.8 m (29 ft)
Draught: 1.9 m (6.1 ft)

Speed: 11 kts

Range: 1,200 n miles at 8 kts

Complement: 14 including two officers

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- 170 tonnes, three M48 tanks (each 48 t) or 350 troops

WEAPONS SYSTEMS

2 20 mm Oerlikon or two 12.7 mm MG (not normally embarked)

COMMAND AND CONTROL SYSTEMS

RADARS

LN-66 or AN/SPS-53; I-Band

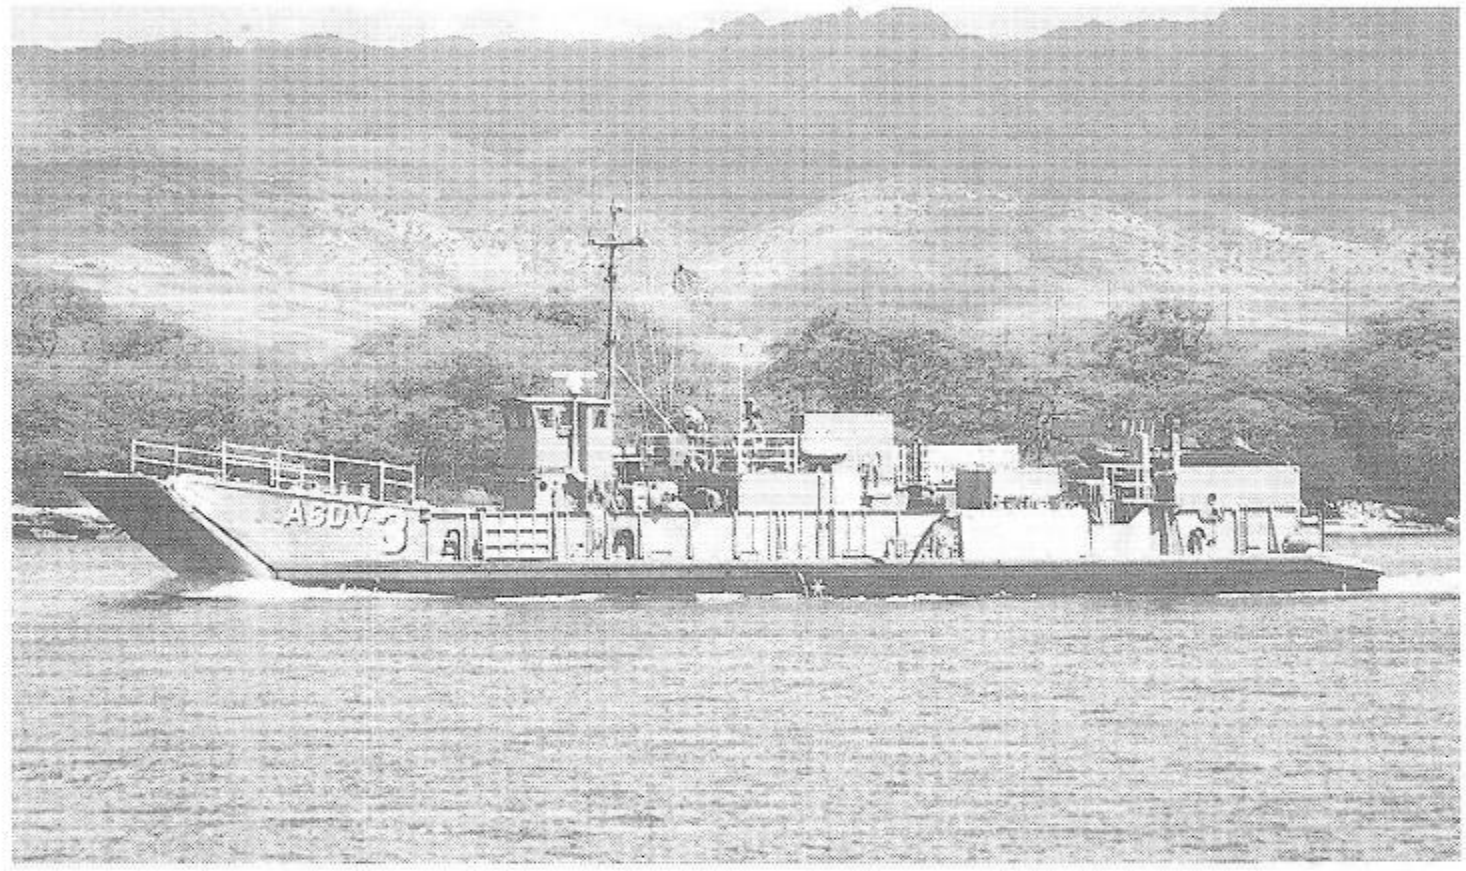
PROPULSION

Specifications
4 detroit 6-71 diesels, 519 kW sustained
Shafts: 2
Nozzles: 2 Kort

FURTHER INFORMATION

These LCUs have a small superstructure on the starboard side, enabling the tank deck to have a drive-through capability over the bow and stern ramps. Two of these LCUs may be embarked aboard 'Tarawa' class LHAs.

67 were built between the mid-1960s and the mid-1980s, and production is complete. Some have been converted for other uses by the US Navy, and a small number has been supplied to foreign navies, including two to Bangladesh. Very similar designs have been built in Germany as the Type 520, of which a number have recently been sold to Greece. Another similar craft has been built in South Korea as the 'Furseal' class.



ASDV-3, a version of the LCU 1600 used by the US Navy and US Army (H & L van Ginderen Collection)

LCM 8

(LCM = Landing Craft, Medium)

GENERAL SPECIFICATIONS

Built: 216
Active: 216 (US Navy — 91; US Army — 125)

Displacement:
full load: 105 t (aluminium version); 60 t (steel version)

Dimensions
Length: 22.5 m (73.7 ft)
Beam: 6.4 m (21 ft)
Draught: 1.6 m (5.2 ft)

Speed: 12 kts
Range: 190 n miles at 9 kts (full load)

Complement: 5

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- 180 tonnes, 1 M48 tank (48 t) or **1** M 60 tank (60 t) or 200 troops

PROPULSION

Specifications
2 Detroit 6-71 diesels, 260 kW sustained
Shafts: 2

FURTHER INFORMATION

LCMs are normally embarked aboard LHDs, LHAs, LPDs. LCM 8 Mod 1 is the steel version; LCM 8 Mod 2 is the aluminium version.

LCM 6

(LCM = Landing Craft, Medium)

GENERAL SPECIFICATIONS

Built:
Active: 55

Displacement:
full load: 64 t

Dimensions
Length: 17.1 m (56.2 ft)
Beam: 4.3 m (14 ft)
Draught: 1.2 m (3.9 ft)

Speed: 9 kts
Range: 130 n miles at 9 kts (full load)

Complement: 5

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- 34 tonnes, 80 troops

PROPULSION

Specifications
2 Detroit 6-71 diesels, 260 kW (348 hp) or 2 Detroit 8V-71 diesels, 344 kW (460 hp)
Shafts: 2

FURTHER INFORMATION

LCMs are normally embarked aboard LHDs, LHAs, LPDs. Numbers reducing as the type is superceded by LCM 8.

LVT 7

(LVT = Landing Vehicle, Tracked)

GENERAL SPECIFICATIONS

Built:
Active: 55

Displacement:
full load: 64 t

Dimensions
Length: 7.5 m (24.6 ft)
Beam: 3.27 m (10.73 ft)
Draught: 1.72 m (5.66 ft)

Speed in water:
waterjets: 13.5 km/h
tracks: 7.2 km/h
Endurance in water: 7 hours at 2,600 rpm
Crew: 3

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- 25 troops or 4,500 kg (10,000 lb) cargo

WEAPONS SYSTEMS

1 12.7 mm M85 machinegun

PROPULSION

Specifications
2 Detroit 8V53T diesels, 400 hp at 2,800 rpm or 2 Cummins VT 400 8-cylinder, water-cooled, supercharged diesel, 400 hp at 2,800 rpm
Drive: 2 waterjets or 2 tracks

LVTP-7 (USMC)

FURTHER INFORMATION

The LVT-7 is a tracked landing vehicle, operated by the US Marine Corps. The vehicle is fully amphibious without any preparation and can operate in rough seas and land through surf up to 3 m (10 ft) high. It is loaded and unloaded through the large stern door, which has a bottom hinge and incorporates a ramp. Various versions are in service including: LVTP-7 — troop carrier; LVTC-7 — command post; LVTR-7 — recovery. It should be noted that while these vehicles resemble army armoured personnel carriers (APC) in appearance, they are unarmoured; thus, while their tracks enable them to be used on land, they are landing craft which can climb onto the beach, as opposed to APCs than can swim.

These highly effective vehicles are carried by various types of amphibious warfare ships, including: 'Tarawa' class — 45; 'Austin' class — 20; 'Whidbey island' — 60; 'Anchorage' — 50.

LCAC/MCAC

(LCAC = Landing Craft Air Cushion/MCAC = Minesweeping Craft Air Cushion)

GENERAL SPECIFICATIONS

Built: 91
Active: 91

Displacement:
light: 88.5 t
full load: 184.0 t

Dimensions
Length:
on cushion: 26.8 m (87.93 ft) oa
between hard structures: 24.7 m (81.0 ft)
Beam:
on cushion: 14.3 m (46.91 ft)
hard structure: 13.1 m (42.98 ft)
draft off cushion: 0.9 m (2.95)

Speed: 40 kts
Range: 300 n miles at 35 kts; 200 n miles at 40 kts

Complement: 5

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- 1 main battle tank plus 24 troops
- or, in transport version — 180 troops
- cargo capacity 60-75 tonnes; 168.1 sq m (1,809 sq ft)

RAMPS, DECKS

- Bow ramp 8.74 m (28.7 ft)
- Stern ramp 4.57 m (15ft)

PROPULSION

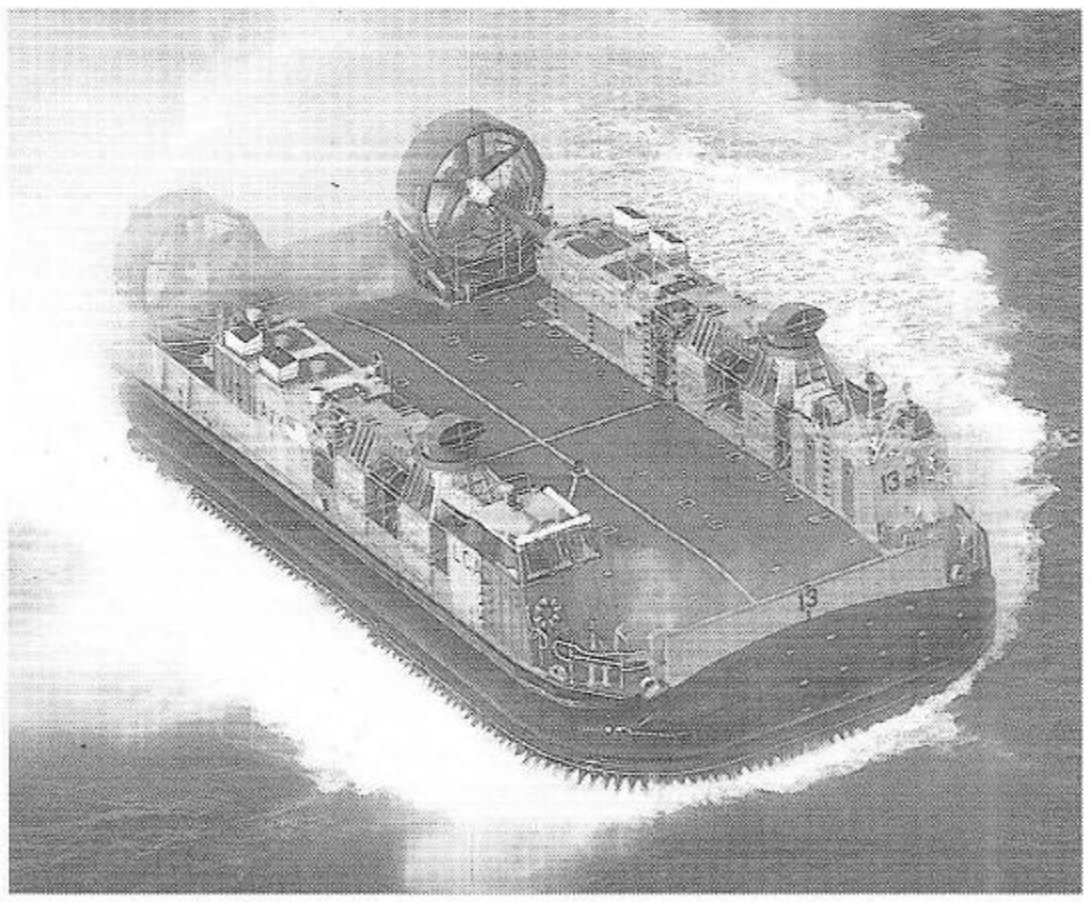
4 Avco-Lycoming TF-40B gas turbines, 2 for propulsion and 2 for lift, 12 MW (16,000 hp) sustained; 2 shrouded reversible pitch airscrews; 4 double entry fans, centrifugal or mixed flow (lift)

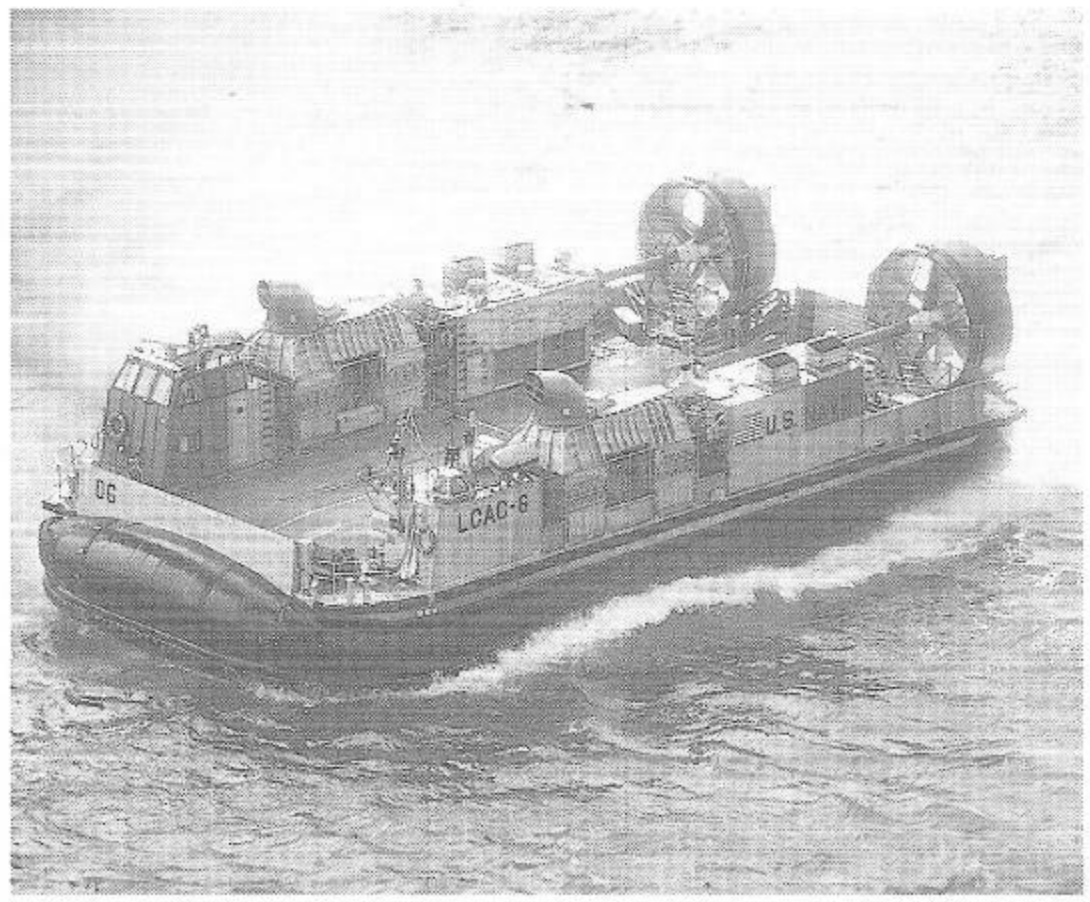
FURTHER INFORMATION

91 LCACs were built by Textron Marine Systems and Avonvale Gulfport between 1983 and 1993. They can be carried on Tarawa (one), Wasp (three), Anchorage (four), Austin (two), Whidbey Island (four) and Harpers Ferry (two) ships. Eight minesweeping kits were acquired in 1994/95 with the intention of converting some to MCAC. US Marine Corps says the craft can cross 70 per cent of the world's coastlines, compared to 15 per cent for conventional landing craft.

Their performance and reliability have exceeded expectations. The craft have been used in the Gulf War and in numerous relief/rescue operations.

Two have been sold to Japan.





LCAC (H & L van Ginderen Collection)

FRANK S BESSON

OVERVIEW

The US Army obtained approval for the first of these ro-ro logistic support vessels in FY85 budget, and the second in FY87, while the other four have been paid for from Army reserve funds. They are of traditional LST size and design, except that they have a flat bow ramp rather than clamshell doors. They are built to commercial standards and use reconditioned General Motors diesel engines.

They have 975 m² (10,500 sq ft) of deck space and can beach with 1.2 m (4 ft) of water over the ramp on a 1:30 gradient with a payload of 900 tonnes of cargo.

The US Army ships have a stern ramp, but the two ships built later for the Philippines do not, the after end of the ship being used to accommodate 150 troops and to support a raised platform for light helicopters.

AMPHIBIOUS CAPABILITIES

MILITARY LIFT

- 2,280 tonnes of vehicles, including 26 M1 Abrams tanks, containers or general cargo

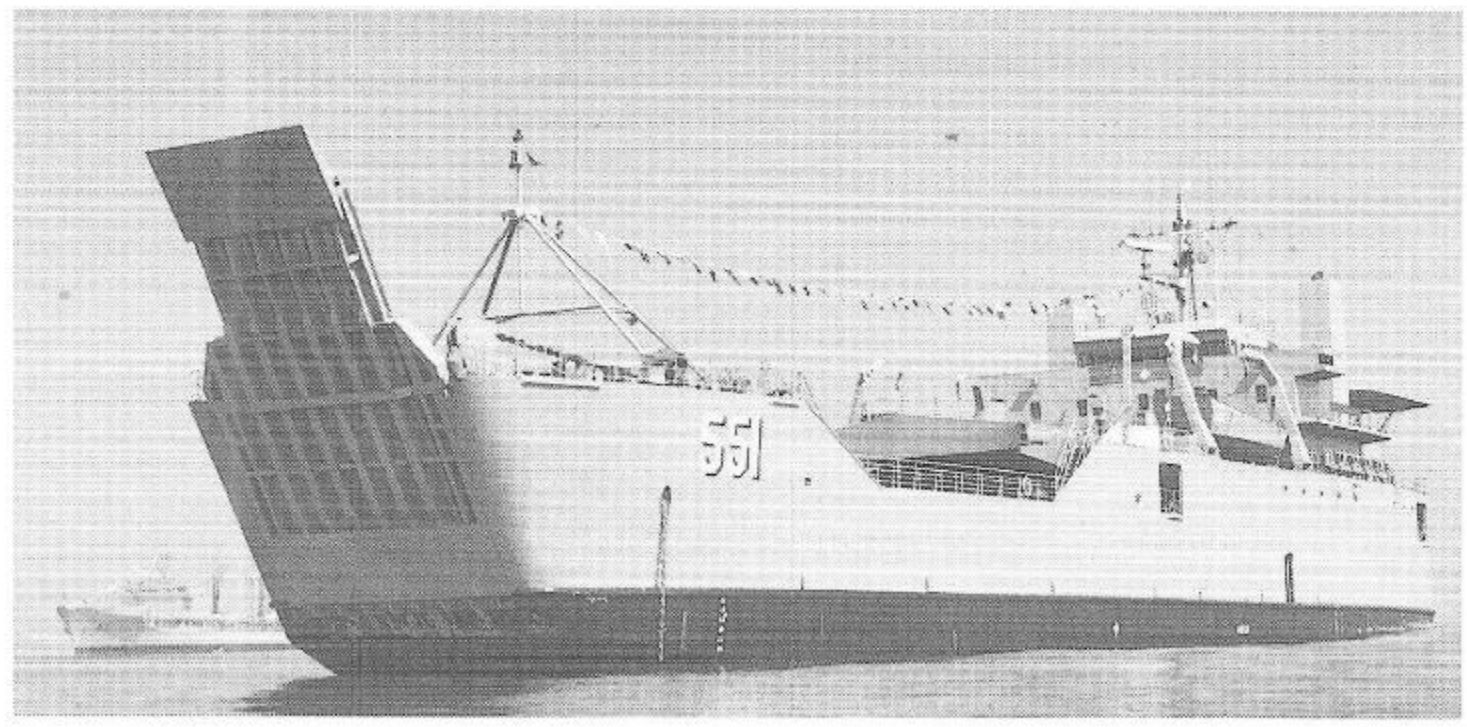
AVIATION FACILITIES

Bacolod City (Philippines) only

Specifications
Flight deck: There is a raised platform on the stern
Hangar: None
Helicopter: 1 light helicopter

AMPHIBIOUS FACILITIES

- Bow ramp, 8.23 m (27.0 ft) wide
- **Frank S Besson (USA) only.** Stern ramp, 8.23 m (27.0 ft) wide
- 975 m² (10,500 sq ft) deck space



Philippine Navy landing ship Dagupan City *(LC 551). The Philippines purchased two of these ships (which are both the largest and newest in the Navy). Note the flight deck aft*

COMMAND AND CONTROL SYSTEMS

RADARS

AN/SPS-64(V)2
There are two AN/SPS-64(V)2 radars, used for navigation and surface surveillance.

Specifications
Frequency: I-band (9,375 ±25 MHz)
Peak power: 10, 25 and 50 kW
Wavelength: 3 cm
Range: 18.3 m-118.5 km
Pulsewidth: 0.06, 0.5, 1 µs
PRF: 3,600, 1,800, 900 pps
Receiver bandwidth: 24, 4, 4 MHz
Receiver IF: 45 MHz
Video Amp bandwidth: 20 MHz
Receiver noise: 10 dB max

Manufacturer/Contractor
Raytheon Marine Company, Hudson, New Hampshire.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors EMD 16-645E2 diesels, 2.9 MW (3,900 hp)

Shafts: 2
Bow thruster: 1 Schottel 250 hp unit.

FURTHER INFORMATION

Frank S Besson (USA) only
Three are based at Fort Eustis in Virginia, two in Hawaii, and *General Brehon B Somervell* (LSV 3) is with the National Guard at Tacoma, Washington.

These ships are unarmed.

Bacolod City (Philippines) only
The contract for these vessels was announced by Trinity Marine on 3 April 1992, with an option on a third vessel.

It should be noted that these ships have several differences compared to the US Army ships, principally in the replacement of the stern exit and ramp by additional accommodation for 150 troops, and a helicopter platform. As with the US Army ships, they are unarmed.

Major General Charles P Gross *(LSV 5) one of six 'Besson' class landing ships operated by the US Army. These ro-ro vessels can carry 26 M1 Abrams main battle tanks and can beach with a payload of 900 tonnes* (H & L van Ginderen Collection)

Major General Charles P Gross *(LSV 5). Note the large stern ramp and kedge anchor*

SILBA

OVERVIEW

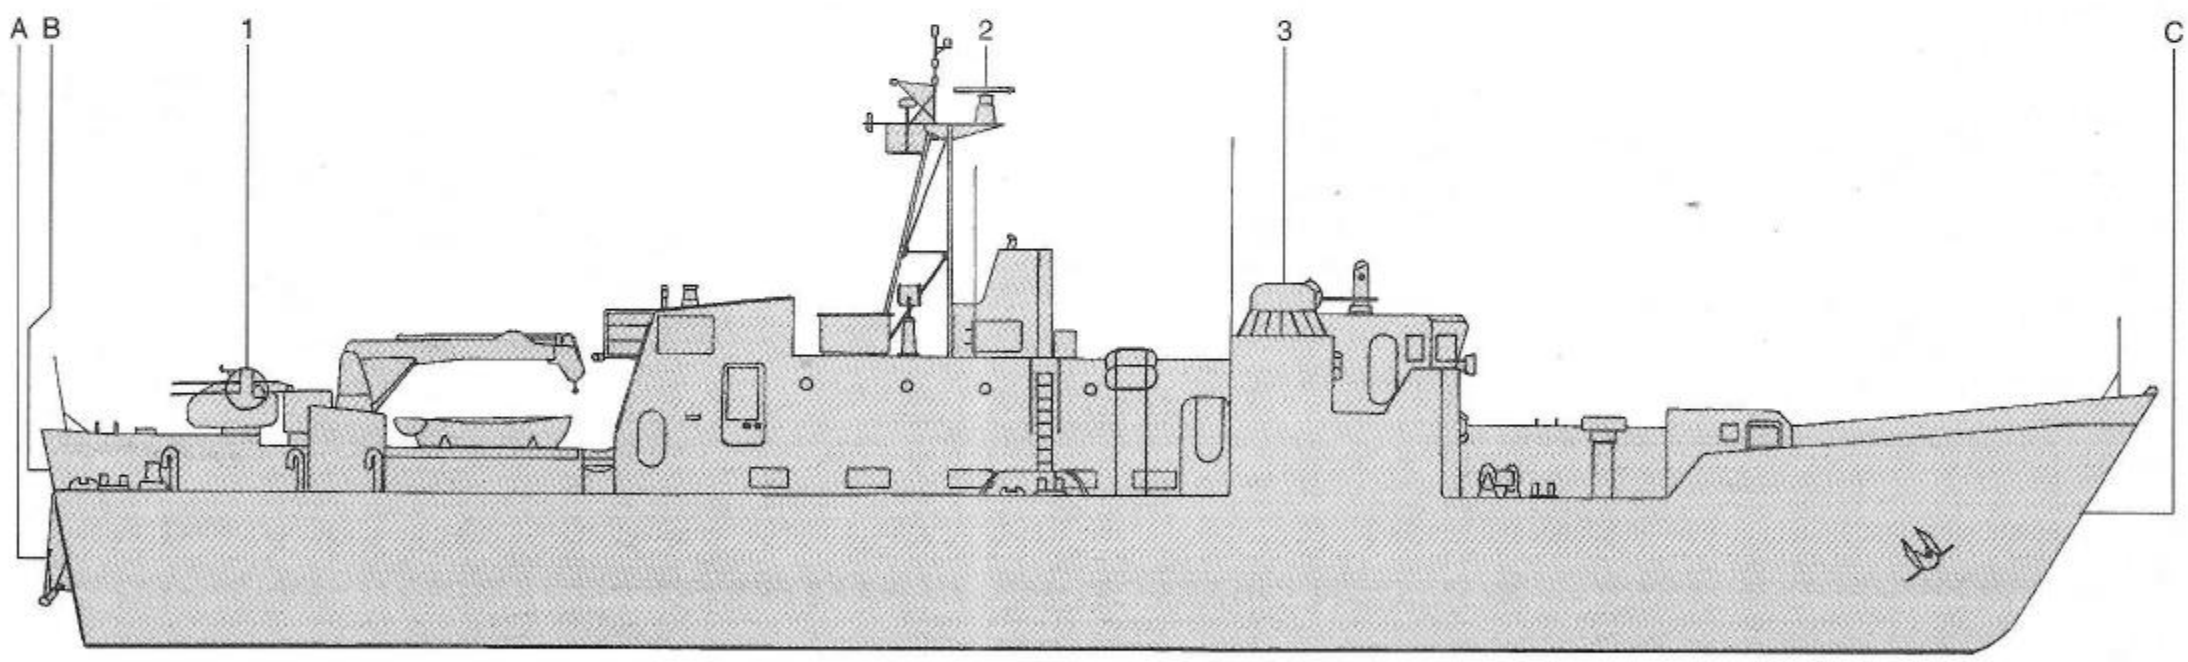
Three 'Silba' class landing craft were produced for the navy of the Yugoslavian Republic, but with the break-up of that state one is now operated by the present Yugoslav Navy of Serbia and Montenegro, while the other two are operated by the Croatian Navy, in whose country the shipyard now is. The Silba is a roll-on roll-off design with ramps at both bow and stern, and is used as both a landing craft and a minelayer. As far as can be ascertained, this is an original Yugoslav design and was not, as was the case in a number of other ships, a modification of a Russian design. As the three ships are identical, they are covered in one entry below.

Cetina *(81), one of the two 'Silba' class landing craft/minelayers now operated by the Croatian Navy* (Tim Ripley)

Cetina *(81)*

Silba *(DBM 241), the only one of three ships to be operated by the new Yugoslav Navy. Note the long stern ramp and kedge anchor* (Yugoslav Navy)

SILBA



'Silba' class (Croatia/Yugoslavia) (Ian Sturton)
Amphibious A *Kedge anchor* **B** *Stern ramp* **C** *Bow ramp*

General 1 *M75 quad 20 mm mount* **2** *Racal-Decca navigation radar* **3** *AK-230 twin 30 mm cannon (two)*

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

SA-N-5 'Grail' (Strela-2M)

There is one, four-missile launcher for the SA-N-5 short-range SAM system. SA-N-5 is the NATO designation for the Russian Strela-2M (Strela = arrow), which is the naval version of the very widely used Strela-2 (NATO = SA-7 Grail) land-based, shoulder-launched short-range missile system. In the naval version, four missiles are mounted on a metal framework, with the operator standing inside the framework, leaning back into a lumbar pad, with the missiles at shoulder level, as in the land-based system.

When the target is acquired the operator selects a missile and then activates the thermal battery. When the seeker acquires the target the operator receives an audio signal and he partially pulls the trigger to activate the missile gyros, which are tame some four to six seconds to warm up. The operator uses stadia reference marks in his optical sight to compute the lead angle to the target then fully engages the trigger to launch the missile. The booster burns for 0.05 seconds, ejecting the missile from the launch tube at a speed of 28 m/s (92 ft/s) and spinning it up. Then, at a distance of 6 m (20 ft), the sustainer ignites and the trailing fins pop out.

The missile has four small fins of cruciform configuration and two pop-out trailing fins behind the exhaust. The missile homes on the 'hottest' part of the aircraft and probably has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead. In Strela 2M (SA-7B 'Grail' Mod 1) the seeker has a filter for improved performance and the warhead has better fragmentation uniformity.

Specifications

Strela 2
Length: 1.45 m (4.76 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (21.98 lb)
Speed: Mach 1.7
Range: 5.5 km (2.6 n miles)
Altitude: 18-4,500 m (60-15,000 ft)
Guidance: IR homing

Manufacturer/Contractor

Fakel.

GUNS

30 mm/65 AK-230

Four 30 mm/65 AK 230 in two twin mounting. AK-230 is a twin barrelled, fully automatic, water-cooled weapon, with a 2,000 round magazine beneath the pedestal. The AK-230 is designed to engage air targets at heights of up to 4,000 m, and is is also capable of engaging surface targets at ranges up to 2.2 n miles (4 km).

Specifications

Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s
Traverse: 360 at 70/s
Elevation: −12 to +87 at 50/s
Crew: 2 (off mount)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (AA)
Rate of fire: 1,000 rds/min (per gun)
Ammunition: 0.54 kg (HE)

20 mm M75

Four 20 mm M75 guns in one quad mounting. After the Second World War Yugoslavia developed its own version of the Hispano-Suiza HS 804 20 mm cannon as the M55 at Crvena Vastava, Kragujevac. In addition to adapting the weapon to Yugoslav industrial capabilities the M55 featured a new muzzle brake and in addition to land-based towed weapons, three naval versions were also produced. The single-barrel mounting is the M71, the quad version is M75 and there is also a triple-barrel version whose designation is unknown.

Specifications

M55 Gun
Calibre: 20 mm
Length of barrel: 80 calibres
Muzzle velocity: 840-850 m/s
Range:
anti-surface: 1.5 km
anti-air: 1,500 m
Rate of fire: 700 rds/m
Round weight: 241 g
Projectile: 122 g

M75 mounting
Elevation: −10 to +85
Weight: 1,900 kg (loaded)

128 mm illuminant launchers

There are two 128 mm illuminant launchers. The model cannot be identified, although the Croatian Navy has certainly operated Bofors 57 mm rocket system on other ships, where it is used primarily as an illuminant and chaff launcher.

MINES

Type SAG-1

94 are carried and are laid over the stern.

COMMAND AND CONTROL SYSTEMS

RADARS

Racal-Decca

There is one Racal-Decca, I-band navigation radar; model unknown.

PROPULSION

Specifications

System: Diesel
Main machinery: 2 Burmeister & Wain Alpha 10V23L-VO diesels, 2.28 MW (3,100 hp) sustained
Shafts: 2
Propellers: Controllable pitch

FURTHER INFORMATION

The Croatian vessesl are based at Split and the Yugoslav vessel at Tivat.

MINELAYERS

MINELAYERS

INTRODUCTION

The sea-mine is a very potent weapon; it is easy to manufacture, the technology is widely available; and it can be laid in a wide variety of ways: by submarines and aircraft, by surface warships, by converted merchant ships and by specialist minelayers. Mines have both strategic and tactical roles, and can be used to deny waters to hostile naval forces, such as through 'choke points' as well as to defend important targets such as harbours, anchorages and offshore facilities. Finally, the sea-mine can have an effect out of all proportion to its cost and complexity.

Many modern warships, especially those designed and built in Russia and China have a limited minelaying capability built in. The 'Udaloy' class, for example, has two rails with a capacity of 30 mines, while Chinese 'Jianghu' class frigates can carry up to 60. Merchant ships can also be given simple conversions to enable them to serve as minelayers, modern Ro-Ro ferries, with their cavernous holds and stern ramps being particularly suitable for such a role. The UK, for example, has paid for a number of British-owned and -registered civilian Ro-Ro ferries to have the necessary fittings installed during construction.

A few nations, however, have developed specialist minelayers, although, since in modern conditions minelaying could probably only take place at the very start of a conflict, most have a secondary role to perform once they have completed their primary missions.

As the majority of minelayers are dual-purpose ships, the problem of where to place them in this book arises. It has, therefore, been decided to place allpurpose-built minelayers in this section, with the exception of five Turkish ships, which are predominantly LSTs with a subsidiary role of minelaying *(Cakabey, Sarucabey, Karamürselbey, Bayraktar* and *Sancaktar)*, and the minelayer version of the Danish 'Flyvefisken' class.

TABLE 1: MINELAYERS IN SERVICE - 1997

Country	Class Name	Number in service	Displacement	Entered service	Mines (see Note)	Secondary Role
China	Beleijan	1	3,100 t	1988	300	—
Denmark	Falster	4	1,910 t	1963-64	400	Training
Finland	Pohjanmaa	1	1,100 t	1979	120	Training
	Häneenmaa	2	1,300 t	1992	150	Transport, support
	Pansio	3	450 t	1991-92	50	Transport, support
Greece	Aktion	2	1,100 t	1953	130	—
Iran	Iran Ajr	2	2,310 t	1980	50	Transport
Japan	Hayase	1	2,000 t	1971	116	—
	Souya	1	3,300 t	1971	460	—
Korea South	?	1	3,300 t	1998	400	—
Norway	Vidar	2	1,673 t	1977-78	400	Transport, ASW escort, offshore patrol, torpedo recovery
Romania	Cosar	2	1,450 t	1980-81	200	MCMV command and support
Russia	Alesha	2	3,860 t	1967-76	400	Command, netlayer, MCM support
Sweden	Älvsborg	1	2,650 t	1976	300	Command ship
	Carlskrona	1	3,550 t	1982	105	Training, torpedo target
Turkey	Mersin	1	1,100 t	1952	400	—
	Bayraktar	2	4,080 t	1945		Primary LST
	Sarucabey	2	2,600 t	1984-1987	150	Primary LST
	Cakabey	1	1,600 t	1983	150	Primary LST

Note: This is the estimated maximum figure and would vary markedly with the type and size of mines carried.

BELEIJAN

GENERAL SPECIFICATIONS

Operator: China, People's Republic
Type: Minelayer

Class: BELEIJAN

Built: 1
Active: 1

Displacement:
full load: 3,100 t

Dimensions
Length: 93.8 m (307.7 ft)
Beam: 14.4 m (47.2 ft)

300 mines

WEAPONS SYSTEMS

GUNS

Chinese 37 mm/63 cannon
There are eight Chinese 37 mm/63 guns in four twin mountings. A Russian-derived weapon manufactured in China, the 37 mm/63 has become a standard light air defence gun in a variety of ships. In the twin mounting, the barrels are enclosed in separate water jackets with exposed spring recuperators.

Specifications
Calibre: 37 mm
Length of barrel: 62.8 calibres
Muzzle velocity: 886 m/s (2,906 ft/s)
Rate of fire: 180 rds/min
Traverse: 360° at 17°/s (25°/s in Type 76)
Elevation: −10 to 85° at 13°/s
Crew: 3

Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 3,000 m (9,840 ft)
Ammunition: 0.732 kg

COMMAND AND CONTROL SYSTEMS

RADARS

Radars are fitted for surface search, fire control, and navigation; types unknown.

PROPULSION

Specifications
System: Diesel
Main machinery: 4 diesels; 6,400 hp(m) (4.7 MW)
Shafts: 2

FURTHER INFORMATION

Following the example of the Russian Navy, the PLA-N fits minerails into virtually all its surface combatants, and this is its first purpose-built minelayer. *Beleijan* was built at Dalian Shipyard and completed successful sea trials in 1988. In appearance it resembles the Japanese 'Souya' class and may have a secondary role as an MCMV support ship.

FALSTER

GENERAL SPECIFICATIONS

Operator: Denmark
Type: Minelayer

Class: FALSTER

Built: 4
Active: 4

Displacement:
full load: 1,910 t

Dimensions
Length: 77 m (252.6 ft)
Beam: 12.8 m (42 ft)
Draught: 3.6 m (11.8 ft)

Speed: 17 kts

Complement: 74 (10 officers) plus cadets

Launched 14 Jun 1963
Commissioned 7 Jul 1964

MINELAYING

SYSTEM

The minelaying system is fully automated, hydraulically operated, and — since a recent refit — computer controlled.

These ships normally lay defensive minefields composed of both bottom and anchored mines, each preferably of two or more different types.

Bottom mines are laid at 17 knots (also the maximum speed of the 'Falster' class) or less in shallow waters. Anchored mines are launched at a speed of 10 to 12 knots. The time to lay a complete load of mines depends on the configuration of the minefield, navigational and weather conditions and type of mine, but would certainly be 'some hours'.

MINES

Average load is 400 mines, the actual number depending on the type of mine to be laid.

Falster *(N 80) showing the minelaying doors open* (Royal Danish Navy)

WEAPONS SYSTEMS

GUNS

US 76 mm (3 in)/50 Mk 33

Two twin 76 mm (3 in) 50: one on the foredeck in 'A' position, the second aft in 'Y' position. The Mk 33 is a twin-gun, power-driven, base-ring mount with local or remote control. All Mk 33 mounts use amplidyne elevation and training power drives. The guns used are the Mk 22 Mods 4 to 9 and each has an automatic loader Mk 2, capable of handling up to 50 rds/min. Four drum ammunition magazines are available.

Specifications
Traverse: 360° at 30°/s (manual)
Elevation: −14/15° to +85° at 24°/s (manual)
Rate of fire: 100 rds/min

Oerlikon 20 mm

Four mounts per ship (due to be replaced by two twin Stinger SAM mountings).

Specifications
Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 1.5 km (1,640 yd)
anti-air: 1,150 m (3,773 ft)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Racal Cutlass B1 ESM system

Cutlass B1 is designed for operation in very dense signal environments, receiving signals in the 1 to 18 GHz frequency range, measuring their parameters, comparing these with those in the radar library which contains the parameters of 2,000 radars, and displaying the information — all within 1 second. The EW operator is presented with a tabular display for threat identity and threat evaluation, and a tactical display giving a pictorial representation of the RF environment. Selected digital outputs can be sent to other local systems, a hard copy printout of the intercepted radar is also available. The tabular display can indicate 150 intercepts, in the order of priority. Cutlass is wide open in both bearing and frequency: that is, it does not employ sweep techniques, giving a very high intercept probability (nearly 100 per cent). Cutlass B1 uses the Cutlass processor and an Instantaneous Frequency Measurement (IFM) receiver. It has a 32-element array antenna to provide bearing measurement by phase analysis techniques. This antenna also provides RF for the IFM. In both systems the processor is provided with fast and accurate information on incoming pulses.

Specifications
Frequency coverage: 1-18 GHz
Accuracy: 2° RMS in bearing
Coverage: 360° azimuth; +40 to −10° elevation
Pulse density capability: 500,000/s
Radar store capability: 2,000 modes

Manufacturer/Contractor
Racal Radar Defence Systems Ltd, Chessington, Surrey, UK.

DECOYS

57 mm launchers

Two 57 mm multiple chaff and IR flare launchers in each ship.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Terma TDS

TDS is a distributed processor system based upon the Motorola 68000 series and designed to acquire data from various sensors, then to process and display it to assist in decision making and weapon selection. The system uses Pascal and C language software. The system interfaces with three radars (search, navigation and fire control) as well as the gun fire-control, missile, ESM, ECM and radio systems. The functions of TDS are to compile a picture of the tactical situation using automatic tracking from onboard and offboard radars (the latter through a datalink). It can allocate targets for gun and surface-to-surface missiles as well as conducting

surface-to-surface missile planning engagements and carrying out chaff and torpedo fire control. Recording, playback and hard-copy facilities are available and the system can be used for exercise simulation.

WEAPONS CONTROL

Contraves CGS-1 fire-control system

CGS-1 is the Danish designation for the Contraves Denezy fire-control system for the two twin 76 mm guns. It is a 1960s vintage analogue system, with an I-band tracking radar.

RADARS

Racal-Decca CWS-2

CWS-2 is the Danish designation for the Racal-Decca AWS-1 air search radar.

Specifications
CWS-2
Role: Air search
Frequency: D/E-band
Beam: 1.5 × 40°
Peak power: 750 kW
Gain: 32 dB
Pulsewidth: 0.35/1.5 µs
PRF: 1,000/400 pps
Scan rate: 10/20 rpm
Range: 60 n miles (110 km)
Company: Racal-Decca

Contraves CGS-1

An I-band fire-control radar, part of the 76 mm gun fire-control system.

CelsiusTech NWS-2

The I-band NWS-2 is normally used as part of the 9LV200 fire-control system, but appears to be used in these ships as a surface search radar.

Terma Pilot

The Pilot is an E/I-band navigation radar from the Danish company Terma.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors GM/EMD 16-567D3 diesels; 3.58 MW (4,800 hp) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME

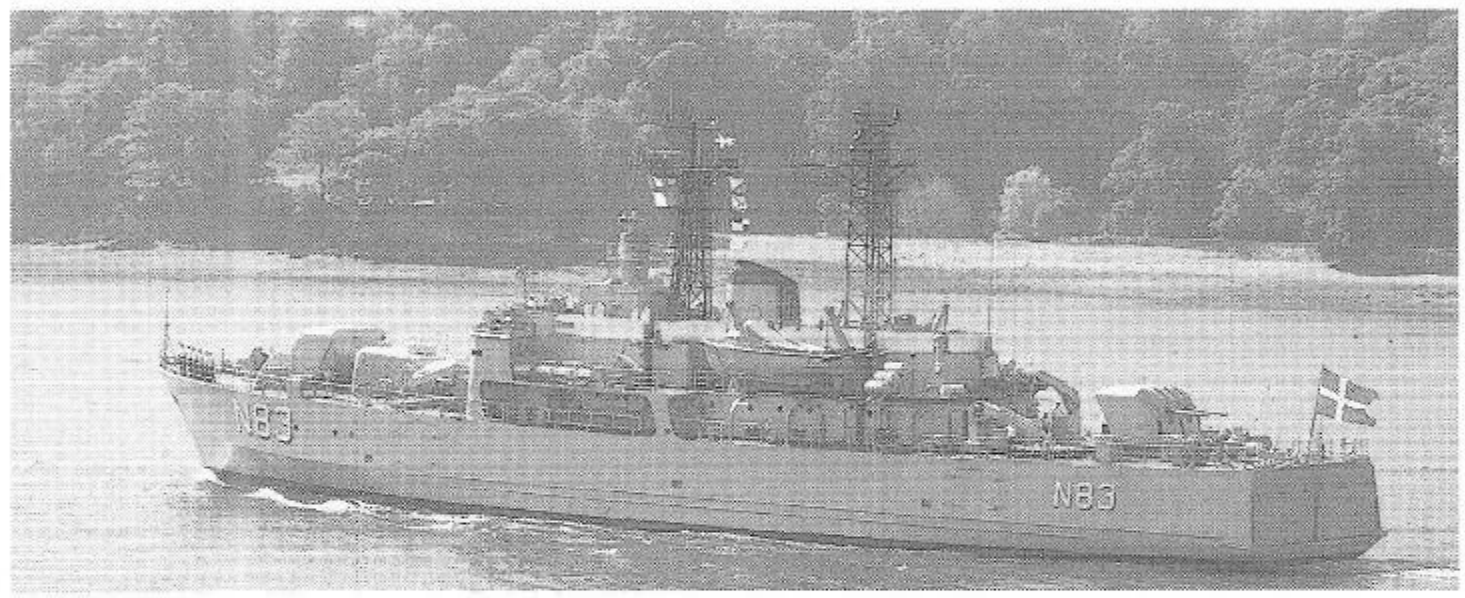
This is a Danish design for a large fast minelayer to lay mines in times of tension in 'choke points.' Five were built in Denmark: four for the Danish Royal Navy to lay mines in the Baltic Approaches and one for the Turkish Navy for a similar task in the Dardanelles. The four Danish ships were ordered in 1960-61 and launched 1962-63, they are named after Danish islands. The four Danish ships were funded 50:50 by the US and Danish governments, an arrangement which had recently taken over from the 100% US-funded Military Aid Program (MAP).

DESIGN

The ships have a steel, flush-decked hull with a raking stem, a prominent knuckle forward and a full stern. The mine deck forms a large internal hangar and there are four mine rails, enabling the mines to be laid speedily. The hull has been specially strengthened for ice navigation.

MODIFICATIONS

In 1987 *Sjaelland's* mainmast was raised, *Falster* and *Fyen* were similarly modified in 1989-91, and *Møen* completed in 1993.



Sjaelland *(N 83) (H M Steele)*

In 1976 *Sjaelland* was converted to act as a depot ship for submarines and fast attack craft, but retained its minelaying capability.

MODERNISATION

The ships have been refitted allowing them to serve until the late 1990s, possibly longer. This included installing a Terma command and control system.

Mine stocks have been updated in collaboration with Germany.

Twin Stinger SAM mountings may be fitted in due course.

OPERATIONAL

Sjaelland is used as a Command ship. *Møen* and sometimes *Fyen* are employed on midshipmen's training.

NUSRET (FALSTER)

GENERAL SPECIFICATIONS

Country of origin: Denmark
Operator: Turkey
Type: Falster (Minelayer)

Class: NUSRET

Purchased: 1
Active: 1

Displacement:
full load: 1,880 t

Dimensions
Length: 77 m (252.6 ft)
Beam: 12.6 m (41.34 ft)
Draught: 3.4 m (11.15 ft)

Speed: 17 kts

Complement: 153 (13 officers)

SHIPS

NUSRET (N 110)
Builder Frederikshavn Vaerft, Frederikshavn, Denmark
Launched 1964
Commissioned 16 Sep 1964

MINELAYING

SYSTEM

The minelaying system is fully automated and hydraulically operated. The ship will normally lay defensive minefields composed of both bottom and anchored mines, each preferably of two or more different types.

Bottom mines are laid at 17 knots (also the maximum speed of the 'Falster' class) or less in shallow waters. Anchored mines are launched at a speed of 10 to 12 knots. The time to lay a complete load of mines depends on the configuration of the minefield, navigational and weather conditions and type of mine, but would certainly be 'some hours'.

MINES

Average load is 400 mines, the actual number depending on the type of mine to be laid.

WEAPONS SYSTEMS

GUNS

US 76 mm (3 in) 50 Mk 33

Two twin 76 mm (3 in) 50: one on the foredeck in 'A' position, the second aft in 'Y' position. The Mk 33 is a twin-gun, power-driven, base-ring mount with local or remote control. All Mk 33 mounts use amplidyne elevation and training power drives. The guns used are the Mk 22 Mods 4 to 9 and each has an automatic loader Mk 2, capable of handling up to 50 rds/min. Four drum ammunition magazines are available.

Specifications

Traverse: 360° at 30°/s (manual)
Elevation: −14/15 to +85° at 24°/s (manual)
Mounting weight: 15.8 t
Rate of fire: 100 rds/min

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

2 Mk 63 GFCS

RADARS

Plessey CWS-2 (AWS-1)

This ship is sometimes reported as having either Selenia (now Alenia) RAN-7S or Selenia CWS-2 radars. In fact, the radar is a Plessey AWS-1 (designated CWS-2 by the Danish Royal Navy) with an Alenia antenna, which had originally been designed for the RAN-7S radar. It did not, however, pass the prototype stage. Similar combinations of Plessey AWS-1, with Alenia antennas, were installed in other Danish ships.

Specifications

CWS-2 (AWS-1)
Role: Air search
Frequency: D/E-band
Beam: 1.5 × 40°
Peak power: 750 kW
Gain: 32 dB
Pulsewidth: 0.35/1.5 µs
PRF: 1,000/400 pps
Scan rate: 10/20 rpm
Range: 60 n miles (110 km)

Manufacturer/Contractor

Siemens-Plessey, UK.

NAVIGATION

One I-band navigation radar; type unknown.

Western Electric AN/SPG-34

The Western Electric SPG-34 is associated with the Mk 63 GFCS. It works in the I/J-bands and produces a 3 × 3° conical scan beam for target acquisition and a 0.75° conical scan beam for target tracking.

Manufacturer/Contractor

Western Electric, USA.

PROPULSION

Specifications

System: Diesel
Main machinery: 2 General Motors GM/EMD 16-567D3 diesels; 3.58 MW (4,800 hp) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME

This is a Danish design for a large fast minelayer to lay mines in times of tension in 'choke points.' Five were built in Denmark: four for the Danish Royal Navy and one for the Turkish Navy to lay mines in the Dardanelles. The Turkish ship was fully funded by the USA.

DESIGN

The ship has a steel, flush-decked hull with a raking stem, a prominent knuckle forward and a full stern. The mine deck forms a large internal hangar and there are four mine rails.

TURKISH MINELAYERS

This ship is the only purpose-built minelayer in the Turkish Navy, but there are also three 'Mordogan' class coastal minelayers, which are converted LSM1s. However, minelaying tends to be an activity where the major effort is required at the very start of hostilities (or, perhaps, even earlier). Thus, a number of ships have a secondary minelaying capability, enabling them to lay their mines and then proceed on their primary missions. These include: 'Cakabey', 'Sarucabey' and 'Osman Gazi' class amphibious warfare ships; the ex-German 'Rhein' class support ships; and Mehmetcik, a controlled mineplanter.

MINELAYING

SYSTEM

Minelaying system is not known.

MINES

120 mines can be carried, of which the only identified type is the GEC-Marconi Stonefish.

GEC-Marconi Stonefish mines

Stonefish warstock mines have a plastic-bonded explosive warhead, which, together with the appropriate launch kit and a standard tail unit containing the sensors, signal-conditioning and processor package, can be configured to cover the range of launch vehicles, depths and targets. The basic sensor pack comprises acoustic, magnetic and pressure sensors. The signal processing includes signal conditioning and information processing, the setting of thresholds, mine logic and sterilisation delay times. The mine programme can be modified by means of a portable presetter, changing threat and operational conditions before the mine is deployed.

Stonefish warstock versions have a laid life of over 700 days and are intended to be laid at depths between 10 and 90 m (32.8 and 295 ft) for surface targets and down to depths of 200 m (656 ft) for submarine targets. They are up to 2 m (6.56 ft) in length, 533 mm (21 in) in diameter, with all-up weights up to 770 kg (1,698 lb), depending on configuration. The Stonefish presetter, designed as a self-contained unit, employs a microprocessor and incorporates built-in data checking during input and automatic test facilities.

Finnish minelayer Pohjanmaa *(01) was commissioned in 1979. Note the mixed equipment sources: Bofors 120 mm gun from Sweden; RBU-100 ASW mortar (just visible above pennant number) from Russia; EW equipment from the USA (cylindrical radome above cross trees on foremast); air search radar from the Netherlands (elliptical open mass radar between masts); main mine type is the British Stonefish.* (Pär-Henrik Sjöström)

Specifications
Stonefish Mk II Warstock Mine
Length: 1.8 m (5.94 ft)
Diameter: 533 mm (21 in)
Weight: 770 kg (1,698 lb)
Warhead: 500 kg (1,103 lb) PBX

Manufacturer/Contractor
GEC-Marconi Naval Systems, Waterlooville, Hampshire, UK.

SONARS

Simrad

Two hull-mounted, active, high-frequency sonars; one for bottom classification.

WEAPONS SYSTEMS

GUNS

Bofors TAK 120 mm (4.7 in)/46

There is a single Bofors 120 mm (4.7 in) gun in 'A' position on the foredeck, which is capable of firing 80 rds/min to a range of 10 n miles (18.5 km). The turret is also fitted with 103 mm (4 in) rails for illuminants. The water-cooled TAK 120 L/46 has two feed tables each holding six rounds, located on the sides of the automatic loader and beneath the ammunition compartments. They can be fed from either magazine, permitting the loading of two different kinds of ammunition.

The gun is normally served by two loaders and an operator; during manual operation the operator acts as the layer in training, while an additional man is responsible for elevation.

Specifications

Calibre: 120 mm
Length of barrel: 46 calibres
Muzzle velocity: 800 m/s (2,625 ft/s)
Traverse: 360° at 40°/s
Elevation: −10 to +80° at 32°/s
Mounting weight: 28.8 t
Crew: 3-4
Range: 10 n miles (18.5 km)
Rate of fire : 80 rds/min/barrel

Manufacturer/Contractor

CelsiusTech, Sweden.

Bofors SAK 40L/70-350

Two single Bofors 40 mm anti-air guns are mounted. The SAK 40L/70-350 mounting is equipped with electrohydraulic laying machinery and is remotely controlled from a central fire-control system or an optical director. It features gyrostabilised local control with hand-cranks for emergency use. Junction boxes for power, remote control and communications are built into the mounting.

Specifications

Mounting
Weight (unloaded): 2.89 t
Traverse: Nominal 360° at 85°/s
Elevation: −9 to +85° at 45°/s
Crew: 4

Specifications

Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000-1,025 m/s (3,280-3,363 ft/s)
Range:
anti-surface: 6.75 n miles (12.5 km)
anti-air (nominal): 6,900 m (22,632 ft)
Rate of fire: 300 rds/min (practical)
Ammunition: 2.21 kg (4.87 lb)

23 mm/87

There are two twin ZU-23-Sako mountings on the *Pohjanmaa*, consisting of two guns installed one above the other in separate cradles and on their sides so that it is fed from the side. The guns have 1.5 m (4.9 ft) long air-cooled barrels of monobloc construction with flash suppressors at one end and an exposed spring recuperator wrapped around the barrel near the breech. The mounting may be either hydraulically or manually operated. With ammunition the mounting weighs 1.735 tonnes and it has two on-mount operators and five loader-carriers.

Specifications

Calibre: 23 mm
Length of barrel: 87 calibres
Traverse: 360° at 80°/s
Elevation: −15 to +80° at 50°/s
Rates of fire: 200 rds/min/barrel
Projectile: 0.19 kg (0.42 lb)
Range:
anti-surface: 1.1 n miles (2 km)
anti-air: 1,500 m (4,920 ft)

12.7 mm machine guns

Two 12.7 mm machine guns are carried.

ANTI-SUBMARINE MORTARS

RBU 1200

Two Russian RBU 1200 launchers are mounted. RBU 1200 is believed to have a range not exceeding 1,200 m (3,936 ft).

Specifications

Length: 1.4 m (4.59 ft)
Range: 1,200 m (1,312 yd)
Warhead: 34 kg (74.95 lb)

DEPTH CHARGES

There are two depth charge racks.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

ArgoSystems Intercept

One radar intercept equipment; type not known.

ELECTRONIC COUNTERMEASURES (ECM)

Philax (Protean) 9CM/100 decoy launchers

The 9CM system is based upon the Philax fixed launcher which consists of four magazines similar to those used in DAGAIE and also uses Lacroix munitions. Usually the magazines contain chaff munitions but one may be replaced by an Infra-Red (IR) munitions magazine. The munitions are fired by a single cartridge in each of the four chaff groups or each of the three to six IR containers. Each chaff magazine has 36 × 40 mm grenades which are fired at an interval of 0.1 second per group and within 1 second begin to create a cloud with a 1,000 m² (10,800 sq ft) radar cross-section. This is complete within 5 seconds at a height of 40 to 60 m (130-197 ft).

Specifications

Philax
Length: 87.5 cm (2.9 ft)
Height: 72 cm (2.3 ft)
Width: 95 cm (3.1 ft)
Weight (unloaded): 180 kg (396.8 lb)

Manufacturer/Contractor

CelsiusTech, Sweden.

COMMAND AND CONTROL SYSTEMS

RADARS

Signaal DA-05

Specifications

DA-05
Role: Air/surface search
Frequency: E/F-band
Beam: 1.5 × 8°
Peak power: 1,200 kW
Gain: 32.2 dB
Pulsewidth: 1.3/2.6 µs
PRF: 1,000/500 pps
Scan rate: 10/20 rpm
Typical range (air target): 2 m² at 84 n miles (156 km) at 18,000 m (60,000 ft)

Manufacturer/Contractor

Hollandse, Signaalapparaten BV, Hengelo, Netherlands.

Celsius Tech 9LV 220

J-band fire-control radar.

Navigation radar

This is one I-band navigation radar; type unknown.

PROPULSION

Specifications

System: Diesel
Main machinery: 2 Wärtsilä-Vasa 16V22 diesels; 4.64 MW (6,300 hp(m)) sustained
Shafts: 2
Propellers: cp
Thruster: 1 bow thruster

FURTHER INFORMATION

The design was completed in 1976 and the ship was ordered in late 1977. The ship has a secondary role as a peacetime training ship, accommodating 70 trainees in Portacabins on the mine deck. There is a helicopter flight deck aft, but no other facilities.

Some modernisation was undertaken in 1992, including replacing the two forward 23 mm guns by 12.7 mm MGs.

MINELAYING

SYSTEM

There are four minerails, discharging the mines over the stern ramp.

MINES

Between 100 and 150 mines can be carried depending on the type.

SONARS

Simrad
These ships have a Simrad hull-mounted, active, mine detection, high-frequency sonar. Model is not known.

Hämeenmaa *(02), nameship of a class of three minelayers for the Finnish Navy. These ships have bow and stern doors which enable them to be employed as both minelayers and as ro-ro transports* (Pär-Henrik Sjöström)

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

Sadral/Mistral
The Sadral launcher, for Mistral IR-homing anti-aircraft missiles is located on the quarterdeck. Sadral is a remotely operated system on a two-axis stabilised mount. It is designed to provide self-protection for smaller second-echelon warships. The Sadral has six launcher-containers and a closed-circuit television camera. The deck mounting weighs 1,080 kg (2,380 lb) and is controlled from a below-deck console with the aid of a servo control unit.

Specifications
Length: 1.81 m (5.94 ft)
Diameter: 9.2 cm (3.6 in)
Wing span: 1.9 cm (6.23 in)
Weight: 18.4 kg (40.6 lb)
Speed: Mach 2.6
Range: 700 m to 5 km (2,300-16,400 ft)

Manufacturer/Contractor
Matra, France.

GUNS

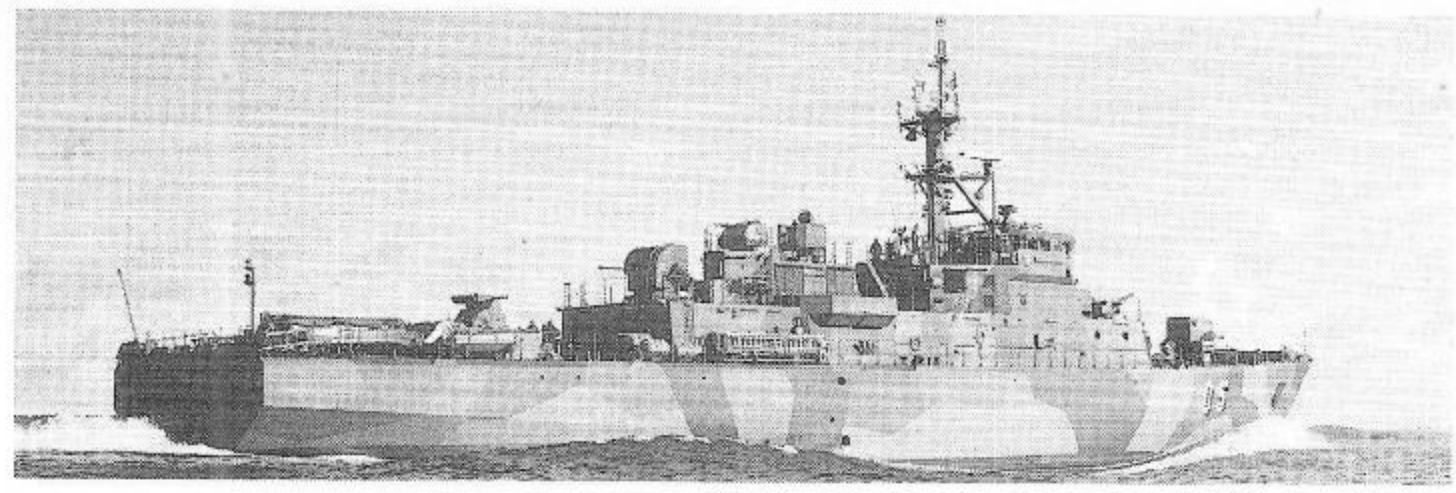
Bofors 40 mm/70-315
There are two SAK 40L/70-315 mountings; one on the foredeck, the second at the after end of the superstructure.

Specifications
Traverse: 360° (nominal) at 30°/s
Elevation: −3 to +85° at 24°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Max range:
anti-surface: 12 km (6.5 n miles)
anti-air: 4,000 m (2.2 n miles)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

Manufacturer/Contractor
Bofors Weapon Systems, Sweden.

Sako 23 mm/87
Two or three twin mountings are usually fitted per ship. The third mounting is interchangeable with the Sadral launcher.

Specifications
Calibre: 23 mm
Length of barrel: 87 calibres
Traverse: Unlimited at 80°/s
Elevation: −15 to +80° at 50°/s
Rates of fire: 200 rds/min/barrel
Projectile: 0.19 kg (0.42 lb)
Range:
anti-surface: 2 km (1.1 n miles)
anti-air: 1,500 m (4,900 ft)



Uusimaa *(05). Note the Sadral launcher on the quarterdeck, Bofors 40 mm and 23 mm twin mount. The object to the right of the 23 mm mount is the associated Officine Galileo fire-control director* (Pär-Henrik Sjöström)

ANTI-SUBMARINE MORTARS

RBU 1200
Two fixed five-tube RBU 1200 launchers are fitted per ship. This mounting is about 1.5 m (4.9 ft) high and has a pyramid-shaped pintle with five rocket launcher tubes; a row of three along the top and one each on either side. The tubes cannot be trained and have a maximum elevation of +65°. Each tube has a diameter of 250 mm (9.8 in), is 1.4 m (4.6 ft) long and is reloaded manually. The 70 kg (154 lb) RGB-12 rocket has a 34 kg (75 lb) warhead and a range of about 0.8 n miles (1.47 km).

Specifications
RBU-1200
Calibre: 250 mm (9.84 in)
Launcher tubes: 5
Elevation: +65°
Warhead: 34 kg (75 lb)
Range: 0.8 n miles (1.5 km)

DEPTH CHARGES

Two launchers.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

MATILDA radar threat warning receiver
MATILDA (Microwave Analysis Threat Indication and Launch Direction Apparatus), also known as Outfit UAR in the UK Royal Navy, covers the frequency range 7.5 to 18 GHz, and is intended to act primarily as a trigger for short-range chaff systems. It detects and recognises the threat, indicates bearing, and, if required, activates chaff launchers. There are three elements: a small, lightweight antenna covering 360° in azimuth; a processing unit; and a display. The antenna unit consists of four antenna horns which are circularly polarised for the detection of vertical-, horizontal- and circular-polarised signals. The warning unit consists of a small indicator panel designed to be located at any convenient position in the operations room. On detecting a threat, the unit sounds an audio warning and provides an indication of the threat and bearing sector channel. Total processing/warning time is claimed to be under 1 second.

Specifications
MATILDA
Frequency range: 7.5-18 GHz
Frequency resolution: 1.5 GHz
Pulsewidth range: 100 ns-6.4 µs
Pulsewidth resolution: 200 ns
Bearing coverage: 360°
Bearing resolution: 45°
Sensitivity (referred to isotropic): −30 dBm
Dynamic range: 40 dB
Antenna gain: 6-8 dB
Voice module: Programmable to any warning required in any language

Manufacturer/Contractor
THORN EMI Electronics Ltd, Sensors Group, Crawley, West Sussex, UK.

DECOYS

ML Aviation Superbarricade countermeasures system
Two launchers are fitted to each of the 'Hameenmaa' class. Superbarricade is an improved version of the widely used Barricade system and provides ships with means of deploying chaff and Infra-Red (IR) decoys to counter missile attacks, using a layered defence against the various types of anti-ship missile. The system uses a 102 mm rocket and a redesigned launcher with four sets of triple-cell launchers. The system has a similar control unit to Barricade Mk III and the same tactical computer. The ammunition lockers each contain 24 rockets. There are four decoy modes: confusion, distraction, dump and centroid.

Manufacturer/Contractor
ML Wallop Defence Systems, Andover, Hampshire, UK.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Radamec System 2400
System 2400 is a remotely operated electro-optic director equipped with thermal imager, daylight TV camera and laser rangefinder. It is designed for multiweapon use and includes a dedicated console which has the Ferranti GP250 digital predictor, a 14 in (35.5 cm) raster scan display.

Manufacturer/Contractor
Radamec Defence Systems Ltd, UK.

Officine Galileo electro-optic directors
There are two Officine Galileo directors for the 23 mm mounts, which are located immediately behind the mounts they serve. Model is believed to be OG.R7.

RADARS

Selesmar ARPA
Three Selesmar ARPA I-band surface search and navigation radars.

PROPULSION

Specifications

Propellers: 2 KaMeWa cp
Thruster: 1 bow thruster; 184 kW (247 hp(m))

FURTHER INFORMATION

PROGRAMME

These were originally ordered from Wärtsilä, but when that yard experienced financial difficulties the order was transferred to Finnyards at Rauma.

DESIGN

These seagoing ships have a dual role as minelayers and as transport/support ships. They have a steel hull, which is ice-strengthened (Ice Class 1A), and are capable of breaking up to 40 mm ice, employing a special cut-back stern. The superstructure is constructed from aluminium alloy.

There are ramps in both bow and stern. The stern ramp is used for minelaying, while the combination of bow and stern ramps enables them to be used as ro-ro transports.

MINELAYING CAPABILITIES

SYSTEM

Moored mines are stored on the hatch cover and are launched by derrick over the side. Others may be stowed in the hold.

MINES

They have only been seen carrying moored mines but there is no reason they could not launch other types.

WEAPONS SYSTEMS

GUNS

12.7 mm (0.50 in) machine guns
These two ships are armed with two 12.7 mm (0.5 in) machine guns. Like most Iranian equipment these are probably of Russian origin. Typically, their effective range will be approximately 1,500 m (1,600 yd), with a practical firing rate of 100 rounds/min.

ELECTRONIC SENSORS

RADAR

These ships appear to carry an I-band navigation radar.

PROPULSION

Specifications
System: Diesel
Main engines: 2 diesels, 1.62 MW (2,200 hp(m)) (see 'Further Information' below)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

Five of these ships were bought on the commercial market in 1980. They were built by Teraoka in Japan and operated commercially for approximately 10 years. They were then taken over by the navy and used primarily as minelayers although they also retain an amphibious capability.

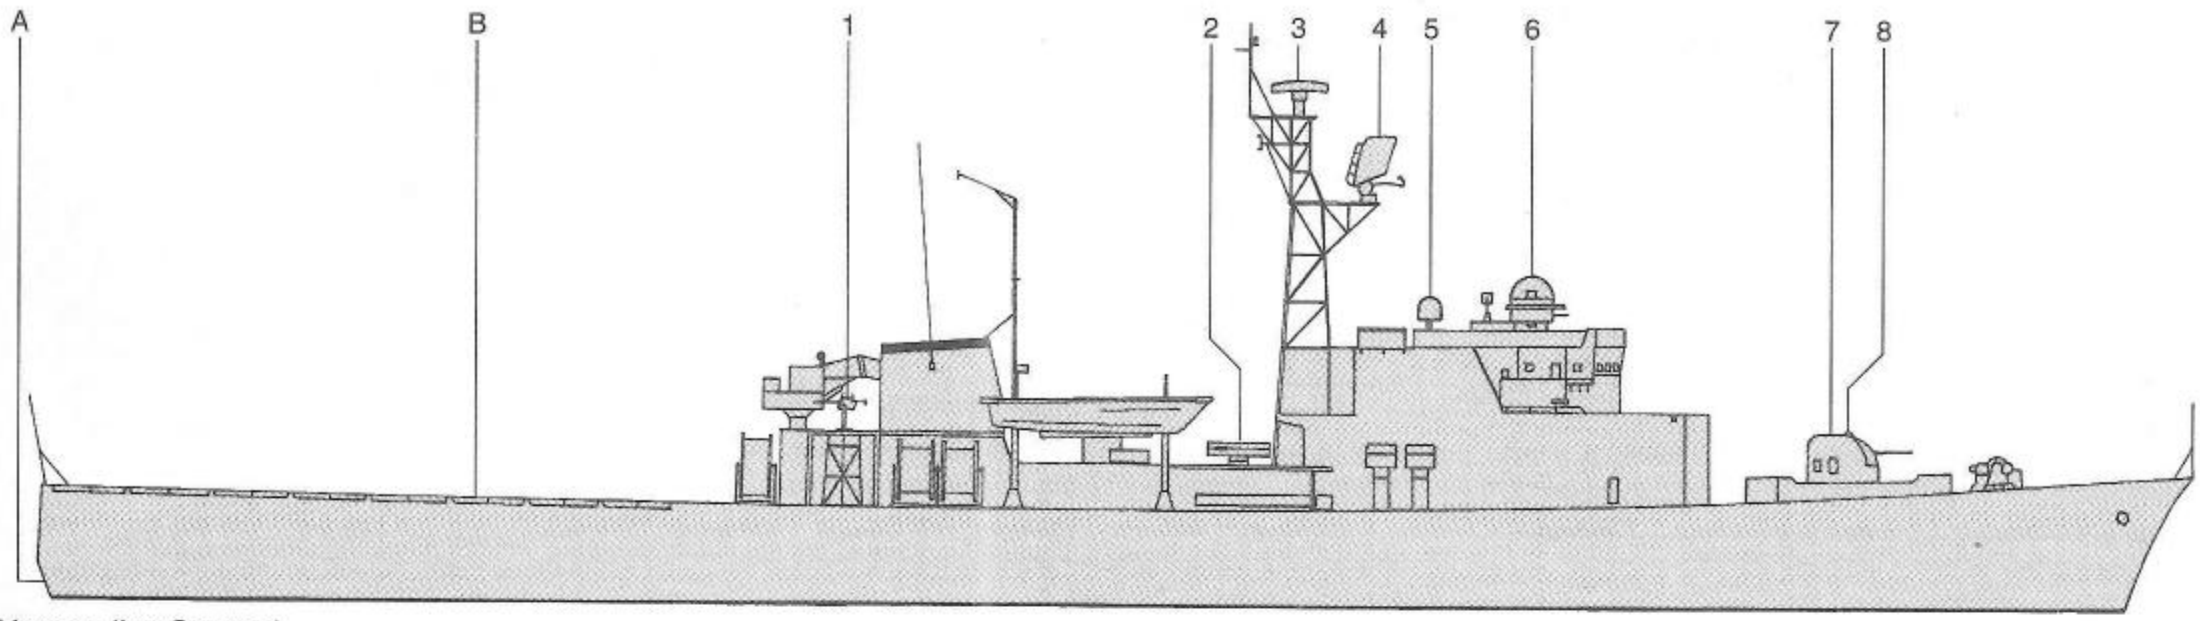
DESIGN

These are rudimentary amphibious ships, with a flat bow door, a cargo hold, and machinery and superstructure aft. It would appear that the ships are intended to off-load onto sloping ramps, rather than onto a beach. The engines in these ships may well be Ikegai MTU engines, as these were used in many other ships of this size, built in Japan in the 1970s.

DEPLOYMENT

Two were sunk in 1980 by Iraq at the start of the Iran-Iraq war, while a third, Iran Ajr, was captured by US Navy forces in 1987 while actually engaged in minelaying and was scuttled by them. The remaining two are both in service.

HAYASE



Hayase (Ian Sturton)
Minelaying A *Five minerails launching through transom* **B** *Flight deck for S-80M-1 Sea Dragon MCM helicopter*

General 1 *Hughes Sea Vulcan* **2** *324 mm torpedo tubes* **3** *JRC OPS-16 surface search radar* **4** *MELCO OPS-14B air search radar* **5** *Satcom* **6** *GFCS Mk 63* **7** *US 76 mm (3 in)/50 gun* **8** *AN/SPG-34 tracking radar (on port side of gun shield)*

GENERAL SPECIFICATIONS

Operator: Japan
Type: Minelayer

Class: HAYASE

Built: 1
Active: 1

Displacement:
standard: 2,000 t

Dimensions
Length: 99 m (324.8 ft)
Beam: 14.5 m (47.6 ft)
Draught: 4.2 m (13.8 ft)

Speed: 18 kts

Complement: 180

SHIPS

HAYASE (MST 462)
Builder Ishikawajima Harima, Tokyo, Japan
Commissioned 6 Nov 1971

MINELAYING

SYSTEM

Five rails, discharging mines through the stern door.

MINES

- The JMSDF uses mainly US-designed mines manufactured under licence in Japan. Mines in service include: Type 55 moored, horned mine: Type 56 moored, antenna contact mine; Type 70 bottom-lying influence mines.
- Stated load is 116 mines although this seems unlikely. The 'Souga' class minelayer, with a virtually identical hull is stated to carry 460 mines.

SONARS

AN/SQS-11A

AN/SQS-11A is a 1960s-vintage US Navy sonar, operating at 20 kHz with a range of some 1,500 m (1,600 yd). It is a hull-mounted, active, search and attack set.

WEAPONS SYSTEMS

TORPEDOES

324 mm Type 68 (2 triple) tubes

Six 324 mm Type 68 (2 triple) tubes for Mk 46 Mod 5 Neartip torpedoes:

Specifications

Mk 46 Mod 5
Length: 2.59 m (8.5 ft)
Diameter: 324 mm
Weight: 230 kg (507 lb)
Warhead: 44 kg (97 lb) HE
Propulsion: Liquid propellant
Speed: 45 kts (max)
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,508 ft) (estimated)

Manufacturers/Contractors

Alliant TechSystems, USA.
Mitsubishi Heavy Industries, Japan.

GUNS

US 76 mm (3 in)/50 Mk 33

One twin 76 mm (3 in) 50 on the foredeck in 'A' position. The Mk 33 is a twin-gun, power-driven, base-ring mount with local or remote control. All Mk 33 mounts use amplidyne elevation and training power drives. The guns used are the Mk 22 Mods 4 to 9 and each has an automatic loader Mk 2, capable of handling up to 50 rds/min. Four drum ammunition magazines are available. The Mods 4 and 7 mountings have environmental shields made from either GRP and aluminium, for protection against icing and bad weather.

Specifications

Traverse: 360° at 30°/s (manual)
Elevation: −14/15° to +85° at 24°/s (manual)
Mounting weight: 15.8 t
Rate of fire: 100 rds/min

Hughes 20 mm/76 Sea Vulcan 20P/ JM-1MB

Two Hughes 20 mm/76 Sea Vulcan 20P mountings, with three barrels per mounting. The Sea Vulcan 20P is a manually operated weapon which has been adopted by the Japanese Maritime Self-Defense Force as JM 61MB, and is, in essence, an M-197 gun on the mounting of the old 20 mm single US Navy Oerlikon Mk 10. The M-197 gun is an externally powered weapon using a cluster of three 20 mm barrels. Each barrel is 1.52 m (5.0 ft) long and weighs 8.18 kg (18 lb). The weapon uses Mk 149 APDS, Mk 220 TPT and Mk 246 HEI-TSD and each barrel has a life of 15,000 rounds.

Specifications

Calibre: 20 mm
Length of barrel: 76 calibres
Muzzle velocity: 1,030 m/s (3,380 ft/s)
Rate of fire: 600-1,200 rds/min
Weight of shell: 294 g (10.4 oz)
Range (effective):
anti-surface: 1 n mile (1.85 km)
anti-air: 1,200 m (4,000 ft)
Traverse: 360°
Elevation: −15 to +75°

Manufacturer/Contractor

General Electric Company, Armament Systems Department (Sea Vulcan).

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

US GFCS Mk 63
Provides control of 76 mm guns.

Manufacturer/Contractor
Mitsubishi Electric Corporation (MELCO), Tokyo, Japan.

RADARS

Mitsubishi OPS 14B
OPS-14B is a B/C-band air search radar. Peak power is 400 kW and beamwidth is 5°.

JRC OPS 16
OPS-16 is a surface search radar, operating in the D-band.

Western Electric SPG-34
The Western Electric SPG-34 is associated with the Mk 63 GFCS. It works in the I/J-bands and produces a $3 \times 3°$ conical scan beam for target acquisition and a 0.75° conical scan beam for target tracking.

AVIATION

AVIATION FACILITIES

Specifications
Flight deck: There is a large flight deck aft
Hangar: No hangar

Helicopters: The flight deck will accommodate one Mitsubishi/Sikorsky S-80M-1 Sea Dragon, a licence-built version of the Sikorsky MH-53E mine counter-measures helicopter.

PROPULSION

Specifications
System: Diesel
Main machinery: 4 Kawasaki-MAN V6V22/30ATL diesels; 4.7 MW (6,400 hp(m))
Shafts: 2

FURTHER INFORMATION

PROGRAMME

Hayase (MST 462) and *Souya* (MMC 951) were laid down and built at the same time, are approximately the same size, and both serve as MCM Flotilla flagships. They are, however, of quite different design.

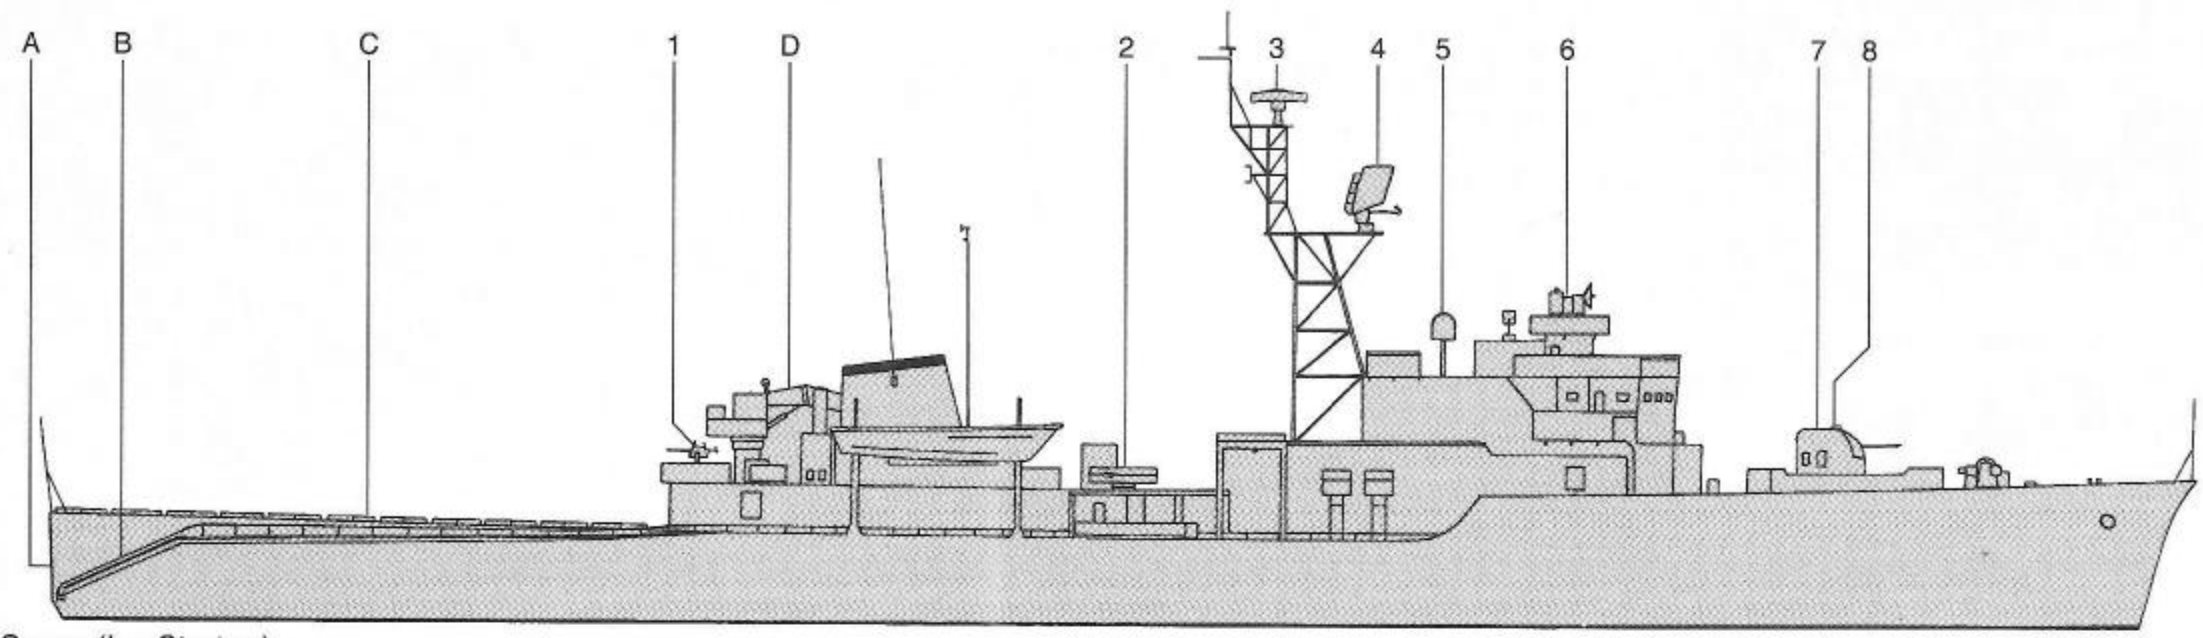
DEPLOYMENT

Hayase served as flagship of the JMSDF deployment to the Gulf in 1991, and is normally employed as flagship for Minesweeper Flotilla One based at Kure.

THE FUTURE

Two new minelayers/MCMV support ships are under construction. *Souya* will be replaced by the first and *Hayase* by the second.

SOUYA



Souya (Ian Sturton)

Minelaying A *Stern door; four minerails* **B** *Side minelaying rails (two)* **C** *Flight deck for S-80M-1 Sea Dragon MCM helicopter* **D** *Crane*

General 1 *Hughes 20 mm/76 Sea Vulcan, JM-1MB* **2** *324 mm torpedo tubes* **3** *JRC OPS-16 surface search radar* **4** *MELCO OPS-14B air search radar* **5** *Satcom* **6** *MELCO GFCS-1B fire-control system* **7** *US 76 mm (3 in)/50 gun* **8** *AN/SPG-34 fire-control radar (on port side of gunhouse)*

GENERAL SPECIFICATIONS

Operator: Japan
Type: Minelayer

Class: SOUYA

Built: 1
Active: 1

Displacement:
standard: 2,150 t
full load: 3,300 t

Dimensions
Length: 99 m (324.8 ft)
Beam: 15 m (49.5 ft)
Draught: 4.2 m (13.9 ft)

Speed: 18 kts
Range: 7,500 n miles at 14 kts

Complement: 185

SHIPS

SOUYA (MMC 951)
Builder Hitachi, Maizuru, Japan
Launched 31 Mar 1971
Commissioned 30 Sep 1971

MINELAYING

SYSTEM

There are six internal mine rails in the mine deck which discharge through doors in the transom. There are also two external rails discharging down sloping ramps on either side of the stern.

MINES

460 buoyant

SONARS

AN/SQS-11A
AN/SQS-11A is a 1960s vintage US Navy sonar, operating at 20 kHz, with a range of some 1,500 m (1,600 yd). It is a hull-mounted, active, search and attack set.

ZQS-1B
The ZQS-1B bow-mounted, active, search and attack, high-frequency set is the standard JMSDF mine avoidance sonar. It is a licence-produced version of the British Type 193M.

WEAPONS SYSTEMS

TORPEDOES

324 mm Type 68 (2 triple) tubes
Six 324 mm Type 68 (2 triple) tubes for Mk 46 Mod 5 Neartip torpedoes.

Specifications

Rate of fire: 600-1,200 rds/min

Weight of shell: 294 g (10.4 oz)
Range (effective):
anti-surface: 1 n mile (1.85 km)
anti-air: 1,200 m (4,000 ft)

Traverse: 360°
Elevation: −15 to +75°

Manufacturer/Contractor
General Electric Company, USA.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Mitsubishi GFCS-1B fire-control system
Souya is fitted with the Gunfire Control System Model 1B (GFCS-1B), also known as the Type 72.

Manufacturer/Contractor
Mitsubishi Electric Corp (MELCO), Tokyo, Japan.

RADARS

Mitsubishi OPS 14B
OPS-14B is a B/C-band air search radar. Peak power is 400 kW and beamwidth is 5°.

Manufacturer/Contractor
Mitsubishi Electric Corporation (MELCO), Tokyo, Japan.

JRC OPS 16
OPS-16 is a surface search radar, operating in D-band.

Manufacturer/Contractor
JRC, Tokyo, Japan.

Western Electric SPG-34
The Western Electric SPG-34 is associated with the GFCS-1B. It works in the I/J-bands and produces a 3 × 3° conical scan beam for target acquisition and a 0.75° conical scan beam for target tracking.

Manufacturer/Contractor
Western Electric, USA.

IFF
US Mk 10.

AVIATION

AVIATION FACILITIES

Specifications
Flight deck: There is a large flight deck aft
Hangar: No hangar

Helicopters: The flight deck will accommodate one Mitsubishi/Sikorsky S-80M-1 Sea Dragon, a licence-built version of the Sikorsky MH-53E mine counter-measures helicopter

PROPULSION

Specifications
System: Diesel
Main machinery: 4 Kawasaki-MAN V6V 22/30 ATL diesels; 4.7 MW (6,400 hp(m))
Shafts: 2

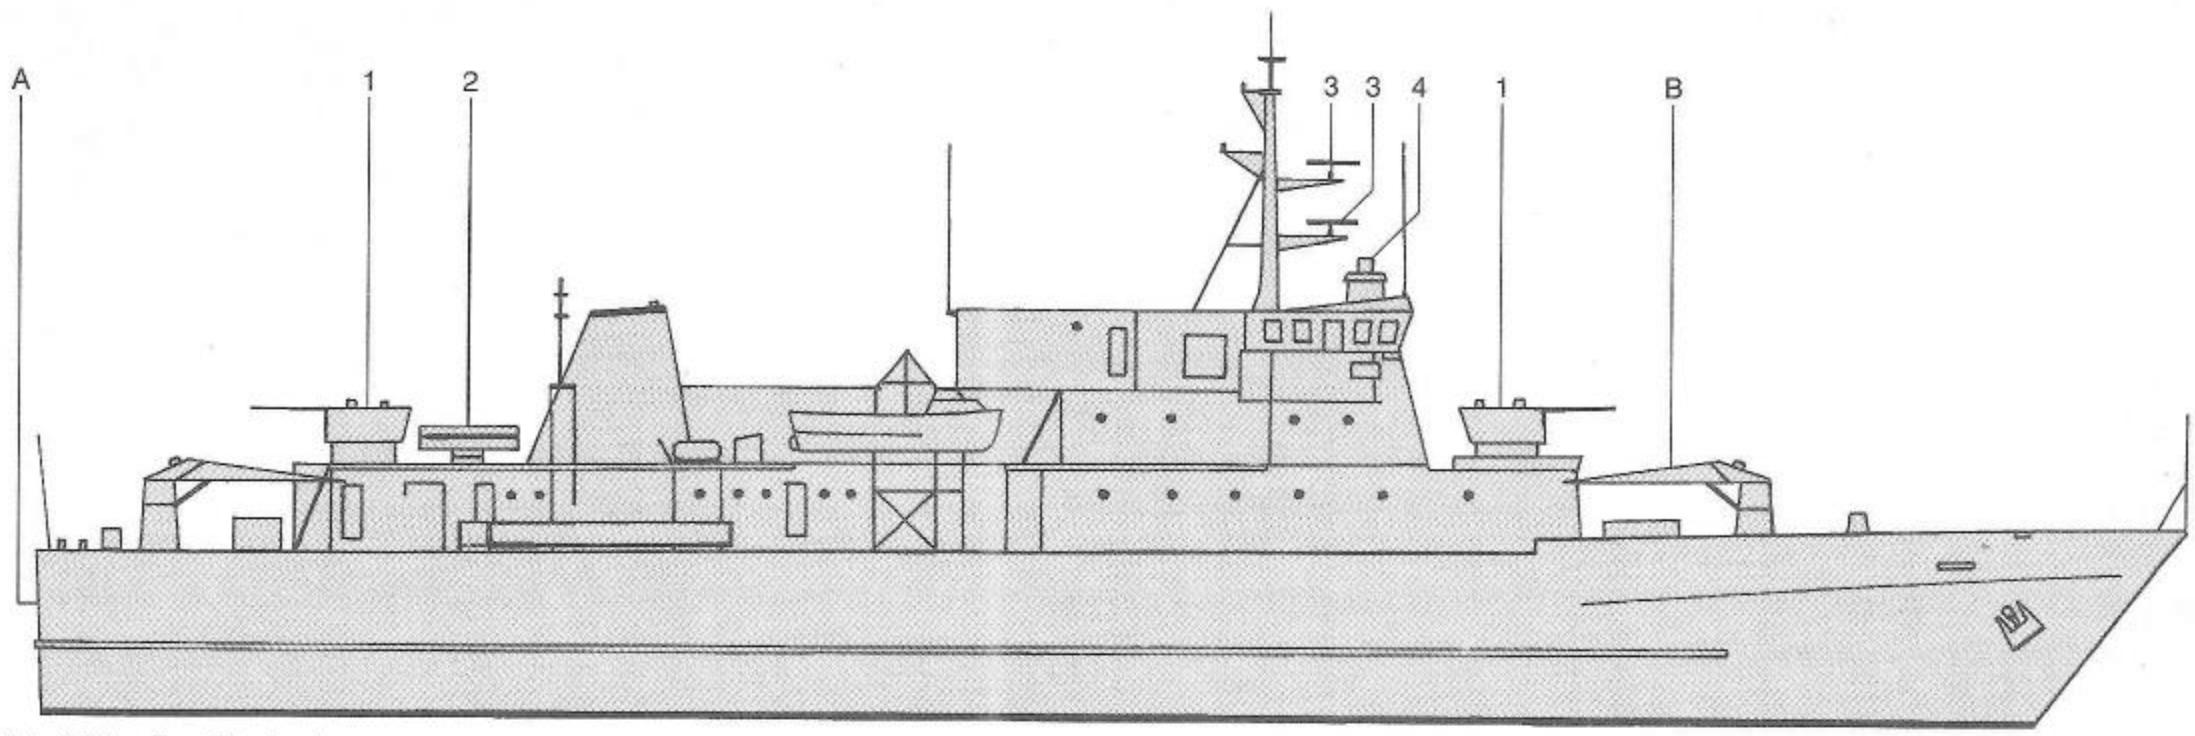
FURTHER INFORMATION

Souya was built in the same time-frame as *Hayase*, but differs in having a forecastle, two sonars and a greater mine capacity. Like *Hayase*, however, *Souya* is a dual-purpose ship, used as a minelayer with a minesweeper support ship, in which role it also serves as flagship for Minesweeper Flotilla Two based at Yukosuka.

THE FUTURE

It is planned that *Souya* will be paid off in 1997, being replaced by the first of the new minelayers.

VIDAR



Vale/Vidar (Ian Sturton)
Minelaying A *Stern door; three rails* **B** *Cranes (two)*

General 1 *Bofors 40 mm/70-315* **2** *324 mm torpedo tubes* **3** *Racal-Decca TM 1226 surface search/navigation radar* **4** *Saab TV3-300 electro-optic director*

GENERAL SPECIFICATIONS

Operator: Norway
Type: Minelayer

Class: VIDAR

Built: 2
Active: 2

Displacement:
standard: 1,500 t
full load: 1,673 t

Dimensions
Length: 64.8 m (212.6 ft)
Beam: 12 m (39.4 ft)

Speed: 15 kts

Complement: 50

SHIPS

VIDAR (N 52)

Builder	Mjellem and Karlsen, Bergen, Norway
Launched	18 Mar 1977
Commissioned	21 Oct 1977

VALE (N 53)

Builder	Mjellem and Karlsen, Bergen, Norway
Launched	5 Aug 1977
Commissioned	10 Feb 1978

MINELAYING

SYSTEM

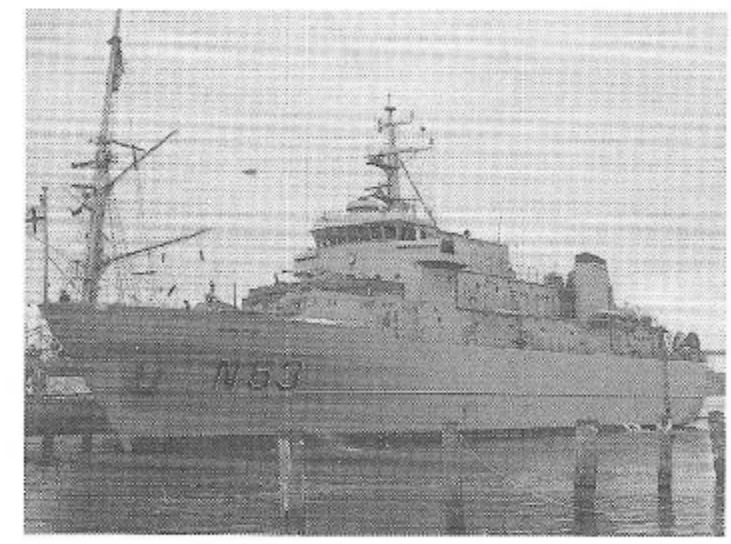
The mines are carried on three decks, with an automatic elevator between them. The mines are loaded through forward and aft hatches, each being served by two cranes. The main deck is equipped with three mine rails which lay the mines through doors in the stern.

MINES

300 to 400 depending on size and type.

SONAR

Simrad SQ-3D
SQ-3D is a hull-mounted search and attack sonar, operating at 24 kHz, with a maximum range of 2,500 m (2,734 yd).



Vale *(N 53)* (H & L van Ginderen Collection)

WEAPONS SYSTEMS

TORPEDOES

324 mm US Mk 32 torpedo tubes
These ships mount six (two triple) 324 mm torpedo tubes for Mk 46 Mod 5 torpedoes. The Mk 46 is a deep-diving, high-speed torpedo fitted with active/passive acoustic homing and is intended mainly for use against submarines.

Specifications
Mk 46 Mod 5
Length: 2.59 m (8.5 ft)
Diameter: 324 mm
Weight: 230 kg (507 lb)
Warhead: 44 kg HE (97 lb)
Propulsion: Liquid propellant
Speed: 45 kts (max)
Range: 5 n miles (9.25 km)
Acquisition range: 460 m (1,508 ft) (estimated)

Manufacturer/Contractor
Alliant TechSystems, USA.

GUNS

Bofors 40 mm/70-315
There are two SAK 40L/70-315 AA guns. This is a manually laid mounting in which the gun platform is on a pedestal. The mounting has a protective shield and includes ammunition racks for 96 rounds.

Specifications
40 mm/70-315
Traverse: 360° (nominal) at 30°/s
Elevation: −3 to +85° at 24°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Max range:
anti-surface: 6.5 n miles (12 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

Manufacturer/Contractor
Bofors Weapon Systems, Sweden.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Saab TVT-300 electro-optic director

The Saab TVT-300 director tracks objects automatically, using the optical contrasts of an object against its background as seen by a TV camera. The system consists of a TV camera on a gyrostabilised platform, a monitor, and an electronics unit containing video processing and servo-control circuits. The operator uses a joystick to place an electronic 'window' on the target. Automatic tracking is then initiated, with the servo-control circuits keeping the 'window' centred on the target contrast and aligning the target to the centre of the camera field of view. The platform angular positions in bearing and elevation are used for automatic tracking of the guns, which are slaved to the system.

Specifications
Traverse: 360°
Elevation: −30 to +85°
Speed (elevation and traverse): 40°/s

Manufacturer/Contractor
Saab Missiles, Linkoping, Sweden.

RADAR

Racal-Decca TM 1226

I-band surface search/navigation radar. Two per ship.

Specifications
TM 1226
Role: Surface search
Frequency: I-band
Beam: 1.2°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25/1 µs
Scan rate: 28 rpm

Manufacturer/Contractor
Racal-Decca, UK.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Wichmann 7AX diesels; 3.1 MW (4,200 hp(m))
Thruster: 1 bow thruster, 312 kW (425 hp(m))
Shafts: 2

FURTHER INFORMATION

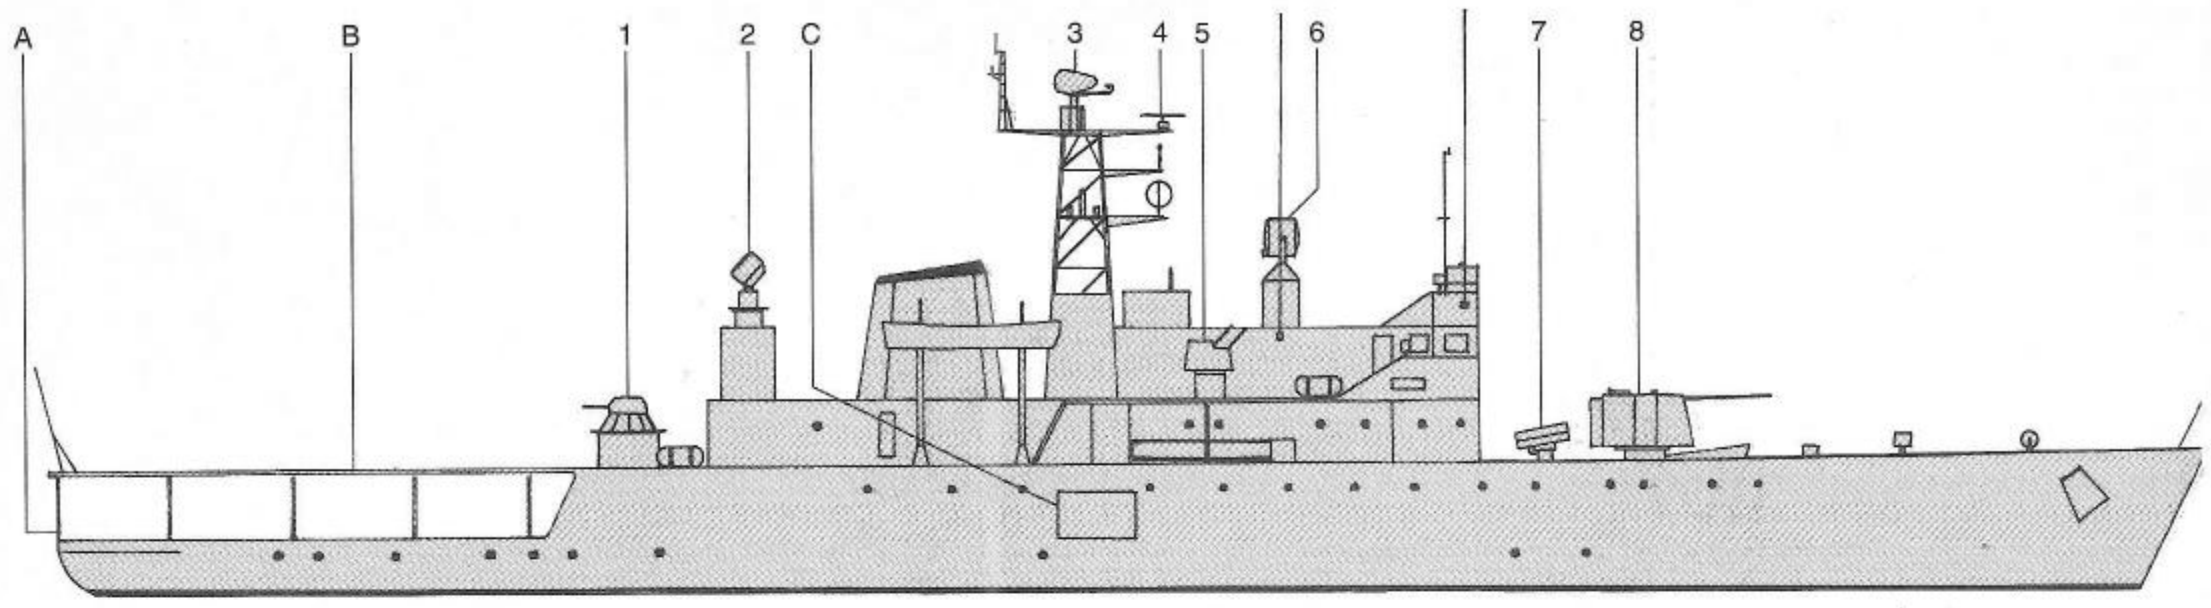
PROGRAMME

These two ships were ordered on 11 June 1975, laid down in 1976 and entered service in 1977 *(Vidar)* and 1978 *(Vale)*.

DESIGN

These are versatile ships that can perform a number of roles in addition to minelaying, including transports, ASW escorts (for which they mount six ASW torpedo tubes), torpedo recovery, offshore patrols and fishery protection. In war they would be supplemented as minelayers by commercial ships such as ro-ro ferries.

COSAR



Cosar (Ian Sturton)
Minelaying A *Two mine rails, discharging over the stern* **B** *Flight deck* **C** *Mine loading ports*

General 1 *AK-230 twin 30 mm CIWS (two)* **2** *Drum Tilt radar fire director (AK-230)* **3** *Strut Curve air/surface search radar* **4** *Don 2 navigation radar* **5** *Type 82 twin 14.5 mm machine gun (two)* **6** *Muff Cob radar fire director (76 mm gun)* **7** *RBU 1200 ASW mortar* **8** *57 mm/70 gun*

GENERAL SPECIFICATIONS

Operator: Romania
Type: Minelayer/MCM support

Class: COSAR

Built: 2
Active: 2

Displacement:
standard: 1,200 t
full load: 1,450 t

Dimensions
Length: 79 m (259.1 m)
Beam: 10.6 m (34.8 ft)
Draught: 3.6 m (11.8 ft)

Speed: 19 kts

Complement: 75

SHIPS

VICE ADMIRAL IOAN MURGESCU (271)
Builder Mangalia Shipyard, Mangalia, Romania
Commissioned 30 Dec 1980

VICE ADMIRAL CONSTANTIN BALESCU (274)
Builder Mangalia Shipyard, Mangalia, Romania
Commissioned 16 Nov 1981

MINELAYING

SYSTEM

In these Romanian ships the mines are discharged from the after deck over the stern, whereas virtually all other dedicated minelayers have their mine rails inside an enclosed mine deck and discharge them through doors in the transom. There are two sets of mine rails and in view of the number of mines these rails must extend well inside the superstructure.

MINES

Up to 200 mines, depending on type.

SONAR

Tamir II
This hull-mounted active search sonar was originally based on a copy of a British wartime searchlight sonar. It is a general purpose sonar, but is probably used in this application for bottom survey.

WEAPONS SYSTEMS

GUNS

57 mm/70
These ships have a single 57 mm in a 'tub' mounting in 'A' position. The air-cooled 57 mm ZIF-31B is a conventional weapon using a vertical wedge breech block with the casing containing part of the loading system while the elevation gear is below it. Rounds are fed into the loading system at the top of the gun with the clips being removed as the individual rounds are fed onto the loading tray. The round is automatically fed into the breech where the block is locked as it moves forward from recoil. Subsequently the breech opens and extractor arms remove the spent round and eject it.

Specifications
ZIF-31B
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Traverse: 360° at 25°/s
Elevation: −10 to +85° at 40°/s
Crew: 5
Range:
anti-surface: 4.52 n miles (8.4 km)
anti-air: 4,500 m (14,760 ft)
Rate of fire: 120 rds/min
Ammunition: 2.81 kg (6.2 lb)

30 mm/65 AK-230 twin mounting
There are two twin AK-230 turrets. The AK-230 is a remotely operated, twin barrel, automatic anti-aircraft gun designed to engage air targets at heights of up to 4,000 m (13,120 ft). It is also capable of engaging surface targets at ranges up to 2.2 n miles (4 km). There are two 64.2 calibre, water-cooled, NN30 guns, each with a liner and a rotating breech with four chambers. The elevating mechanism is on the carriage together with a compressed air tank and associated equipment for the loading system. Russian ammunition for this weapon consists of two rounds; BR-83 and OF-83D (see Specifications). The fire-control radar is the I/J-band *Rys* (NATO = Drum Tilt), whose maximum acquisition range is approximately 22 n miles (40 km), with each radar director controlling two gun mountings.

Specifications
NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,444 ft/s)

Vice Admiral Ioan Murgescu (271) is one of two combined minelayers and MCMV support ships, but is the only one with a flight deck (Romanian Navy)

Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,120 ft)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s
Mounting weight: 1,857-1,905 kg (4,094-6,248 lb)
Crew: 2 (off mount)

Type 82 14.5 mm machine guns

Two twin mounts. These are Russian-designed weapons, produced in China and exported to Romania.

Specifications

Type 82
Calibre: 14.7 mm
Length of barrel: 93 calibres
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Range (max): 7,000 m (7,700 yd)
Rate of fire: 600 rds/min/barrel
Traverse: 360°
Elevation: −5 to +90°

ANTI-SUBMARINE MORTARS

RBU 1200

Two fixed five-tube RBU 1200 launchers are fitted per ship. This mounting is about 1.5 m (4.9 ft) high and has a pyramid-shaped pintle with five rocket launcher tubes; a row of three along the top and one each on either side. The tubes cannot be trained and have a maximum elevation of +65°. Each tube has a diameter of 250 mm, is 1.4 m (4.6 ft) long and is reloaded manually. The 70 kg (154 lb) RGB-12 rocket has a 34 kg (75 lb) warhead and a range of about 0.8 n miles (1.5 km).

Specifications

RBU-1200
Calibre: 250 mm
Launcher tubes: 5
Elevation: +65°
Warhead: 34 kg (75 lb)
Range: 0.8 n miles (1.5 km)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Watch Dog

One Watch Dog radar warning receiver covering the band 1 to 12 MHz. There is also at least one DF loop antenna.

COMMAND AND CONTROL SYSTEMS

RADARS

Strut Curve

Strut Curve is an F-band air/surface search radar.

Don 2

A standard Russian I-band navigation radar.

Muff Cob

Muff Cob is the fire-control system for the 57 mm gun. Its antenna array is in a 1 m (3.28 ft) wide, weatherproof mounting suspended from a trunnion-yoke carried on a traversing mounting on the mast. The radar is supplemented by an electro-optic sensor. The height of the mounting is about 3 m (9.8 ft) and the H-band radar can probably tilt from −10 to +50° as with the gun mounting.

Drum Tilt

Drum Tilt is the H/I-band radar used in the fire-control system for the AK-630 CIWS. Normally there is one Drum Tilt to each pair of AK-630s, but it appears that in this ship the single Drum Tilt controls both pairs.

AVIATION

Specifications

Vice Admiral Ioan Murgescu (271) only
Flight deck: There is a flight deck at the stern, which, coincidentally, provides some shelter for the mine rails underneath.
Hangar: There is no hangar
Helicopters: The only aircraft likely to be used is the IAR-316, a licence-built version of the Alouette IIIB.

PROPULSION

Specifications

System: Diesel
Main machinery: 2 diesels; 4.7 MW (6,400 hp(m))
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These two minelayers were part of the major warship-building programme undertaken by the Ceausescu regime in the early 1980s.

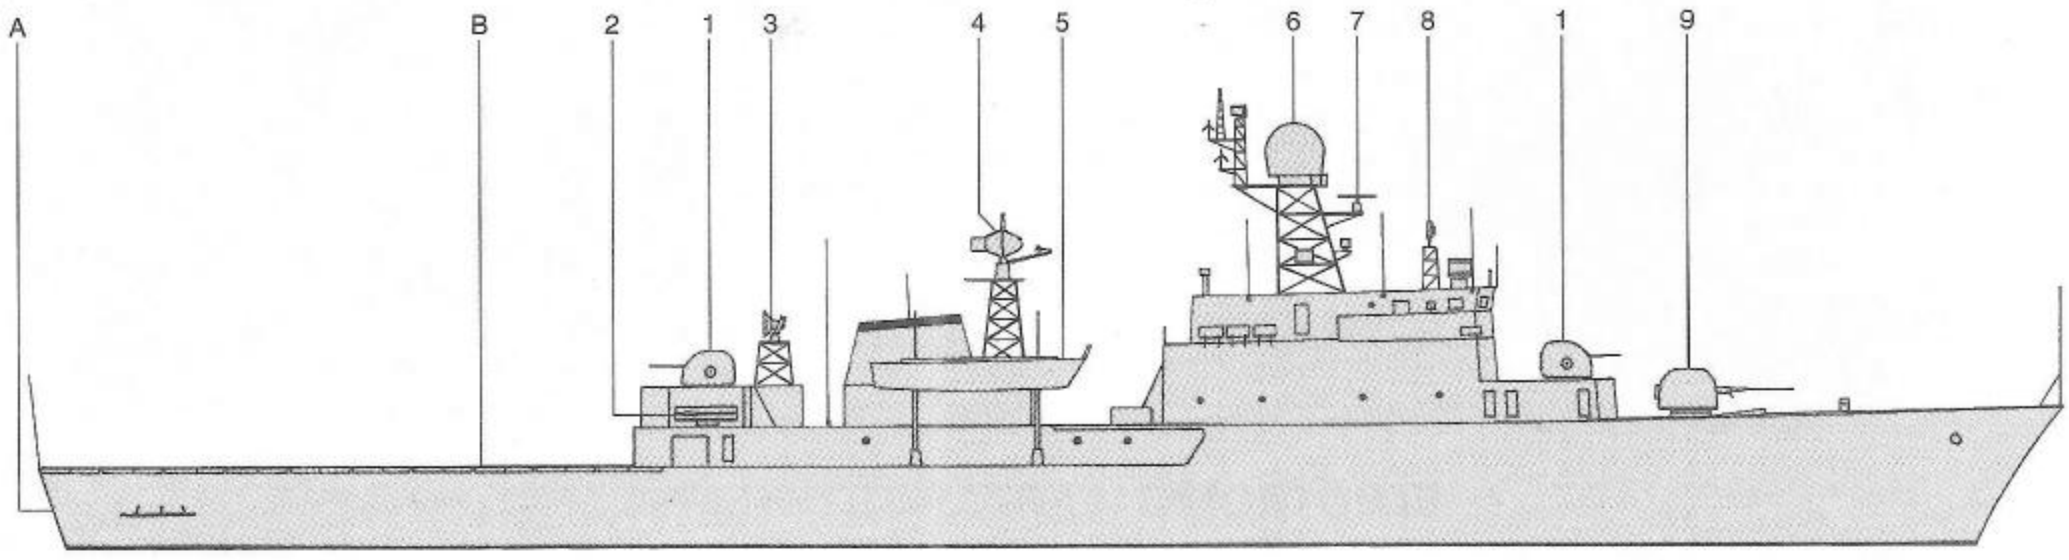
DESIGN

These ships appear to use the same hull as the survey/research ship *Grigore Antipa;* the particulars are virtually identical, although there are, of course, differences in the superstructure and layout.

The two ships in the class are different from each other in that *Vice Admiral Ioan Murgescu* (271) has a helicopter platform aft, while *Vice Admiral Constantin Balescu* (274) does not, mounting a large crane on the after deck, instead.

Recognising that the minelaying tasks will be completed soon after the outbreak of hostilities, these ships have a secondary role as Mine CounterMeasure Vessel (MCMV) command and support ships.

SOUTH KOREA MINELAYER



Korean Minelayer (Ian Sturton)
Minelaying A *Stern doors for two mine rails* **B** *flight deck*

General 1 *OTOBREDA 40 mm/70 compact* **2** *Triple 324 mm torpedo tubes (two)* **3** *Electro-optic director* **4** *Air search radar* **5** *LCVP* **6** *Surface search radar* **7** *Navigation radar* **8** *Electro-optic director* **9** *OTOBREDA 76 mm (3 in)/62 gun*

Dimensions
Length: 103.8 m (340.5 ft)

Beam: 15 m (49.2 ft)
Draught: 3.4 m (11.2 ft)

Speed: 22 kts
Range: 4,500 n miles at 15 kts

Complement: 160

MINELAYING

SYSTEM

There will be two mine rails in the hull, laying mines through two large doors in the transom. Loading will be done using two derricks forward.

MINES

Estimated 300 to 400, depending on type.

AVIATION FACILITIES

There will be a large helicopter flight deck, but no hangar.

WEAPON SYSTEMS

TUBES

Six 324 mm US Mark 32 Mod 5 (two triple) torpedo tubes will be fitted in each ship.

Specifications
Length: 3.43 m (11.25 ft)
Height: 1.26 m (4.13 ft)
Width 94.3 cm (3.09 ft)
Tubes: 3
Tube diameter: 324 mm (12.75 in)

GUNS

OTOBREDA 76 mm (3 in)/62 Compact
There is one OTOBREDA 76 mm (3 in) gun sited in the 'A' position on the foredeck for use in either air defence or anti-surface roles. If the weapon is designated to the air-defence solution, the command and control system will decide whether the target should be engaged by gun, missile or electronic emission.

Specifications
Calibre: 76 mm (3.0 in)
Length of barrel: 62 calibres
Traverse: 360° at 70°/s
Elevation: −15 to +85° at 40°/s
Muzzle velocity: 900 m/s (2,952 ft/s)
Maximum rate of fire: 85 rds/min
Range:
anti-surface: 8.6 n miles (16 km)
anti-air: 6.5 n miles (12 km)

Manufacturer/Contractor
OTOBREDA, La Spezia, Italy.

OTOBREDA 40 mm L/70 Compact (Type 70)
Two single 40 mm turrets are mounted, one in 'B' position, the other aft in 'X' position.

Specifications
Traverse: 360° (nominal) at 90°/s
Elevation: −13° to +85° at 60/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Effective range:
anti-surface: 3.25 n miles (6 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 2

SENSORS AND ELECTRONIC SYSTEMS

No details of electronic warfare and command systems have yet been announced, but will include:

- Decoys. Two chaff launchers
- Electronic warfare. Complete suite, with both ESM and ECM components.
- Weapons control. Electro-optic director.
- Radars. Radar sets will include air/surface search, fire control, and navigation functions.
- Sonar. A model shows a bow-mounted sonar.

PROPULSION

System: Combined diesel and diesel (CODAD)
Main machinery: 4 diesels, 12.64 MW (17,200 hp(m))
Shafts: 2

FURTHER INFORMATION

PROGRAMME

This is the RoK Navy's first purpose-built minelayer design, and will be one of the most sophisticated of its type in any navy. The project design contract was placed with Hyundai in 1991 and completed in mid-1993. The order for the first of class was placed in 1994 with Hyundai and the ship is due to be completed in September 1997.

A model shows the flight deck occupied by a Sikorsky MH-53, although this is not a type currently operated by the South Korean Navy. This seems to suggest that these ships will be used as MCMV support ships once they have discharged their minelaying tasks.

ALESHA (ALYOSHA POPOVICH)

GENERAL SPECIFICATIONS

Operator: Russia
Type: 617
National type name: *Zagraditel Minny* (Minelayer)

Class: ALYOSHA POPOVICH (RUSSIA); ALESHA (NATO)

Displacement:
full load: 3,860 t

Dimensions
Length: 99 m (324.8 ft)
Beam: 13.5 m (44.3 ft)
Draught: 5.4 m (17.7 ft)

Speed: 24 kts
Range: 4,000 n miles at 16 kts

Complement: 150

SHIPS

VYCHEGDA
SUKONA

MINELAYING

SYSTEM

These ships are fitted with four mine tracks running through the hull and launching the mines over the transom. There is an arch-like device across the stern which is clearly part of the mine-launching system.

MINES

An average of 400 mines can be carried, depending upon the type

WEAPONS SYSTEMS

GUNS

Quad 57 mm/70
The only armament is a single quad 57 mm/50 mount on a pedestal on the foredeck. This mount was obtained from army stocks and is the only known remaining example of the type in naval use.

Specifications
Length of barrel: 77 calibres
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Traverse: 360° at 30°/s
Elevation: −10 to +85° at 25°/s
Crew: 5

Range:
anti-surface: 4.52 n miles (8.4 km)
anti-air: 4,500 m (15,000 ft)
Rate of fire: 120 rds/min/barrel
Ammunition: 3.81 kg (6.2 lb)

COMMAND AND CONTROL SYSTEMS

RADARS

Strut Curve search radar
The air search radar is the Russian MR-302 (NATO = Strut Curve) a medium-range, general-purpose, F-band, air search radar. The elliptical lattice reflector is mounted at the masthead. Range performance against a 2 m² aircraft target at medium altitude is about 60 n miles (110 km) with a likely maximum range of 150 n miles (280 km).

Don 2
Don 2 is an I-band navigation radar

Muff Cob
Muff Cob is the director for the 57 mm fire-control system and is the large cylindrical radome atop the small tower overlooking the quarterdeck. The radome is supported by a trunnion yoke in a traversing mounting and is thus capable of both elevation and traverse. There is a device to the left of the radome (from the front), with a remotely-controlled cover, which may be a TV camera. The F/G-band radar is named Muff Cob by NATO and Bars (Wildcat) by the Russian Navy.

IFF
High Pole B.

PROPULSION

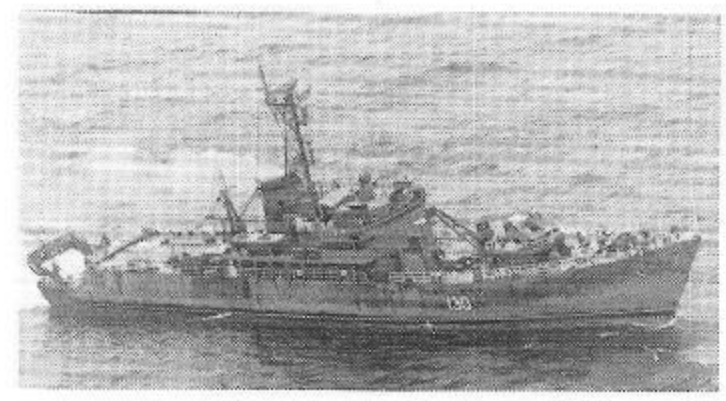
Specifications
System: Diesel
Main machinery: 4 diesels; 22.4 MW (30,000 hp(m))
Shafts: 2

FURTHER INFORMATION

Three of these ships were built between 1967 and 1976, and while their primary mission is minelaying, they have been designed to meet a number of other requirements, as well. These alternative roles include: MCMV support; netlayers; command ships; and ELINT (*Vychegda* was sighted in the Pacific in 1991 with Elint vans on the foredeck).

DEPLOYMENT

The three ships were originally deployed with one to each of the major fleets (Northern, Baltic and Pacific) but only the Northern (*Sukhona*) and Pacific Fleet (*Vychegda*) ships are now operational.



Vychegda. *Note the arch-like device over the stern, which is part of the minelaying system* (G Jacobs)

ÄLVSBORG

GENERAL SPECIFICATIONS

Operator: Sweden
Type: Minelayer

Class: ÄLVSBORG

Built: 2
Active: 1

Displacement:
standard: 2,400 t
full load: 2,650 t

Dimensions
Length: 92.4 m (303.1 ft)
Beam: 14.7 m (48.2 ft)
Draught: 4 m (13 ft)

Speed: 16 kts

Complement: 95 (plus accommodation for 158 Admiral's staff)

SHIPS

VISBORG (M 03)

Builder	Karlskronavarvet, Karlskrona, Sweden
Laid down	16 Oct 1973
Launched	25 Jan 1975
Commissioned	6 Feb 1976

MINELAYING

SYSTEM

Two mine rails inside the hull, laying through doors in the transom.

MINES

Up to 300 depending on type.

AVIATION

Specifications
Flight deck: There is a T-shaped flight deck aft
Hangar: No hangar
Helicopters: No specific helicopter is allocated to the ship

WEAPONS SYSTEMS

GUNS

Bofors SAK 40 L/70
There are three Bofors 40 mm, one each in 'A', 'B' and 'X' positions, respectively.

Specifications
Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Rate of fire: 300 rds/min
Range: 6.75 n miles (12.5 km)

Mounting
Weight: 2.89 t (unloaded)
Traverse: 360°
Elevation: −9 to +85°

Manufacturer/Contractor
Bofors Ordnance, Sweden

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES

CelsiusTech Philax
The Philax fixed launcher has four magazines similar to those used in Dagaie with Lacroix munitions. Usually the magazines contain chaff munitions but one may be replaced by an Infra-Red (IR) munitions magazine. Philax systems use Lacroix munitions, which are fired by a single cartridge in each of the four chaff groups or each of the three to six IR containers. Each chaff magazine has 36 × 40 mm grenades, which are fired at intervals of 0.1 second per group and within 1 second begin to create a cloud with a 1,000 m² radar cross-section, which is complete within 5 seconds at a height of 40 to 60 m (131 to 197 ft).

Specifications
Launchers
Length: 87.5 cm (34.5 in)
Height: 72 cm (28.35 in)
Width: 95 cm (37.4 in)
Weight (unloaded): 180 kg (397 lb)

Control
Length: 32.9 cm (12.95 in)
Height: 40.8 cm (16.1 in)
Width: 49 cm (19.3 in)
Weight: <20 kg (<44.1 lb)

Manufacturer/Contractor
CelsiusTech, Sweden.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

CelsiusTech 9LV 200 Mk 2
The weapons control system is the 9LV 200 Mk 2, which uses electro-optical and computing elements from the 9LV 100 electro-optic director. It can engage two air targets simultaneously and for surface engagements, using surface-to-surface missiles, it features a track while scan capability.

Manufacturer/Contractor
CelsiusTech, Sweden.

RADAR

Surface Search
One Raytheon E/F band radar is used for surface search; type unknown.

PROPULSION

Specifications
System: diesel

Main machinery: 2 Nohab-Polar diesels; 3.1 MW (4,200 hp (m))
Shafts: 1

FURTHER INFORMATION

First of class *Älvsborg* was ordered in 1968, followed shortly after by the order for *Visborg*. *Älvsborg's* role was changed in 1994 to that of general support ship with no minelaying capability, while *Visborg* now serves as Command Ship for C-in-C Coastal Fleet and as a minelayer.

CARLSKRONA

GENERAL SPECIFICATIONS

Operator: Sweden
Type: Minelayer/Training ship

Built: 1
Active: 1

Displacement:
standard: 3,300 t
full load: 3,550 t

Dimensions
Length: 105.7 m (346.7 ft)
Beam: 15.2 m (49.9 ft)
Draught: 4 m (13.1 ft)

Speed: 20 kts

Complement: Minelayer — 118, Training ship — 50 plus 136 trainees

SHIPS

CARLSKRONA (M 04)

Builder	Karlskronavarvet, Karlskrona, Sweden
Launched	28 Jun 1980
Commissioned	11 Jan 1982

MINELAYING

SYSTEM

The mine rails are inside the hull and eject the mines through doors in the transom.

MINES

Can lay approximately 105 mines, depending on size.

AVIATION FACILITIES

Specifications
Flight deck: There is a T-shaped flight deck aft
Hangar: No hangar
Helicopters: No specific helicopter is allocated to the ship

WEAPONS SYSTEMS

GUNS

Bofors SAK 57/70 Mk 1
There are two Bofors 57 mm/70 Mk 1, one in 'A' position, the other in 'Y' position.

Specifications
Gun
Calibre: 57 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,020 m/s (3,346 ft/s)
Rate of fire: 200 rds/min
Range: 9 n miles (17 km)

Mounting
Weight: 6.3 t
Traverse: 360°
Elevation: −10 to +75°

Manufacturer/Contractor
Bofors Ordnance, Sweden.

Bofors SAK 40 L/70
There are two Bofors 40 mm, one each in 'B' and 'X' positions, respectively.

Specifications
Gun
Calibre: 40 mm
Length of barrel: 70 calibres
Muzzle velocity: 1,000 m/s (3,280 ft/s)
Rate of fire: 300 rds/min
Range: 6.75 n miles (12.5 km)

Mounting
Weight: 2.89 t (unloaded)
Traverse: 360°
Elevation: −9 to +85°

Manufacturer/Contractor
Bofors Ordnance, Sweden.

Length: 87.5 cm (34.5 in)
Height: 72 cm (28.35 in)
Width: 95 cm (37.4 in)
Weight (unloaded): 180 kg (397 lb)

Control Unit
Length: 32.9 cm (12.95 in)
Height: 40.8 cm (16.1 in)
Width: 49 cm (19.3 in)
Weight: <20 kg (<44.1 lb)

Manufacturer/Contractor
CelsiusTech, Sweden.

ARGOsystems AR 700 radar detection system
AR 700 is a modular ESM system covering frequencies from 0.5 to 18 GHz, which is designed to detect most known radar threats. It is fully automatic, identifying threat emitters using a variety of IFM receivers. The antenna array consists of a mast-mounted ESM antenna assembly with two DF arrays, on omnidirectional unit and two monopulse units.

Specifications
ESM frequency coverage: 0.5-18 GHz
High sensitivity: up to −67 dBm
Detection range: 200 n miles (370 km) (ships); 50 n miles (92.5 km) (aircraft)
DF accuracy: 4° RMS; 2° RMS fine DF
Automatic tracking: 500 active signals in dense signal environment
Signal identification speed <1s

Manufacturer/Contractor
ARGOsystems Inc, Sunnyvale, California, USA.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

CelsiusTech 9LV 200 MK 2

The weapons control system is the 9LV 200 Mk 2, which uses electro-optical and computing elements from the 9LV 100 electro optic director. It can engage two air targets simultaneously.

Manufacturer/Contractor

CelsiusTech, Sweden.

RADARS

CelsiusTech Sea Giraffe 50 HC

The Sea Giraffe is used for air and surface search, with the antenna sited at the masthead.

Specifications

Operating frequency: G/H-band
Output power: 60 kW; average power 1200 W
Antenna rotation rate: 60/30 rpm
Instrumented range: 13.6, 27.2, 54.4, 81.4 n miles (25, 50, 100 and 150 km)
Tracking capacity: More than 30 automatically initiated air targets; more than 50 manually initiated surface targets
Antenna sidelobe levels: −45 dB
Beamwidth, bearing: 1.8°
Elevation coverage: 0-70°
Accuracy: 20 m range; 0.3° azimuth

Manufacturer/Contractor

CelsiusTech, Sweden

Surface search

One Raytheon E/F band radar is used for surface search; type unknown.

PROPULSION

Specifications

System: Diesel
Main machinery: 4 Nohab F212 D825 diesels; 7.76 MW (10,560 hp(m))
Shafts: 2
Propellers: cp
Thruster: 1 bow thruster

FURTHER INFORMATION

PROGRAMME

Carlskrona was ordered on 25 November 1977, laid down in sections late 1979 and launched to coincide with the Karlskrona company's tercentenary. It is employed as a Midshipmen's training ship as well as a minelayer, and the hull is reinforced below the waterline to enable it to be used also as a 'padded' target for exercise torpedoes. The sonar, which was originally fitted, has now been removed.

The ship's name was originally 'Karlskrona' (the modern spelling of the town's name), but the ship's name was later changed to 'Carlskrona' to honour the present king, Carl Gustav.

Carlskrona *(M 04) is used in peace as the Royal Swedish Navy's major training ship and undertakes an annual 'round-the-world' cruise* (Karlskrona)

MINELAYING

SYSTEM

There are two minerails in the hull, laying mines through two large doors in the transom. Loading is done using two derricks forward.

MINES

Greece: 100 to 130 mines, depending on type
Turkey: Up to 400 mines, depending on type

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60

There are eight 40 mm/60 automatic cannon in four twin mountings for air defence roles, which may also be used to engage surface targets.

Specification
Calibre: 40 mm
Length of barrel: 56.25 calibres
Muzzle velocity: 881 m/s (2,890 ft/s) (new gun); 850 m/s (2,788 ft/s) (mid-life)
Range:
anti-surface: 5.5 n miles (10 km)
anti-air: 6,900 m (22,600 ft)

Rate of fire: 60 rds/min (practical), 120 rds/min (cyclic)
Ammunition: 2.21 kg (4.87 lb)

Oerlikon 20 mm cannon

There are six Oerlikon 20 mm cannon.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 0.8 n miles (1.5 km)
anti-air: 1,150 m (3,770 ft)

Rate of fire: 450 rds/min
Round weight: 241 g (8.5 oz)
Projectile: 122 g (4.3 oz)

Mounting
Elevation: −15 to +90°
Total weight: 497 kg (1,095 lb) (including shield)

COMMAND AND CONTROL SYSTEMS

RADAR

Racal-Decca
One Racal-Decca, I-band, navigation radar is carried; type unknown.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors GM 16-278A diesels, 2.24 hp (3,000 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

In the early 1950s NATO instigated a rapid programme to enhance the ability of a number of member states to lay mines in their littoral waters, particularly 'choke points'. With no suitable ships immediately to hand, it was decided to convert a number of LSM 1s, which were fairly new, of a suitable size, and in plentiful supply. Nine LSM 1s were converted, which were supplied under the Mutual Aid Pact (MAP) to: Denmark — 2; Greece — 2; Norway — 2; and Turkey — 3. The two Norwegian ships were returned to the USA in October 1960 and transferred to the Turkish Navy one month later. Of these, three now survive: two in Greece and one in Turkey.

The German Navy met a similar requirement in a slightly different way, by acquiring three former LSTs from the USA in 1960 and then converting the hulls in Germany.

LSM 1 conversion programme

Country	Name	Original Number	Hull Commissioning date	Transfer date	Current status
Denmark	*Beskytteren* (N 50)	LSM 390	1945	8 Jun 1954	Stricken 1966
	Vindhunden (N 51)	LSM 392	1945	1954	Stricken 1966

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

BAe-SEMA Wire Sweep Mk 9 system
The British Wire Sweep Mk 9 has been purchased for use in these two ships, which, from their supply-ship design, offer what is almost certainly the largest sweep deck in any navy. WS Mk 9 was developed to enable the wire to be operated much closer to the seabed and at far greater depths than had been possible with previous systems. This required the minesweeper to control not only the height of the sweep wire above the seabed, but also its flatness, otherwise it would drag on the seabed and either break or cause the explosive cutters to detonate needlessly. This was achieved by using an additional device, the Wire Sweep Monitoring Equipment (WSME).

MINEHUNTING SONARS

These two ships are fitted with a towed side-scan variable depth sonar.

WEAPONS SYSTEMS

GUNS

These two ships are each armed with two 7.62 mm machine guns.

COMMAND AND CONTROL SYSTEMS

RADARS

Brighttrack 502
There are two Brighttrack 502, I-band, civil navigation radars.

PROPULSION

Specifications
System: Diesel
Main machinery: Four Wärtsilä Nohab Polar SF 16RS diesels; 3.38 MW (4,600 hp(m))

Shafts: Two
Thruster: One Gil Jet bow thruster; 429 kW (57 hp)

FURTHER INFORMATION

PROGRAMME

These former offshore supply/towing vessels were acquired by the Canadian Maritime Command in 1988, commissioned in 1989, and completed their conversion to MSAs in 1991. They carry the British Wire Sweep Mk 9, and are fitted with Hyperfix and PINS 2000 navigation system. *Anticosti* was also fitted for astern refuelling in mid-1995. Both are designed for use in light ice.

Anticosti *(MSA 110) is a converted Arctic supply ship now used as a minesweeper* (H & L van Ginderen Collection)

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

MacDonald Dettwiler Integrated Minehunting System

The mine countermeasures suite for the 'Kingston' class comprises the MCDV vessel itself, a shipboard mine warfare control system, a route survey sonar payload, a remotely operated vehicle (ROV) and a mine warfare data centre.

For route surveying the MCDV deploys a towed side scan sonar which provides the necessary data to build up and maintain a sonar image of the seabed. During minehunting, a remotely controlled vehicle tows the sonar and radio the sonar imagery to the ship's command and control centre. Mine neutralisation may be carried out by an ROV or expendable mine destructor.

Each MCDV has a permanently installed mine warfare control system comprising tactical MCM sensor positioning, data analysis and database management subsystems (DBMS). The tactical subsystem integrates all navigation sensor inputs and generates a local operations plot, based on electronic charts. This plot displays 'own ship's' position, sonar towfish position, radar contacts and mine warfare contacts. The data analysis subsystem includes Digital Equipment of Canada multifunction detection and classification consoles for the display and analysis of real-time and historic

Glace Bay *(701)* (H & L van Ginderen Collection)

sonar imagery. The DBMS retrieves all sonar imagery and contacts from previous missions for display by the data analysis subsystem. As new objects are detected and classified they are stored by the DBMS.

Manufacturer/Contractor
MacDonald Dettwiler, Canada.

Side scan sonar
The primary requirement for the side scan sonar for the 'Kingston' class was that it should be capable of detecting buried ground mines, mines with anechoic coatings and irregularly shaped mines in conditions of high background clutter. The sonar is required to operate at depths of 200 m (656 ft) and close to the seabed, providing good object shadowing for accurate classification and to avoid thermal and salinity layers.

The sonar system for the route survey payload has been developed by AlliedSignal Inc, with C-Tech responsible for wet-end electronics, transmitter/receiver, digitiser and beamformer algorithms. Resolution in the classification mode is 12.5 × 12.5 cm and high coverage rates dictate a speed of advance of 10 knots with a 400 m (1,312 ft) swath width.

To meet these requirements a multibeam side scan sonar has been selected. The array is housed in a hydrodynamically stable towfish body based on the US Navy's AN/AQS-20 prototype side scan sonar system, incorporating active control surfaces for bottom following and comprehensive position monitoring instrumentation.

In the route survey mode the sonar towfish is stored in a standard 6 m (19.7 ft) ISO container module incorporating its own deployment crane and winch. During both launch and recovery the crane maintains positive control of the towfish, release and recovery taking place below the surface. The module can be installed on the MCDV within 12 hours.

The route survey inspection payload comprises a towfish complete with launch and recovery system. The towfish is electrohydraulically powered through an umbilical which gives it unlimited endurance. Manoeuvrability in three axes is provided by four thrusters. Sensors include a side scan sonar, colour and LLTV cameras. The towfish is monitored and controlled from the ship's command centre while deployed. Its maximum operating depth is 300 m (984 ft) at a range of 600 m (1,968 ft).

The geocoding and mosaicking technology applied to the sonar imagery has been developed by Macdonald Dettwiler using surveillance satellite technology. Algorithms have been developed that automatically fuse geocoded imagery, from sensors of different resolution, into a single image. Geocoding is sensor independent and the technology can be used to enhance the performance of sector scan sonars and to integrate side scan sonar data with that of sector scan sonars.

Geocoding allows sonar imagery to be registered precisely to a chosen map projection and absolute geographic locations assigned to targets identified in the imagery. The sonar towfish groundspeed, its position relative to the towing platform and the seabed, its roll, pitch and yaw, together with differential GPS and gyro navigational data are integrated into the geocoding process to position each pixel of sonar imagery in a geographic reference grid. Geocoding permits sonar images acquired during earlier missions to be compared with those of the present mission, with changes detected semi-automatically. Geocoded sector scan images may also be mosaicked, either for the purpose of building up a continuous map of the seabed or to smooth out background noise to improve the detection and classification range of the sonar.

Mosaicking is the process of combining swaths of geocoded imagery to create a continuous sonar image map database. Mosaicking fills in gaps in the sonar map with new mission data and discards duplicate imagery. The best data can thus be used to create the mosaic. Large areas which are in shadow from one aspect can be replaced by usable imagery acquired from a different aspect. The single mosaicked database is faster to access and the preparation of mission databases simplified.

Manufacturer/Contractor
MacDonald Dettwiler, Canada.

Other MCM roles
These ships are also designed to undertake:
- Route survey
- Mine inspection
- Minesweeping

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60 Mk 5C
One Bofors gun is mounted on the foredeck.

Specifications
Traverse: 360° (nominal) at 90°/s
Elevation: −3 to +85° at 60°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Max range:
anti-surface: 6.5 n miles (12 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

Manufacturer/Contractor
Bofors, Sweden

M2HB 12.7 mm machine gun
Two M2HB 12.7 mm (0.50 in) machine guns are carried in each ship. The M2HB is a selective short recoil automatic operation weapon using 110-round belts.

Specifications
Calibre: 12.7 mm
Length of barrel: 90 calibres
Gun weight: 38.1 kg (84.0 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

COMMAND AND CONTROL SYSTEMS

RADARS

Kelvin Hughes Type 6000
E/F-band surface search

Manufacturer/Contractor
Kelvin Hughes, Hainault, Essex, UK.

Kelvin Hughes Type 1007
Navigation radar is the Kelvin Hughes Type 1007.

Specifications
(Type 1007)
Role: Navigation
Frequency: H/I-band (9,410 MHz)
Beam: 1.0 × 18°/0.75 × 18°
Peak power: 25 kW
Pulsewidth: 0.08/0.3/0.8 µs
PRF: 1,600/800/400 pps
Scan rate: 26 rpm

Manufacturer/Contractor
Kelvin Hughes, Hainault, Essex, UK.

PROPULSION

Specifications
System: Diesel-electric
Main machinery: 4 Wärtsilä-SACM UD 23V12 diesels; 4 alternators, 7.2 MW; 2 Jeumont electric motors, 2.2 MW (3,000 hp(m))

Thrusters: 2 LIPS Z-drive azimuth thrusters
Shafts: 2
Ship's services: Wärtsilä-SACM UD 19 diesel-generator set, 300 kW
Emergency: Wärtsilä-SACM UD 60 diesel, 106 kW

FURTHER INFORMATION

PROGRAMME

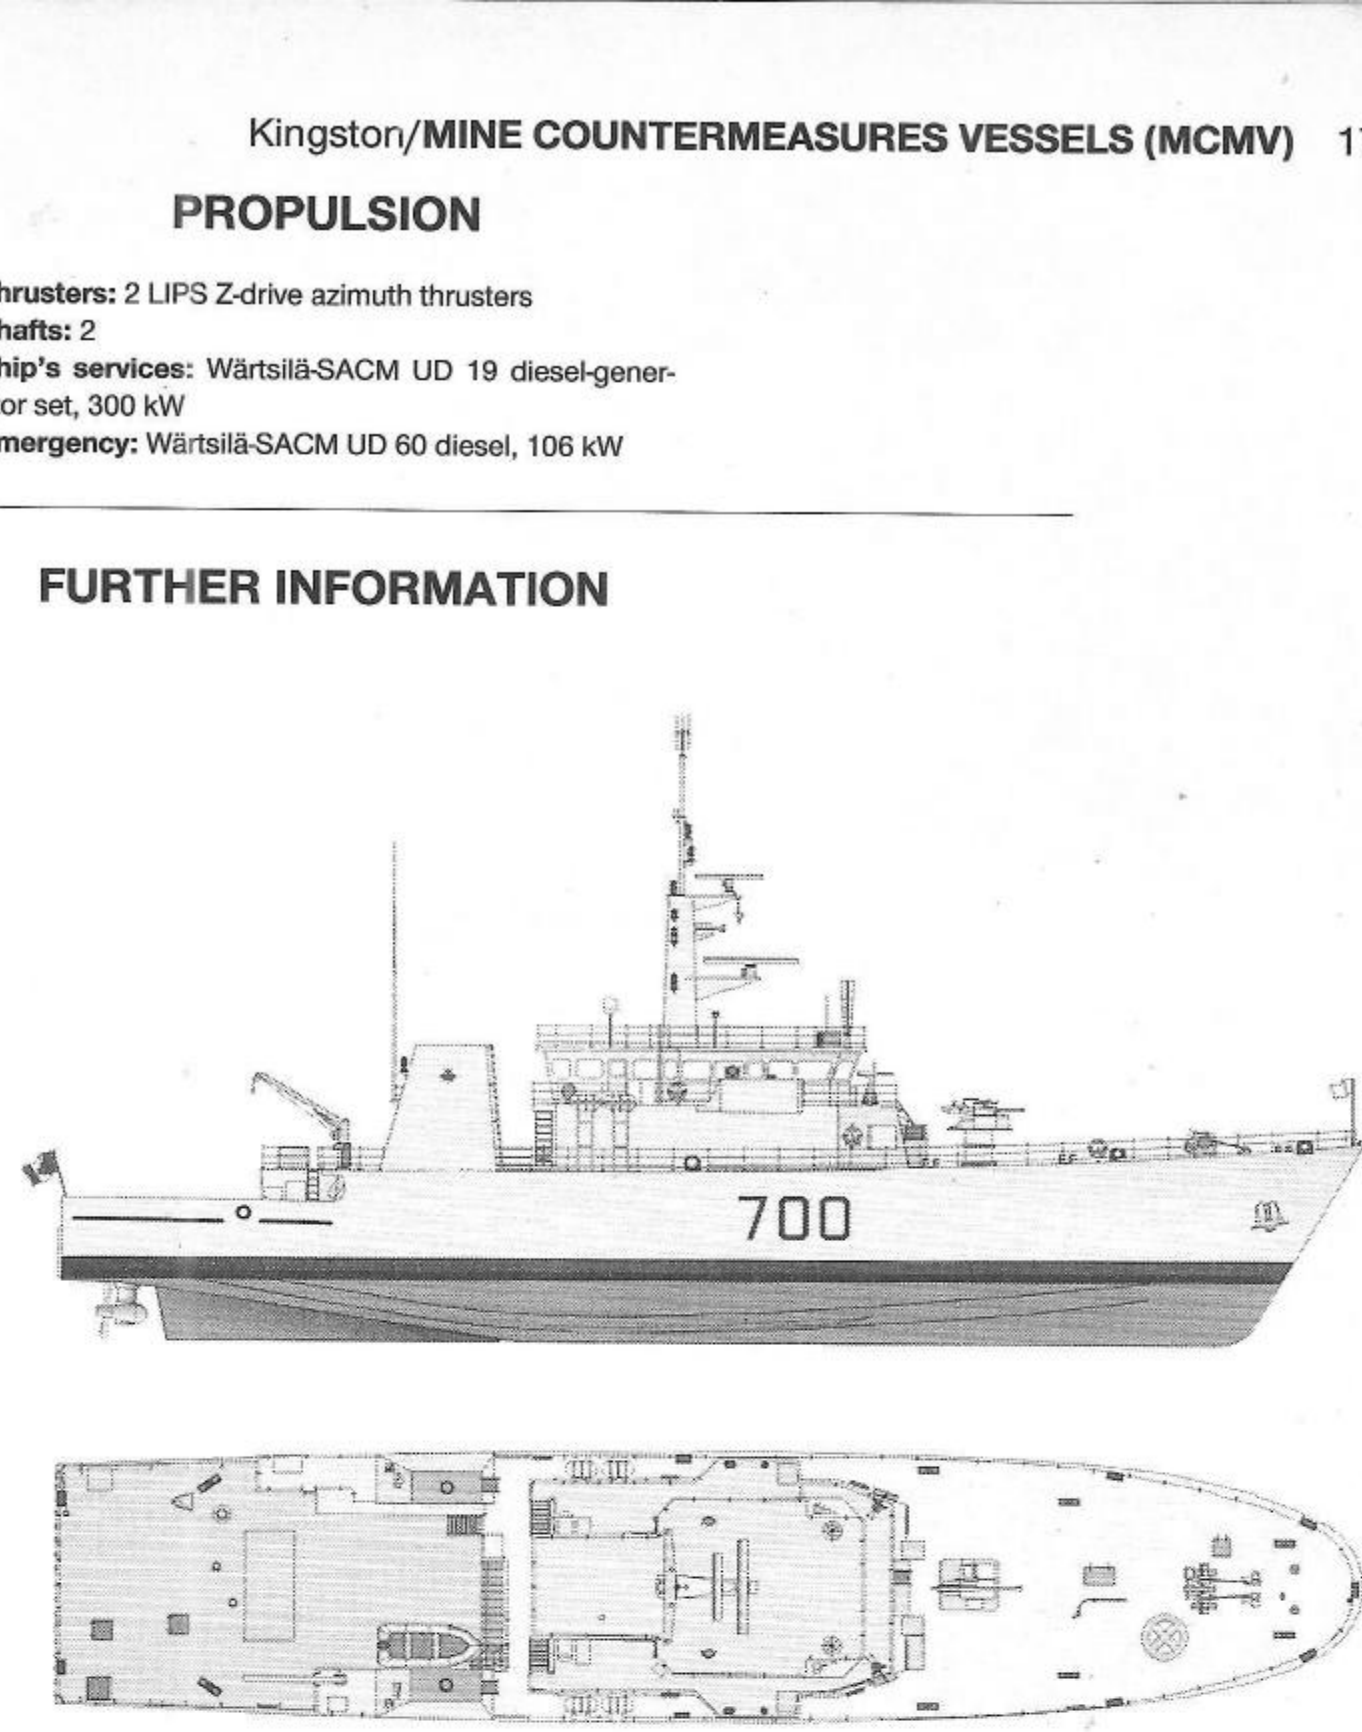
The requirement which these ships are to meet was altered several times. They were originally planned as MCMVs to replace the 1950s-vintage ships ('Bay' class and 'Porte' class), then they were to be reservist training ships. But they have emerged finally as offshore patrol vessels with a secondary mine clearance role.

The contract was awarded to Fenco MacLaren on 2 October 1991 but the first of class was not laid down until 1994 and was commissioned in December 1995.

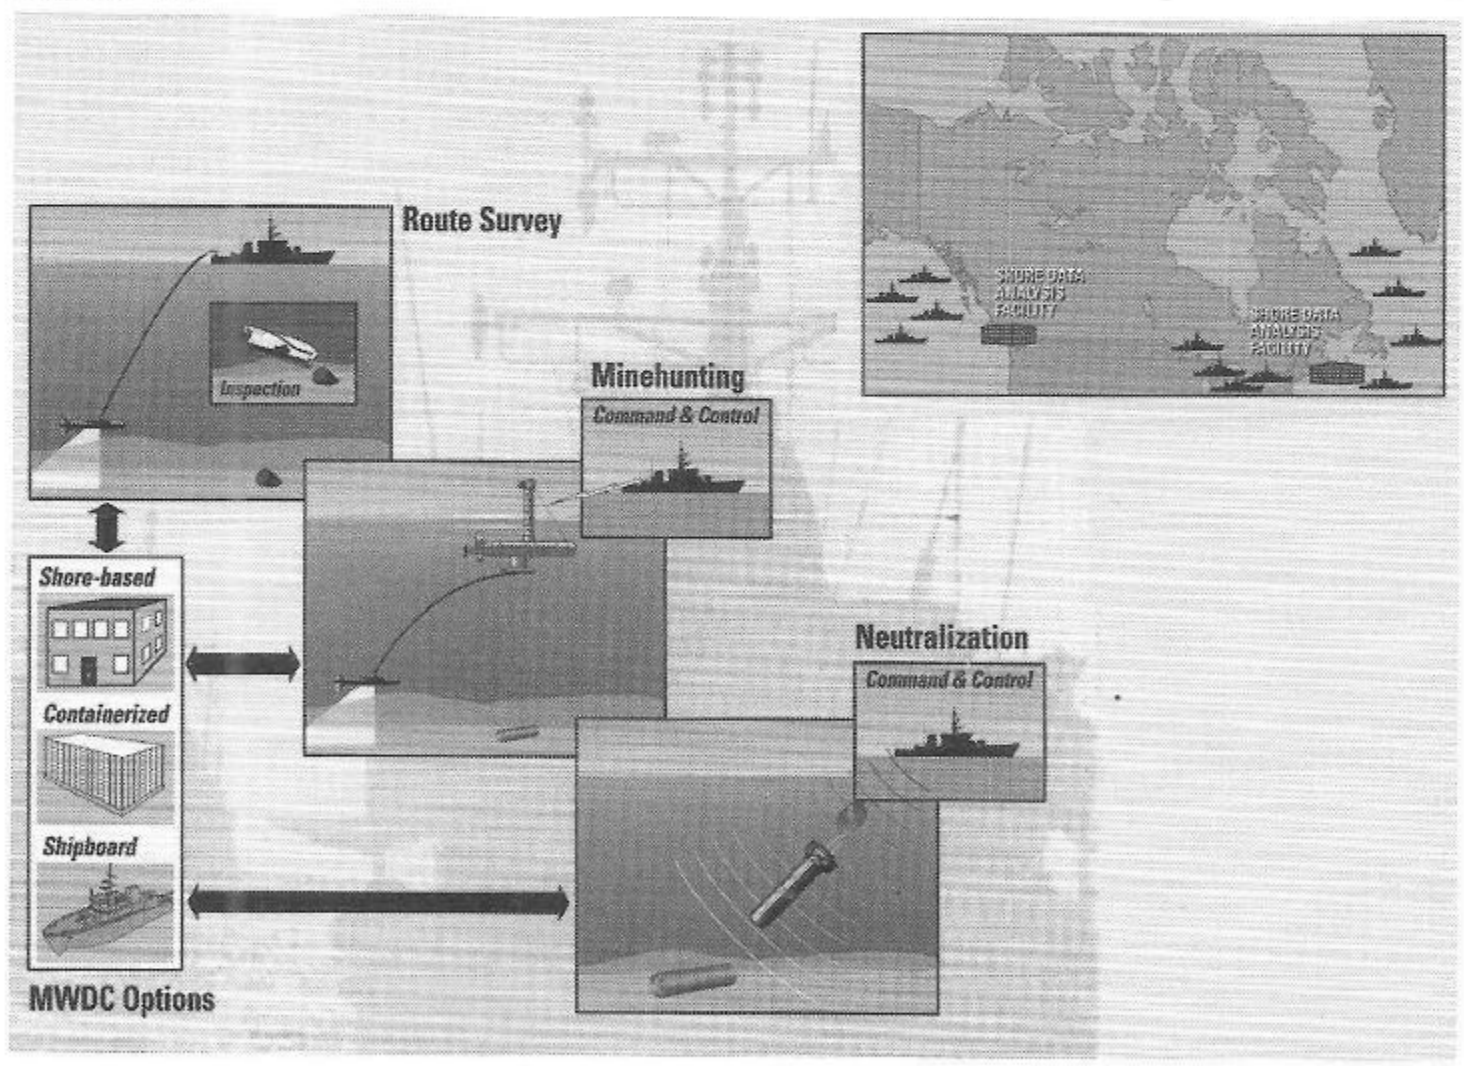
DEPLOYMENT

These ships are predominantly manned by reservists, with six ships deployed to each coast. 700, 701, 704, 707, 708 and 711 are based in the Atlantic and on the St Lawrence and the remainder on the Pacific coast

.

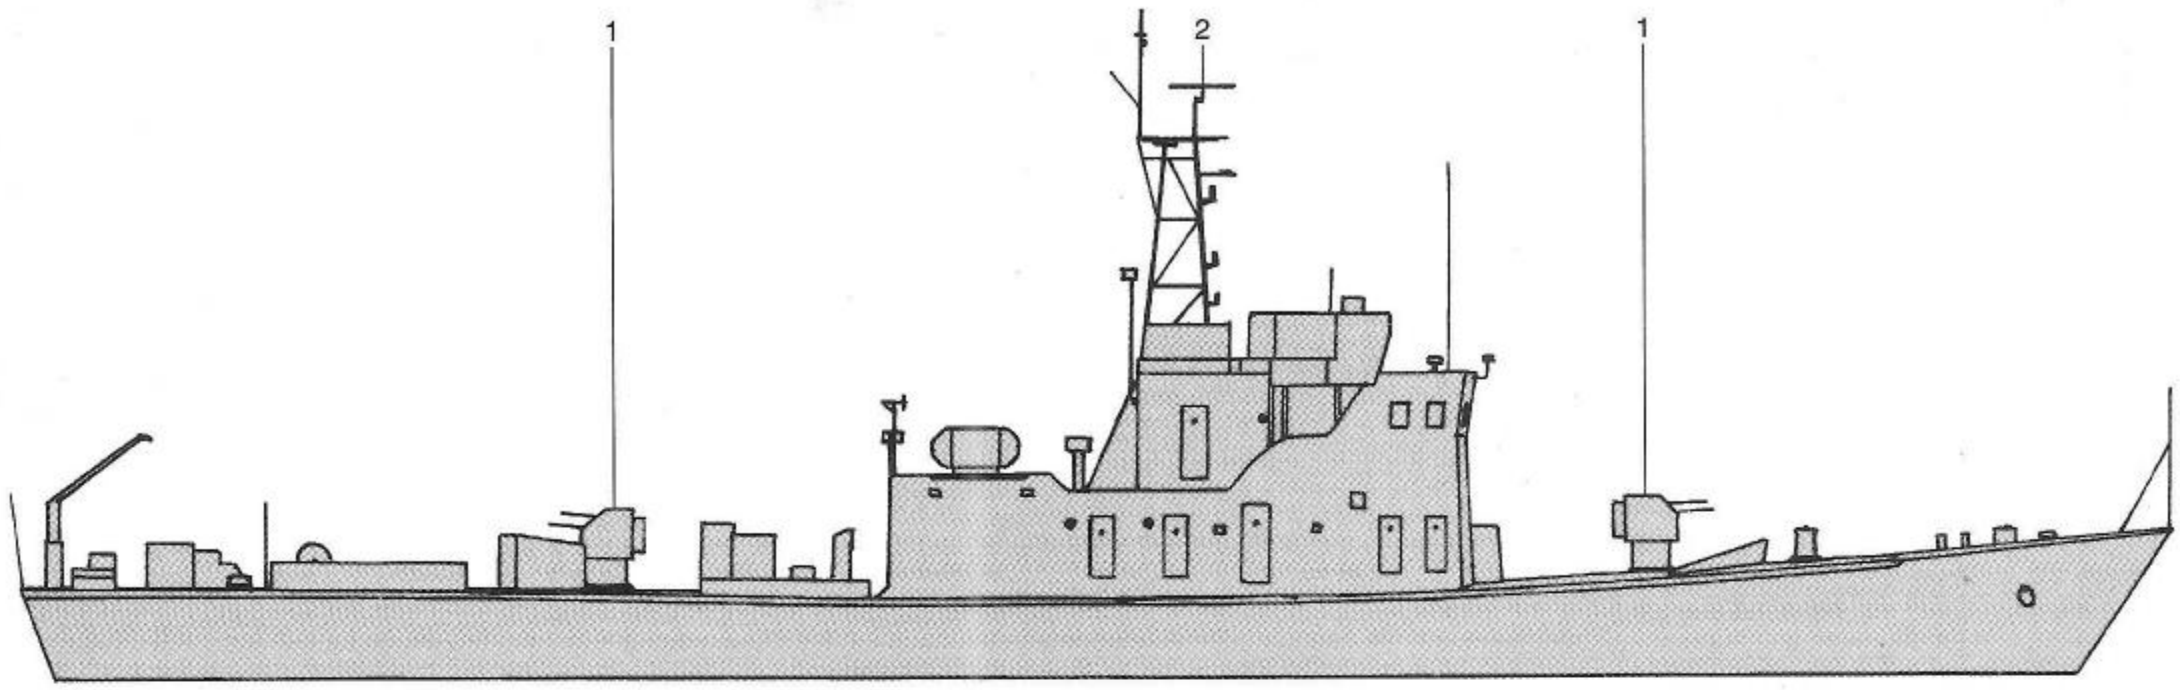


General arrangement of the new Canadian Maritime Coastal Defense Vessel (MCDV) (St John's Shipbuilding)



The twelve MCDVs are an integral part of the Canadian 'Minehunting 2000' programme. The three phases comprise (i) Route survey, using towed side scan sonar to build up and maintain a seabed sonar image map of all Q routes (ii) Minehunting, using an ROV to tow the sonar and radio data to the shoreside C² centre (iii) Neutralisation, using an ROV or expendable destructor

WOSAO



General 1 *Twin 25 mm/60 cannon* **2** *Type 753 navigation radar*

GENERAL SPECIFICATIONS

Operator: China, People's Republic
Type: Minehunter/sweeper

Class: WOSAO

Built: ?
Active: 1

Displacement:
full load: 310 t

Dimensions
Length: 44.79 m (146.95 ft)
Beam: 6.2 m (20.34 ft)
Draught: 2.27 m (7.45 ft)

Speed: 15 kts
Range: 500 n miles at 15 kts

Complement: 40 (6 officers)

SHIPS

4422

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

The ship has been offered for export with:

One small-size cutting-explosive sweeping gear
One electromagnetic sweeping gear
One sound frequency acoustic sweeping gear
One subsonic frequency acoustic sweeping gear

MINEHUNTING SONAR

One Chinese hull-mounted, active minehunting sonar.

WEAPONS SYSTEMS

GUNS

Chinese Type 61 25 mm/60
Two twin mounts per ship.

Specifications
Calibre: 25 mm
Length of barrel: 60 calibres

Traverse: 360° at 25°/s
Elevation: −10 to +85° at 15°/s
Rates of fire: 450 rds/min/barrel
Projectile: 0.28 kg HEI-T
Range:
anti-surface: 1.5 n miles (2.75 km)
anti-air: 2,800 m (9,190 ft)

MINES

Six mines can be carried.

COMMAND AND CONTROL SYSTEMS

RADARS

Chinese Type 753
I-band navigation radar.

PROPULSION

Specifications
System: Diesel

Main machinery: 4 M 50 diesels; 3.23 MW (4,400 hp(m))
Shafts: 4

FURTHER INFORMATION

This building programme started in 1986, with the first of class commissioned in 1988. Reports have suggested that building continued at a rate of one a year, but this cannot be confirmed and only one of the class (4422) has ever been seen. It appears that it has a hull constructed of steel with low magnetic properties.

Publicity brochures state that the vessel is "...to be used for clearing influence mines and moored mines with sweeping gears in coastal waters, harbour areas, and rivers. Influence mines may include those fitted with acoustic, subsonic, electromagnetic or combined fuzes."

FLYVEFISKEN (MCM VERSION)

GENERAL SPECIFICATIONS

Operator: Denmark
Type: STANFLEX 300

Class: FLYVEFISKEN

Built: 14
Active: 14 (6 in MCM role)

Displacement:
full load: 480 t

Dimensions
Length: 54 m (177.2 ft)
Beam: 9 m (29.5 ft)
Draught: 2.5 m (8.2 ft)

Speed: 30 kts (20 on diesels, 10 on hydraulic propulsion)
Range: 2,400 n miles at 18 kts

Complement: 19-29, depending on role (4 officers)

SHIPS

Builder Danyard A/S, Aalborg, Denmark
Commissioned 2 Apr 1996

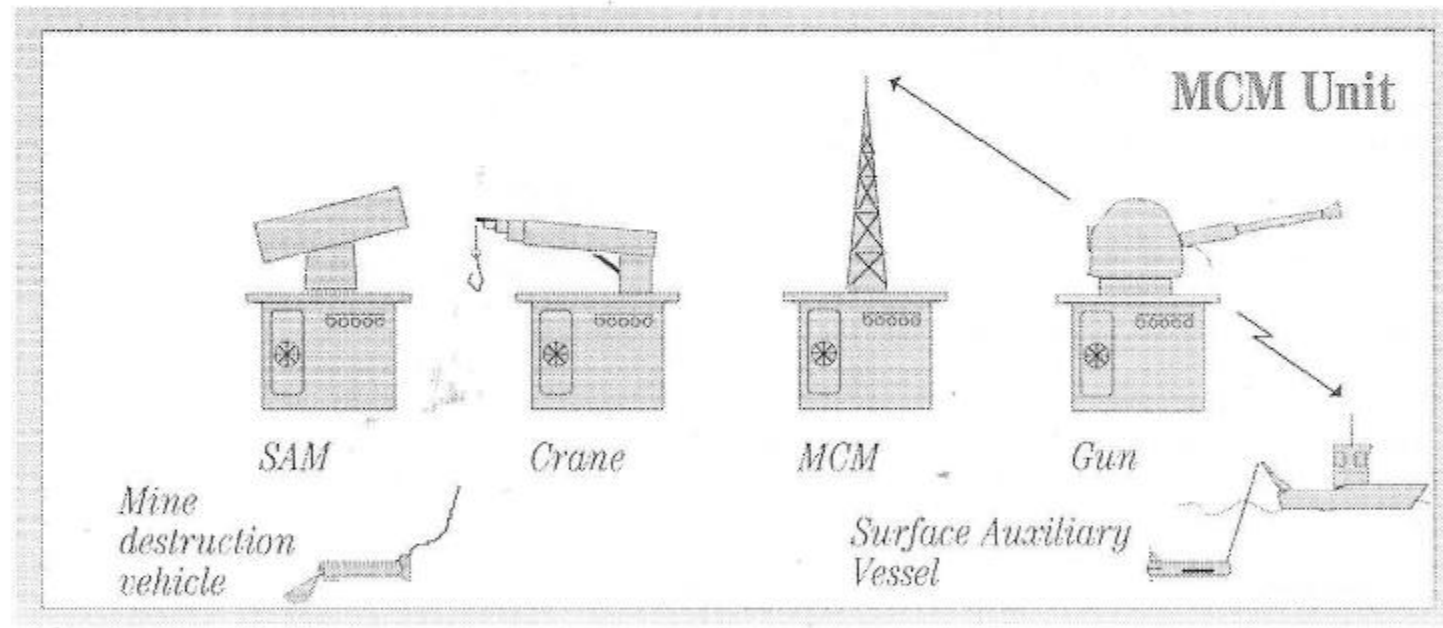
MINE COUNTERMEASURES SYSTEMS

StanFlex 300 — MCM version

The StanFlex 300 (MCM version) (SF 300MCM) uses four containers from the StanFlex range:

- 76 mm gun
- MCM unit
- crane unit
- SAM unit

Two Surface Auxiliary Vessels (SAV) and a mine destruction vehicle are also part of the MCM outfit. The control systems of the side-scan sonars and the underwater vehicles are interfaced with the SF 300(MCM)'s command and control system, as are the communication links and the data from the sonar sensors. In this way, all operations are conducted from the standard consoles of the system in the combat information centre (CIC).



Flyvefisken MCM outfit

MINESWEEPING

Surface Auxiliary Vessels (SAV)

Each SF 300(MCM) is designed to control two SAVs. Like the StanFlex 300s, the SAVs are of GRP sandwich construction. They are powered by a Schottel pump-jet propulsor, which is installed well aft so that it flushes with the bottom. The SAVs are deployed in the detection phase, operating their sonars so that the suspected mined area is searched systematically. They may also be used in the classification phase but are withdrawn prior to the neutralisation phase. They have a Terma datalink to the parent Flyvefisken ship.

The sonar is a Thomson CSF TSM 2054 active, side scan, minehunting sonar, which is mounted in a special 'fish.' The fish is deployed from the stern of the SAV using an A-frame gantry.

A total of 12 of these drones is planned: six are in service, and four more are planned for delivery in 1998. All are being built by Danyard at Aalborg.

Specifications

(SAV)
Displacement: 32 t (full load)
Dimensions: 18.2 × 4.8 × 1.2 m (59.7 × 15.6 × 3.9 ft)
Main machinery: 1 Schottel pump-jet propulsor
Speed: 12 kts
Complement: 4 (passage)

MINEHUNTING

IBIS 43 minehunting system

IBIS 43 includes the Thomson CSF TSM 2061 tactical system and the TSM 2054 side scan sonar, which is towed by the SAV. Detection and classification of mine-like objects is performed at a maximum speed of 15 kts with a 200 m (656 ft) swept channel. The sonar towfish is 3 m (9.8 ft) in length, and weighs less than 300 kg (661.4 lb).

Specifications

Water depth: 6 m (19.7 ft) to more than 200 m (656 ft)
Speed in relation to water: 4-15 kts
Sonar range: 2 × 50 m (2 × 164 ft); 2 × 100 m (2 × 328 ft)
Resolution: 2 × 10 cm (2 × 3.9 in) or 2 × 20 cm (2 × 7.8 in), according to sonar range
Coverage: Up to 2.9 n miles (5.4 km)

Manufacturer/Contractor

Thomson Sintra-CSF, France.

SuTech Double Eagle ROV

Double Eagle is fitted with powerful high-speed thrusters for use in currents up to at least 3 kts, the eight thrusters giving over 5 kts forward, 3 kts astern, 3 kts lateral and 1 kt vertical movement. The ROV is fitted with a computerised stabilisation control system and is extremely manoeuvrable, exhibiting unlimited movement in six degrees of freedom (pitch ±180°, roll ±180°).

There are two monitors, one displaying the picture from a colour TV camera, the other the picture from a monochrome TV camera mounted at the tip of a telescopic arm. Digital data such as heading, depth, pitch and roll angle, cable twist, leakage warnings, real-time clock with date and time and diagnostics are

superimposed on the TV monitor. High-quality video is available using the fibre optic link in the umbilical cable. The standard umbilical is 600 m (1,968 ft) long, but there is also an optional 1,000 m (3,280 ft) cable. The vehicle is fitted with one colour CCD camera as standard, and tilt arrangement with colour and SIT camera is available as an optional extra. Optional sensors include echo-sounder, and electronic scanning or conventional sonar.

The vehicle uses a unique precision charge placement technique, using a small mine disposal charge which also features several advantages. The vehicle can also carry a heavy standard NATO mine disposal charge as well as cable cutters.

Specifications
(Double Eagle)
Length: 1.90 m (6.2 ft)
Width: 1.30 m (4.2 ft)
Height: 0.80 m (2.6 ft)
Weight: 400 kg (881.8 lb)
Payload: 80 kg (176 lb)
Speed: 5 kts
Service depth: 500 m (1,640 ft)

Manufacturer/Contractor
Bofors Underwater Systems, Sweden.

MINEHUNTING SONARS

C-Tech CTS-36 Sonar
CTS-36 hull-mounted sonar is optimised for shallow water operation. It is a scanning and multibeam sonar, using narrow receiving beams, high-speed scanning and digital processing techniques to provide instantaneous detection, classification and target data in a full 360° field of view. Simultaneous video and audio information is available in both active and passive modes. A minimum of three tracking channels is provided with target and ship's track, target range, depth, bearing, speed and heading instantaneously displayed. CTS-36 also provides:

- Detection of torpedoes and divers
- Detection of targets such as mines, wrecks and rocks on the seabed
- Detection, location and classification of large targets at long ranges
- Electronic tilt and stabilisation of transmit and receiving array
- Interface to ship's own command/communications systems
- A high-resolution control/display unit.

Specifications
Operating frequency: CW mode: dual frequency 36 kHz (39 kHz operator selectable); FM chirp: nominal 1 kHz centred at CW frequency
Beam tilt/stabilisation: Electronic tilt continuously adjustable from 8° above the horizontal to 24° below. Electronically stabilised for roll and pitch
Receiving beamwidth: Horizontal and vertical: 6° transmitting beam omni or directional sector
Transmitter: 270 channels; power output/channel 50 W max
Source level: 223 dB/µPa/m

Modes of operation
Active: Simultaneous audio and video, selectable omni or directional CW or FM transmission. Automatic detection mode in which area on display is automatically outlined where signal reception exceeds operator-selected threshold. Audio continuously steerable through 360°. Transmit sector width and position selectable
Passive: Reception system as above
Tracking: FM chirp or CW. Each of three independent receive channels track automatically one, two or three targets. Position, course and speed provided for each target
Surveillance: Operator-selectable transmit sector width and position, 12° receive beam stepped through operator-selected sector.
Video and audio search: Omni transmission. Broad 30° depressed receive beam facilitates maintenance of contact on close in targets

Manufacturer/Contractor
C-Tech Ltd, Cornwall, Ontario, Canada.

Thomson Sintra TSM 2640 Salmon
Variable depth sonar (VDS) medium frequency for ASW. Salmon is a compact sonar designed for shallow water ASW. The basic version consists of an acoustic array of 24 staves housed in a streamlined fish. Embedded facilities include passive listening, sound ray tracer, integrated onboard simulator and acoustic propagation prediction.

Specifications
Acoustic array: 24 identical staves of 7 transducers, weight 260 kg (573 lb)
Frequency: Approx 19 kHz.
Transmitter: Omnidirectional transmission in CW and FM modes
Receiver: 36 preformed beams; advanced processing coherent in FM with pulse compression and spectrum analysis (FFT) in CW

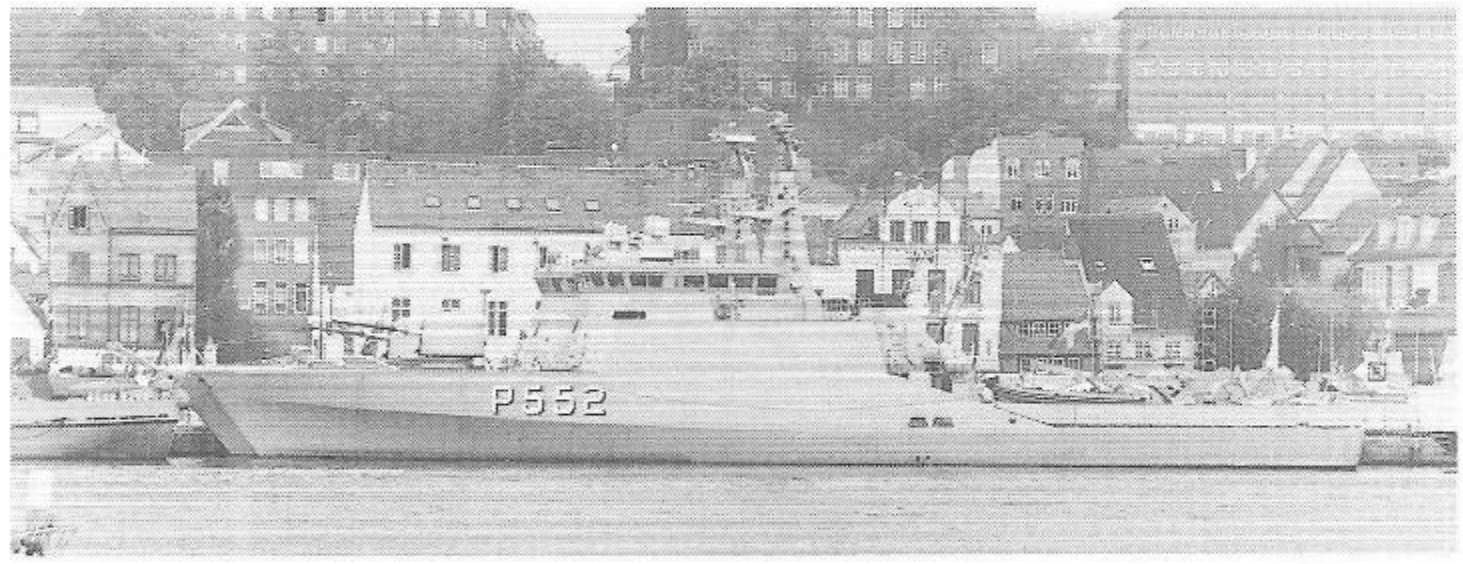
Manufacturer/Contractor
Thomson-CSF, France.

WEAPONS SYSTEMS

GUNS

OTOBREDA 3 in (76 mm)/62 Super Rapid
The containerised OTOBREDA 76 mm gun is part of the MCM package. The 62 calibre barrel is of two-part construction consisting of the tube and a liner with rifling consisting of one turn in 30 calibres. Ammunition is fed from a magazine containing 15 rounds, each of which is moved by a feeding system which can be from 2.5 to 11 m (8.2-36.1 ft) long, to the loading tray where it is automatically rammed into the breech. The mounting is normally under local electrical and hydraulic control but may be controlled remotely if required. The mounting weighs 12 tonnes. The Super Rapid mounting features upgraded hydraulic motors for the feed and hoist systems, rocker arms made from titanium, a redesigned feeder device and loading tray which moves shorter distances for faster action. There is also a new digital console with plasma display for gun control.

Specifications
Elevation: −15 to +85°
Training speed: 60°/s



Havkatten *(P 552) in the MCMV role. This involves one 76 mm gun module forward, and aft an MCM communications module and a crane module (the SAM module has not yet been procured)* (H M Steele)

Elevation speed: 35°/s
Weight (unloaded): 8 t
Muzzle velocity: 925 m/s (3,035 ft/s)
Rate of fire: 120 rds/min
Range: 8.5 n miles (15.75 km)

Manufacturer/Contractor
OTOBREDA, Italy.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Racal SABRE ESM system
The Sabre ESM system covers the 0.5 to 18 GHz frequency range and provides facilities for threat warning, surveillance, identification, intelligence gathering and targeting. It uses the Racal Sadie processor and advanced antenna techniques to achieve a high specification and operational flexibility. It is fully integrated with the ship's AIO and ECM systems including interfacing with the ship's multifunction consoles through standard bus interfaces.

The ESM processor tracks 200 radars automatically and provides a continuous update on status to the ESM operator and the command. Scan analysis is measured on all intercepted transmitters. The ESM library holds 3,000 radar emitter modes, while an auxiliary library of 250 emitter modes is provided to hold operator-loaded data. The operator's console features twin high-resolution colour displays, a normal keyboard, special function keys and a rollerball.

Specifications
(Sabre)
Frequency range: 0.5-18 GHz (option to 40 GHz)
Accuracy: 2° RMS
Sensitivity: −60 dBmi
Dynamic range: 60 dB
Pulse density capability: 500,000 pps
Radar store capacity: 3,000 modes
Processing time: <1 s

Manufacturer/Contractor
Racal Radar Defence Systems, Chessington, Surrey, UK.

ELECTRONIC COUNTERMEASURES (ECM)

Racal Cygnus ECM system
The Cygnus radar jammer operates in the I- or J-bands and was designed for integration with Cutlass ESM equipment. Cygnus uses both responsive noise and deception jamming to provide an effective jamming capability against all types of radar including early warning, target acquisition and missile guidance. It has a narrow beamwidth giving high effective radiated power (300 kW) and is kept on target by a built-in, interferometer-type, passive tracking system in both azimuth and elevation. The tracking system may also be used to relay accurate position data to systems of other ships. RF received by the tracking antennas is also used as the basis for transmitted RF and modulation and power management is under the control of a processor which

also controls the tracking procedure. Types of modulation sequence available include range gate pull off and false target generation.

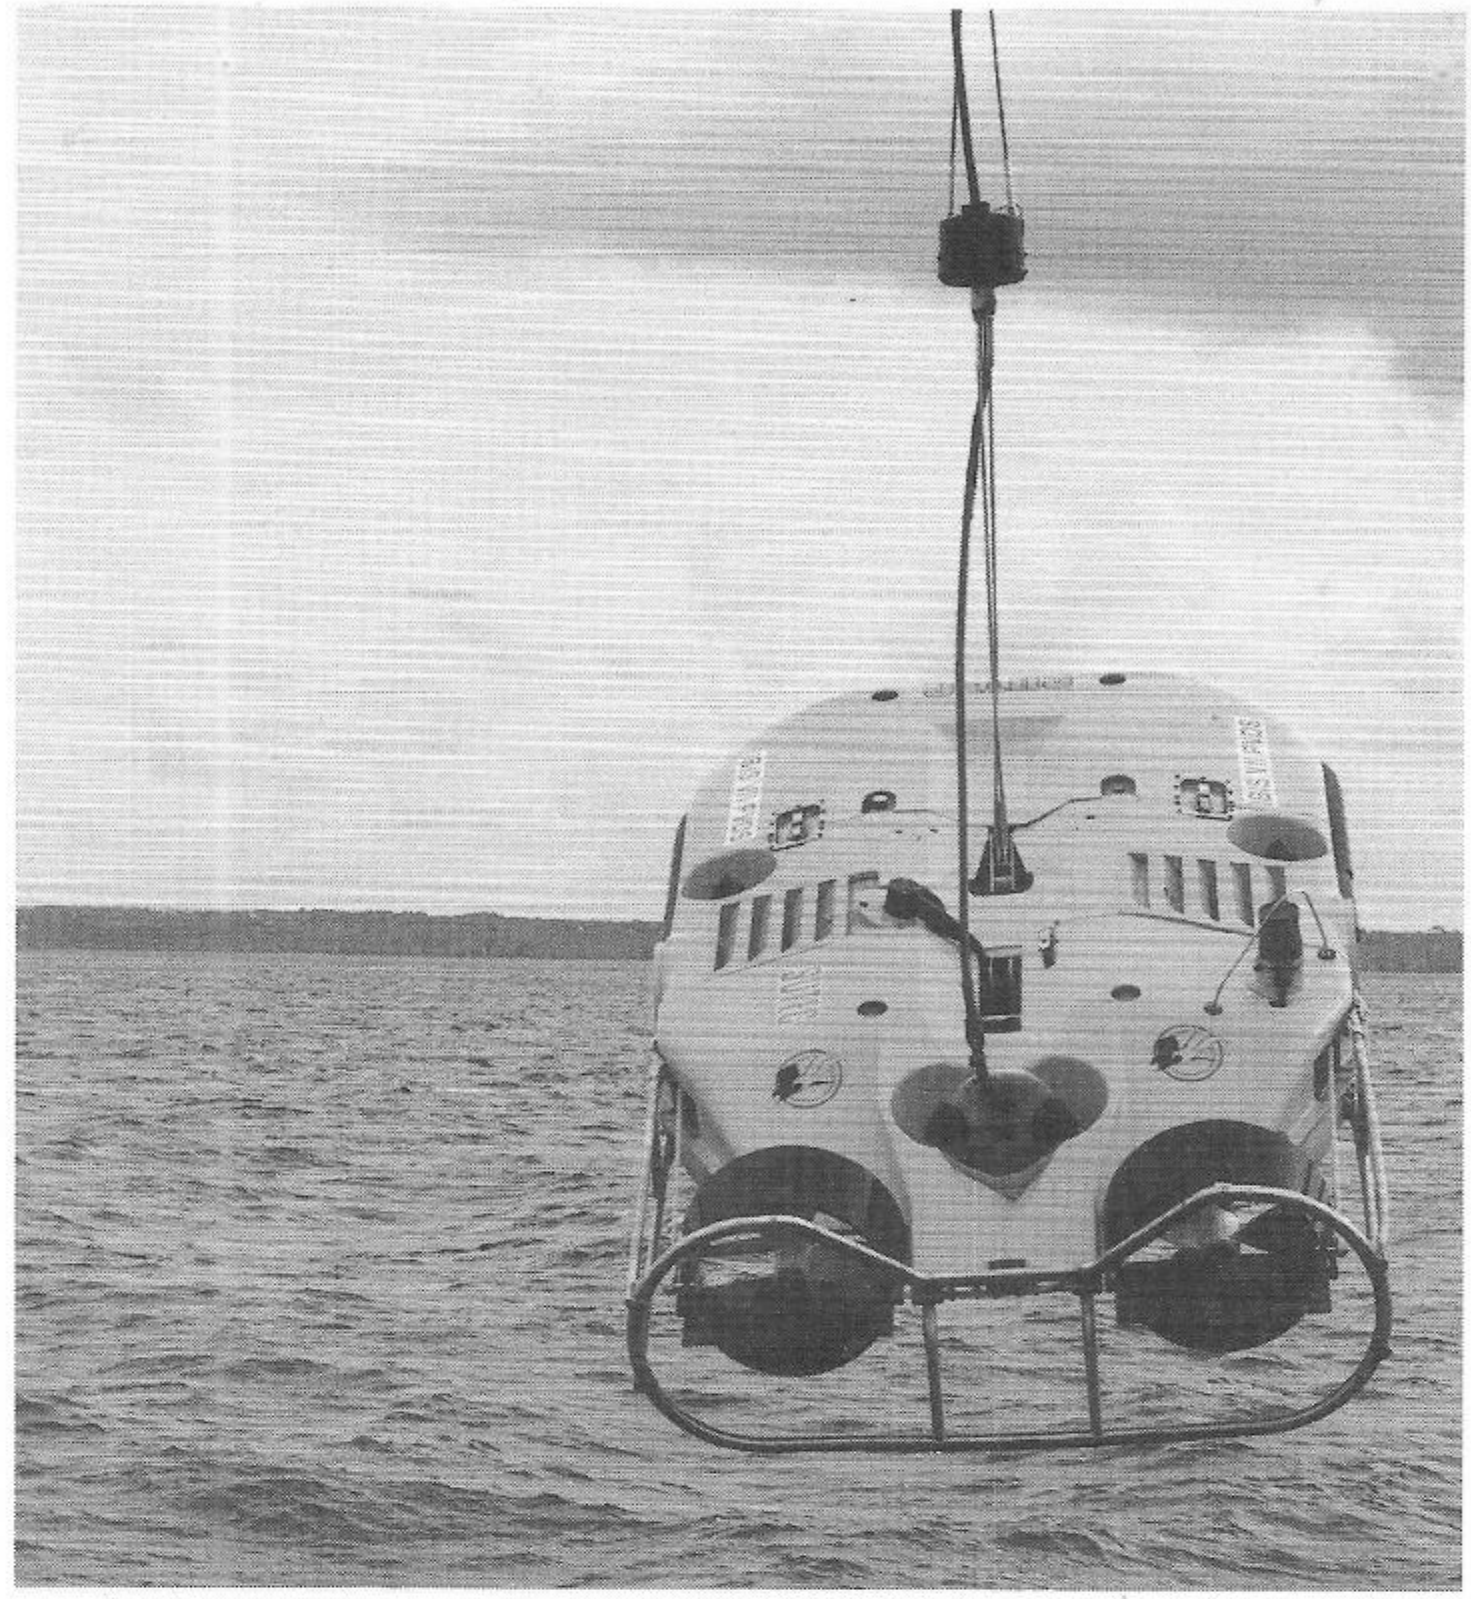
Manufacturer/Contractor
Racal Radar Defence Systems, Chessington, Surrey, UK.

DECOYS

NATO Sea Gnat
NATO Sea Gnat is a long-range chaff/infra-red (IR) decoy launching system for NATO warships. It consists of a control unit, a launcher with 130 mm tubes and munitions. The control unit provides for the launching of the most effective combination of rounds for distraction and centroid/seduction given the type, speed and direction of the threat, the ship's speed and heading as well as wind direction and speed. There are three types of round:

Mk 214 RF seduction
Mk 216 RF distraction
Mk 218 IR seduction

Manufacturers/Contractors
THORN EMI/AB Precision Ltd, UK (control unit).
Hunting Engineering, UK (launchers).
Chemring Ltd, UK (munitions).



SuTech Double Eagle ROV, a joint French/ Swedish development (Jane's/David Miller)

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

CelsiusTech 9LV Mk 3
The 9LV Mk 3 command system has a distributed architecture and is based upon a 32-bit computer using Motorola 68020 and 68040 microprocessors and Ada-language software, workstations and an Ethernet IEEE 802.3 standard local area network. Memory consists of 4 Mbyte RAM and 256 k of EPROM. The hardware is used to create nodes which may be workstations, processing or interface nodes with a network interface, one or more processing units, power supply, local PROM and appropriate interfaces. Memory management is by means of the Motorola 68851 while the floating-point processor is the Motorola 68881. All the software programs run independently but communicate through an Inter-Program Communication 2000 (IPC2000) mechanism. The software is in Ada and the basic system has about 500,000 lines of code, although this is usually more than doubled to meet additional requirements.

The dual-redundant LAN interfaces with all sensors, weapon systems and workstations and there are two processors (one redundant) that provide command, communications and control as well as a database. The systems are capable of acting as a data handling system compiling the tactical situation, conducting threat evaluation and target designation, as well as providing navigation and offboard sensor data (the latter via a datalink), while recording and providing a simulation capability.

The fire-control radar is CelsiusTech's Sea Viking director, which acts as a stand-alone system with servo-controlled pedestal, tracking and ballistic computer to control both guns and SAMs. It controls different weapons sequentially and has an automated air defence function for use against multiple targets. It takes sensor data, evaluates the threat and automatically deploys the most effective hard or soft kill countermeasure to neutralise each target.

The Sea Viking tracker radar (see next page) may be supplemented by a range of electro-optical sensors including a Si-Vidicon CCIR-compatible TV camera with 300 mm lens and 42 × 31 mrad field of view, an 8 to 12 µm infra-red camera using Cadmium Mercury Telluride detectors with closed-cycle Sterling cooling and fields of view of 52 × 35 mrad and 157 × 105 mrad. There may also be a 1.06 Nd:YAG laser rangefinder with a peak power of 4 MW and a PRF of 10 Hz.

Also available is an independent G/H or C-band and I/J or X-band search radar with parabolic, horn-fed stabilised 2.4 × 1.0 m (7.9 × 3.28 ft) antenna. This also has a travelling-wave tube transmitter and operates in 5.4 to 5.9 GHz and 8.5 to 9.6 GHz frequency band. An optional I/J-band magnetron transmitter is also available.

On the 'Flyvefisken' class, the prime HCI consists of Terma Standard Consoles, using Motorola 68020 and 68040 microprocessors on a VME bus. The Type I was designed for the SF 300 C3 system and is a one-man console with two 21 in (53.34 cm) 1,024 × 1,224 pixel raster scan displays which can present radar, tactical situation, graphics and electro-optic data as well as providing space of 80 columns and 18 lines for alphanumeric data. There may also be provision for internal and external communications facilities (including a telephone).

Manufacturer/Contractor
CelsiusTech, Sweden.

RADARS

Plessey AWS 6
P 550 to P 556 only.

Specifications
(AWS-6)
Role: Air search
Frequency: G-band
Beam: 1.5°
Peak power: 49 kW
Gain: 29 dB
Pulsewidth: 0.1/4.3 µs
Scan ráte: 30/60 rpm

Manufacturer/Contractor
Plessey, UK.

DASA TRS-3D
P 557 to P 563 only. TRS-3D has several modes of operation:

- Self-defence mode. Combined long- and short-range scanning with high elevation coverage. May be used in sea and ground clutter environment and in light rain; scan time is 2 seconds
- Self-defence/clutter mode. Offers an adapted waveform for severe clutter or chaff conditions; scan time is 3.5 seconds
- Surveillance mode. Provides 49.7 n miles (92 km) instrumented range with 9.2 n miles (17 km) altitude coverage. It is useful up to medium-clutter conditions, scan time is 6 seconds
- Long-range mode: Gives an instrumented range of 97.2 n miles (180 km) for duct conditions with a scan time of 6 seconds.

The antenna group comprises a primary G/H-band planar phased-array antenna, an IFF antenna and an optional I-band navigation radar antenna. The G/H-band radar incorporates a full pulse-to-pulse polarisation agility. Scanning in elevation is performed with a single agile pencil beam; the antenna is scanned in bearing mechanically using a fully stabilised platform rotating at 30 rpm.

Manufacturer/Contractor
Daimler-Benz Aerospace AG, Ulm, Germany.

Terma Scanter
I-band surface search radar

Furuno
I-band navigation radar.

9 LV 200 (Sea Viking)
Prime sensor is a tracking Ku/J-band radar with stabilised cassegrain monopulse antenna and travelling-wave tube transmitter which operates in the 15.9 to 17.1 GHz frequency range and permits the combination of pulse Doppler-MTI operation with batch-to-batch frequency agility. Pulse-to-pulse frequency agility is retained for use when return suppression is not required. Also available is an independent G/H or C-band and I/J or X-band search radar with parabolic, horn-fed stabilised 2.4 × 1.0 m antenna. This also has a travelling-wave tube transmitter and operates in 5.4 to 5.9 GHz and 8.5 to 9.6 GHz frequencies. An optional I/J-band magnetron transmitter is also available.

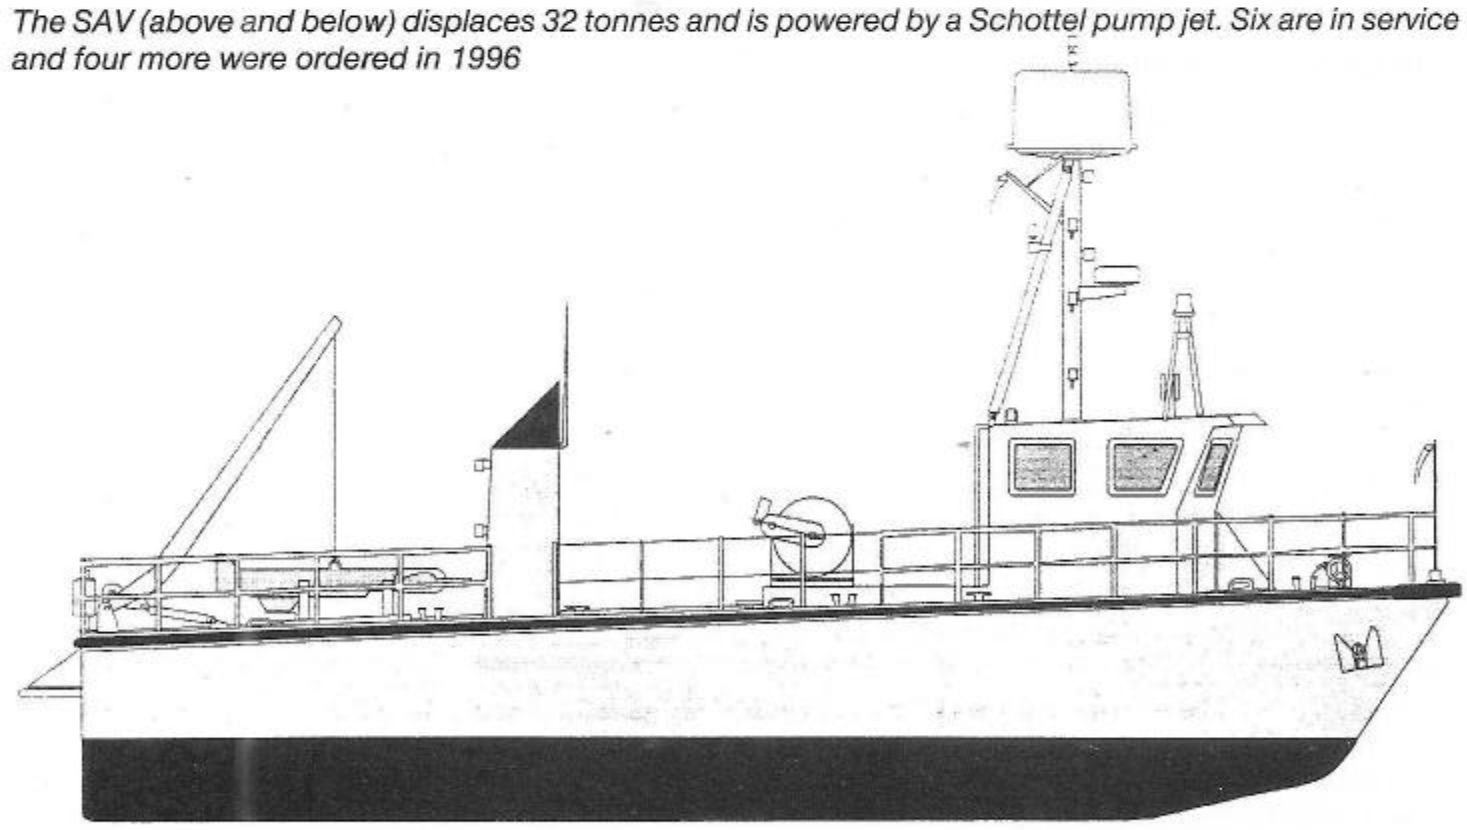
Manufacturer/Contractor
CelsiusTech, Sweden.

PROPULSION

Specifications
System: CODAG
Main machinery: 1 GE LM 500 gas turbine on centre shaft; 2 MTU 16V 396 TB94 diesels on outer shafts; plus auxiliary propulsion by hydraulic motors on outer gearboxes (hydraulic pumps driven by 1 GM 12V-71 diesel)
Power output: 4.1 MW (5,450 hp) from gas turbine; 4.26 MW (5,800 hp) from diesel engines; 375 kW (500 hp) from diesel for hydraulic pumps.
Shafts: 3

FURTHER INFORMATION

The 14th and final SF 300 was commissioned on 2 April 1996, but acquisition of all the elements of the system has yet to be completed. Thus, only three MCM systems are actually in service, but funds for systems #4 and #5 were granted in mid-1996. These new systems will each comprise a containerised Thomson-CSF IBIS 43, a Double Eagle ROV and two SAVs, each equipped to tow the TSM 2054 side scan sonar. The four new SAVs are likely to be enlarged versions of the current SAV design.



The SAV (above and below) displaces 32 tonnes and is powered by a Schottel pump jet. Six are in service and four more were ordered in 1996

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

PAP Mk 4 ROV

'Circé' class MCMVs carry two PAP Mk 4 (PAP = *poisson auto-propulsé*) ROVs, which have the capability to hunt and destroy ground mines by placing and remotely detonating a charge or tethered mines by cutting the mooring rope. The vehicle is powered by onboard batteries, but is guided from a control console in the operations centre, with signals being passed via a tether, which can be either a 2,000 m (6,562 ft) fibre optic cable or a 1,000 m (3,280 ft) coaxial cable. It is horizontally propelled by two side thrusters.

In the bottom-following mode a constant altitude can be achieved by instructing the vehicle to deploy a 'guide-rope'. The winch in the PAP then deploys a selected length of rope and the operator then uses return signals from the vehicle to maintain the vehicle at the desired height; limits are 2 m (6.56 ft) minimum and 8 m (25.25 ft) maximum.

The PAP is able to carry the 126 kg (277 lb) charge necessary to ensure the total destruction of a mine. Cutters can be carried with the charge. The front section of the vehicle carries a sonar, either a high-resolution near-field sonar or a mid-range relocation sonar. Identification is carried out by a tiltable low-light TV camera and/or by a tiltable colour TV camera. Vertical thrusters are used to achieve mid-water navigation. Alternative payloads include: explosive charges, cutters (frontal, lateral mechanical and lateral explosive) and a manipulator with a variety of tools.

Ceres *(M 716)* (H & L van Ginderen Collection)

Specifications

(PAP Mk 5)
Length: 3 m (9.84 ft)
Diameter: 1.2 m (3.94 ft)
Height: 1.3 m (4.26 ft)

Performance:
Max vehicle velocity
mid-water transit: 6 kts (3 m/s)
bottom-following mode: 5.5 kts (2.75 m/s)
Vehicle incidence: ±20° (max)
Vertical velocity with charge: 0.7 m/s (2.3 ft/s)
Ascent velocity (charge released): 1.5 m/s (4.9 ft/s)

Payload:
NATO charge: 100 kg (220 lb)
Small charge: 30 kg (66 lb)
Horizontal range:
with fibre optic cable: 2,000 m (6,560 ft)
with coaxial cable: 1,000 m (3,280 ft)
Max continuous endurance: 2 h (depending on type of mission)
Max operating depth: 300 m (984 ft)
Watertight integrity: 36 bar

Manufacturer/Contractor
Société ECA, Colombes, France.

MINEHUNTING SONARS

Thomson-CSF DUBM 20B
This hull-mounted, active search, high-frequency minehunting sonar was the first of its type to be designed and built in France. It can locate a mine at 300 m (984 ft) and classify it at about 100 to 130 m (328 to 426 ft). Operating frequencies are: detection — 100 kHz ±20 kHz; classification — 400 kHz ±30 kHz.

Manufacturer/Contractor
Thomson-CSF, Paris, France.

WEAPONS SYSTEMS

GUNS

Oerlikon 20 mm
One 20 mm mounting is carried per vessel, although it is not known which of the many versions of this particular gun is carried. The ships are frequently seen without the gun fitted.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,739 ft/s)
Range:
anti-surface: 0.81 n miles (1.5 km)
anti-air: 1,150 m (3,772 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g

COMMAND AND CONTROL SYSTEMS

RADARS

Racal-Decca 1229
The navigation radar is the Racal-Decca Type 1229, which is equipped with a 2.7 m (8.8 ft) antenna and operates in the I/J-band

Specifications
Role: Navigation
Frequency: I/J-band
Beam: 1.3 × 30°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25/1.0 µs
PRF: 1,300/650 pps
Scan rate: 25 rpm

PROPULSION

Specifications
System: Diesel/diesel-electric
Main machinery: 1 MTU diesel; 1.32 MW (1,800 hp(m))
Shafts: 1
Auxiliary drive: 2 electric-powered, active rudders, 260 hp.

FURTHER INFORMATION

PROGRAMME

These ships were ordered in 1968 and entered service in 1972-73. Their primary mission is the location, classification and destruction of mines at depths of up to 60 m (200 ft). They were due to be deleted in 1991-93 but were retained when the planned BAMO project was cancelled.

DESIGN

Like all MCMVs, these are designed to have a minimal magnetic signature and thus, in line with the practice at the time, their hulls are constructed of laminated wood. They also have two propulsion systems: a diesel-driven propeller is used for high speed and transits, while two electrically driven active rudders are used for MCM operations.

MODERNISATION

A modernisation programme completed in 1989 included the addition of computer-aided sonar classification.

OPERATIONAL

All based at Brest. Planned deletion now in 1997-98.

KARAMÜRSEL (MERCURE)

Main machinery: Two MTU MB diesels; 1.1 MW (1,500 hp(m))

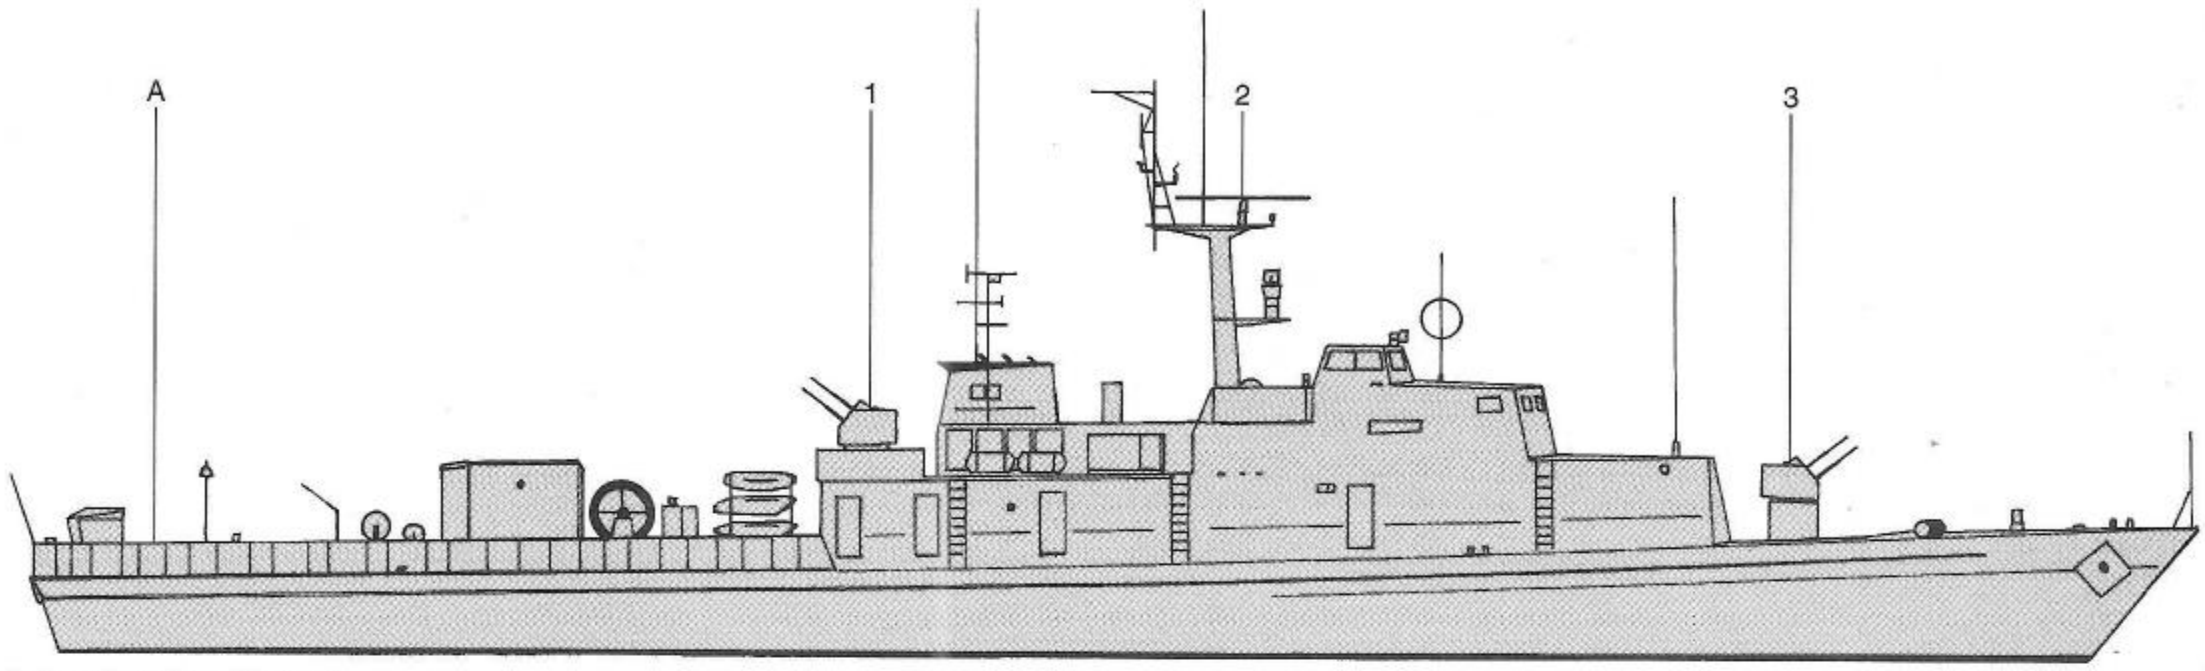
Shafts: 2
Propellers: cp

FURTHER INFORMATION

These wooden-hulled ships have a somewhat curious history. The design originated with the 'Mercure', a French development of the US Navy's MSC class. Only one was built for the French Navy, being launched in 1957, which served for some years, until being scrapped in 1990. Meanwhile the design had attracted the interest of the West German Navy, which ordered six ships from CMN, Cherbourg, as part of the build-up of its MCM force. These entered service with the *Bundesmarine* in 1959/60, but were placed in reserve in 1963 and only recommissioned for mobilisation exercises. They were deleted in 1973, five were passed to the Turkish Navy in 1974/5, followed by the sixth in 1979.

KONDOR II (TYPE 89.200)

OVERVIEW



Pulau Rote (Ian Sturton)
MCM A *Working deck also includes mine rails*

General 1 *Twin 25 mm/80 2-M-3 (two)* **2** *TSR-33 navigation radar* **3** *Twin 25 mm/80 2-M-3 (one)*

The German Democratic Republic (DDR) probably produced more warships than any other Soviet satellite, particularly at the Peenewerft (*werft* = shipyard) at Wolgast. A series of minesweepers was produced starting with the 'Krake' class in the late 1950s, followed by the 'Kondor I' class, of which 22 were built. All were launched in 1970-71. These were followed by the slightly larger 'Kondor II' class, 28 of which were launched between 1971 and 1973. All ships in the class were modernised in 1985-89, which included the addition of an SA-N-5 launcher and a new deckhouse aft.

On German reunification in 1990 the *Volksmarine* was disbanded and the boats were taken over the the German Navy *(Bundesmarine).* Six Kondor IIs were actually taken into service for a short period and given *Bundesmarine* pennant numbers (M 2669 to 2674), while the others were simply laid up.

A number has been sold abroad, all of which were disarmed prior to delivery, but which retained their minesweeping gear. Some remain in Germany and may also be sold abroad. Sales to date are:

- Uruguay — four in 1991
- Indonesia — nine in 1993
- Latvia — two in 1993.

KONDOR II (TYPE 89.200)

GENERAL SPECIFICATIONS

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

The ships were transferred with their minesweeping equipment, which was of Russian origin, including:

- FRG-1 long-range magnetic sweeping gear
- MSG-3 variable depth sweep device.

MINEHUNTING SONARS

Bendix AN/AQS-17
AN/AQS-17 variable depth minehunting sonar was installed in Germany prior to the departure of the ships for Indonesia. AQS-17 was developed in both helicopter and surface ship versions, and is used for both search and classification, operating at 200 kHz. Maximum search range is 600 m (1,966 ft), classification range is 300 m (984 ft) and maximum operational depth 100 m (328 ft).

Manufacturer/Contractor
Bendix, USA.

WEAPONS SYSTEMS

GUNS

25 mm/80 2-M-3
The ships were transferred without any weapons, but are now definitely armed with three twin 25 mm in 2-M-3 mounts: one is on the foredeck and two are side by side immediately abaft the stack. These were found from Indonesian Navy stocks and installed after arrival.

Specifications
(2-M-3)
Calibre: 25 mm
Length of barrel: 60 calibres
Traverse: 360° at 25°/s
Elevation: −10 to +85° at 15°/s
Rates of fire: 450 rds/min/barrel
Projectile: 0.28 kg HEI-T
Range:
anti-surface: 1.5 n miles (2.75 km)
anti-air: 2,800 m (9,184 ft)

MINES

As usual in minesweepers designed in countries of the former Warsaw Pact, there are minerails; in this case, two.

COMMAND AND CONTROL SYSTEMS

RADARS

TSR-333
An I-band navigation radar.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Kolomna Type 40-DM diesels; 3.24 MW (4,408 hp(m)) sustained

Shafts: 2
Propellers: cp

FURTHER INFORMATION

DEPLOYMENT

They are currently being employed with a primary role of EEZ patrol, but retain MCM as their secondary mission. Existing MCM equipment is retained and ADI Dyads are being purchased from Australia, with *Pulau Rondo* (725) being used for the trials.

FRG-1 long-range magnetic sweeping gear
MSG-3 variable depth sweep device.

WEAPONS SYSTEMS

GUNS

Wrobel-I ZU-23-2M twin 23 mm cannon

The ships were supplied from Germany unarmed, but Poland supplied the weapons; Polish Wrobel-I ZU-23-2M 23 mm mounts. One is on the foredeck and two are side by side abaft the stack. The ZU-23-2 was manufactured for some years in Poland and this particular mounting is designated Wrobel-I and consists of twin 23 mm cannon mounted side by side in an open tub-type mounting, but with a clear cover of either glass or plastic. The ZU-23-2 consists of two air-cooled 2A14 cannon of monobloc construction. Each barrel weighs 27.2 kg (60 lb), is 2.01 m (6.6 ft) long including flash suppressor, and they fit into separate cradles. A ZAP-23 optical sight is attached to the rear of the weapon which is on a manually operated firing platform. The mounting has a five-man crew, of whom two are on the mounting and three are ammunition carriers and loaders.

Specifications

(Wrobel I ZU-23-2M)
Calibre: 23 mm
Length of barrel: 87 calibres

One I-band navigation radar.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU MB 12V 493 TY70 diesels; 1.62 MW (2,200 hp(m)) sustained
Shafts: 2

FURTHER INFORMATION

These ten vessels were launched in 1965-67 and were originally designated coastguard boats with the appropriate 'W' pennant numbers. They were then re-rated in 1968 as auxiliaries and allocated 'Y' numbers, but, finally, in 1974, they were again rerated, this time as minesweepers, and given 'M' numbers, which they have retained ever since.

New guns were fitted in 1992.

Five were paid off in 1994/95 and the rest will follow soon.

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

PAP Mk 5 ROV

Klasse 331B minehunters only. The German minehunters carry two PAP Mk 5 (PAP = *poisson autopropulsé*) ROVs, which have the capability simultaneously to hunt and destroy ground mines and tethered mines either by placing and remotely detonating a charge or by cutting the mooring rope of tethered mines. The vehicle is powered by onboard batteries, but is guided from a control console in the operations centre, with signals being passed via either a tether, which can be either a 2,000 m (6,560 ft) fibre optic cable or a 1,000 m (3,280 ft) coaxial cable. It is horizontally propelled by means of two side thrusters.

In the bottom-following mode a constant altitude can be achieved by instructing the vehicle to deploy a 'guide-rope'. The winch in the PAP is instructed to deploy a selected length of rope and the operator then uses return signals from the vehicle to maintain the vehicle at the desired selected height; limits are 2 m (6.56 ft) minimum and 8 m (25.25 ft) maximum.

The PAP Mk 5 is able to carry the 126 kg (278 lb) charge necessary to ensure the total destruction of a mine. Cutters can be carried with the charge. The front section of the vehicle carries a sonar, either a high-resolution nearfield sonar or a mid-range relocation sonar. Identification is carried out by a tiltable low-light TV camera and/or by a tiltable colour TV camera. Vertical thrusters are used to achieve mid-water navigation. Alternative payloads include: explosive charges, cutters (frontal, lateral mechanical and lateral explosive) and a manipulator with a variety of tools.

Specifications

(PAP Mk 5)
Length: 3 m (9.8 ft)
Diameter: 1.2 m (3.9 ft)
Height: 1.3 m (4.2 ft)
Performance:
Max vehicle velocity
mid-water transit: 6 kts (3 m/s)
bottom-following mode: 5.5 kts (2.75 m/s)
Vehicle incidence: ±20° (max)
Vertical velocity with charge: 0.7 m/s
Ascent velocity (charge released): 1.5 m/s
Payload:
NATO charge: 100 kg (220 lb)
Small charge: 30 kg (66 lb)
Horizontal range:
with fibre optic cable: 2,000 m (6,560 ft)
with coaxial cable: 1,000 m (3,280 ft)
Max continuous endurance: 2 h (depending on type of mission)
Max operating depth: 300 m (984 ft)
Watertight integrity: 36 bars

Manufacturer/Contractor

Société ECA, 92707 Colombes, France.

Type HL 351 'Troika' minesweeping drones

The 'Troika' system consists of a Type 351 control ship and three self-propelled minesweeping drones, designated HFG-F1. The 'Troika' drones, known as *Seehunde* are 24 m (79 ft) long and have a steel, blast-resistant hull, encased in a wooden outer hull. The overall design of the minesweepers is characterised by extremely high shock resistance, with a diesel engine driving a combined rudder/propeller via a hydraulic transmission system.

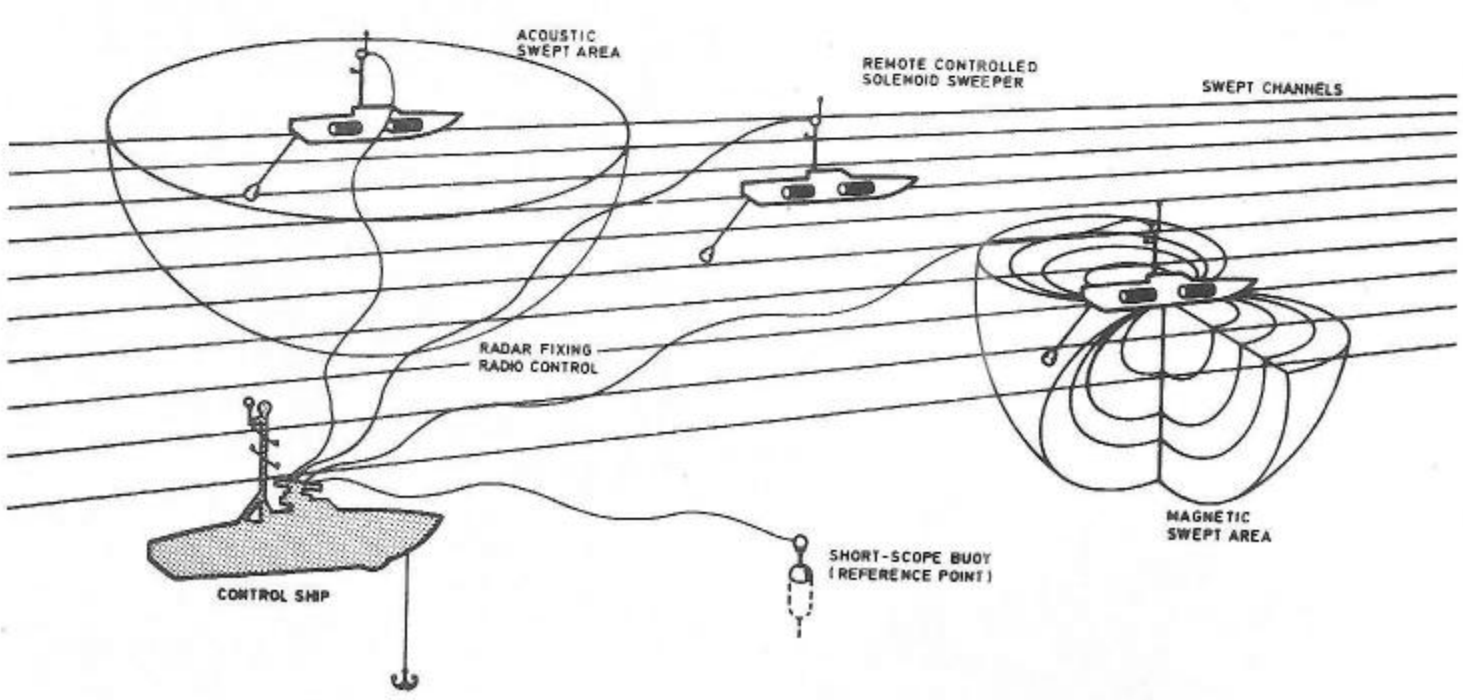
For sweeping magnetic mines, the drone contains two coils, one mounted forward, the other aft, while for acoustic minesweeping two medium-frequency acoustic hammers and one towed low-frequency acoustic displacer are provided.

The Troika system uses a converted 'Lindau' class coastal minesweeper as the minesweeping operations centre. The remote-control equipment comprises a horizon-stabilised X/C-band precision navigation radar, a digital target extractor, a master console and three control displays. Each of the latter is associated with one unmanned minesweeper on the one hand, and with a remote action system operator console on the other. The control displays allow the radar image of the swept channel to be greatly magnified so that a high degree of precision is achieved in guiding the unmanned minesweepers along the specified tracks electronically inserted into the radar image.

Control commands are sent to the minesweepers over a line of sight UHF radio link, using multiplexed data messages. Their responses and functions are monitored automatically by an integrated monitoring system. There is also a reference buoy which provides a geographically stabilised radar image.

Manufacturer/Contractor

Lürssen Werft, Vegesack, Bremen, Germany.



The Troika system with a Klasse 351 vessel acting as the control ship for three Seehunde

MINEHUNTING SONAR

STN Atlas DSQS-11M

The DSQS-11M minehunting sonar is a high-definition, dual-frequency sonar which forms an integral part of the Atlas MWS 80-5 minehunting weapons system. In the 'Rushcutter' class installation the sonar transducer is housed in a self-contained module located in the forward part of the port hull. The sonar performs:

Detection and classification of all types of ground, short tethered and moored mines
High-clearance performance by simultaneous detection and classification within a 90° sector
Simultaneous 3D precision target localisation
Computer-aided detection (CAD) and classification (CAC)
Automatic tracking of stationary and moving targets
Integrated sonar performance prediction function
Integrated route survey mode (side scan function)
Video and data recording and playback
Comprehensive BITE to ensure system availability

The system comprises an operator console, an electronics cabinet, the hoisting unit (with transducer arrays, signal processing units and stabilisation unit) and the hydraulics unit.

The DSQS-11 M console includes two high-resolution raster scan displays and keypads for direct system operation. Additionally the operation is supported by easily accessible menu guidance on both graphic displays.

The DSQS-11M sonar operates on three frequencies (40, 100 and 200 kHz).

Manufacturer/Contractor

STN Atlas Elektronik, Bremen, Germany.

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/70

The SAK 40L/70-315 is a manually laid mounting in which the gun platform is on a pedestal. The total height to the centre of the barrel from the deck when the gun is horizontal is 1.36 m (4.5 ft). The mounting weighs 2.87 t unloaded, is 1.83 m (6.0 ft) long and has a training radius of 3.31 m (10.8 ft). The mounting has a protective shield and includes ammunition racks for 96 rounds.

Specifications
Traverse: 360° (nominal) at 30°/s
Elevation: −3 to +85° at 24°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Max range:
anti-surface: 6.5 n miles (12 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

Manufacturer/Contractor
Bofors Weapon Systems, Sweden.

COMMAND AND CONTROL SYSTEMS

RADAR

Raytheon AN/SPS-64(V)9

The ships were fitted with either Kelvin Hughes 14/9 or STN Atlas Elektronik TRS N; both are I-band navigation radars. These are in the process of being replaced by the Raytheon AN/SPS-64(V)9.

Specifications
AN/SPS-64(V)9
Role: Navigation
Frequency: I-band
Beam: 1.9 × 22°
Peak power: 20 kW
Gain: 28 dB
Pulsewidth: 0.06/0.5/1.0 µs
PRF: 3,600/1,800/900 pps
Scan rate: 33 rpm

Manufacturer/Contractor
Raytheon, USA.

PROPULSION

Specifications
System: Diesel
Main machinery:
Minehunters: 2 MTU MD diesels; 2.94 MW (4,000 hp(m))
Troika: 2 MTU MD 16V 538 TB90 diesels, 3.68 MW (5,000 hp(m))
Shafts: 2

FURTHER INFORMATION

DESIGN

As originally built, the ships belonged to Klasse 320, which was essentially a German version of the NATO standard coastal minesweeper, great numbers of which were produced in the 1950s. The hull is of wooden construction and the components, such as the engines, are made of non-magnetic materials. There were some early problems with the design. The bridge was found to be too high, making the ships unstable, and had to be lowered by one deck level, while there was insufficient working space on the afterdeck, which had to be enlarged. An early refit was required to resolve these problems.

Twelve ships were converted to minehunters. Two (*Fulda* and *Flensburg*) were converted under the original programme, designated Klasse 331A, and have now been retired. The remaining ten were slightly different and were designated Klasse 331B.

The remaining six ships were converted to Klasse 351 as Troika control ships, in which they control up to three Seehunde.

FURTHER INFORMATION

PROGRAMME

The 'Schütze' class minesweepers were built for the (then) West German Navy *(Bundesmarine)* by Abeking & Rasmussen between 1957 and 1959. 25 were built and by 1992 all had been deleted, most of them being disarmed and sold to private owners; none was sold to overseas navies.

The Brazilian Navy, however, purchased six new boats to the same design as those built for the *Bundesmarine*. The first four were ordered in April 1969 and last two in November 1973. All six remain in service.

DESIGN

The Schütze design was based on that of the last of the R-class boats built for the *Kriegsmarine* during the Second World War. The boats are constructed of wood and non-magnetic materials, and carry mechanical, acoustic and magnetic sweeping gear.

MODERNISATION

It is expected that all six boats will be modernised in the late 1990s.

MINE COUNTERMEASURES SYSTEMS

These ships are equipped for mechanical, acoustic and magnetic minesweeping, and are also equipped with a minehunting sonar.

COMBAT DIVERS

There are six combat divers and a decompression chamber is mounted on the sweep deck.

MINESWEEPING

PAP-104 Mk 4 ROV

The South African MCMVs carry two PAP Mk 4 (PAP — *poisson auto-propulsé*) ROVs, which have the capability simultaneously to hunt and destroy ground mines and tethered mines either by placing and remotely detonating a charge or by cutting the mooring rope of tethered mines. The vehicle is powered by onboard batteries, but is guided from a control console in the operations centre, with signals being passed via either a tether or a coaxial cable. It is horizontally propelled by means of two side thrusters.

In the bottom-following mode a constant altitude can be achieved by instructing the vehicle to deploy a 'guide rope'. The winch in the PAP is instructed to deploy a selected length of rope and the operator then uses return signals from the vehicle to maintain the vehicle at the desired selected height; limits are 2 m (6.56 ft) minimum and 8 m (25.25 ft) maximum.

The PAP Mk 4 is able to carry the 126 kg (278 lb) charge necessary to ensure the total destruction of a mine. Cutters can be carried with the charge. The front section of the vehicle carries a sonar, either a high-resolution nearfield sonar or a mid-range relocation sonar. Identification is carried out by a tiltable low-light TV camera and/or by a tiltable colour TV camera. Vertical thrusters are used to achieve mid-water navigation. Alternative payloads include: explosive charges, cutters (frontal, lateral mechanical and lateral explosive) and a manipulator with a variety of tools.

Specifications
PAP Mk 4
Length: 3 m (9.8 ft)

Shafts: 2
Propellers: Two Voith-Schneider

FURTHER INFORMATION

PROGRAMME

Abeking & Rasmussen built a series of 25 'Schütze' class minesweepers for the (then) West German Navy between 1957 and 1959. In the 1970s, the South African Navy (SAN) was faced with an international arms embargo. The first two of these vessels were purchased for 'hydrological and geophysical research' and the hulls were constructed by Abeking & Rasmussen in Germany, following which they were shipped to Cape Town where they were completed and fitted out.

On completion the hulls were painted blue and white upperworks and, having been named *RV Navors I* and *Navors II*, respectively, they were then operated by the navy 'on behalf of' the Department of Transport, flying the national flag (and not the naval ensign). They were finally commissioned into the navy, painted grey and given pennant numbers on 3 February 1988.

It is intended to give them a second-generation mine-hunting system as soon as funds become available, but there are many other calls on the limited funds available.

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

Pinguin B3 ROV

Two per ship. The Pinguin B3 is a remotely controlled, unmanned underwater vehicle for minehunting operations. With the input of target information derived from minehunting sonars, the ROV is capable of identifying a mine and, if necessary, placing a 125 kg (275 lb) mine disposal charge to destroy it. A second charge enables the ROV to continue the mission and approach a second target.

The Pinguin B3 is equipped with a 1,000 m (3,281 ft) fibre optic cable for data transmission. In low-velocity currents, its operating distance is up to 900 m (2,953 ft) at 200 m (656 ft) depth. In currents of 3 knots the vehicle has a range of about 500 m (1,640 ft) at 200 m (656 ft) depth.

The propulsion system consists of two horizontal propeller thrusters, mounted laterally to the stern section of the vehicle.

Specifications
Length: 3.5 m (11.5 ft)
Hull diameter: 70 cm (27.5 in)
Width: 1.5 m (5.0 ft)
Height: 1.2 m (3.9 ft) including MDCs 1.5 m (4.9 ft)
Mass: 1,350 kg (2,976 lb)
Propulsion: 2 variable speed thrusters, 1 automatic controlled

Vertical thruster
Power supply: Internal battery systems
Max diving depth: 200 m (656 ft)
Speed: 6 kts (continuous), 8 kts (max)
Endurance: 60/120 min
Payload: 255 kg (562 lb) (2 mine disposal charges and other payloads)
Sensors: TV camera, different sonar options

Manufacturer/Contractor
STN Atlas Elektronik, Bremen, Germany.

IBIS V

IBIS V is a lightweight minehunting action information system, elements of the system including the Thomson-CSF TSM-2022 single array sonar and the TSM-2026 NAVIPLOT.

Manufacturer/Contractor
Thomson-CSF, France.

MINEHUNTING SONAR

Thomson-CSF TSM-2022

TSM-2022 is a hull-mounted minehunting sonar, based on experience gained with the DUBM 21B in the field of high-resolution beam-forming techniques. One of the main features of the TSM 2022 is its small-size retractable single array assembly, used for both detection and classification, which enables easy installation and maintenance.

The main functions of the sonar are: detection and classification of moored and bottom mines, detection at distances up to 600 m (1,968 ft) and classification of targets by analysis of the shape of their echo or shadow at distances up to 250 m (820 ft). In the classification mode, horizontal beamwidth is 7°; in detection mode either 14° or 28° beamwidth can be selected. In both modes the vertical beamwidth is 15°.

The main assemblies are:
The hoisting and stabilisation system together with the retractable array which is installed in the sonar trunk (0.75 m (2.5 ft) diameter). The total weight is 900 kg (1,984 lb)

Electronics cabinet
Operator's console, which provides display of sonar images in the various modes, memory and display of former sonar contacts, and includes interfaces with current mine disposal and navigation equipments.

Manufacturer/Contractor
Thomson-CSF, France.

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60
There is one 40 mm Bofors in a manually operated mount on the foredeck. The 40 mm Bofors L/60 is an automatic cannon for air defence roles which may also be used to engage surface targets.

Specifications
Gun
Calibre: 40 mm
Length of barrel: 60 calibres
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Rate of fire: 300 rds/min
Traverse: Nominal 360° at 12°/s
Elevation: −5 to +90° at 25°/s
Crew: 3
Max range:
anti-surface: 6.5 n miles (12 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)

M2HB 12.7 mm machine gun
Two M2HB 12.7 mm (0.50 in) machine guns are carried in each ship. The M2HB is a selective short recoil automatic operation weapon using 110-round belts.

Specifications
(M2HB)
Calibre: 12.7 mm
Length of barrel: 90 calibres
Gun weight: 38.1 kg (84.0 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

COMMAND AND CONTROL SYSTEMS

RADAR

Navigation
There is one I-band navigation radar; type not known.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU 12V 396 TC80 diesels; 1.874 MW (2,553 hp(m)) sustained
Shafts: 2
Propellers: Two Voith-Schneider five-bladed propellers

FURTHER INFORMATION

PROGRAMME

These four ships were built for the civilian, Taiwan-based, Chinese Petroleum Corporation by Abeking & Rasmussen, Lemwerder, Germany as offshore oil rig support ships. On arrival in Taiwan, however, they converted for minehunting and even appeared in their new role, but with a 'civilian' paint scheme, which included the CPC logo on the side, which contrasted with the Bofors gun and the minesweeping gear on the quarterdeck.

Some reports suggest that up to eight more of the class may be built. Also, two were reported to be under construction in 1993 in Taiwan but this has never been confirmed and no new ships have been seen. In any case, the first four ships seem to spend little time at sea.

Yung Feng *(1301). Four of these vessels were delivered to Taiwan as 'oil-rig support ships' but are now employed as MCMVs*

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

STN Atlas MWS 80

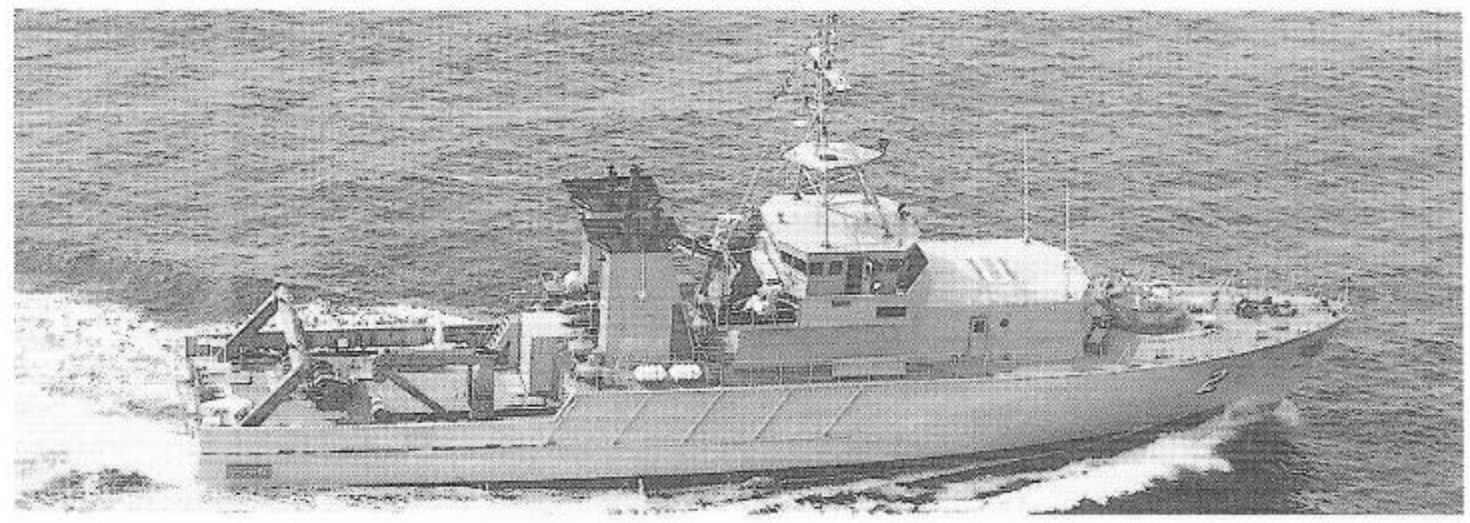
The MWS 80 minehunting action information system is an integrated multirole MCM system. It performs the following functions: search, detection, classification, identification and neutralisation of ground and moored mines, precision navigation and vessel control, and full control and co-ordination of all MCM operations. It also maintains an accurate record of all areas searched and targets located, with geographic positions and details of classification results.

MWS 80 integrates the DSQS-11M minehunting sonar, the NBD (navigation and vessel control equipment), the TCD tactical command system for co-ordinating and documenting MCM operations and the mine disposal system and the AIS 11 active identification sonar installed on the ROV.

The TCD assists the operator to control all phases of an MCM operation by providing means for display, plotting, storage and retrieval of tactical data. The equipment employs a comprehensive database which is continuously updated during operation.

The navigation sensors such as GPS, Radio Location Systems, Gyro or Inertial Platform and so on, and the integrated Doppler Log (DLO 3-2) enable the NBD to compute with a very high degree of accuracy the various navigational parameters such as ship's geographical position, groundspeed, speed through water, course, heading and drift.

All data handled are recorded on hard disk, tape and printer to enable missions to be stopped and started at will, provide recall of data for comparison and evaluation, maintenance of a permanent record of the seabed for MCM survey and for training purposes ashore.



Bangrachan *(631) (here wearing earlier pennant number). These two Thai ships have frames and superstructure made of austenitic steel, and frames and decks made of wood. Note the gantry at the stern used to swing sweeps clear of the transom* (Fr Lürssen)

Manufacturer/Contractor
STN Atlas Elektronik, Bremen, Germany.

Gaymarine Pluto ROV

Two per ship. Pluto is available in three configurations: battery-powered with a 6 mm, 500 m (1,640 ft) long umbilical cable; battery-powered with a 3 mm, 2,000 m (6,561 ft) long fibre optic umbilical cable; or remote-powered of unlimited endurance with 8 mm, 500 m (1,640 ft) long umbilical cable. The vehicle is powered by five thrusters: two horizontal for forward/reverse, two vertical for vertical and lateral shift, and a transversal thruster. The thrusters are controlled by two joysticks.

The vehicle can maintain automatic depth control within ±10 cm (4 in). Forward maximum speed is 4 knots and vertical speed 1 knot. Sensors are mounted in the forward tiltable section of the vehicle and can include black and white LLTV, colour TV or still camera, search or scanning sonar, acoustic pinger, strobe flash, measuring instruments, manipulators and so on. There are ten free channels for remote control and two four-digit telemetry channels for measurements. The console incorporates a 9 in TV monitor for displaying information showing TV image, depth, compass, head tilt angle, elapsed time and sonar diagram. All displayed data can be video recorded.

Specifications
Length: 1,680 mm (66 in)
Width: 600 mm (24 in)
Height: 630 mm (25 in)
Weight: 160 kg (353 lb)
Service depth: 400 m (1,312 ft)
Payload: 15 kg (33 lb)

Manufacturer/Contractor
Gaymarine, Italy.

MINEHUNTING SONAR

STN Atlas DSQS-11M

The DSQS-11M minehunting sonar is a high-definition, dual-frequency sonar which forms an integral part of the Atlas MWS 80-5 minehunting weapons system. In the 'Rushcutter' class installation the sonar transducer is housed in a self-contained module located in the forward part of the port hull. The sonar performs:

- Detection and classification of all types of ground, short tethered and moored mines
- High-clearance performance by simultaneous detection and classification within a 90° sector
- Simultaneous 3D precision target localisation
- Computer-aided detection (CAD) and classification (CAC)
- Automatic tracking of stationary and moving targets
- Integrated sonar performance prediction function
- Integrated route survey mode (side scan function)
- Video and data recording and playback
- Comprehensive BITE to ensure system availability.

The system comprises an operator console, an electronics cabinet, the hoisting unit (with transducer arrays, signal processing units and stabilisation unit) and the hydraulics unit.

The DSQS-11 M console includes two high resolution raster scan displays and keypads for direct system operation. Additionally the operation is supported by easily accessible menu guidance on both graphic displays.

The DSQS-11M sonar operates on three frequencies (40, 100 and 200 kHz).

Manufacturer/Contractor
STN Atlas Elektronik, Bremen, Germany.

Other MCM equipment

- Motorola Miniranger MRS III precise navigation system.
- Draeger decompression chamber for mine-disposal divers.
- Unspecified acoustic and magnetic gear
- SDG-31 mechanical sweeps.

WEAPONS SYSTEMS

GUNS

Oerlikon 20 mm om GAM-BO1 mountings

Three Oerlikon 20 mm on GAM-BO1 mountings: one on forecastle, one either side of after end of the bridge-house. This is an unpowered, light, compact swivel fork-type mount with the sidewalls having the trunnion bearings. These mountings usually have the RC35 optical ring sight, but they can be fitted with the SLC 001 lightweight lead-computing sight. The 200-round ammunition box is attached to the front of the mounting and the belt is fed from the right side of the gun, with spent cartridge cases ejected between the sidewalls of the cradle into a separate compartment while the links are collected in a bag on the other side of the mounting. The GAM-BO1 has the KAA gun.

Specifications
KAA Gun
Calibre: 20 mm
Length of barrel: 85 calibres
Muzzle velocity: 1,050-1,150 m/s (3,445-3,773 ft/s)

Range
anti-surface: 1.7 km
anti-air: 1,700 m (5,577 ft)
Rate of fire: 900 rds/min
Round weight: 320-345 g
Projectile: 110-125 g

GAM-BO1 Mounting
Elevation: −15 to +60°
Weight: 500 kg (1,102 lb) (loaded)

COMMAND AND CONTROL SYSTEMS

RADAR

STN Atlas Elektronik 8600 ARPA

Two STN Atlas Elektronik 8600 ARPA I-band navigation radars are fitted.

Specifications
Frequency: I-Band (9,375 MHz)
Pulse peak power: 25 kW
Horizontal beamwidth: 1.5/0.95°
Vertical beamwidth: >20°
Antenna rotation: 23 rpm

Polarisation: Horizontal
Antenna: 5/8 ft slotted array
Antenna weight: 61 kg (134 lb)

Manufacturer/Contractor
STN Atlas Elektronik.

PROPULSION

Specifications
System: Diesel/diesel-electric
Main Machinery: 2 MTU 12V 396 TB83 diesels; 2.3 MW (3,120 hp(m)) sustained

Shafts: 2
Propellers: KaMeWa cp
Electric propulsion and ship's services: Two 275 kVA generator sets; two 150 kVA generator sets.

FURTHER INFORMATION

PROGRAMME

These are the first modern MCMVs in the Royal Thai Navy. The first was ordered from Lürssen in late 1984 and arrived in Bangkok on 22 October 1987. The second was ordered on 5 August 1985 and arrived in Bangkok May 1988.

DESIGN

These ships are constructed with amagnetic (austenitic) steel frames and deckhouses, with a wooden hull.

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

STN Atlas MWS 80-4

Minehunting action information system. The MWS 80-4 is an integrated multirole MCM system which performs search, detection, classification, identification and neutralisation of ground and moored mines, precision navigation and vessel control, and full control and co-ordination of all MCM operations. It also maintains an accurate record of all areas searched, targets located, their geographic position and details of classification results.

MWS 80-4 integrates the DSQS-11M minehunting sonar, the NBD (navigation and vessel control equipment), the TCD tactical command system for co-ordinating and documenting MCM operations and the mine disposal system and the AIS 11 active identification sonar installed on the ROV.

The TCD assists the operator to control all phases of an MCM operation by providing means for display, plotting, storage and retrieval of tactical data. The equipment employs a comprehensive database which is continuously updated during operation.

The navigation sensors such as GPS, Radio Location Systems, Gyro or Inertial Platform and so on, and the integrated Doppler Log DLO 3-2 enable the NBD to compute with a very high degree of accuracy the various navigational parameters such as ship's geographical position, groundspeed, speed through water, course, heading and drift.

All data handled are recorded on hard disk, tape and printer to enable missions to be stopped and started at will, provide recall of data for comparison and evaluation, maintenance of a permanent record of the seabed for MCM survey and for training purposes ashore.

Manufacturer/Contractor
STN Atlas Elektronik, Bremen, Germany.

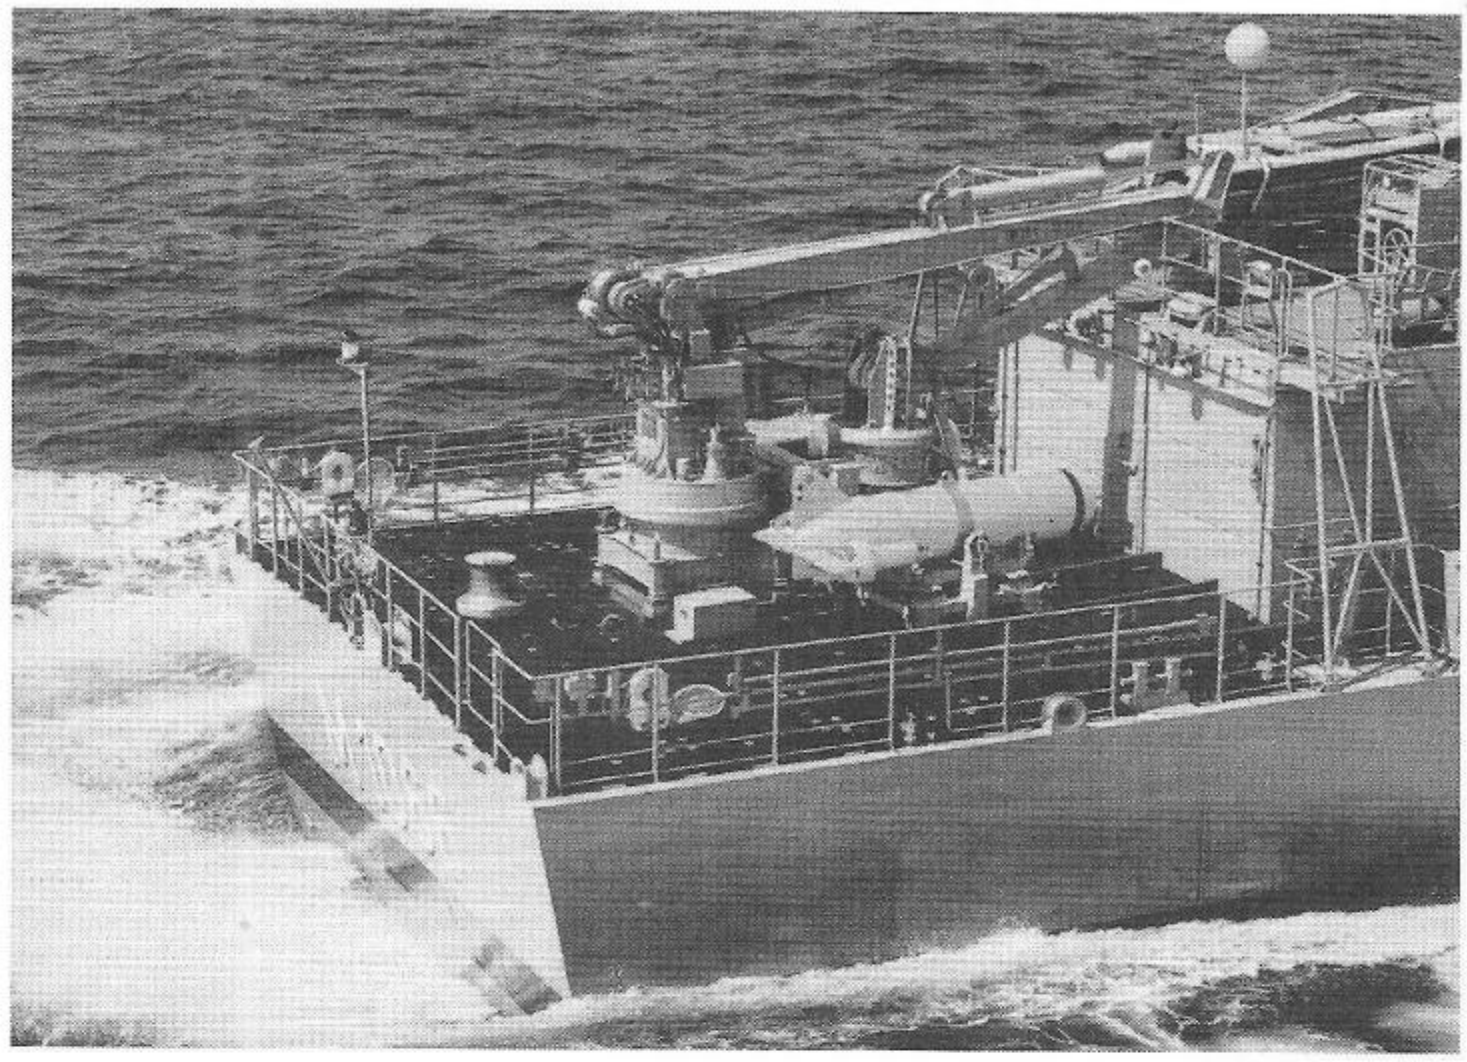
STN Atlas Pinguin B3 ROV

The Pinguin B3 is a remotely controlled, unmanned underwater vehicle for minehunting operations. With the input of target information derived from minehunting sonars, the ROV is capable of identifying a mine and, if necessary, dropping a mine disposal charge to destroy it. A second charge enables the ROV to continue the mission and approach a second target.

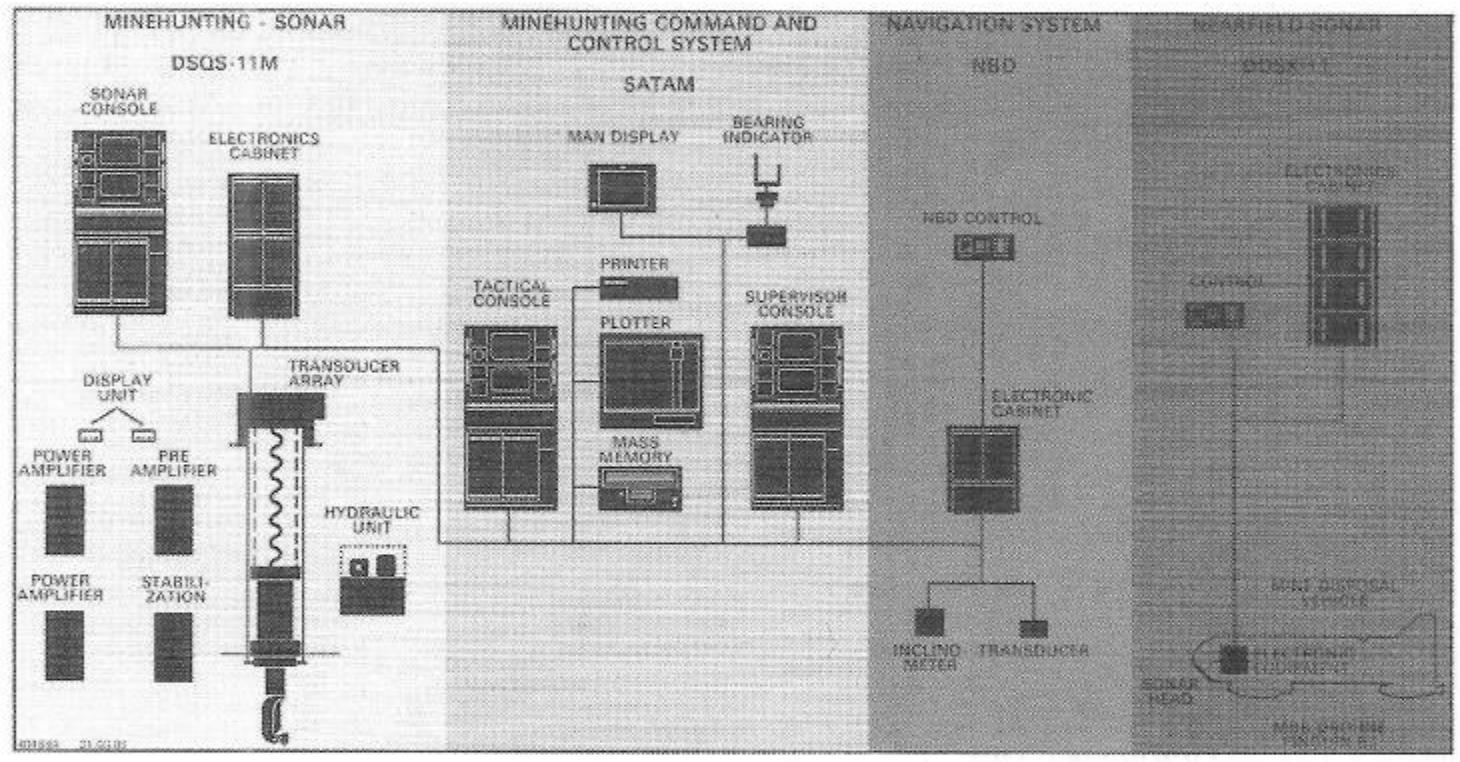
The Pinguin B3 is equipped with a 1,000 m (3,281 ft) fibre optic cable for data transmission. In low-velocity currents, its operating distance is up to 900 m (2,953 ft) at 200 m (656 ft) depth. In currents of 3 knots the vehicle has a range of about 500 m (1,640 ft) at 200 m (656 ft) depth.

The propulsion system consists of two horizontal propeller thrusters, mounted laterally to the stern section of the vehicle. The Pinguin B3 carries two charges of up to 125 kg (275 lb) each.

Specifications
Length: 3.5 m (11.5 ft)
Hull diameter: 70 cm (27.5 in)
Width: 1.5 m (4.9 ft)
Height: 1.2 m (3.9 ft) including MDCs 1.5 m (4.9 ft)
Mass: 1,350 kg (2,976 lb)
Propulsion: 2 variable speed thrusters, 1 automatic controlled vertical thruster
Power supply: Internal battery systems
Max diving depth: 200 m (656 ft)
Speed: 6 kts (continuous), 8 kts (max)
Endurance: 60/120 min
Payload: 255 kg (562 lb) (2 mine disposal charges and other payloads)
Sensors: TV camera, different sonar options



The stern of a Klasse 332 minehunter with a Pinguin B3 ROV on deck. The hangar holds two Pinguins and they are lifted in and out of the water by the crane



The STN Atlas MWS 80-4 integrated MCM system

Manufacturer/Contractor
STN Atlas Elektronik, Bremen, Germany.

MINEHUNTING SONARS

STN Atlas DSQS-11M

The DSQS-11M minehunting sonar is a high-definition, dual-frequency sonar which forms an integral part of the Atlas MWS 80-5 minehunting weapons system. The sonar performs:

- Detection and classification of all types of ground, short tethered and moored mines
- High-clearance performance by simultaneous detection and classification within a 90° sector
- Simultaneous 3D precision target localisation
- Computer-aided detection (CAD) and classification (CAC)
- Automatic tracking of stationary and moving targets
- Integrated sonar performance prediction function
- Integrated route survey mode (side scan function)
- Video and data recording and playback
- Comprehensive BITE to ensure system availability.

The system comprises an operator console, an electronics cabinet, the hoisting unit (with transducer arrays, signal processing units and stabilisation unit) and the hydraulics unit.

The DSQS-11 M console includes two high-resolution raster scan displays and keypads for direct system operation. Additionally the operation is supported by easily accessible menu guidance on both graphic displays.

The DSQS-11M sonar operates on three frequencies (40, 100 and 200 kHz).

Manufacturer/Contractor
STN Atlas Elektronik, Bremen, Germany.

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES

Fliegerfaust-2 (Stinger)

The 'Frankenthal' class is equipped with two quad launchers for Stinger surface-to-air missiles which are designated *Fliegerfaust-2* in the *Bundesmarine*. The basic version of Stinger is an IR-guided missile for use against aircraft. In the German Navy, *Fliegerfaust-2* launchers are being installed in several classes of mine countermeasures vessels (MCMV), including 'Frankenthal' (Type 332) class; 'Hameln' class (Type 343); and 'Elbe' (Type 404) class tenders, which support MCMV units.

Specifications
Length: 1.52 m (5.0 ft)
Diameter: 70 cm (27.5 in)
Weight: 8.2 kg (18.0 lb)
Speed: Mach 2.2
Range: 8,000 m (26,246 ft)
Altitude: 3,500-3,800 m (11,483-12,467 ft)
Guidance: Passive homing (FIM-92A)
IR/UV: Passive homing (FIM-92B/C)

Manufacturer/Contractor
Hughes Missile Systems, US.

GUNS

Bofors 40 mm/70

The SAK 40L/70-315 is a manually laid mounting in which the gun platform is on a pedestal. The total height to the centre of the barrel from the deck when the gun is horizontal is 1.36 m (4.5 ft). The mounting weighs 2.87 t unloaded, is 1.83 m (6.0 ft) long and has a training radius of 3.31 m (10.8 ft). The mounting has a protective shield and includes ammunition racks for 96 rounds.

Specifications
Traverse: 360° (nominal) at 30°/s
Elevation: −3 to +85° at 24°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Max range:
anti-surface: 6.5 n miles (12 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

Manufacturer/Contractor
Bofors Weapon Systems, Sweden.

COMMAND AND CONTROL SYSTEMS

RADAR

Specifications
Raytheon AN/SPS-64(V)9
Role: Navigation
Frequency: I-band
Beam: 1.9 × 22°
Peak power: 20 kW
Gain: 28 dB
Pulsewidth: 0.06/0.5/1.0 µs
PRF: 3,600/1,800/900 pps
Scan rate: 33 rpm

Manufacturer/Contractor
Raytheon, USA.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU 16V 396 TB84 diesels; 4.08 MW (5,550 hp(m)) sustained.
Shafts: 2
Propellers: 2 Voith-Schneider cycloidal propellers

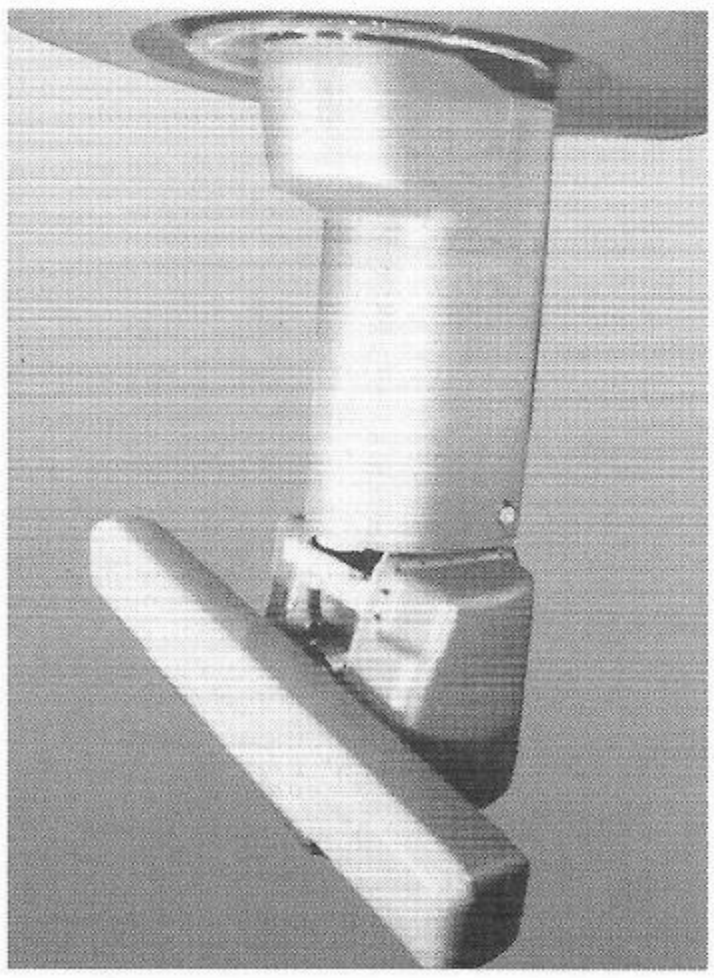
FURTHER INFORMATION

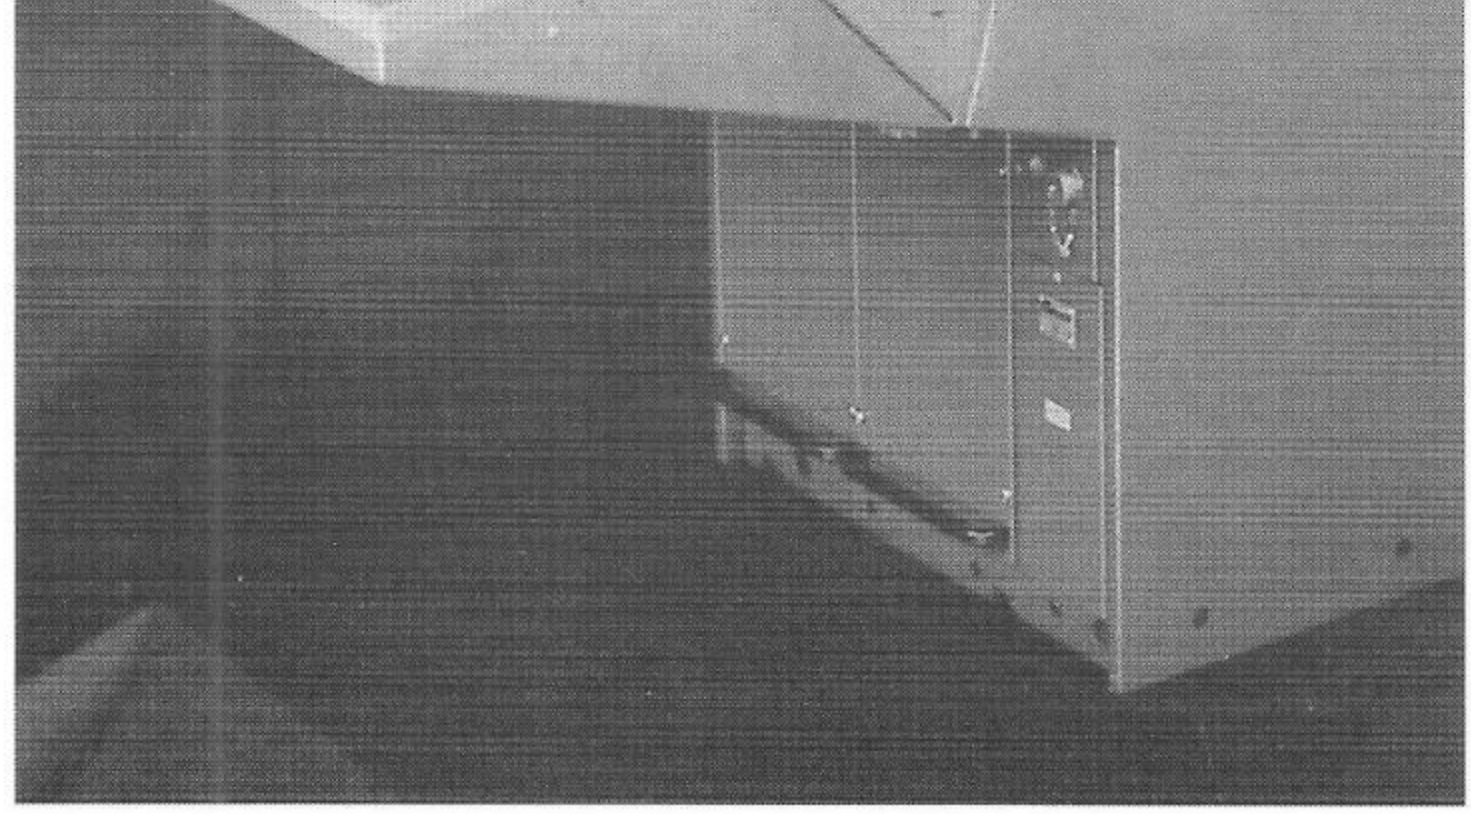
PROGRAMME

The first ten were ordered in September 1988 with STN Systemtechnik Nord (now STN Atlas Elektronik) as main contractor. M 1066 was laid down at Lürssen on 6 December 1989. The last two were ordered on 16 October 1995.

DESIGN

This is a minehunter version of the Type 343, but with a hull form, propulsion system, and equipment adapted for the different mission. Like the Type 343, the Type 332 is built of amagnetic steel, which is an effective solution to the MCMV's magnetic problem, but one that has found no export customers to date.





The STN Atlas DSQS-11M minehunting sonar is an integral part of the MWS 80-4 system. The sonar has a 90° detection sector, trainable over the total azimuth to give gapless coverage of the search path. Modes include: LF long-range detection, LF long-range classification, HF high-resolution detection and classification, and depth classification (STN Atlas)

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

The German MCMVs carry:
- SDG-31 double Oropesa mechanical sweep for moored mines. Maximum depth is 60 m (197 ft) and for depths greater than this, the sweep is usually employed by two vessels acting as a 'team.'
- HFG-G1 acoustic sweep
- GBT-3 (GBT = *Geräuschboje Turbine*)
- GHA magnetic sweep, a large solenoid

MINEHUNTING SONARS

STN Atlas DSQS-11M

DSQS-11M is a high-definition, dual-frequency, minehunting sonar which forms an integral part of the Atlas MWS 80-4 and MWS 80-5 minehunting weapons systems. The sonar performs:
- Detection and classification of all types of ground, short tethered and moored mines
- High-clearance performance by simultaneous detection and classification within a 90° sector
- Simultaneous 3D precision target localisation
- Computer-aided detection (CAD) and classification (CAC)
- Automatic tracking of stationary and moving targets
- Integrated sonar performance prediction function
- Integrated route survey mode (side scan function)
- Video and data recording and playback
- Comprehensive BITE to ensure system availability.

The system comprises an operator console, an electronics cabinet, the hoisting unit (with transducer arrays, signal processing units and stabilisation unit) and the hydraulics unit. The DSQS-11M console includes two high-resolution raster scan displays and keypads for direct system operation. Additionally the operation is supported by easily accessible menu guidance on both graphic displays.

Manufacturer/Contractor
STN Atlas Elektronik, Bremen, Germany.

Digital Navigation Data Transmitter
The DNDT collates all navigation information relevant to MCM operations, including position, compass bearings, speed, wind strength and direction, currents and time. DNDT is linked to the plotter in the CIC, automatic steering system, operator's console and the AN/UYK-20 computer. The ships are also fitted for GPS.

MINELAYING SYSTEM

The ships are equipped to lay a total of 60 mines. The four sets of mine rails and the laying chutes are permanently installed. The parameters of the required lay are entered into the command system and the remainder of the operation is automatic.

WEAPONS SYSTEMS

SURFACE-TO-SURFACE MISSILES

Hughes Fliegerfaust-2 (FIM-92 Stinger)
The 'Hameln' class is equipped with two quad launchers for Stinger surface-to-air missiles. The basic version of Stinger is an IR-guided missile for use against aircraft. In the German Navy, Stinger launchers are being installed in several classes of mine countermeasures vessels (MCMV), each ship having two quad launchers. (The German Stinger system is known as the Fliegerfaust-2 or FIF-2).

Specifications
Length: 1.52 m (5.0 ft)
Diameter: 70 cm (27.5 in)
Weight: 8.2 kg (18.0 lb)
Speed: Mach 2.2
Range:
anti-surface: 8,000 m (26,246 ft)
anti-air: 3,500-3,800 m (11,483-12,467 ft)
Guidance: Passive homing (FIM-92A)
IR/UV: Passive homing (FIM-92B/C)

Manufacturer/Contractor
Hughes Missile Systems, USA.

GUNS

Bofors SAK 40 mm/70-315
The SAK 40/70-315 is a manually laid mounting in which the gun platform is on a pedestal. The total height to the centre of the barrel from the deck when the gun is horizontal is 1.36 m (4.5 ft). The mounting weighs 2.87 t unloaded, is 1.83 m (6.0 ft) long and has a training radius of 3.31 m (10.9 ft). The mounting has a protective GRP shield and includes ammunition racks for 96 rounds.

Specifications
Traverse: 360° (nominal) at 30°/s
Elevation: −3 to +85° at 24°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Max range:
anti-surface: 6.5 n miles (12 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

Manufacturer/Contractor
Bofors Weapon Systems, Sweden.

Hameln *(M 1092), lead ship of ten minesweepers of the Klasse 343. The Signaal 'egg' houses the fire-control radar for the Bofors 40 mm, but air defence is now augmented by two Fliegerfaust-2 (Stinger) missile launchers* (German Navy)

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES

Thomson-CSF DR 2000 radar threat warner
The Thomson-CSF DR 2000U ESM system detects pulse and continuous wave (CW) signals and, when coupled with the Dalia analyser, is used as a basic ESM suite, under the company designation TMV 434. There are six DF antennas and one omni-antenna on a telescopic mast, and a processing control/display console in the EW centre. It provides a virtual 100 per cent probability of detection over the complete 360° of azimuth and gives instantaneous audio and video alerts.

Manufacturer/Contractor
Thomson-CSF, Elancourt, France.

ELECTRONIC COUNTERMEASURES

BUCK-Wegmann Hot Dog/Silver Dog decoy system
Two 12-tube launchers. The BUCK-Wegmann Hot Dog/Silver Dog equipment is an IR/chaff dispenser decoy system to counter anti-ship missiles equipped with active radar and/or IR seeker heads. The system consists of a reloadable 12- or 24-tube launcher, main and auxiliary control units, emergency release, IR decoy grenades (Hot Dog), and chaff grenades (Silver Dog). Two or four carrier mountings, each with three launcher tubes, are deck-mounted on the port and starboard sides of the ships. The tubes can be loaded with either all IR decoys or all chaff grenades, or a combination of the two, and they can be fired in single shots or in a series of shots. In the latter mode the decoy cloud becomes effective after only two seconds, and is sustained over a considerable period.

Specifications
Type: 76 mm decoy grenade launcher
Tubes: 12 or 24 per system

IR decoy (Hot Dog)
Grenade type: 76 mm
Weight: 0.74 kg (1.6 lb) (approx)
Payload weight: 0.41 kg (0.9 lb) (approx)
Cloud development time: 2 s

Chaff decoy (Silver Dog)
Grenade type: 76 mm
Weight: 0.95 kg (2.1 lb) (approx)
Payload weight: 0.45 kg (1.0 lb) (approx)
Cloud development time: 2 s

Manufacturers/Contractors
Wegmann GmbH, Kassel, Germany (launcher).
BUCK System GmbH, Neuenburg, Germany (grenades).

Scan rate: 60 rpm

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, The Netherlands.

Raytheon AN/SPS-64(V)9

Specifications
Role: Navigation
Frequency: I-band
Beam: 1.9 × 22°
Peak power: 20 kW
Gain: 28 dB
Pulsewidth: 0.06/0.5/1.0 µs
PRF: 3,600/1,800/900 pps
Scan rate: 33 rpm

Manufacturer/Contractor
Raytheon, USA.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU 16V396 TB84 diesels; 4.5 MW (6,140 hp(m)) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME

On 3 January 1985 a consortium headed by STN Systemtechnik Nord (now STN Atlas) was awarded the contract.

DESIGN

The key feature of the Type 343 is that it is constructed of amagnetic (austenitic) steel. This material was chosen after detailed examination of the alternatives and was carefully compared with various types of GRP, including: sandwich; stiffened, solid GRP; and non-stiffened, solid GRP. Amagnetic steel came best out of the tests, but a further factor in the choice was Germany's industrial capabilities and experience with this steel which had been developed for use in the *Bundesmarine's* submarines.

MODERNISATION

The sonar was fitted to all ships from 1991 onwards, although the first three only have a mine-avoidance version. All will have the full DSQS-11M sonar in due course.

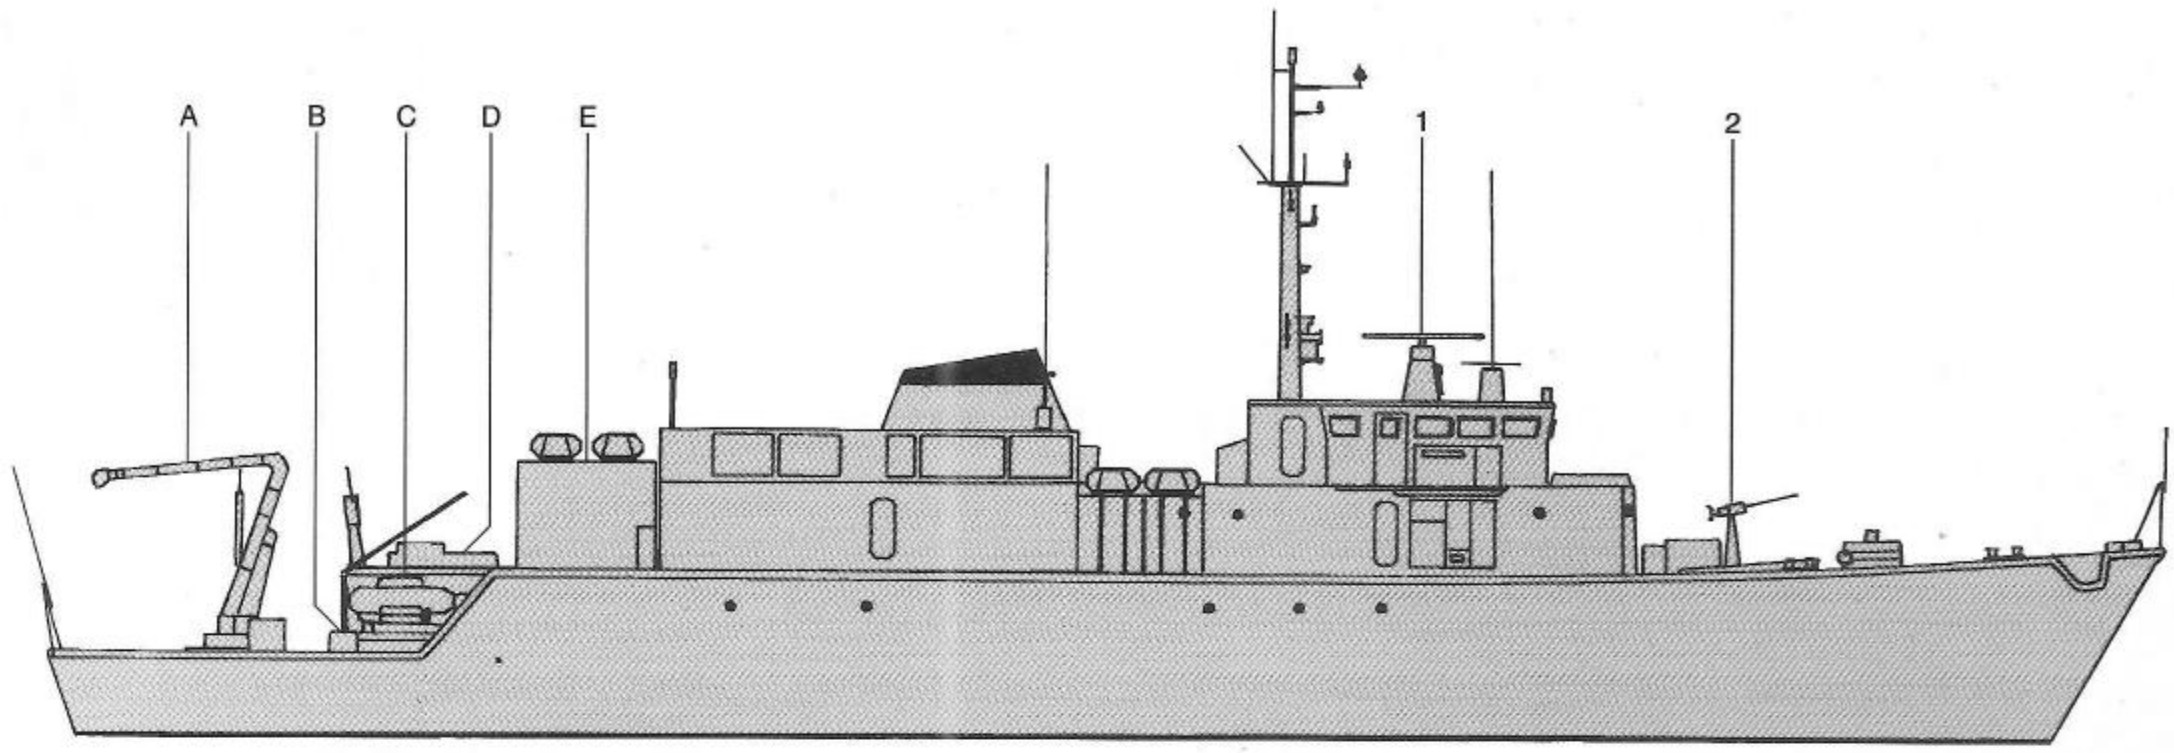
Five of the class are to be modernised to improve SDG-31 mechanical sweeps and to control improved Troika drones. Disposable ROVs (Sea Wolf and Sea Fox) are also being evaluated.

The ships are fitted with Link 11 which enables them to exchange information with NATO AWACS and with other MCMs. Link 11 can also be used to guide other Link 11-equipped ships through minefields with greater safety than ever before.

Ensdorf *(M 1094)* (H & L van Ginderen Collection)

TRIPARTITE MINEHUNTER

OVERVIEW



Minehunter (Ian Sturton)
MCM A *Sweep crane* **B** *Minesweeping winch* **C** *PAP 104 Mk III* **D** *Two-person decompression chamber* **E** *5-tonne container*

General 1 *Racal-Decca 1229 navigation radar* **2** *Giat 20 mm F2*

This is one of the more successful international collaborative projects, in this case between Belgium, France and The Netherlands; hence, its usual name of the 'Tripartite minehunter.' The three nations made initial contact with each other in April 1974 and their needs were so similar that a joint operational requirement was signed by the chiefs of the naval staff of the three countries in December 1974, followed by an intergovernmental agreement in May 1975. The agreement was that each navy would build 15 identical ships in their own shipyards, but from a single set of plans. In addition, the Belgians were made responsible for the electrical systems, including the electrical auxiliary propulsion system, while France was responsible for MCM systems and Netherlands the mechanical-engineering aspects. This ensured that each nation's industry obtained an equal financial share of equipment 'pie,' which amounted, in total, to some 70 per cent of the programme costs, with the remaining 30 per cent being for construction material.

STRUCTURE

The hull, decks and bulkheads all form a single skin, reinforced by trapezoidal formers, glued and pinned to the skin. There are nine watertight bulkheads. The ship is fitted with an active tank stabilisation system and has full NBC protection and air conditioning.

One of the features of the design is the 5-tonne role container mounted at the after end of the superstructure. This can easily be changed and users have developed their own fits to provide special facilities for different missions, such as extra decompression facilities, staff facilities for the HQ ship role, control facilities for drone operations, and so on.

MCM OPERATIONS

The ships are designed as minehunters, but all are capable of carrying and operating a light mechanical sweep. In addition, the Indonesian ships have a magnetic and acoustic minesweeping capability. All ships are capable of being used as patrol ships.

PROPULSION

For normal steaming there is a Stork-Werkspoor RUB 215 × 12 V-12 diesel, which was specially designed for the Tripartite MCMV. More than 60 per cent of the total engine weight consists of non-magnetic materials, with large components (frame, cylinder block, counterweights and flywheel) cast in Ni-Resist D2 austenitic

PRODUCTION

Country	National class name	Number purchased	Builder	Launched	Remarks
Belgium	Aster	10	Beliard, Ostende	1985-1990	
France	Eridan	10	DCN, Lorient	1979-1996	
Netherlands	Alkmaar	15	Van der Giessen, Alblasserdam	1982-1989	
Indonesia	Pulau Rengat	2	Van der Giessen, Alblasserdam	1987	Note 1
Pakistan	Munsif	3	Two — DCN, Lorient One — Karachi	1988, 1995 ?	Note 2
TOTALS		40			

Notes:
1. Both ships for Indonesia were allocated from ships then under construction for RNethN and two more were then built as replacements.
2. Of Pakistan's three ships:

- The most recently completed French Navy ship was allocated and a new ship was then built for the French Navy.
- The second ship was built for Pakistan by DCN, Lorient
- The third ship is to be completed in Karachi with DCN assistance, with the hull being built in France

Willemstad *(M 864) one of 15 Dutch Tripartite minehunters and one of 40 of these versatile ships now in service around the world* (H & L van Ginderen Collection)

steel. Other parts are also fabricated from non-magnetic materials such as austenitic steel, cunifer and bronze.

For minehunting operations, there is a silent, electrical propulsion system consisting of two active rudders, each with its own 100 kW electric motor. There are also twin bow thrusters to give the required degree of manoeuvrability at slow speed.

The power for the active rudders, bow thruster and other electrical equipment is provided by three Turbomeca 250 kW gas-turbine generators providing 440 V/60 Hz AC, which are sited in the superstructure so that power remains available even when much of the hull is flooded. There is also a DAF 180 kW diesel generator in the engine room.

COMPLEMENT

The ship's company varies from 23-45 depending on the assigned task. The maximum that can be accommodated is 45 for the HQ ship role when endurance would be 15 days. For inshore patrols, however, a crew of 22 will suffice and endurance increases to 22 days. Six divers are carried when minehunting.

MODERNISATION

A joint modernisation programme started in 1995, which includes new sonars, navigation systems and PAPs.

SALES

Three of the Belgian ships have been purchased by France to replace the "Circe" class. After refit, they will join the fleet in mid-1997.

ASTER (TRIPARTITE MINEHUNTER)

GENERAL SPECIFICATIONS

Country of origin: International
Operator: Belgium
Type: Tripartite (Coastal minehunter)

Class: ASTER

Built: 10
Active: 7

MINE COUNTERMEASURES SYSTEMS

COMBAT DIVERS

Normal complement is six mine clearance divers who can operate down to 80 m (263 ft) with an air or breathing mixture supply. A two-person recompression chamber is installed and an additional eight-person chamber can be installed abaft the stack.

MINESWEEPING

The ships normally carry:
Medium depth mechanical sweep; single Oropesa.

PAP Mk 5 ROV

The 'Tripartite' class carries two PAP Mk 5 (PAP = *poisson auto-propulsé*) ROVs, which have the capability simultaneously to hunt and destroy ground mines and tethered mines either by placing and remotely detonating a charge or by cutting the mooring rope of tethered mines. The vehicle is powered by onboard batteries, but is guided from a control console in the operations centre, with signals being passed via either a tether, which can be either a 2,000 m (6,562 ft) fibre optic cable or a 1,000 m (3,281 ft) coaxial cable. It is horizontally propelled by means of two side thrusters.

In the bottom-following mode a constant altitude can be achieved by instructing the vehicle to deploy a 'guide rope'. The winch in the PAP is instructed to deploy a selected length of rope and the operator then uses return signals from the vehicle to maintain the vehicle at the desired selected height; limits are 2 m (6.56 ft) minimum and 8 m (25.25 ft) maximum.

The PAP Mk 5 is able to carry the 126 kg (277 lb) charge necessary to ensure the total destruction of a mine. Cutters can be carried with the charge. The front section of the vehicle carries a sonar, either a high-resolution nearfield sonar or a mid-range relocation sonar. Identification is carried out by a tiltable low-light TV camera and/or by a tiltable colour TV camera. Vertical thrusters are used to achieve mid-water navigation. Alternative payloads include: explosive charges, cutters (frontal, lateral mechanical and lateral explosive) and a manipulator with a variety of tools.

Specifications

(PAP Mk 5)
Length: 3 m (9.8 ft)
Diameter: 1.2 m (3.9 ft)
Height: 1.3 m (4.2 ft)
Performance
Max vehicle velocity
mid-water transit: 6 kts (3 m/s)
bottom-following mode: 5.5 kts (2.75 m/s)
Vehicle incidence: ±20° (max)
Vertical velocity with charge: 0.7 m/s (2.3 ft/s)
Ascent velocity (charge released): 1.5 m/s (4.9 ft/s)
Payload
NATO charge: 100 kg (220 lb)
Small charge: 30 kg (66 lb)
Horizontal range:
with fibre optic cable: 2,000 m (6,562 ft)
with coaxial cable: 1,000 m (3,281 ft)
Max continuous endurance: 2 h (depending on type of mission)
Max operating depth: 300 m (984 ft)
Watertight integrity: 36 bars

Manufacturer/Contractor

Société ECA, 92707 Colombes, France.

MINEHUNTING SONARS

TSM 2021B (DUBM 21B)

Hull-mounted minehunting sonar. TSM 2021B is intended for use in conjunction with precision navigation equipment, and a mine countermeasure (destruction) system such as the PAP 104. The functions of TSM 2021 are to detect mines at distances up to 600 m (1,968 ft), and to classify them by studying the shape of their echo and acoustic shadow, at distances up to 250 m (820 ft).

Each detection and classification sonar chain consists of an acoustic transmitter/receiver transducer, the associated transmission and reception electronics, and

a display console. A subassembly performs the stabilisation, steering, and retraction of the detector and classifier arrays. The electroacoustic subassembly (EAA) includes:

- The classification sonar transmitter/receiver chain cabinet
- A display console which controls the transmission and reception functions and has CRT presentation of mine detection and location by the detector sonar chain
- A display console with CRT displays for presentation of mine locations within the classification chain
- Bridge repeater display, showing range and bearing of designated targets.

Specifications

Coverage:
detector chain: ±175° in sectors of 30, 60 and 90°
classification chain: sectors of 3, 5 or 10°
Elevation: Variable, between −5 and −40°
Stabilisation: ±15° (roll); ±5° (pitch)

Detection sonar
Frequency: 100 kHz (modulated ±10 kHz)
Pulse duration: 0.2 or 0.5 ms
Range scales: 400, 600 or 900 m
Max sound level: 120 dB
Channels: 20
Beam aperture: 1.5°
Display: PPI

Classification sonar
Range scales: 200 or 300 m (656 or 984 ft)
Max sound level: 122 dB
Channels: 80
Beam aperture: 0.17°
Display: CRT and storage magnifier tube

Manufacturer/Contractor

Thomson Sintra ASM, France.

WEAPONS SYSTEMS

GUNS

20 mm/90 (F2)

One mount per ship on the foredeck. The F2 Type A mounting is of the swivel fork type revolving on a fixed ferrule. The mounting, which is unpowered, is largely made up of light alloys and stainless steel to reduce weight. The DCN 20 mm mounting is based upon the Giat 811 which has a dual feed. It is electrically initiated and capable of firing single rounds, short (three-round), long (eight-round) or continuous bursts. It has adjustable rates of fire of 125 and 400 rds/min as well as 125 and 650 rds/min. The DCN mounting weighs 500 kg (1,102 lb) and occupies 2.75 m (9.0 ft) of deck space. An unusual feature is a display showing the number of rounds remaining in the two magazines on either side of the mounting.

Specifications

(20 mm/90 (F2))
Calibre: 20 mm
Length of barrel: 90 calibres
Muzzle velocity: 1,050-1,250 m/s (3,445-4,101 ft/s)
Traverse: 325°
Elevation: −15 to +80°
Mounting weight (loaded): 470 kg (1,036 lb)
Crew: 2
Range: 3.5-5.5 n miles (6.75-10 km)

Manufacturers/Contractors

Giat/DCN, France.

12.7 mm machine gun

One 12.7 mm machine gun is carried; type unknown.

COMMAND AND CONTROL SYSTEMS

RADAR

Racal-Decca 1229

The navigation radar is the Racal-Decca Type 1229, with an output of 20 kW. It is equipped with a 2.7 m (8.9 ft) antenna and operates in the I/J band.

Specifications

Role: Navigation
Frequency: I/J-band
Beam: 1.3 × 30°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25/1.0 µs
PRF: 1,300/650 pps
Scan rate: 25 rpm

Manufacturer/Contractor

Racal-Decca, UK.

PROPULSION

Specifications

System: Diesel
Main machinery: 1 Stork-Werkspoor A-RUB 215 V12 diesel 1.37 MW (1,900 hp(m)) sustained
Shaft: 1
Propeller: 1 LIPS, five-bladed, controllable pitch propeller
Active rudders: 2 ACEC electric motors; 176 kW (240 hp(m))
Bow thrusters: 2 Schottel, 2 × 90 kW
Shaft: 1
Ship's services: Three Turbomeca gas-turbine alternators (3 × 250 kW)
Emergency power: One diesel-generator set (180 kW)

FURTHER INFORMATION

PROGRAMME

These ships were the Belgian element of the Tripartite minehunter programme with France and the Netherlands. The Belgians built a special 'ship factory' for the fabrication of the hulls at Ostend and the hulls were then towed to Rupelmonde for fitting out.

MODERNISATION

Three of the class are being fitted with improved sonar and ROVs.

MODIFICATIONS

Myosotis (M 922) has been modified as an ammunition transport.

DEPLOYMENT

All of the class are based at Zeebrugge.

SALES

Three of the class paid off in July 1993. It was announced in January 1997 that these have been purchased by the French Navy.

Notes:
* This was the second 'Eridan' class MCMV of this name and pennant number to be built for the French Navy. The first, which was launched on 9 Nov 1988, was sold to Pakistan in 1992 and was replaced by the ship listed here.

Three were purchased from Belgium in January 1997. French names/numbers are not yet known.

MINE COUNTERMEASURES SYSTEMS

COMBAT DIVERS

Normal complement is five mine clearance divers who can operate down to 80 m (263 ft) with an air or breathing mixture supply. A two-person recompression chamber is installed and an additional eight-person chamber can be installed forward of the stack.

MINESWEEPING

The ships normally carry:

- OD-3 mechanical sweep. This is a lightweight sweep developed for the 'Eridan' class to give it a mechanical sweeping capability. It uses a single Oropesa sweep.
- AP-4 acoustic sweep. This may sometimes be carried by the Eridan for specific missions. It uses an electrodynamic noise generation technique and is housed in a large towed body.

MINEHUNTING SYSTEMS

PAP Mk 5 ROV

The 'Tripartite' class carries two PAP Mk 5 (PAP = *poisson auto-propulsé*) ROVs, which have the capability simultaneously to hunt and destroy ground mines and tethered mines either by placing and remotely detonating a charge or by cutting the mooring rope of tethered mines. The vehicle is powered by onboard batteries, but is guided from a control console in the operations centre, with signals being passed via either a tether, which can be a 2,000 m (6,562 ft) fibre optic cable or a 1,000 m (3,281 ft) coaxial cable. It is horizontally propelled by means of two side thrusters.

In the bottom-following mode a constant altitude can be achieved by instructing the vehicle to deploy a 'guide rope'. The winch in the PAP is instructed to deploy a selected length of rope and the operator then uses return signals from the vehicle to maintain the vehicle at the desired selected height; limits are 2 m (6.56 ft) minimum and 8 m (25.25 ft) maximum.

The PAP Mk 5 is able to carry the 126 kg (277 lb) charge necessary to ensure the total destruction of a mine. Cutters can be carried with the charge. The front section of the vehicle carries a sonar, either a high-resolution nearfield sonar or a mid-range relocation sonar. Identification is carried out by a tiltable low-light TV camera and/or by a tiltable colour TV camera. Vertical thrusters are used to achieve mid-water navigation. Alternative payloads include: explosive charges, cutters (frontal, lateral mechanical and lateral explosive) and a manipulator with a variety of tools.

Specifications
(PAP Mk 5)
Length: 3 m (9.8 ft)
Diameter: 1.2 m (3.9 ft)
Height: 1.3 m (4.2 ft)
Performance
Max vehicle velocity
mid-water transit: 6 kts (3 m/s)
bottom-following mode: 5.5 kts (2.75 m/s)
Vehicle incidence: ±20° (max)
Vertical velocity with charge: 0.7 m/s (2.3 ft/s)
Ascent velocity (charge released): 1.5 m/s (4.9 ft/s)
Payload
NATO charge: 100 kg (220 lb)
Small charge: 30 kg (66 lb)
Horizontal range:
with fibre optic cable: 2,000 m (6,562 ft)
with coaxial cable: 1,000 m (3,281 ft)
Max continuous endurance: 2 h (depending on type of mission)
Max operating depth: 300 m (984 ft)
Watertight integrity: 36 bars

Manufacturer/Contractor
Société ECA, 92707 Colombes, France.

MINEHUNTING SONARS

TSM 2021B (DUBM 21B)

All except *Sagittaire* (M 650). Hull-mounted minehunting sonar. TSM 2021B is intended for use in conjunction with precision navigation equipment, and a mine countermeasure (destruction) system such as the PAP 104. The functions of TSM 2021 are to detect mines at distances up to 600 m (1,968 ft), and to classify them by studying the shape of their echo and acoustic shadow, at distances up to 250 m (820 ft).

Each detection and classification sonar chain consists of an acoustic transmitter/receiver transducer, the associated transmission and reception electronics, and a display console. A subassembly performs the stabilisation, steering and retraction of the detector and classifier arrays. The electroacoustic subassembly (EAA) includes:

The classification sonar transmitter/receiver chain cabinet
A display console which controls the transmission and reception functions and has CRT presentation of mine detection and location by the detector sonar chain
A display console with CRT displays for presentation of mine locations within the classification chain
Bridge repeater display, showing range and bearing of designated targets.

Specifications
Coverage:
detector chain: ±175° in sectors of 30, 60 and 90°
classification chain: sectors of 3, 5 or 10°

Giat/DCN, France.

12.7 mm machine gun
One 12.7 mm machine gun is carried; type unknown.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

EVEC 20
EVEC 20 *(Ensemble de Visualisation et d'Enregistrement de la Chasse aux Mines)* is a data handling system which was developed specifically for the French Tripartite minehunter. EVEC 20 samples and processes data from the sonar, radio navigation systems, navigation radar, gyrocompass and Doppler log to present the operator with a continuously updated display of the minehunting area showing the positions of own ship and located targets, as well as radar contacts, tracks and lines representing specified zones. All or part of the displayed images can be recorded on cassette for subsequent recall, updating and maintaining an up-to-date permanent record of operations relating to a specified zone. A repeater on the bridge displays point co-ordinates from the minehunting sonar derived by the EVEC 20 and transmitted to the repeater.

The computer in the EVEC 20 also assists the automatic pilot, providing command inputs and error generation, and helps to control the automatic radar navigation systems providing location computations, error corrections and location of tracking windows.

The automatic pilot is used to keep the ship on a predetermined track during minehunting operations, receiving necessary data from the gyrocompass and Doppler log.

The navigation radar and automatic tracking system integrate with the EVEC 20 to provide a buoy location system.

The horizontal plotting table uses an 80 cm² screen on which up to 200 sonar contacts can be displayed. The table receives data from the central processing unit which has a 20 kbyte random access memory.

Manufacturer/Contractor
Thomson-CSF, France.

RADAR

Racal-Decca 1229
The navigation radar is the Racal-Decca Type 1229, with an output of 20 kW. It is equipped with a 2.7 m (8.9 ft) antenna and operates in the I/J band

Specifications
Role: Navigation
Frequency: I/J-band
Beam: 1.3 × 30°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25/1.0 µs
PRF: 1,300/650 pps
Scan rate: 25 rpm

Manufacturer/Contractor
Racal-Decca, UK.

PROPULSION

Specifications
System: Diesel
Main machinery: 1 Stork-Werkspoor A-RUB 215V-12 diesel; 1.37 MW (1,860 hp(m)) sustained

Propeller: 1 LIPS, five-bladed, controllable pitch propeller
Auxiliary propulsion: 2 ACEC electric motors; 179 kW (240 hp(m)), two active rudders

Thrusters: 2 Schottel bow thrusters, 2 × 90 kW
Shaft: 1

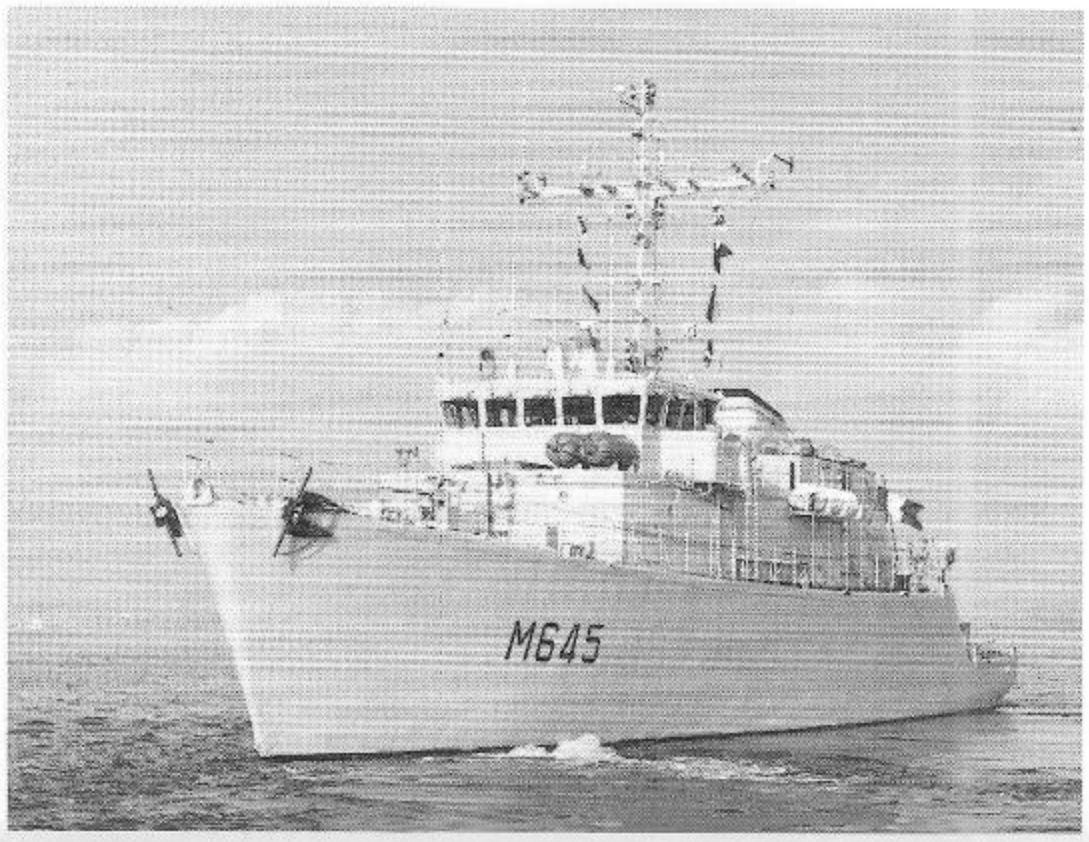
FURTHER INFORMATION

PROGRAMME

The original French Navy requirement was for 15, but this was later reduced to 10, all of which were built at Lorient. The original tenth ship of the class, completed in 1989, was subsequently transferred to Pakistan on 24 September 1992 as the first in an order for three, and a new tenth ship for the French Navy was ordered in January 1992. It bears the same name and pennant number as the ship it replaces. The French Navy has bought three ships from Belgium, bringing its total to 13.

DEPLOYMENT

M 641-646 plus the ex-Belgian ships are based at Brest, the remainder at Toulon.



Perseé *(M 649)* (H & L van Ginderen Collection)

Orion *(M 645) turning under the power of its Schottel bow thrusters* (DCN/Jean Biaugeaud)

MINE COUNTERMEASURES SYSTEMS

COMBAT DIVERS

Normal complement is five mine clearance divers who can operate down to 80 m (263 ft) with an air or breathing mixture supply. A two-person recompression chamber is installed and an additional eight-person chamber can be installed forward of the stack.

MINESWEEPING

The ships normally carry:

OD-3 mechanical sweep. This is a lightweight sweep developed for the 'Eridan' class to give them a mechanical sweeping capability. It uses a single Oropesa sweep.

PAP Mk 5 ROV

The 'Tripartite' class carries two PAP Mk 5 (PAP = poisson auto-propulsé) ROVs, which have the capability simultaneously to hunt and destroy ground mines and tethered mines either by placing and remotely detonating a charge or by cutting the mooring rope of tethered mines. The vehicle is powered by onboard batteries, but is guided from a control console in the operations centre, with signals being passed via either a tether, which can be a 2,000 m (6,562 ft) fibre optic cable or a 1,000 m (3,281 ft) coaxial cable. It is horizontally propelled by means of two side thrusters.

In the bottom-following mode a constant altitude can be achieved by instructing the vehicle to deploy a 'guide-rope'. The winch in the PAP is instructed to deploy a selected length of rope and the operator then uses return signals from the vehicle to maintain the vehicle at the desired selected height; limits are 2 m (6.56 ft) minimum and 8 m (25.25 ft) maximum.

The PAP Mk 5 is able to carry the 126 kg (277 lb) charge necessary to ensure the total destruction of a mine. Cutters can be carried with the charge. The front section of the vehicle carries a sonar, either a high-resolution nearfield sonar or a mid-range relocation sonar. Identification is carried out by a tiltable low-light TV camera and/or by a tiltable colour TV camera. Vertical thrusters are used to achieve mid-water navigation. Alternative payloads include: explosive charges, cutters (frontal, lateral mechanical and lateral explosive) and a manipulator with a variety of tools.

Specifications

(PAP Mk 5)
Length: 3 m (9.8 ft)
Diameter: 1.2 m (3.9 ft)
Height: 1.3 m (4.2 ft)
Performance
Max vehicle velocity
mid-water transit: 6 kts (3 m/s)
bottom-following mode: 5.5 kts (2.75 m/s)
Vehicle incidence: ±20° (max)
Vertical velocity with charge: 0.7 m/s (2.3 ft/s)
Ascent velocity (charge released): 1.5 m/s (4.9 ft/s)
Payload
NATO charge: 100 kg (220 lb)
Small charge: 30 kg (66 lb)
Horizontal range:
with fibre optic cable: 2,000 m (6,562 ft)
with coaxial cable: 1,000 m (3,281 ft)
Max continuous endurance: 2 h (depending on type of mission)
Max operating depth: 300 m (984 ft)
Watertight integrity: 36 bars

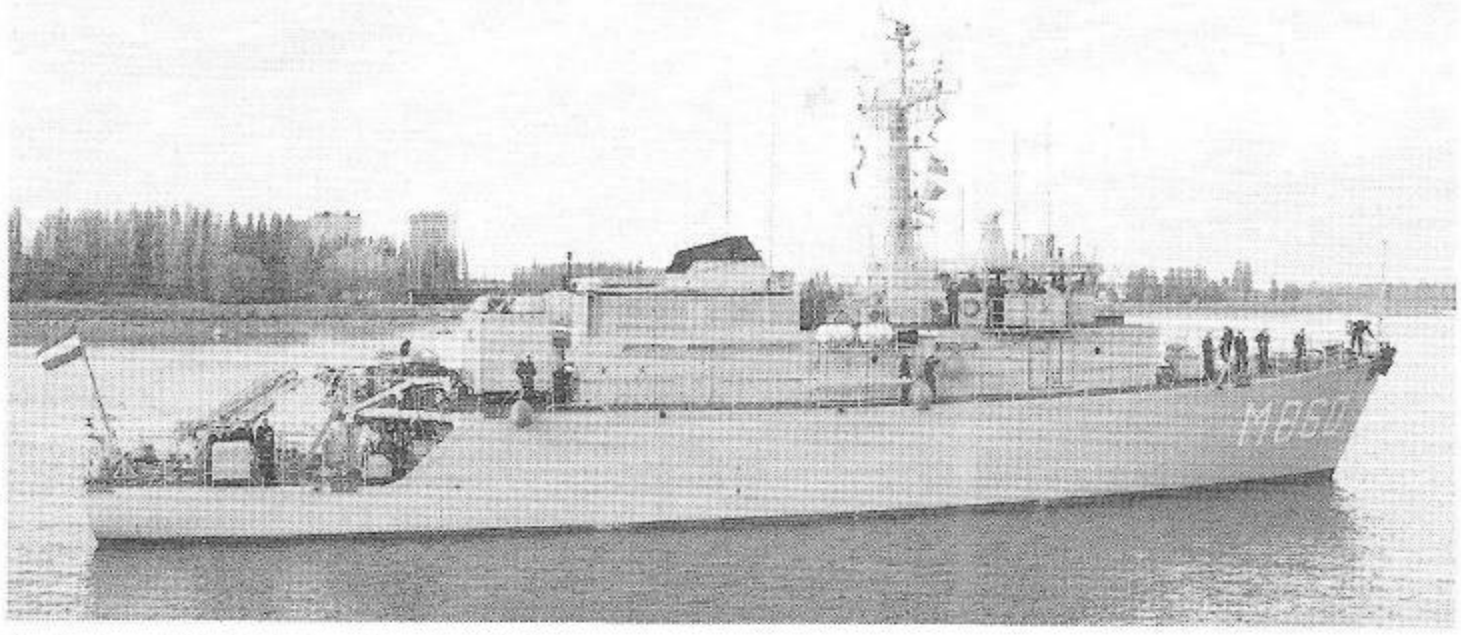
Manufacturer/Contractor

Société ECA, 92707 Colombes, France.

MINEHUNTING SONARS

TSM 2021A

Hull-mounted minehunting sonar. Unlike the Belgian and French ships which have TSM-2021B, the Dutch ships have TSM 2021A, which differs only in minor ways, such as the displays. TSM 2021A is intended for use in conjunction with precision navigation equipment, and a mine countermeasure (destruction) system such as the PAP 104. The functions of TSM 2021 are to detect mines at distances up to 600 m (1,968 ft), and to classify them by studying the shape of their echo and acoustic shadow, at distances up to 250 m (820 ft).



Schiedam *(M 860), showing detail of the sweep deck. Note also the 5-tonne container (above fender) which can be exchanged with other units, roled according to the user's operational requirements* (H & L van Ginderen Collection)

Each detection and classification sonar chain consists of an acoustic transmitter/receiver transducer, the associated transmission and reception electronics, and a display console. A subassembly performs the stabilisation, steering, and retraction of the detector and classifier arrays. The electroacoustic subassembly (EAA) includes:

The classification sonar transmitter/receiver chain cabinet

A display console which controls the transmission and reception functions and has CRT presentation of mine detection and location by the detector sonar chain

A display console with CRT displays for presentation of mine locations within the classification chain

Bridge repeater display, showing range and bearing of designated targets.

Specifications

Coverage:

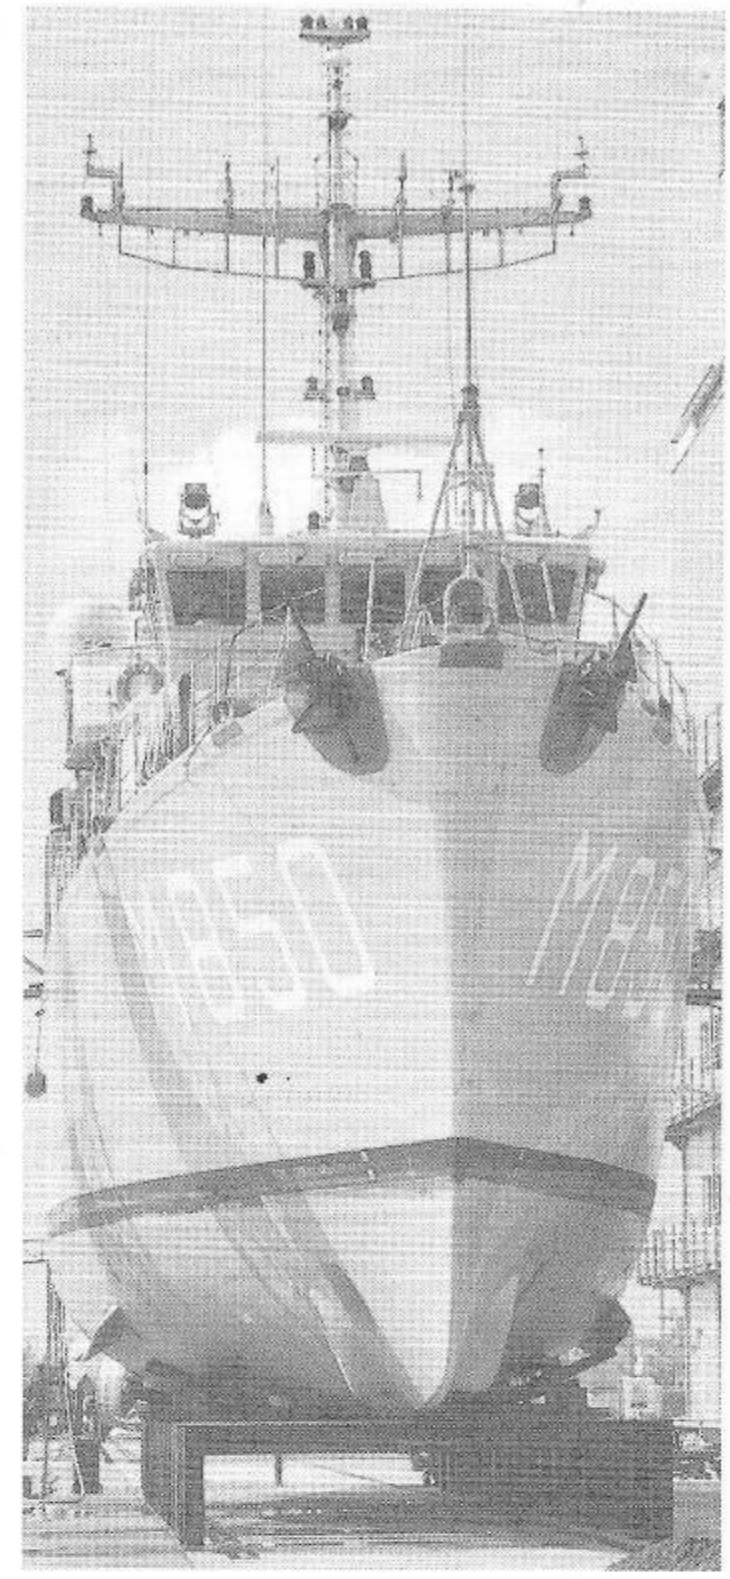
detector chain: ±175° in sectors of 30, 60 and 90°
classification chain: sectors of 3, 5 or 10°
Elevation: Variable, between −5 and −40°
Stabilisation: ±15° (roll); ±5° (pitch)

Detection sonar
Frequency: 100 kHz (modulated ±10 kHz)
Pulse duration: 0.2 or 0.5 ms
Range scales: 400, 600 or 900 m
Max sound level: 120 dB
Channels: 20
Beam aperture: 1.5°
Display: PPI

Classification sonar
Range scales: 200 or 300 m (656 or 984 ft)
Max sound level: 122 dB
Channels: 80
Beam aperture: 0.17°
Display: CRT and storage magnifier tube

Manufacturer/Contractor

Thomson Sintra ASM, France.



Alkmaar *(M 850) showing its hull profile. Note the bow thrusters and bilge keels* (MoD Netherlands)

WEAPONS SYSTEMS

GUNS

20 mm/90 (F2)

One mount per ship on the foredeck. The F2 Type A mounting is of the swivel fork-type revolving on a fixed ferrule. The mounting, which is unpowered, is largely made up of light alloys and stainless steel to reduce weight. The DCN 20 mm mounting is based upon the Giat 811 which has a dual feed. It is electrically initiated and capable of firing single rounds, short (three-round), long (eight-round) or continuous bursts. It has adjustable rates of fire of 125 and 400 rds/min as well as 125 and 650 rds/min. The DCN mounting weighs 500 kg (1,102 lb) and occupies 2.75 m (9.0 ft) of deck space. An unusual feature is a display showing the number of rounds remaining in the two magazines on either side of the mounting.

Specifications

(20 mm/90 (F2))
Calibre: 20 mm
Length of barrel: 90 calibres
Muzzle velocity: 1,050-1,250 m/s (3,445-4,101 ft/s)
Traverse: 325°
Elevation: −15 to +80°
Mounting weight (loaded): 470 kg (1,036 lb)
Crew: 2
Range: 3.5-5.5 n miles (6.75-10 km)

Manufacturers/Contractors

Giat/DCN, France.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

EVEC 20

EVEC 20 *(Ensemble de Visualisation et d'Enregistrement de la Chasse aux Mines)* is a data handling system which was developed specifically for the French Tripartite minehunter. EVEC 20 samples and processes data from the sonar, radio navigation systems, navigation radar, gyrocompass and Doppler log to present the operator with a continuously updated display of the minehunting area showing the positions of own ship and located targets, as well as radar contacts, tracks and lines representing specified zones. All or part of the displayed images can be recorded on cassette for subsequent recall, updating and maintaining an up-to-date permanent record of operations relating to a specified zone. A repeater on the bridge displays point coordinates from the minehunting sonar derived by the EVEC 20 and transmitted to the repeater.

The computer in the EVEC 20 also assists the automatic pilot, providing command inputs and error generation, and helps to control the automatic radar navigation systems providing location computations, error corrections and location of tracking windows.

The automatic pilot is used to keep the ship on a predetermined track during minehunting operations, receiving necessary data from the gyrocompass and Doppler log.

The navigation radar and automatic tracking system integrate with the EVEC 20 to provide a buoy location system. The horizontal plotting table uses an 80 cm² screen on which up to 200 sonar contacts can be displayed. The table receives data from the central processing unit which has a 20 kbyte random access memory.

Manufacturer/Contractor

Thomson-CSF, France.

Signaal SEWACO IX

The Dutch MCMVs are fitted with the Signaal SEWACO IX minehunting action information system. This is a cut-down version of the SEWACO combat data systems originally developed for frigate-size vessels.

Manufacturer/Contractor

Hollandse Signaalapparaten BV, Hengelo, Netherlands.

Satcom

MARISAT

RADAR

Racal-Decca TM 1229C

The navigation radar is the Racal-Decca Type TM 1229C, with an output of 20 kW. It is equipped with a 2.7 m (8.9 ft) antenna and operates in the I/J band.

Specifications

Role: Navigation
Frequency: I/J-band
Beam: 1.3 × 30°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25/1.0 µs
PRF: 1,300/650 pps
Scan rate: 25 rpm

Manufacturer/Contractor

Racal-Decca, UK.

PROPULSION

Specifications
System: Diesel
Main machinery: 1 Stork-Werkspoor A-RUB 215V-12 diesel; 1.37 MW (1,860 hp(m)) sustained

Propeller: 1 LIPS, five-bladed, controllable pitch propeller
Auxiliary propulsion: 2 ACEC electric motors; 179 kW (240 hp(m)), 2 active rudders

Thrusters: 2 Schottel bow thrusters, 2 × 90 kW
Shaft: 1

FURTHER INFORMATION

PROGRAMME

These ships are the Dutch element of the Tripartite Minehunter programme and it should be noted that, in the event, the RNethN was the only one of the three partners to take their originally agreed full share of 15 ships. The Dutch ships were all built by van der Giessen de Noord, which launched them virtually ready for sea-going trials.

The Dutch programme was slightly interrupted when the Indonesian Navy placed an order for two. Two unfinished ships in the Dutch production order were diverted to meet the Indonesian requirement and two further hulls were then laid down to complete the Dutch order for 15.

There was also a plan to transfer two ships to Egypt, but the deal was never finalised.

MODERNISATION

Conversions started in 1996 for three of the class to become Troika control ships operating four drones each. The drones are being developed by Signaal and will be based on the German type. The first one is planned to be in service in 1998 and it is planned to produce 14, in order that 12 will always be available.

The remaining twelve ships are to have minehunting capability upgrades including a new mine disposal system. Four of the class will also be fitted with propelled variable depth sonars (PVDS) to enable them to be employed as deep-water minehunters.

At least some of the ships may carry shoulder-launched air defence missiles (probably Stinger) when employed on patrol duties.

DEPLOYMENT

One of the class is to be converted for use as a survey vessel but will be capable of restoration to a minehunter at three months' notice.

PULAU RENGAT (TRIPARTITE MINEHUNTER)

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

These two ships are outfitted and employed as minesweepers as well as minehunters. Their minesweeping equipment includes:

OD-3 mechanical sweep
This is a French lightweight sweep, which was developed for the 'Eridan' class to give them a mechanical sweeping capability. It uses a single Oropesa float.

F-82 magnetic sweep
The two Indonesian ships have the F-82 magnetic sweep, which is more usually combined with a Fiskars acoustic sweep and an integration package to form the FIMS (Fiksars Integrated Mine System), three electrode magnetic sweep cables, with current capacities of 400 A DC, 100 A repetitive peak. The 346 mm (13.6 in) diameter, buoyant sweep cables have a low-tow resistance enabling them to be used at speeds up to 10 knots. The magnetic sweep current generator is normally powered from the ship's supply, but can be supplied with its own diesel generator.

Manufacturer/Contractor
Fiskars-Elesco Oy, Espoo, Finland.

AS 203 acoustic sweep gear
AS 203 is a Swedish-manufactured acoustic sweep.

Manufacturer/Contractor
S A Marine, Sweden.

Cranes
There are two sweep-gear cranes on the afterdeck to handle these sweeps.

MINEHUNTING SYSTEMS

PAP-104 Mk 4 ROV
The Indonesian 'Tripartite' class carries two PAP Mk 4 (PAP = *poisson auto-propulsé*) ROVs, which have the capability simultaneously to hunt and destroy ground mines and tethered mines either by placing and remotely detonating a charge or by cutting the mooring rope of tethered mines. The vehicle is powered by onboard batteries, but is guided from a control console in the operations centre, with signals being passed via either a tether or a coaxial cable. It is horizontally propelled by means of two side thrusters.

In the bottom-following mode a constant altitude can be achieved by instructing the vehicle to deploy a 'guide-rope'. The winch in the PAP is instructed to deploy a selected length of rope and the operator then uses return signals from the vehicle to maintain the vehicle at the desired selected height; limits are 2 m (6.56 ft) minimum and 8 m (25.25 ft) maximum.

The PAP Mk 4 is able to carry the 126 kg (277 lb) charge necessary to ensure the total destruction of a mine. Cutters can be carried with the charge. The front section of the vehicle carries a sonar, either a high-resolution nearfield sonar or a mid-range relocation sonar. Identification is carried out by a tiltable low-light TV camera and/or by a tiltable colour TV camera. Vertical thrusters are used to achieve mid-water navigation. Alternative payloads include: explosive charges, cutters (frontal, lateral mechanical and lateral explosive) and a manipulator with a variety of tools.

Specifications
(PAP Mk 4)
Length: 3 m (9.8 ft)
Diameter: 1.2 m (3.9 ft)
Height: 1.3 m (4.2 ft)
Performance
Max vehicle velocity
mid-water transit: 5 kts
bottom-following mode: 5 kts
Vehicle incidence: ±20° (max)
Vertical velocity with charge: 0.7 m/s (2.3 ft/s)
Ascent velocity (charge released): 1.5 m/s (4.9 ft/s)
Payload
NATO charge: 100 kg (220 lb)
Small charge: 30 kg (66 lb)
Max continuos endurance: 2 h (depending on type of mission)
Max operating depth: 300 m (984 ft)
Watertight integrity: 36 bars

Manufacturer/Contractor
Société ECA, 92707 Colombes, France.

ACTION INFORMATION

Ibis V minehunting action information system
IBIS V is a lightweight system comprising:

- Thomson-CSF TSM 2022 single array sonar system
- Thomson-CSF TSM 2026 NAVIPLOT
- Thomson-CSF TSM 2060 four-colour tactical display
- Thomson-CSF TSM 5721 Doppler bottom log

The sonar array has a span of about 1.5 m (4.9 ft) but pivots to retract vertically into the sonar well, which is only 75 cm (30 in) in diameter.

Manufacturer/Contractor
Thomson-CSF, France.

MINEHUNTING SONAR

Thomson-CSF TSM 2022
TSM 2022 is a hull-mounted high-frequency minehunting sonar, which can also be used for mine avoidance on minesweepers. It is based largely on experience gained with the French DUBM 21B in the field of high-resolution beam-forming techniques. It is a hull-mounted equipment intended also for use in conjunction with precision display and navigation equipment and a mine countermeasures system.

The main feature of the TSM 2022 is its small-size retractable single array assembly, used for both detection and classification, which enables easy installation and maintenance. The high-resolution features of the DUBM 21 are maintained and improvements are mainly in the field of digital processing technology. The main functions of the sonar are: detection and classification of moored and bottom mines, detection at distances up to 600 m (1,968 ft), and classification of targets by analysis of the shape of their echo or shadow at distances up to 250 m (820 ft). In the classification mode, horizontal beamwidth is 7°; in detection mode either 14° or 28° beamwidth can be selected. In both modes the vertical beamwidth is 15°. In the Mk II configuration the TSM 2022 is equipped with a 19 in high-resolution colour console and specific sonar processing such as computer-aided detection (CAD), computer-aided classification (CAC) and performance indicator (PI).

Manufacturers/Contractors
Thoray, USA.
Thomson Sintra ASM, France.

WEAPONS SYSTEMS

GUNS

Rheinmetall Rh-202 20 mm/85 multipurpose cannon
Two Rheinmetall Rh-202 20 mm/85 are carried. The 85 calibre Rh 202 is 2.61 m (8.56 ft) long, weighs 81.5 kg (180 lb) and is capable of single shot or automatic fire. Naval versions use either a conventional single belt feed in which rounds enter from the right and spent cartridges are ejected to the left, or the Type 2 two-way belt-feed mechanism. The Rheinmetall powered twin mounting installed in the 'Jason' class is 4.05 m (13.3 ft) long, 1.67 m (5.5 ft) high and 2.3 m (7.5 ft) across, and weighs 1.64 t. The twin guns, their ammunition boxes and the operator's seat are on a platform that can rotate through 360°. It has a three- or four-man crew.

Specifications
(Rh 202)
Calibre: 20 mm
Length of barrel: 85 calibres
Muzzle velocity: 1,050-1,250 m/s (3,445-4,101 ft/s)
Rate of fire: 800-1,000 rds/min

Manufacturer/Contractor
Rheinmetall, Germany.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

SEWACO-RI
SEWACO-RI (RI = *Republik Indonesia*) is an action data automation system developed specifically for these Indonesian MCMs. It is derived from the more sophisticated SEWACO combat data systems for larger surface combatants.

Manufacturer/Contractor
Hollandse Signaalapparaten BV, Hengelo, Netherlands.

RADAR

Racal-Decca AC 1229C
The navigation radar is the Racal-Decca Type AC 1229C, with an output of 25 kW. It is equipped with a 2.7 m (8.9 ft) antenna and operates in the I/J band.

Specifications
Role: Navigation
Frequency: I/J-band
Beam: 1.3 × 30°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25/1.0 µs
PRF: 1,300/650 pps
Scan rate: 25 rpm

Manufacturer/Contractor
Racal-Decca, UK.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU 12V 396 TC82 diesels; 1.92 MW (2,610 hp(m)) sustained
Shafts: 2
Propulsors: 2 ACEC retractable electric motors, 1.76 MW (2,400 hp(m))
Thrusters: 2 Schottel bow thrusters; 110 kW (150 hp(m))
Ship's services: 3 Turbomeca gas-turbine generators (3 × 250 kW) plus diesel-generator set in engine room (180 kW)

FURTHER INFORMATION

PROGRAMME

The original Indonesian programme was for a class of twelve Tripartite minehunters, of which two would be built in the Netherlands and the balance in Indonesia. The two Dutch ships were duly ordered. First ordered on 29 March 1985, laid down 22 July 1985 and both were delivered in 1988. The plan to build a further ten has, however, been cancelled due to a lack of funds.

DESIGN

These ships were required from the start to serve as minehunters, minesweepers and patrol ships, and as a result there are differences from the standard European Tripartites. The Indonesian ships have MTU engines, their deckhouses and general layout are different, and they have Rheinmetall instead of Giat guns.

MODERNISATION

Consideration is being given to an additional short-range missile system or a third 20 mm gun.

MUNSIF (TRIPARTITE)

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

OD-3 mechanical sweep.

This is the French lightweight sweep developed for the 'Eridan' class to give them a mechanical sweeping capability. It uses a single Oropesa sweep.

MRK 400 acoustic sweep

The MRK 400 is an acoustic sweep developed by Fiskars.

Manufacturer/Contractor
Fiskars Elesco, Finland.

MRK 960 magnetic sweep

Manufacturer/Contractor
Fiskars Elesco, Finland.

COMBAT DIVERS

Normal complement is five mine clearance divers, who can operate down to 80 m (263 ft) with an air or breathing mixture supply. A two-person recompression chamber is installed and an additional eight-person chamber can be installed forward of the stack.

MINEHUNTING SYSTEMS

PAP Mk 5 ROV

The 'Tripartite' class carries two PAP Mk 5 (PAP = *poisson auto-propulsé*) ROVs, which have the capability simultaneously to hunt and destroy ground mines and tethered mines either by placing and remotely detonating a charge or by cutting the mooring rope of tethered mines. The vehicle is powered by onboard batteries, but is guided from a control console in the operations centre, with signals being passed via either a tether, which can be a 2,000 m (6,562 ft) fibre optic cable or a 1,000 m (3,281 ft) coaxial cable. It is horizontally propelled by means of two side thrusters.

In the bottom-following mode a constant altitude can be achieved by instructing the vehicle to deploy a 'guide rope'. The winch in the PAP is instructed to deploy a selected length of rope and the operator then uses return signals from the vehicle to maintain the vehicle at the desired selected height; limits are 2 m (6.56 ft) minimum and 8 m (25.25 ft) maximum.

The PAP Mk 5 is able to carry the 126 kg (277 lb) charge necessary to ensure the total destruction of a mine. Cutters can be carried with the charge. The front section of the vehicle carries a sonar, either a high-resolution nearfield sonar or a mid-range relocation sonar. Identification is carried out by a tiltable low-light TV camera and/or by a tiltable colour TV camera. Vertical thrusters are used to achieve mid-water navigation. Alternative payloads include: explosive charges, cutters (frontal, lateral mechanical and lateral explosive) and a manipulator with a variety of tools.

Specifications
(PAP Mk 5)
Length: 3 m (9.8 ft)
Diameter: 1.2 m (3.9 ft)
Height: 1.3 m (4.2 ft)
Performance
Max vehicle velocity
mid-water transit: 6 kts (3 m/s)
bottom-following mode: 5.5 kts (2.75 m/s)
Vehicle incidence: ±20° (max)
Vertical velocity with charge: 0.7 m/s (2.3 ft/s)
Ascent velocity (charge released): 1.5 m/s (4.9 ft/s)
Payload
NATO charge: 100 kg (220 lb)
Small charge: 30 kg (66 lb)
Horizontal range:
with fibreoptic cable: 2,000 m (6,562 ft)
with coaxial cable: 1,000 m (3,281 ft)
Max continuous endurance: 2 h (depending on type of mission)
Max operating depth: 300 m (984 ft)
Watertight integrity: 36 bars

Manufacturer/Contractor
Société ECA, 92707 Colombes, France.

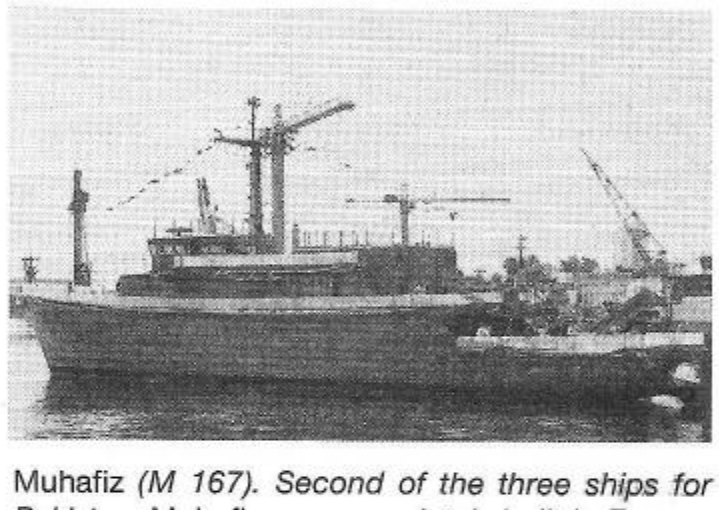
MINEHUNTING SONARS

TSM 2021B (DUBM 21B)

***Munsif* (M 166) and *Muhafiz* (M 168) only.** Hull-mounted minehunting sonar. TSM 2021B is intended for use in conjunction with precision navigation equipment, and a mine countermeasure (destruction) system such as the PAP 104. The functions of TSM 2021 are to detect mines at distances up to 600 m (1,968 ft), and to classify them by studying the shape of their echo and acoustic shadow, at distances up to 250 m (820 ft).

Each detection and classification sonar chain consists of an acoustic transmitter/receiver transducer, the associated transmission and reception electronics, and a display console. A subassembly performs the stabilisation, steering, and retraction of the detector and classifier arrays. The electroacoustic subassembly (EAA) includes:

- The classification sonar transmitter/receiver chain cabinet
- A display console which controls the transmission and reception functions and has CRT presentation of mine detection and location by the detector sonar chain
- A display console with CRT displays for presentation of mine locations within the classification chain
- Bridge repeater display, showing range and bearing of designated targets.



Muhafiz *(M 167). Second of the three ships for Pakistan,* Muhafiz *was completely built in France, but while the hull of the third of class has been constructed in France it is being completed and fitted out in Karachi* (Jane's/H M Steele)

Specifications
Coverage:
detector chain: ±175° in sectors of 30, 60 and 90°
classification chain: sectors of 3, 5 or 10°
Elevation: Variable, between −5 and −40°
Stabilisation: ±15° (roll); ±5° (pitch)

Detection sonar
Frequency: 100 kHz (modulated ±10 kHz)
Pulse duration: 0.2 or 0.5 ms
Range scales: 400, 600 or 900 m
Max sound level: 120 dB
Channels: 20
Beam aperture: 1.5°
Display: PPI

Classification sonar
Range scales: 200 or 300 m (656 or 984 ft)
Max sound level: 122 dB
Channels: 80
Beam aperture: 0.17°
Display: CRT and storage magnifier tube

Manufacturer/Contractor
Thomson Sintra ASM, France.

TSM 2021D (DUBM 21D)

***Mahmood* (M 169) only.** *Mahmood* (M 169) which is being fitted out in Pakistan, will have a more modern version of the sonar.

WEAPONS SYSTEMS

GUNS

Giat 20 mm/90 F2

One mount per ship on the foredeck. The F2 Type A mounting is of the swivel fork-type revolving on a fixed ferrule. The mounting, which is unpowered, is largely made up of light alloys and stainless steel to reduce weight. The DCN 20 mm mounting is based upon the Giat 811 which has a dual feed. It is electrically initiated and capable of firing single rounds, short (three-round), long (eight-round) or continuous bursts. It has adjustable rates of fire of 125 and 400 rds/min as well as 125 and 650 rds/min. The DCN mounting weighs 500 kg (1,102 lb) and occupies 2.75 m (9.0 ft) of deck space. An unusual feature is a display showing the number of rounds remaining in the two magazines on either side of the mounting.

Specifications
(20 mm/90 (F2))
Calibre: 20 mm
Length of barrel: 90 calibres
Muzzle velocity: 1,050-1,250 m/s (3,445-4,101 ft/s)
Traverse: 325°
Elevation: −15 to +80°
Mounting weight (loaded): 470 kg (1,036 lb)
Crew: 2
Range: 3.5-5.5 n miles (6.75-10 km)

Manufacturers/Contractors
Giat/DCN, France.

12.7 mm machine gun

One 12.7 mm machine gun is carried; type unknown.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Thomson-CSF TSM 2061 Mk II

***Muhafiz* (M 167) and *Mahmood* (M 168) only.** TSM 2061 Mk II is a minehunting and mine disposal system which includes onboard, real-time analysis.

EVEC 20

EVEC 20 *(Ensemble de Visualisation et d'Enregistrement de la Chasse aux Mines)* is a data handling system, which was developed specifically for the French Tripartite minehunter. EVEC 20 samples and processes data from the sonar, radio navigation systems, navigation radar, gyrocompass and Doppler log to present the operator with a continuously updated display of the minehunting area showing the positions of own ship and located targets, as well as radar contacts, tracks and lines representing specified zones. All or part of the displayed images can be recorded on cassette for subsequent recall, updating and maintaining an up-to-date permanent record of operations relating to a specified zone. A repeater on the bridge displays point co-ordinates from the minehunting sonar derived by the EVEC 20 and transmitted to the repeater.

The computer in the EVEC 20 also assists the automatic pilot, providing command inputs and error generation, and helps to control the automatic radar navigation systems providing location computations, error corrections and location of tracking windows.

The automatic pilot is used to keep the ship on a predetermined track during minehunting operations, receiving necessary data from the gyrocompass and Doppler log.

The navigation radar and automatic tracking system integrate with the EVEC 20 to provide a buoy location system. The horizontal plotting table uses an 80 cm^2 screen on which up to 200 sonar contacts can be displayed. The table receives data from the central processing unit which has a 20 kbyte random access memory.

Manufacturer/Contractor
Thomson-CSF, France

RADAR

Racal-Decca 1229

The navigation radar is the Racal-Decca Type 1229, with an output of 20 kW. It is equipped with a 2.7 m (8.9 ft) antenna and operates in the I/J band

Specifications
Role: Navigation
Frequency: I/J-band
Beam: 1.3 × 30°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25/1.0 µs
PRF: 1,300/650 pps
Scan rate: 25 rpm

Manufacturer/Contractor
Racal-Decca, UK.

PROPULSION

Specifications
System: Diesel
Main machinery: 1 Stork-Werkspoor A-RUB 215V-12 diesel; 1.37 MW (1,860 hp(m)) sustained
Propeller: 1 LIPS, five-bladed, controllable pitch propeller
Auxiliary propulsion: 2 ACEC electric motors; 179 kW (240 hp(m)), 2 active rudders
Thrusters: 2 Schottel bow thrusters, 2 × 90 kW
Shaft: 1

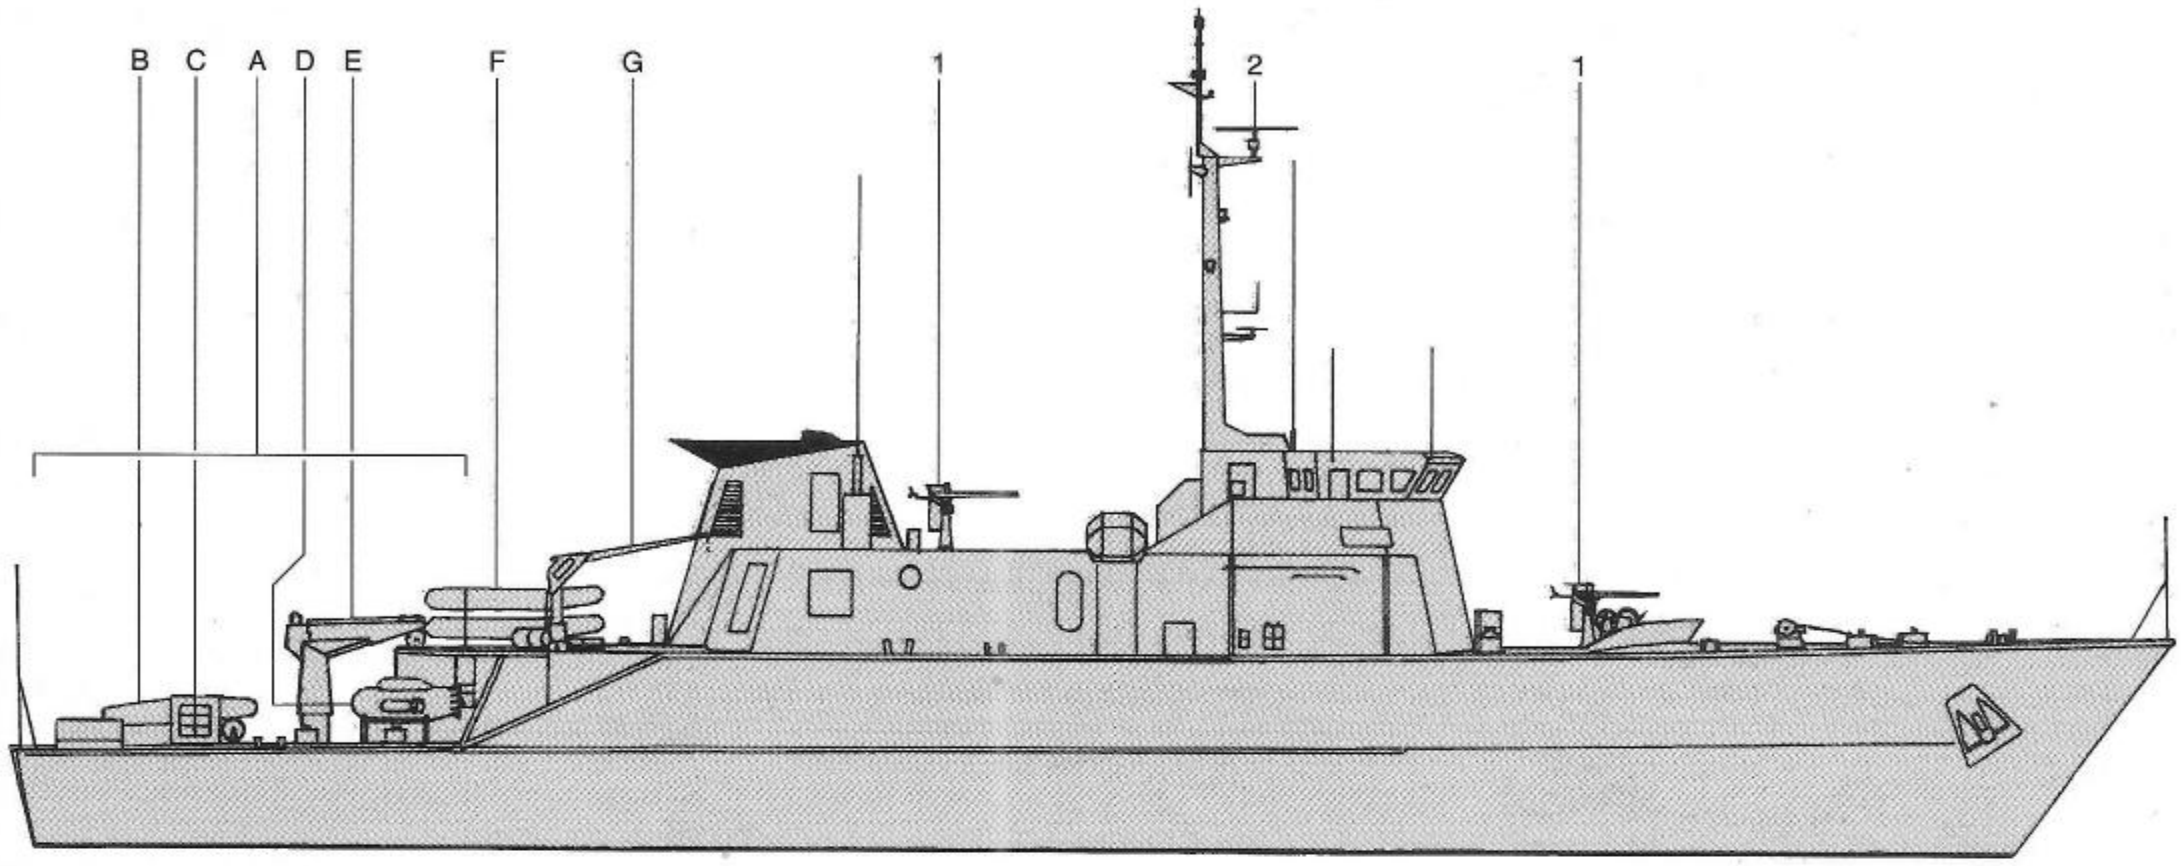
FURTHER INFORMATION

PROGRAMME

The contract for the supply of three MCMVs was signed with France 17 January 1992. In order to provide the purchaser with a working ship as quickly as possible, the French Navy handed over its ship *Sagittaire,* which had already seen service in the Gulf in 1991. It was recommissioned into the Pakistan Navy on 24 September 1992 and sailed for Pakistan in November 1992. The second was built for the Pakistan Navy and started sea trials in February 1996, sailing for Karachi on completion. The third hull was built in France and then shipped out to Karachi in April 1995 by transporter ship; sea trials were scheduled to start in December 1996. It is reported that Thomson Sintra TSM 2054 sonar may be included in the third ship.

LERICI/GAETA

OVERVIEW



'Gaeta' class (Ian Sturton)
MCM A *Sweep deck* **B** *Oropesa float* **C** *Kite* **D** *MIN Mk 2 ROV* **E** *Sweep crane* **F** *RIB* **G** *Crane*

General 1 *Oerlikon 20 mm (not always mounted)* **2** *SMA SPN-728(V)3*

The Italian Lerici/Gaeta MCMV design has achieved a considerable degree of success in a very competitive market, with 38 ships ordered so far, by six navies, with particular successes in the Far East and the USA. Intermarine uses a monocoque structure which has no longitudinal or transverse reinforcements other than the nine bulkheads and the main deck. The design of such a hull — and especially its stress characteristics — is very carefully calculated, with the Intermarine hull varying in hull thickness from 150 mm at the keel to 50 mm at the sides. The bulkheads serve as load-carrying members and are spaced to meet the watertight subdivision requirements. They also carry the GRP cradles for the main engines (which are constructed of amagnetic materials) and major items of equipment. In design terms this provides a very elegant solution.

All ships are capable of carrying and operating mechanical, magnetic and acoustic sweeps. They also carry full facilities for combat divers, including two-man compression chambers, boats and a telescopic launching crane.

The design incorporates a passive roll-damping system, but the tanks can be used for extra fuel for long transits, increasing range to 4,000 n miles at 12 knots.

There are only a small number of MCMV designs currently available and each order over the past 20 years has been keenly contested. As is shown in the table below, however, the Lerici/Gaeta design has been successful in a large number of those competitions, and there will be 38 in service with six navies by 2000.

It was announced in October 1996 that the Royal Thai Navy has ordered two modified 'Gaeta' class MCMVs which will differ from both the Italian 'Gaeta' class and the Australian 'Huon' class. The Thai ships will have STN Atlas DSQS-11M minehunting sonar and the same company's MWS-80 control system; they will also have the Australian ADI Dyad influence sweep. The Thai ships will be built in Italy.

Navy	Type	Class name	Ordered	Built	Entered service
Italy	Lerici Gaeta	Lerici Gaeta	4 — 1978 6 — 1988 2 — 1991	Italy Italy	1985 1992-96
Australia	Gaeta	Huon	6 — 1994	Australia	1998-2002
Malaysia	Lerici	Mahamiru	4 — 1981	Italy	1985
Nigeria	Lerici	Ohue	1 — 1983 1 — 1986	Italy	1987-88
Thailand	Gaeta	(not known)	2 — 1996	Italy	1998/1999
USA	Osprey	Osprey	12 — 1986	USA	1993-98
Total			38		

LERICI

GENERAL SPECIFICATIONS

Operator: Italy
Type: Minehunter/sweeper

Class: LERICI

Built: 4
Active: 4

Displacement:
full load: 620 t

Dimensions
Length: 50 m (164 ft)
Beam: 9.9 m (32.5 ft)
Draught: 2.6 m (8.6 ft)

Speed: 14 kts (6 kts hunting)
Range: 1,500 n miles at 14 kts
Endurance: 12 days

Complement: 47 (4 officers) including 7 divers

SHIPS

LERICI (M 5550)
Builder Intermarine, Sarzana, La Spezia, Italy
Launched 3 Sep 1982
Commissioned 22 Mar 1985

SAPRI (M 5551)
Builder Intermarine, Sarzana, La Spezia, Italy

MINE COUNTERMEASURES SYSTEMS

COMBAT DIVERS

Normal complement is seven combat divers.

COMBAT DATA SYSTEMS

Integrated Minehunting Combat System (IMICS)

IMICS was designed and developed specifically for the 'Lerici' class and integrates the various command and data systems aboard, including:

- Datamat SMA SSN-714(V)2 Minehunting Action Information System (MACTIS).
- SPN-728(V)3 navigation radar
- SSN-715 navigation and tracking system
- SSQ-14(IT) sonar
- MRS III/GPS Eagle precision (GPS) navigation system

There are two IMICS displays: one is in the action information centre, the second on the bridge.

MIN 77 ROV

The MIN 77 (MIN = Mine Identification and Neutralisation) remotely operated vehicle (ROV) was developed specifically for the 'Lerici' class MCMVs to provide the capability to identify and neutralise both bottom and moored mines. It is a torpedo-shaped device, propelled by a single, steerable, battery-driven propeller.

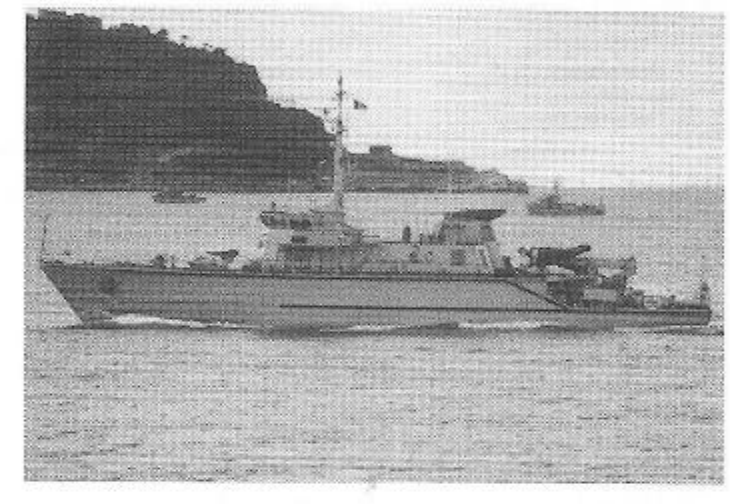
MIN 77 is equipped with a low-light TV camera or a sonar, both of which can be panned through 120° in the vertical plane allowing flexibility of observation during both bottom and moored minehunting. The vehicle's maximum operational depth is 200 m (656 ft). It is battery powered and the batteries can be recharged in approximately 15 minutes. The system can use two types of weapons (bottom charge and explosive cutter) thus enabling the hunting of either bottom or moored mines.

Specifications
Diameter: 105 mm (4.1 in)
Length: 3.5 m (11.5 ft)
Weight: 1,300 kg (2,866 lb)
Max diving depth: 200 m (656 ft)
Max operational range: 400 m (440 yd)
Speed: 6 kts
Endurance: <40 min at 3 kts

Manufacturer/Contractor
Consorzio SMIN, Rome, Italy.

Oropesa 0 Size 4

The wire sweeping system is the Oropesa 0 Size 4, which has 300 fathoms of streamed wire and a swept path of approximately 400 m (1,312 ft). It is operated at a speed of advance of 8 kts.



Milazzo *(M 5552) of the original 'Lerici' class* (H & L van Ginderen Collection)

MINEHUNTING SONAR

SQQ-14(IT)

SQQ-14(IT) is a variable depth sonar system which is lowered from the keel forward of the bridge. The SQQ-14(IT) is a redesigned version of the General Electric AN/SQQ-14 minehunting sonar, with completely new electronics for both the dry and wet ends, and, in fact, only the mechanical elements of the old hoist system remain. New functions such as a real-time performance monitor, speed scan, memory display and remote display have been included, as well as BITE functions which provide self-diagnosis and the location of malfunctions down to the printed circuit cards.

The transmitter unit is now inside the towed body resulting in an increase in operational performance, as well as a redundancy of the principal functions, that is, console interchangeability and the possibility of operating with reduced efficiency in the case of malfunction in one or more of the transmitter sections. The adoption of the latest consoles for search and classification operations has greatly improved the man/machine interface, and simplified the use of the system and the training of operators. Recording and mission playback facilities are available, as well as training and simulation programmes.

Manufacturer/Contractor
FIAR, Italy

WEAPONS SYSTEMS

GUNS

Oerlikon 20 mm/70

One Oerlikon 20 mm/70 is on a single mount on the foredeck.

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 1.5 km
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +55°

COMMAND AND CONTROL SYSTEMS

RADAR

SMA SPN-728(V)3

SPN-728(V)3 is an I-band navigation radar.

PROPULSION

Specifications
System: Diesel
Main machinery:
Passage: 1 Fincantieri GMT BL 230.8 M diesel, 1.46 MW (1,985 hp(m)) sustained

Minehunting: 3 Isotta-Fraschini ID 36 SS 6V diesels 1.1 MW (1,481 hp(m)) sustained
Shafts: 1
Propellers:
Passage: 1 cp

Minehunting: 3 hydraulic, drop-down, 360° rotating thrust propellers; 372 kW (506 hp(m)) (one forward, 2 aft)

FURTHER INFORMATION

PROGRAMME

These four MCMVs were ordered on 7 January 1978 under the Legge Navale. It was originally planned to order six more, but this was first postponed and then revived, but for a modified design designated the 'Gaeta' class.

MINE COUNTERMEASURES SYSTEMS

MINEHUNTING

Thomson-CSF Ibis V
IBIS V is a lightweight MCM combat information system, which includes other Thomson-CSF products such as the TSM 2022 single array sonar, TSM 2026 NAVIPLOT, TSM 5721 Doppler bottom log and TSM 2060 four-colour tactical display. IBIS V weighs 1.5 tonnes.

Manufacturer/Contractor
Thomson-CSF, France.

MINEHUNTING SONAR

Thomson-CSF TSM 2022
The TSM 2022 sonar array has a span of about 1.5 m (4.9 ft) and pivots to retract vertically into the sonar well, which is only 75 cm (29.5 in) in diameter. The 2022 performs detection and classification sequentially and requires only a single operator. TSM 2022 can detect moored and bottom mines at ranges of up to 600 m (1,968 ft) and can classify them at 250 m (820 ft).

COMBAT DIVERS

There are five combat divers who are equipped with the Draeger Duocom decompression chamber.

PAP-104 ROV
The Malaysian MCMVs each carry two PAP-104 ROVs. The PAP 104 has the capability simultaneously to hunt and destroy ground mines and tethered mines by either placement and remote detonation of a charge or by cutting the mooring rope of tethered mines. The vehicle is wire-guided and remote-controlled from a control console situated in the operation room. It is horizontally propelled by means of two side thrusters. Using a 'guide rope' deployed from a winch in the underside of the ROV, it can be maintained at a constant altitude within the vicinity of the seabed.

The ROV can carry the 126 kg (278 lb) charge necessary to ensure the total destruction of a mine. Cutters can be carried with the charge. The front section of the vehicle carries a sonar, either a high-resolution near-field sonar or a mid-range relocation sonar. Identification is carried out by a tiltable low-light TV camera and/or by a tiltable colour TV camera.

Vertical thrusters are used which allow mid-water navigation. A new payload can be fitted in place of the charge, consisting of a manipulator with associated camera and projector.

Specifications
Length: 3 m (9.8 ft)
Diameter: 1.2 m (3.9 ft)
Height: 1.3 m (4.3 ft)
Total weight: 850 kg (1,874 lb) (including 100 kg (220 lb) charge)
Operating range: 2,000 m (6,561 ft) max (at depths of 300 m (984 ft))
Speed: 6 kts max

Manufacturer/Contractor
Société ECA, France.

MINESWEEPING

Oropesa 0 Size 4
The wire sweeping system is the Oropesa 0 Size 4, which has 300 fathoms of streamed wire and a swept path of approximately 400 m (1,312 ft). It is operated at a speed of advance of 8 kts.

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/70-315
There is one single 40 mm/70-315 per ship, mounted on the forecastle. The SAK 40L/70-315 is a manually laid mounting in which the gun platform is on a pedestal. The total height to the centre of the barrel from the deck when the gun is horizontal is 1.36 m (4.5 ft). The mounting weighs 2.87 t unloaded, is 1.83 m (6.0 ft) long and has a training radius of 3.31 m (10.8 ft). The mounting has a protective shield and includes ammunition racks for 96 rounds.

Specifications
Traverse: Nominal 360° at 30°/s
Elevation: −10 to +90° at 24°/s
Crew: 4
Weight (unloaded): 1.7 t

Manufacturer/Contractor
Bofors Weapon Systems, Sweden.

COMMAND AND CONTROL SYSTEMS

RADAR

Racal-Decca 1226

Specifications
Role: Navigation

Band: I
Range: 48 n miles (81 km)

Scan rate: 28 rpm

Manufacturer/Contractor
Racal-Decca.

PROPULSION

Specifications
System: Diesel
Main machinery:
Passage: 2 MTU 12V 396 TC82 diesels, 1.91 MW (2,605 hp(m)) sustained

Minehunting: 3 Fincantieri Isotta-Fraschini ID 36 SS 6V diesels; 1.09 MW (1,481 hp(m)) sustained
Shaft: 1
Propellers:
Passage: 1 KaMeWa cp

Minehunting: 2 Riva-Calzoni hydraulic thrust jets 372 kW (506 hp(m)) (one forward, one aft)

FURTHER INFORMATION

These four ships were ordered on 20 February 1981 and all arrived in Malaysia on 26 March 1986. They are 1 m (3.3 ft) longer than the Italian 'Lerici' class ships.

There were plans at one stage to purchase another two 'Lerici' class ships, but it has been decided to shelve this proposal and to buy a completely new design in due course. There are, however, plans to upgrade the tactical data system in the existing four ships.

Jerai *(12) of the Royal Malaysian Navy* (H & L van Ginderen Collection)

Kinabalu *(14). The Malaysian ships are 1 m (3.3 ft) longer than the original Italian 'Lerci' class* (H & L van Ginderen Collection)

MINE COUNTERMEASURES SYSTEMS

MINEHUNTING

Thomson-CSF Ibis V
IBIS V is a lightweight MCM combat information system, which includes other Thomson-CSF products such as the TSM 2022 single array sonar, TSM 2026 NAVIPLOT, TSM 5721 Doppler bottom log and TSM 2060 four-colour tactical display. IBIS V weighs 1.5 tonnes.

Manufacturer/Contractor
Thomson-CSF, France.

Thomson-CSF TSM 2022
The TSM 2022 sonar array has a span of about 1.5 m (4.9 ft) and pivots to retract vertically into the sonar well, which is only 75 cm (29.5 in) in diameter. The 2022 performs detection and classification sequentially and requires only a single operator. TSM 2022 can detect moored and bottom mines at ranges of up to 600 m (1,968 ft) and can classify them at 250 m (820 ft).

COMBAT DIVERS

There are six or seven combat divers. The ship carries a Galeazzi two-man decompression chamber.

Gaymarine Pluto ROV

There are two ROVs per vessel. Pluto is available in three configurations: battery-powered with a 6 mm, 500 m (1,640 ft) long umbilical cable; battery-powered with a 3 mm, 2,000 m (6,561 ft) long fibre optic umbilical cable; or remote-powered of unlimited endurance with 8 mm, 500 m (1,640 ft) long umbilical cable. The vehicle is powered by five thrusters: two horizontal for forward/reverse, two vertical for vertical and lateral shift, and a transversal thruster. The thrusters are controlled by two joysticks. The vehicle can maintain automatic depth control within ±10 cm (4.0 in). Forward maximum speed is 4 knots and vertical speed 1 knot. Sensors are mounted in the forward tiltable section of the vehicle.

Specifications

Length: 1,680 mm (66 in)
Width: 600 mm (23.6 in)
Height: 630 mm (24.8 in)
Weight: 160 kg (253 lb)

Payload: 15 kg (33.0 lb)

Manufacturer/Contractor

Gaymarine, Italy.

MINESWEEPING

Oropesa 0 Size 4

The wire sweeping system is the Oropesa 0 Size 4, which has 300 fathoms of streamed wire and a swept path of approximately 400 m (1,312 ft). It is operated at a speed of advance of 8 kts.

WEAPONS SYSTEMS

GUNS

ESCO 30 twin 30 mm mounting

The Emerlec 30 is a twin 30 mm weapon designed for air defence, surface engagement and anti-missile operations, using either local or remote control. Ship's power supplies are used normally but there is an on-mount battery which will provide sufficient power to operate the guns and fire a full complement of ammunition in an emergency. Traditional hand-crank mechanisms provide further back-up. There is an enclosed, environmentally controlled cabin for the operator and an integral below-deck magazine.

The Emerlec 30 employs the Oerlikon KCB positively locked, gas-operated cannon and the gunner sits in a cabin for local control operation using a daylight reflex, or an image-intensifier, sight, together with gyro-assisted line of sight stabilisation. The cabin is located between the barrels and forward of the elevating mass. Behind it, in a sealed compartment are the elevating and training drives together with flexible chutes to channel ammunition to the feeding mechanisms.

Ready ammunition is stored in an integral, below-deck, drum magazine with a capacity of 985 rounds for each barrel in a continuous disintegrating-link belt. These are transferred to the guns through separate chutes by means of electrically operated drives which automatically respond to the individual demand for ammunition supply.

Specifications

Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Traverse: 360° at 80°/s
Elevation: −15 to +80° at 80°/s
Crew: 1
Range: 3.25 n miles (6 km) (anti-surface) (max)
Rate of fire: 600 rds/min/barrel (nominal) or 140 rds/min/barrel (nominal)
Ammunition: 870 g (HEI/HEI-T, SAPHEI, TP/TP-T)

Manufacturer/Contractor

Electronics & Space Corporation (ESCO), St Louis, Missouri, USA.

20mm GAM-BO1

The GAM mounting is an unpowered light, compact design for use in a wide variety of vessels, but especially those involved in patrol operations. It is of the swivel fork type with the sidewalls having the trunnion bearings. The cradle is made of light alloy and the weapon's working parts are enclosed in a protective case whose top opens to ease maintenance and installation. The sight, shoulder rests and back support strap are all attached to the sight bracket which is adjustable for height. Usually these mountings have the RC35 optical ring sight but they can be fitted with the SLC 001 lightweight lead computing sight. The GAM-BO1 mounting is 3.32 m (10.9 ft) long and is adjustable in height from 1.5 to 1.7 m (4.9 to 5.5 ft). The ammunition box with 200 rounds is attached to the front of the mounting and the belt is fed from the right side of the gun. Spent cartridge cases are ejected between the sidewalls of the cradle into a separate compartment while the links are collected in a bag on the other side of the mounting. The GAM-BO1 has the KAA gun.

Specifications

Gun (KAA)
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Rate of fire: 650 rds/min
Ammunition: 870 g

COMMAND AND CONTROL SYSTEMS

RADAR

Racal-Decca 1226

Specifications

Role: Navigation
Band: I
Range: 48 n miles (81 km)
Beam: 1.2°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25/1.0 µs
Scan rate: 28 rpm

Manufacturer/Contractor

Racal-Decca.

PROPULSION

Specifications

System: Diesel
Main machinery: 2 MTU 12V 396 TB83 diesels; 2.3 MW (3,120 hp(m)) sustained
Shafts: 1
Propellers:
Passage: one cp
Minehunting: 2 Turbomeccanica PG-2000 water-jets

FURTHER INFORMATION

Ohue was ordered in April 1983 and *Marabai* in January 1986. They have GRP hulls but, unlike the Italian and Malaysian 'Lerici' class ships, they do not have separate hydraulic minehunting propulsion and are fitted with water-jets, instead.

Like many other ships in the Nigerian Navy, these two MCMVs were both non-operational in 1996 but are assessed to be repairable.

GAETA

GENERAL SPECIFICATIONS

Operator: Italy
Type: Minehunter/sweeper

Class: GAETA

Built: 8
Active: 8

Displacement:
full load: 697 t

Dimensions
Length: 52.5 m (172.1 ft)
Beam: 9.9 m (32.5 ft)
Draught: 2.6 m (8.6 ft)

Speed: 14 kts (6 kts hunting)
Range: 1,500 n miles at 14 kts

Complement: 47 (4 officers) including 7 divers

SHIPS

MINE COUNTERMEASURES SYSTEMS

Integrated Minehunting Combat System (IMICS)

IMICS was designed and developed specifically for the 'Lerici' class and integrates the various command and data systems aboard, including:

- Datamat SMA SSN-714(V)2 Minehunting Action Information System (MACTIS).
- SPN-728(V)3 navigation radar
- SSN-715 navigation and tracking system
- SSQ-14(IT) sonar
- MRS III/GPS Eagle precision (GPS) navigation system

There are two IMICS displays: one is in the action information centre, the second on the bridge.

MINESWEEPING

Oropesa 0 Size 4

The wire sweeping system is the Oropesa 0 Size 4, which has 300 fathoms of streamed wire and a swept path of approximately 400 m (1,312 ft). It is operated at a speed of advance of 8 kts.

COMBAT DIVERS

There are seven combat divers. The ship carries a Galeazzi two-man decompression chamber.

MIN Mk 2

MIN Mk 2 is carried by the 'Gaeta' class, replacing the MIN 77 in the 'Lerici' class. The MIN (Mine Identification and Neutralisation) system was developed to provide the capability to identify and neutralise both bottom and moored mines, and the latest version, the Mk 2, comprises a wire-guided underwater vehicle, an operations room console, tracking system, auxiliary console, and set of operational accessories. The ROV is equipped with a TV camera and sonar which can be panned through 150° in the vertical plane allowing flexibility of observation during both bottom and moored minehunting. The vehicle's operational depth has been increased to over 300 m (984 ft).

The system can use two types of weapons (bottom charge and explosive cutter) thus enabling the hunting of either bottom or moored mines. The MIN Mk 2 and its control console are integrated into the MCMV combat system via serial datalinks with the command centre, parent vessel's search/classification sonar and parent vessel's gyrocompass.

Specifications
Weight: 1,150 kg (2,535 lb)
Max diving depth: 350 m (1,148 ft)
Speed: 6 kts
Endurance: <1 h

Manufacturer/Contractor
Consorzio SMIN, Rome, Italy.

MINEHUNTING SONAR

SQQ-14(IT)

SQQ-14 (IT) is a variable depth sonar system which is lowered from the keel forward of the bridge. The SQQ-14(IT) is a redesigned version of the General Electric AN/SQQ-14 minehunting sonar, with completely new electronics for both the dry and wet ends, and, in fact, only the mechanical elements of the old hoist system remain. New functions such as a real-time performance monitor, speed scan, memory display and remote display have been included, as well as BITE functions which provide self-diagnosis and the location of malfunctions down to the printed circuit cards.

The transmitter unit is now inside the towed body resulting in an increase in operational performance, as

Gaeta *(M 5554) nameship of the second class of this successful Italian MCMV design* (Italian Navy)

well as a redundancy of the principal functions, that is, console interchangeability and the possibility of operating with reduced efficiency in the case of malfunction in one or more of the transmitter sections. The adoption of the latest consoles for search and classification operations has greatly improved the man/machine interface, and simplified the use of the system and the training of operators. Recording and mission playback facilities are available, as well as training and simulation programmes.

Manufacturer/Contractor
FIAR, Italy

WEAPONS SYSTEMS

Oerlikon 20 mm/70
The 'Gaeta' class mounts one twin Oerlikon 20 mm/70 on the foredeck.

Specifications
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 1.5 km
anti-air: 1,150 m (3,800 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +55°

COMMAND AND CONTROL SYSTEMS

RADAR

SMA SPN-728(V)3
SPN-728(V)3 is an I-band navigation radar.

PROPULSION

Specifications
System: Diesel
Main machinery:
Passage: 1 Fincantieri GMT BL 230.8 M diesel, 1.46 MW (1,985 hp(m)) sustained
Minehunting: 3 Isotta-Fraschini ID 36 SS 6V diesels 1.1 MW (1,481 hp(m)) sustained
Shafts: 1
Propellers:
Passage: 1 cp
Minehunting: 3 hydraulic 360° rotating thrust props; 372 kW (506 hp(m)) (one forward, 2 aft)

FURTHER INFORMATION

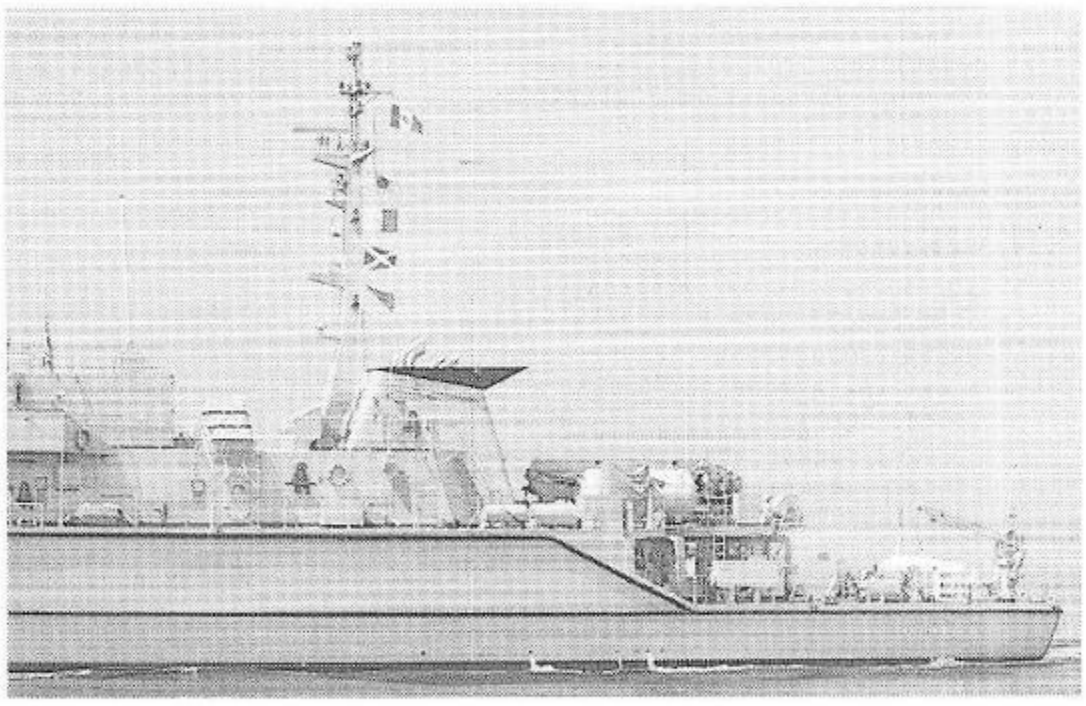
PROGRAMME

The 'Gaeta' class is the follow-on MCMV for the Italian Navy and is 2 m (6.5 ft) longer than its predecessor, with a number of equipment improvements. The first six were ordered from Intermarine on 30 April 1988. This was followed by an order for two more, which was placed in 1991, then cancelled due to budget cuts, but then reordered on 17 September 1992. The Italian Navy is reported to be interested in ordering a further six to an improved design.

DESIGN

Improvements incorporated in the 'Gaeta' class include a better minehunting sonar system (which was backfitted to the 'Lerici' class in 1991), a third hydraulic system, improved electrical generators, an ROV with better endurance and equipment, a new type of recompression chamber, and a reduced magnetic signature.

All machinery is mounted on vibration dampers and the main engines are made of amagnetic material. The ships are fitted with Galeazzi two-man compression chambers and a telescopic crane for launching Callegari frogmen boats.



Alghero *(M 5556) showing the sweep deck in detail. Note the inflatable dinghies and the diver decompression chamber abaft the stack, and the Oropesa float and kite on the sweep deck* (Italian Navy)

MINE COUNTERMEASURES SYSTEMS

MINEHUNTING

Bofors SUTEC Double Eagle Mk 2

Two Double Eagle mine disposal vehicles with DAMDIC charges. Double Eagle is a comparatively low-weight system fitted with high-speed thrusters for use in currents up to at least 3 knots. The vehicle is driven by eight thrusters, which, in various combinations, enable the vehicle to be propelled at 5 knots forward, 3 knots astern, 3 knots laterally and 1 knot vertically. Double Eagle is fitted with a computerised stabilisation control system and is extremely manoeuvrable, exhibiting unlimited movement in six degrees of freedom (pitch ±180°, roll ±180°).

The operations room display comprises two monitors with control keyboard. One monitor displays the picture from a colour TV camera, the other the picture from a monochrome TV camera mounted at the tip of a telescopic arm. Digital data such as heading, depth, pitch and roll angle, cable twist, leakage warnings, real-time clock with date and time and diagnostics are superimposed on the TV monitor. High-quality video is available using fibre optic link in the umbilical cable. The standard umbilical is 600 m (1,968 ft) long, but as an option a 1,000 m (3,281 ft) cable can be attached. The vehicle is fitted with one colour CCD camera as standard, and tilt arrangement with colour and SIT camera is available as an optional extra. Optional sensors include echo-sounder, and electronic scanning or conventional sonar.

The vehicle uses a unique precision charge placement technique using a small mine disposal charge which also features several advantages. The vehicle can also carry a heavy standard NATO mine disposal charge as well as cable cutters.

Specifications
Length: 1.90 m (6.2 ft)
Width: 1.30 m (4.2 ft)
Height: 0.80 m (2.6 ft)
Weight: 400 kg (881 lb)
Payload: 80 kg (176 lb)
Speed: 5 kts
Max operating depth: 500 m (1,640 ft)

Manufacturer/Contractor
Bofors Underwater Systems, Sweden.

MINESWEEPING

Double Oropesa sweep

The double Oropesa sweep has been developed in Australia and incorporates lessons learned from modern fishing technology. It is designed to cut the cables on moored mines, releasing the mines to float to the surface, where they can be located and destroyed. A double Oropesa sweep consists of two sweep wires, which are towed astern of the MCMV, which are kept in the required positions by Oropesa floats, lightweight otters and a new type of kite designed for easy handling. Explosive cutters are attached to the sweep wires at intervals.

Manufacturer/Contractor
ADI, Australia.

ADI Mini-Dyad

The 'Huon' class will tow the mini-Dyad influence sweep, an emulation sweep developed in Australia. This is a modular, distributed dipolar system, based on combinations of positive buoyant permanent magnets (Dyads) and water-driven acoustic generators. The latter produce a ship-like acoustic signature in the low, audible and HF ranges. The mini-Dyads are designed to emulate degaussed and undegaussed ships of various sizes up to approximately 100,000 t dwt.

MINESWEEPING SONAR

GEC-Marconi Type 2093 VDS

Sonar Type 2093 variable depth sonar (VDS) will detect, localise and classify all current and future mine threats. The variable depth, dual-frequency search and dual-frequency classification capability provides a sonar able to operate under all bottom and sea conditions at a range claimed to be twice that of hull-mounted sonar and with an increase of three times detection depth.

The towed body ('fish') is cylindrical with hemispherical ends and contains sonar arrays comprising two 360° rings for LF and VLF operation, hydrophones for HF and VHF reception, and separate HF and VHF projectors. Underneath the 'fish' there is a cylindrical VLF projector and a VLF depth sounder. LF and VLF are used for search, survey and moored mine classification, while HF and VHF are used for classification and survey.

Sonar 2093 employs multiple operating modes which offer the MCM commander the choice of a number of operational configurations to match the prevailing threat and environment. These multiple operating modes comprise VLF and LF search and moored mine classification, VLF and LF search, search and ground mine classification, also search and route survey. Sonar 2093 can combine these modes to enable concurrent operation.

Manufacturer/Contractor
GEC-Marconi, UK.

WEAPONS SYSTEMS

GUNS

Oerlikon 30 mm in DS30B mounting

Single 30 mm mounting fitted forward of bridge. The DS30B uses the Astra/Oerlikon KCB.

Specifications
Gun (KCB)
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Rate of fire: 650 rds/min
Ammunition: 870 g
Traverse: 230° at 55°/s
Elevation: −25 to +70° at 55°/s
Crew: 1
Mounting weight (loaded): 1,463 kg (3,225 lb)
Power requirement: 440/415/380 V, 50-60 Hz, three phase (4 kVA)

Manufacturer/Contractor
MSI Defence Systems, UK.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

AWADI Prism ESM receiver

Prism is a radar warning receiver operating in the frequency range 2 to 18 GHz. The four-port monopulse antenna array contains the RF processing, video processing and pulse processing functions and has high receiver sensitivity to allow long-range detection of radar emitters. The processor uses amplitude comparison coupled into a distributed transputer network to provide passive detection, direction-finding and classification of pulsed radar systems. The console unit, normally located on the ship's bridge, houses the emitter processing, display processing, system control functions and operator interface. Automatic emitter classification is by matching with library data and can be programmed to trigger audio and visual threat alarms.

Specifications
Antenna: 4 antenna monopulse DF array
Frequency: 2-18 GHz
System sensitivity: Better than −65 dBm
DF accuracy: Better than 10° RMS
Emitter intercept probability: 70% within 4 emitter scan periods for scanning emitters; 95% within 1 s for constant illuminating emitters
Emitter library: 600 emitter modes
Alarm: Visual and audio automatic alert
Weight: Antenna 14 kg (30.8 lb); console unit 20 kg (44.0 lb)

Manufacturer/Contractor
AWA Defence Industries Pty Limited, Adelaide, South Australia, Australia.

ELECTRONIC COUNTERMEASURES (ECM)

ML Aviation Superbarricade countermeasures system

There will be two Superbarricade launchers. Super-

barricade is an improved version of the widely used Barricade system and provides ships with means of deploying chaff and infra-red (IR) decoys to counter missile attacks, using a layered defence against the various types of anti-ship missile. The system uses a 102 mm rocket and a redesigned launcher with four sets of triple-cell launchers. The system has a similar control unit to Barricade Mk III and the same tactical computer. The ammunition lockers each contain 24 rockets. There are four decoy modes: confusion; distraction; dump; and centroid.

Manufacturer/Contractor
ML Wallop Defence Systems, Andover, Hampshire, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

NAUTIS-M
NAUTIS-M is specifically designed for use in the mine countermeasures (MCM) role, and can be a one, two or three console system. It provides support for operational planning, ship control guidance, underwater and surface picture compilation, command and control for mine disposal, together with a real-time MCM database. The version to be installed in the 'Huon' class is a three-console (minehunting, operations, bridge) monochrome system similar to that purchased for the UK Royal Navy and the Royal Saudi Arabian Navy for use in their 'Sandown' minehunters and by the US Navy for the 'Avenger' class MCM ships.

WEAPONS CONTROL

Radamec 1000N
Radamec System 1000N consists of a lightweight, stabilised director with TV camera and thermal imager. It is controlled from a below-decks console with a display screen, function buttons and switches, a joystick and a touch-sensitive panel.

Manufacturer/Contractor
Radamec, UK.

RADAR

Kelvin Hughes Type 1007
Navigation radar is the Kelvin Hughes Type 1007.

Specifications
Type 1007
Role: Navigation
Frequency: H/I-band (9,410 MHz)
Beam: 1.0 × 18°/0.75 × 18°
Peak power: 25 kW
Pulsewidth: 0.08/0.3/0.8 µs
PRF: 1,600/800/400 pps
Scan rate: 26 rpm

Manufacturer/Contractor
Kelvin Hughes Ltd, Hainault, Essex, UK.

PROPULSION

Specifications
System: Diesel
Main machinery:
Passage: 1 Fincantieri GMT BL 230.8 M diesel, 1.46 MW (1,985 hp(m)) sustained

Minehunting: 3 Isotta Fraschini 1,300 diesels; 1,058 kW (1,440 hp(m))
Shafts: 1
Propellers:
Passage: 1 cp

Minehunting: 3 Riva-Calzoni hydraulic 360° rotating thrust props; 372 kW (506 hp(m)) (1 forward, 2 aft)

FURTHER INFORMATION

PROGRAMME

The Australian 'Force Design Review' of May 1991 recommended the acquisition of coastal minehunters of proven design. These ships would be required to operate in deeper and more exposed waters, to achieve lower transit times and remain on station longer than the two inshore minehunters ('Rushcutter' class) currently in service. After receiving bids from all the major MCMV builders, the RAN eventually awarded the contract to Australian Defence Industries (ADI) on 12 August 1994 to build six Intermarine-designed derivatives of their 'Gaeta' class ships.

The hull of the first ship was constructed at Intermarine's shipyard at Sarzana, La Spezia, Italy and arrived in Australia as deck cargo on 31 August 1995 for fitting out in Newcastle, New South Wales, Australia, where the remaining five ships are building at ADI's Throsby Basin. Local content for this project is about 70 per cent.

DEPLOYMENT

This class, which is named after Australian rivers, is to be based at HMAS Waterhen in Sydney. Sea trials for *Huon* are planned to start in April 1998.

MINE COUNTERMEASURES SYSTEMS

MINEHUNTING

AN/SLQ-48(V)2 mine neutralisation system (MNS)

The AN/SLQ-48(V)2 Mine Neutralisation System (MNS) is centred on the remotely operated vehicle (ROV). The system is designed to detect, locate, classify and neutralise moored and bottom mines, using high-resolution sonar, low-light level TV, cable cutters and mine destruction charges.

The ROV operates at the end of a 1,066 m (3,000 ft) umbilical, which carries power cables from the ship, together with datalinks for the control systems and sensors. The ROV is powered by two 12 hp motors and two side thrusters, giving it a forward speed of 6 knots. Onboard equipment includes a high-definition sonar, a low-light TV for examining objects, cable cutters and an explosive charge for destroying a mine. There is also a tracking transponder to enable the parent ship to track the ROV.

Initial target detection and vehicle guidance information is provided by the ship's AN/SQQ-32 variable depth minehunting sonar. Initial vehicle navigation is plotted and monitored within the MNS acoustic tracking system, with the ROV's onboard sonar being used during the mid-course search and final homing phases; its high resolution enables operations in poor visibility by sonar guidance alone. Low-light TV is used in conjunction with sonar during the precision guidance phase near the target.

Specifications

AN/SLQ-48(V)2 ROV
Length: 3.8 m (12.47 ft)
Width: 0.9 m (2.95 ft)
Height: 1.2 m (3.94 ft)
Speed: 6 kts
Vehicle weight: 1,247 kg (2,749 lb) (in air)
Propulsion: Hydraulic, twin 15 hp
Thrusters: Horizontal/vertical/lateral
Cable length: 1,066 m (3,000 ft)
Power requirements: 43 kVA

Manufacturer/Contractor

Alliant Techsystems, US.

MINESWEEPING

AN/SLQ-53

AN/SLQ-53 (also known as Single Ship Deep Sweep) is under development for use aboard the 'Osprey' class MCMVs. It will provide mechanical and modular influence sweep systems and is based on the sled system used by helicopters.

Modular Influence Minesweeping System (MIMS)

MIMS is under development for the 'Osprey' class. It is a towed sweep and the system will include its own gas-turbine sweep-current generator.

MINEHUNTING SONAR

AN/SQQ-32

AN/SQQ-32 consists of two separate sonars: a search sonar for initial detection; and a high-frequency, high-resolution sonar for target classification. The detection sonar, designed and manufactured by Raytheon, detects mines and mine-like objects over a wide range of distances and bottom conditions, and the system incorporates a computer-aided detection facility to enable the sonar operator to discard the latter. Raytheon also provides the computer facilities and display consoles and is responsible for overall system integration.

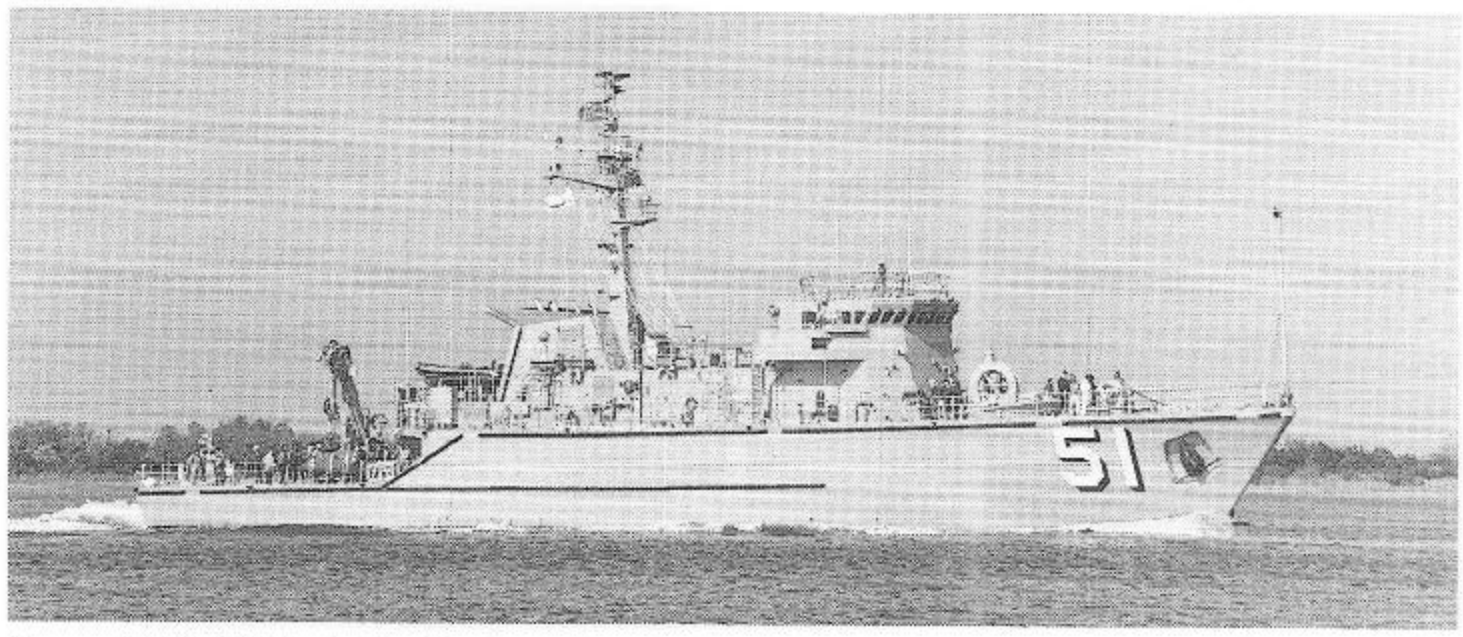
The classification sonar, designed and produced by Thomson-CSF, is based on its experience with the DUBM 21 and TSM 2022 minehunting sonars. The classification sonar provides very high-resolution transmission and reception of underwater signals to enable targets to be seen with near-picture quality.

AN/SQQ-32 has two identical operator consoles with high-resolution displays. Search and classification data can be displayed simultaneously or independently. Automated detection and control functions are performed by two AN/UYK-44 computers.

The sonars are mounted in a cylindrical towed body which is housed in a well under the forward part of the ship. The sensors can, however, also be operated from the housed position when in shallow water. Search frequency is 35 kHz and classification frequency 445-650 kHz.

Manufacturers/Contractors

Raytheon, Portsmouth, Rhode Island, USA (prime).
Thomson-CSF, Sophia Antipolis Cedex, France (sonar).



Osprey *(MHC 51), lead ship of a class of twelve. Note the large winch-wheel on the foredeck, which is used to lower and raise the AN/SQQ-32 minehunting sonar. The AN/SLQ-48(V)2 remotely operated vehicle can be seen below the crane on the sweep deck* (Intermarine)

WEAPONS SYSTEMS

GUNS

M2HB 12.7 mm machine guns

Two M2HB are carried. This is a selective short recoil automatic operation weapon with a 1,143 mm (45 in) long barrel.

Specifications
Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Paramax AN/SYQ-13

The AN/SYQ-13 Navigational Command and Control System was developed specifically for the 'Osprey' class and is designed to integrate the major onboard systems, including:

- AN/SQQ-32 variable depth minehunting sonar
- AN/SLQ-48(V)2 Mine Neutralisation System (MNS)
- AN/SPS-64(V)9 surface search sonar
- precision navigation system
- environmental sensors
- AN/SSQ-109 machinery control system

It consists primarily of software packages hosted on the onboard computers.

RADAR

Raytheon AN/SPS-64(V)9

Specifications
Role: Navigation
Frequency: I-band
Beam: 1.9 × 22°
Peak power: 20 kW
Gain: 28 dB
Pulsewidth: 0.06/0.5/1.0 µs
PRF: 3,600/1,800/900 pps
Scan rate: 33 rpm

Manufacturer/Contractor
Raytheon, Portsmouth, Rhode Island, USA.

PROPULSION

Specifications
System: Diesel
Main machinery:
Passage: 2 Isotta-Fraschini ID 36 SS 8V-AM diesels; 1.18 MW (1,600 hp(m)) sustained
Minehunting: 3 Isotta-Fraschini ID 36 diesel generators, 984 kW

Auxiliary propulsion systems: 2 hydraulic motors, 265 kW (360 hp(m)), 1 bow thruster, (132 kW) (180 hp(m))
Propellers: 2 Voith-Schneider propellers

FURTHER INFORMATION

PROGRAMME

The original US Navy MCMV project (the 'Cardinal' class) was based on a surface-effect ship (SES) but this was cancelled in 1986 when the design failed shock testing. A design contract for 'Lerici' class minehunters was then awarded in August 1986 followed by a construction contract in May 1987 for the lead ship of the class. The Italian company, Intermarine SpA, then established Intermarine USA and purchased the Sayler Marine Corporation in Savannah, Georgia. On 2 October 1989 Avondale, Gulfport was mandated by the US Congress as the second construction source.

The programme has suffered repeated delays, which were due in part to the engine modifications.

DESIGN

The design and method of construction is similar to the Italian Navy's 'Gaeta' class, but the hull is somewhat larger as shown in the summary:

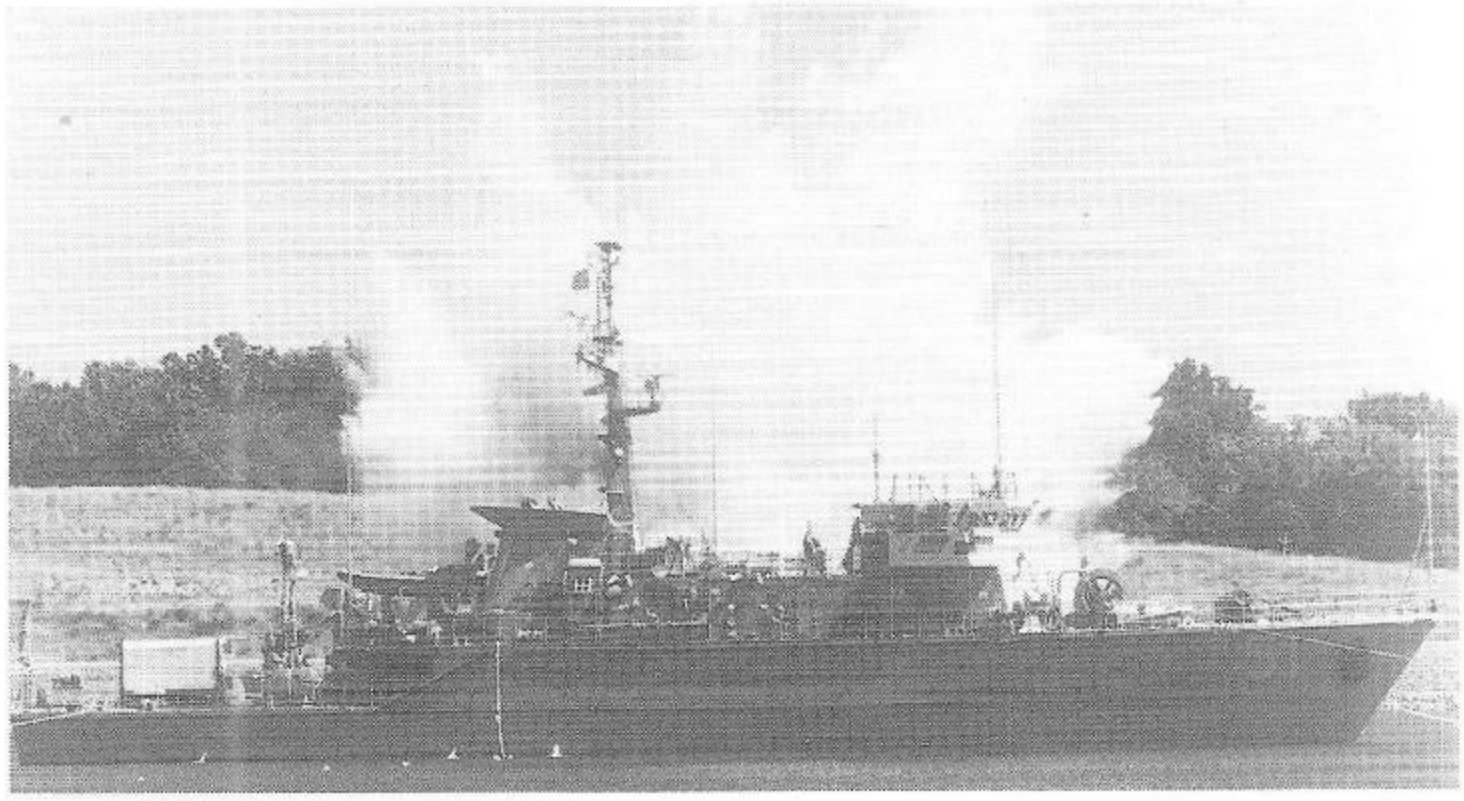
	Osprey	Gaeta
Displacement:		
full load	918 t	697 t
Dimensions:		
Length	57.3 m (188 ft)	52.5 m (172.1 ft)
Beam	11 m (35.9 ft)	9.9 m (32.5 ft)
Draught	2.9 m (9.5 ft)	2.6 m (8.6 ft)
Speed	12 kts	14 kts (6 kts hunting)
Range	1,500 n miles at 10 kts	1,500 n miles at 14 kts

At one time there was a plan to produce a lengthened version, in order to accommodate additional supplies for oceanic transits, but this has been cancelled.

The 'Osprey' class is fitted with US minehunting equipment, but a significant difference from all other versions of the Lerici/Gaeta design is that it is fitted with two Voith-Schneider cycloidal propellers.

DEPLOYMENT

It is planned that one ship will be retained in the active fleet, while eleven will be transferred to the Naval Reserve Force (NRF) after a year in active service. *Heron* (MHC 52) was the first to transfer to the NRF in July 1995.



Osprey *(MHC 51) successfully undergoes a shock resistance test* (Intermarine)

MINE COUNTERMEASURES SYSTEMS

CLEARANCE DIVERS

Four clearance divers are embarked in all ships.

Type S-4 ROV

***Enoshima* (MSC 652) to *Sakushima* (MSC 671) only.** The early series ships carry the Japanese Type S-4 ROV, which is designed to lay its own mine-demolition charges. It is electrically powered with two thrusters, one either side of the main body.

Type S-7 ROV

***Uwajima* (MSC 672) to MSC 680 only.** The later series ships carry a new ROV, designated the Type S-7. No details are known.

MINEHUNTING SONARS

Type ZQS-2B

***Enoshima* (MSC 652) to *Sakushima* (MSC 671) only.** Type ZQS-2B is a licence-produced version of the British Type 193M short-range, high-definition, sector-scanning sonar. This employs two frequencies: 100 kHz for long-range search and 300 kHz for short-range search and classification, with the transducers carried beneath the ship on a stabilised, steerable mounting, contained within a dome of either inflated fabric or GRP material. The receiver uses a modulation scanning technique with 15 beams, 1° wide in LF and 0.33° wide in HF, giving azimuth coverage of 15° and 6° respectively.

Searching wider areas of the sea bottom is achieved by an automatic search sequence selected in accordance with the nature of sea bottom, with returned echoes presented to operators on separate CRTs at the control console. One display shows range and bearing of targets while the other is used for expanded range presentation in search mode and also the presentation of the classification channel data. The controls for adjusting the transducer position, signal parameters such as frequency and pulse length and for co-ordinating with the rest of the minehunting and destruction systems, are also provided at the console.

Manufacturer/Contractor
NEC/Hitachi, Japan.

ZQS-3

***Uwajima* (MSC 672) to MSC 680 only.** ZQS-3 is a new, Japanese-designed, hull-mounted, minehunting sonar, which was developed for the 'Uwajima' class MCMVs. No details are known.

Manufacturer/Contractor
NEC/Hitachi, Japan.

WEAPONS SYSTEMS

GUNS

JM-61 20 mm/76 Sea Vulcan

The Sea Vulcan 20P/JM 61MB is essentially an M-197 gun on the mounting of the old 20 mm single US Navy Oerlikon Mk 10. A battery attached to the base of the mounting provides the power for up to 6,000 rounds and the working circle is 279.5 cm (110 in). The JM 61MB features two shoulder stocks compared with the two pistol grips of the Sea Vulcan 20P. This mounting provides convenient room for the installation of the 300-round ammunition can behind the right-hand shield, the battery and control box being mounted behind the other half. Twenty complements of ammunition can be fired without battery recharging; the battery conveniently can be connected to a main power source to provide a 28 V trickle feed, thus maintaining the battery in a charged condition.

COMMAND AND CONTROL SYSTEMS

RADARS

Fujitsu OPS-9

***Enoshima* (MSC 672) to *Ieishima* (MSC 673) only.**
An I-band surface search/navigation radar.

Fujitsu OPS-39 (MSC 674 onwards)

***Tsukishima* (MSC 654) to MSC 680) only.**
An I-band surface search/navigation radar.

PROPULSION

Specifications
System: Diesel
Main machinery:
***Enoshima* (MSC 652) to *Himeshima* (MSC 665) only:** 2 Mitsubishi YV122C-15/20 diesels 1.06 MW (1,440 hp(m))

***Ogishima* (MSC 666) to MSC 680 only:** 2 Mitsubishi 6NMU-TAI diesels, 1.03 MW (1,400 hp(m)).
Shafts: 2

FURTHER INFORMATION

PROGRAMME

The first of these MCMVs was ordered in 1976 and the last two authorised in FY94, a very lengthy programme. There have been numerous minor changes as the series has progressed, but major changes from *Uwajima* (MSC 672) onwards caused this and later ships to be designated the 'Uwajima' class. For all practical purposes, however, they form one class.

DESIGN

These are typical, wooden-hulled MCMVs, similar in design and size to those constructed by numerous other navies. From *Awashima* (MSC 670) onwards the hull has been lengthened by 2.7 m (8.86 ft) in order to improve the sleeping accommodation from three tier to two tier bunks.

Numerous changes have been incorporated in the series as the programme has progressed:

MSC 666 onwards. Improved type of diesel engine.
MSC 670 onwards. Length increased by 2.7 m (8.86 ft)
MSC 672 onwards. ZQS-3 minehunting sonar.
MSC 672 onwards. S-7 mine detonating equipment.
MSC 674 onwards. OPS-39 radar

DEPLOYMENT

The JMSDF formed the 'Minesweeper Squadron' to deploy to the Gulf in 1991. Somewhat surprisingly the squadron was made up of four ships of the first series (MSC 668, MSC 669, MSC 670 and MSC 671) rather than the 'Uwajima' (MSC 672) class ships.

Three of the earliest vessels of the class have already been paid off and more will follow.

MINE COUNTERMEASURES SYSTEMS

AN/SLQ-48(V)2 mine neutralisation system (MNS)

The AN/SLQ-48 ROV(V)2 Mine Neutralisation System (MNS) is centred on the remotely operated vehicle (ROV). The system is designed to detect, locate, classify and neutralise moored and bottom mines, using high-resolution sonar, low-light level TV, cable cutters and mine destruction charges.

The ROV operates at the end of a 1,066 m (3,000 ft) umbilical, which carries power cables from the ship, together with datalinks for the control systems and sensors. The ROV is powered by two 12 hp motors and two side thrusters, giving it a forward speed of 6 knots. Onboard equipment includes a high-definition sonar, a low-light TV for examining objects, cable cutters and an explosive charge for destroying a mine. There is also a tracking transponder to enable the parent ship to track the ROV.

Initial target detection and vehicle guidance information is provided by the ship's AN/SQQ-32 variable depth minehunting sonar. Initial vehicle navigation is plotted and monitored within the MNS acoustic tracking system, with the ROV's onboard sonar being used during the mid-course search and final homing phases; its high resolution enables operations in poor visibility by sonar guidance alone. Low-light TV is used in conjunction with sonar during the precision guidance phase near the target.

Specifications
(AN/SLQ-48(V)2 ROV)
Length: 3.8 m (12.47 ft)
Width: 0.9 m (2.95 ft)
Height: 1.2 m (3.94 ft)
Speed: 6 kts
Vehicle weight: 1,247 kg (2,749 lb) (in air)
Propulsion: Hydraulic, twin 15 hp
Thrusters: Horizontal/vertical/lateral
Cable length: 1,066 m (3,000 ft)
Power requirements: 43 kVA

Manufacturer/Contractor
Alliant Techsystems, USA.

MINESWEEPING

The Type S-8 deep sea moored minesweeping system is carried.

CLEARANCE DIVERS

Four clearance divers are carried.

MINEHUNTING SONAR

AN/SQQ-32

AN/SQQ-32 consists of two separate sonars: a search sonar for initial detection; and a high-frequency, high-resolution sonar for target classification. The detection sonar, designed and manufactured by Raytheon, detects mines and mine-like objects over a wide range of distances and bottom conditions, and the system incorporates a computer-aided detection facility to enable the sonar operator to discard the latter. Raytheon also provides the computer facilities and display consoles and is responsible for overall system integration.

The classification sonar, designed and produced by Thomson-CSF, is based on its experience with the DUBM 21 and TSM 2022 minehunting sonars. The classification sonar provides very high-resolution transmission and reception of underwater signals to enable targets to be seen with near-picture quality.

AN/SQQ-32 has two identical operator consoles with high-resolution displays. Search and classification data can be displayed simultaneously or independently. Automated detection and control functions are performed by two AN/UYK-44 computers.

The sonars are mounted in a cylindrical towed body which is housed in a well under the forward part of the ship. The sensors can, however, also be operated from the housed position when in shallow water. Search frequency is 35 kHz and classification frequency 445-650 kHz.

Manufacturers/Contractors
Raytheon, Portsmouth, Rhode Island, USA (prime).
Thomson-CSF, Sophia Antipolis Cedex, France (sonar).

WEAPONS SYSTEMS

GUNS

JM-61 20 mm/76 Sea Vulcan

The Sea Vulcan 20P/JM 61MB is essentially an M-197 gun on the mounting of the old 20 mm single US Navy Oerlikon Mk 10. A battery attached to the base of the mounting provides the power for up to 6,000 rounds and the working circle is 279.5 cm (110 in). The JM 61MB features two shoulder stocks compared with the two pistol grips of the Sea Vulcan 20P. This mounting provides convenient room for the installation of the 300-round ammunition can behind the right-hand shield, the battery and control box being mounted behind the other half. Twenty complements of ammunition can be fired without battery recharging; the battery conveniently can be connected to a main power source to provide a 28 V trickle feed, thus maintaining the battery in a charged condition.

COMMAND AND CONTROL SYSTEMS

RADAR

Fujitsu OPS-39

I-band surface search radar.

Manufacturer/Contractor

Fujitsu, Japan.

PROPULSION

Specifications

System: Diesel

Main machinery: 2 Mitsubishi 6NMU-TAI diesels; 1.76 MW (2,400 hp(m))

Shafts: 2

Bow thruster: 1 hydrojet bow thruster; 257 kW (350 hp(m))

FURTHER INFORMATION

PROGRAMME

The first two were approved in the 1989 estimates, followed by the third in the 1990 estimates. It was understood at one time that it was intended to build at least six, but the programme has been terminated with the third, indicating a possibility of some dissatisfaction with some elements of the design.

DESIGN

The ships have GRP-sheathed wooden hulls and, as frequently happens with JMSDF ships, they are very similar in design and size to their contemporaries in the US Navy, in this case the 'Avenger' class.

They are fitted with the Type S-7 deep sea minehunting system and the Type S-8 deep sea moored minesweeping equipment. An integrated tactical system is also fitted.

SHIPS

MSC 681, MSC 682

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

ADI Mini-Dyad

It is reported that these ships will carry the mini-Dyad influence sweep, an emulation sweep developed in Australia. This is a modular, distributed dipolar system, based on combinations of positive buoyant permanent magnets (Dyads) and water-driven acoustic generators. The latter produce a ship-like acoustic signature in the low, audible and HF ranges. The mini-Dyads are designed to emulate degaussed and undegaussed ships of various sizes up to approximately 100,000 t dwt.

Manufacturer/Contractor
ADI, Australia.

MINEHUNTING

PAP Mk 5 ROV

The Japanese MCMs will carry two PAP Mk 5 (PAP = *poisson auto-propulsé*) ROVs, which have the capability simultaneously to hunt and destroy ground mines and tethered mines either by placing and remotely detonating a charge or by cutting the mooring rope of tethered mines. The vehicle is powered by onboard batteries, but is guided from a control console in the operations centre, with signals being passed via either a tether, which can be either a 2,000 m (6,562 ft) fibre optic cable or a 1,000 m (3,281 ft) coaxial cable. It is horizontally propelled by means of two side thrusters.

In the bottom-following mode a constant altitude can be achieved by instructing the vehicle to deploy a 'guide-rope'. The winch in the PAP is instructed to deploy a selected length of rope and the operator then uses return signals from the vehicle to maintain the vehicle at the desired selected height; limits are 2 m (6.56 ft) minimum and 8 m (25.25 ft) maximum.

The PAP Mk 5 is able to carry the 126 kg (277 lb) charge necessary to ensure the total destruction of a mine. Cutters can be carried with the charge. The front section of the vehicle carries a sonar, either a high-resolution nearfield sonar or a mid-range relocation sonar. Identification is carried out by a tiltable low-light TV camera and/or by a tiltable colour TV camera. Vertical thrusters are used to achieve mid-water navigation. Alternative payloads include: explosive charges, cutters (frontal, lateral mechanical and lateral explosive) and a manipulator with a variety of tools.

Specifications
(PAP Mk 5)
Length: 3 m (9.8 ft)
Diameter: 1.2 m (3.9 ft)
Height: 1.3 m (4.2 ft)
Performance:
Max vehicle velocity
mid-water transit: 6 kts (3 m/s)
bottom-following mode: 5.5 kts (2.75 m/s)
Vehicle incidence: ±20° (max)
Vertical velocity with charge: 0.7 m/s (2.3 ft/s)
Ascent velocity (charge released): 1.5 m/s (4.9 ft/s)
Payload:
NATO charge: 100 kg (220 lb)
Small charge: 30 kg (66 lb)
Horizontal range:
with fibre optic cable: 2,000 m (6,562 ft)
with coaxial cable: 1,000 m (3,281 ft)
Max continuous endurance: 2 h (depending on type of mission)
Max operating depth: 300 m (984 ft)
Watertight integrity: 36 bars

Manufacturer/Contractor
Société ECA, 92707 Colombes, France.

MINEHUNTING SONAR

GEC-Marconi Type 2093

The Type 2093 sonar is designed to operate in either hull-mounted or variable depth mode, deployed through the ship's centre well, and will detect, localise and classify all current and future mine threats. Total system weight is 13,000 kg (28,650 lb). The variable depth, dual-frequency search and dual-frequency classification capability provides a sonar able to operate under all bottom and sea conditions at a range claimed to be twice that of hull-mounted sonar and with an increase of three times detection depth.

The towed body of the 2093 is cylindrical with hemispherical ends. The sonar arrays within the body consist of two 360° rings for LF and VLF operation, hydrophones for HF and VHF reception, and separate HF and VHF projectors. Below is a cylindrical VLF projector and finally a VLF depth sounder. LF and VLF are used for search, survey and moored mine classification; HF and VHF for classification and survey.

Sonar 2093 employs multiple operating modes which offer the MCM commander a choice of operational configurations to match the prevailing threat and environment. These multiple operating modes comprise VLF and LF search and moored mine classification, VLF and LF search, search and ground mine classification, also search and route survey. Sonar 2093 can combine these modes to enable concurrent operation.

Manufacturer/Contractor
GEC-Marconi, UK.

WEAPONS SYSTEMS

GUNS

JM-61 20 mm/76 Sea Vulcan

The Sea Vulcan 20P/JM 61MB is essentially an M-197 gun on the mounting of the old 20 mm single US Navy Oerlikon Mk 10. A battery attached to the base of the mounting provides the power for up to 6,000 rounds and the working circle is 279.5 cm (110 in). The JM 61MB features two shoulder stocks compared with the two pistol grips of the Sea Vulcan 20P. This mounting provides convenient room for the installation of the 300-round ammunition can behind the right-hand shield, the battery and control box being mounted behind the other half. Twenty complements of ammunition can be fired without battery recharging; the battery conveniently can be connected to a main power source to provide a 28 V trickle feed, thus maintaining the battery in a charged condition.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

GEC-Marconi/NEC NAUTIS M

The NAUTIS-M for the Japanese MSC is likely to be based on the three-console system, which has already been selected by the UK Royal Navy, Royal Saudi Navy and the US Navy. The system provides support for operational planning, ship control guidance, underwater and surface picture compilation, command and control for mine disposal together with a real-time MCM database.

Manufacturers/Contractors

GEC-Marconi, UK.
NEC Corporation, Japan.

RADAR

Furuno OPS-39

OPS-39 is a Japanese-designed, I-band, surface search and navigation radar.

Manufacturer/Contractor

Furuno, Japan.

PROPULSION

Specifications

System: Diesel
Main machinery: 2 diesels, 1.33 MW (1,800 hp(m))
Shafts: 2

FURTHER INFORMATION

The first pair was authorised in FY95, followed by the third in FY96. The hull is similar to the 'Uwajima' class, but the upper deck is extended aft to provide greater stowage for mine disposal gear, and there are twin funnels. Some reports suggest that this class is for comparison with the US sonar and data system in the 'Yaeyama' class.

SWALLOW

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

The only known sweep equipment is a single-sweep mechanical gear which is deployed at 8 knots.

MINEHUNTING

Gaymarine Pluto ROV

Pluto is available in three configurations: battery-powered with a 6 mm, 500 m (1,640 ft) long umbilical cable; battery-powered with a 3 mm, 2,000 m (6,560 ft) long fibre optic umbilical cable; or remotely powered, unlimited endurance with 8 mm, 500 m (1,640 ft) long umbilical cable. The vehicle is powered by five thrusters: two horizontal for forward/reverse, two vertical for vertical and lateral shift, and a transversal thruster. The thrusters are controlled by two joysticks. The vehicle can maintain automatic depth control within ±10 cm (4 in). Maximum speed forwards is 4 knots and vertical speed 1 knot. Sensors are mounted in the forward tiltable section of the vehicle. Optional equipment includes black and white LLTV, colour TV or still-camera, search or scanning sonar, acoustic pinger, strobe flash, measuring instruments, manipulators and so on. There are 10 free channels for remote control and two four-digit telemetry channels for measurements. The console incorporates a 9 in TV monitor for display of information showing TV image, depth, compass, head tilt angle, elapsed time and sonar diagram. All displayed data can be video recorded.

Specifications

Length: 1,680 mm (66 in)
Width: 600 mm (23.6 in)
Height: 630 mm (24.8 in)
Weight: 160 kg (353 lb)
Service depth: 400 m (1,312 ft)
Payload: 15 kg (33 lb)

Manufacturer/Contractor

Gaymarine, Italy.

MINEHUNTING SONAR

GEC-Marconi Type 193M Mod 1

Type 193M Mod 1 is a British hull-mounted, short-range, high-definition, sector-scanning sonar, operating at two frequencies, providing detection and classification of both moored and ground mines. The sonar provides both bearing and range data; the fine range and bearing resolution enable the operator to assess accurately the shape of a target and hence its nature. Since the resolution depends both on operating frequency and pulse length, two selectable frequencies are provided, with a choice of pulse lengths in the classification mode.

Range and bearing data appear on two displays: in the search mode one display shows the total range covered; in the classification mode, a 27 m (30 yd) section of the search display is expanded to fill the second display screen and permit close examination of the target. Two frequencies are employed by the 193M sonar: 100 kHz for long-range search and 300 kHz for short-range search and classification. The transducers for these signals are carried beneath the ship on a stabilised, steerable mounting, the whole assembly contained within a dome.

Manufacturer/Contractor

GEC-Marconi Sonar Systems, UK.

WEAPONS SYSTEMS

GUNS

Oerlikon 20 mm cannon in US Mk 10 mount

Specifications

Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range:
anti-surface: 1.5 km
anti-air: 1,150 m (1,476 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g
Elevation: −15 to +90°

7.62 mm machine guns

Two per ship.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Racal-Decca MAINS 500

MAINS (Minehunting Action Information and Hunting System) provides the following main functions: accurate navigation; ship control; guidance; integration of minehunting sonar; combined surface/subsurface tactical display; automatic hard-copy tactical plot with detailed data printout; patrol navigation/combat information operating characteristics as an optional second role.

'Own ship' position is fixed using one or more high-accuracy radio and microwave ranging systems such as the Racal Hi-Fix 6 or Hyperfix, or the portable line of sight Trisponder with a range of 80 km. Other navaids include the statutory navigational radar which has sufficient resolution to track marker buoys, Satnav, Decca, Loran C, the Doppler sonar, gyrocompass, and conventional EM or Doppler/acoustic log.

The MAINS computer can also be used for ship control and steering guidance. An automatic plotter and printer provides a hard-copy record of operations necessary for subsequent operations covering the same area.

The interactive PPI display is the Racal ED1202 which combines both radar surface situation and own vessel position relative to sonar search plan together with underwater contacts as a single presentation. The displayed picture has multilevel brilliance and correlated data and is presented in alphanumeric form.

Manufacturer/Contractor
Racal, UK.

RADAR

Raytheon
One Raytheon surface search/navigation radar; model not known.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU diesels, 1.5 MW (2,040 hp(m)) sustained

Propellers: 2 Voith-Schneider cycloidal propulsion units
Thruster: 1 bow thruster, 75 kW (102 hp(m))

FURTHER INFORMATION

PROGRAMME

The first of class was delivered at the end of 1986 for trials. A further two, incorporating some modifications, were ordered in 1988, followed by three more in 1990. There were reports in 1992 of two more being ordered but this is not confirmed and no more ships have been reported.

It is more likely that a follow-on class will be built, which will be larger, have a variable depth sonar and be equipped with a fully integrated minehunting system.

DESIGN

This design bears a certain resemblance both physically and dimensionally to the Italian 'Lerici' class, but is officially stated to be an independent design developed by the Kangnam Corporation in South Korea.

MODERNISATION

GEC-Marconi tactical minehunting system may be fitted in due course.

MINE COUNTERMEASURES SYSTEMS

MISSION CONTROL

MICOS

MICOS (MIssion COntrol System) is a Norwegian integrated mission control system which can be configured for either minehunting or minesweeping. It is an open architecture design with a high COTS content. There are two configurations:

- **'Oksøy' class minehunters:** an integrated bridge system; an MCM command and control system; the sonar system; and an ROV and mine disposal system.
- **'Alta' class minesweepers:** an integrated bridge system; an MCM command and control system in the operations room; the sonar system; interfaces to the sweep gear.

The integrated bridge system comprises a Simrad ADP 701 navigation and dynamic positioning system for high-precision navigation and automatic control of the vessel, and a Norcontrol DB 2000 officer-of-the-watch ARPA system for surface surveillance.

The MCM command and control system comprises two Simrad ATC 900 multifunction tactical consoles, two operator consoles for the Simrad/Thomson Sintra TSM 2023 detection and classification minehunting sonars and a control console for the ROV operator. The system components are all integrated via a dual-redundant Ethernet LAN.

The command and control system has a wide range of functions for planning, operation, reporting and documentation of an MCM mission. The system comprises a database containing 2D electronic charts, 3D bottom terrain models, previous observations of bottom objects, navigation routes and so on. Also available are functions for performing MCM calculations for coverage and system performance analysis, including updating of the MCM database.

The Dynamic Positioning (DP) system is based on Simrad's ADP 701 which is in service with a great number of offshore vessels. It includes functions for automatic control of the vessel comprising a full 3-axis manual mode, autopilot (for transit), hovering mode, auto-track and auto-sail modes. The two latter modes are used to steer the vessel automatically on a planned course with minimum cross-track error. The DP system is interfaced to the sweep gear for automatic calculation of the gear's position and coverage and for measuring and counteracting the forces induced by the gear on the vessel.

Manufacturer/Contractor
Simrad Subsea A/S, Norway

MINESWEEPING

The minesweeping version, ('Alta' class) is fitted with an A-frame to deploy the various sweeps. The sweeps include mechanical, acoustic and magnetic types.

MINEHUNTING

Gaymarine Pluto ROV

Pluto is available in three configurations: battery-powered with a 6 mm, 500 m (1,640 ft) long umbilical cable; battery-powered with a 3 mm, 2,000 m (6,560 ft) long fibre optic umbilical cable; or remotely powered, unlimited endurance with 8 mm, 500 m (1,640 ft) long umbilical cable. The vehicle is powered by five thrusters: two horizontal for forward/reverse, two vertical for vertical and lateral shift, and a transversal thruster. The thrusters are controlled by two joysticks. The vehicle can maintain automatic depth control within ±10 cm. Maximum speed forwards is 4 knots and vertical speed 1 knot. Sensors are mounted in the forward tiltable section of the vehicle. Optional equipment includes black and white LLTV, colour TV or still-camera, search or scanning sonar, acoustic pinger, strobe flash, measuring instruments, manipulators and so on. There are 10 free channels for remote control and two four-digit telemetry channels for measurements. The console incorporates a 9 in TV monitor for display of information showing TV image, depth, compass, head tilt angle, elapsed time and sonar diagram. All displayed data can be video recorded.

Specifications
Length: 1,680 mm (66 in)
Width: 600 mm (23.6 in)
Height: 630 mm (24.8 in)
Weight: 160 kg (353 lb)
Service depth: 400 m (1,312 ft)
Payload: 15 kg (33 lb)

Manufacturer/Contractor
Gaymarine, Italy.

MINEHUNTING SONARS

Thomson-CSF TSM 2023N

The TSM 2023 minehunting sonar has been developed by Thomson-CSF as the main contractor with Simrad Subsea as subcontractor responsible for the detection sonar. The TSM 2023 performs mine detection and classification simultaneously, and comprises:

- a detection sonar which covers a bearing sector of 90° electronically steerable through 360°
- a classification sonar which can perform shadow analysis at three different frequencies. The three different frequencies allow the beam resolution and bearing sector to be adjusted according to the size of the detected object
- two sonar consoles, one for detection, one for classification, equipped with CAD and CAC processing and a performance indicator.

Manufacturer/Contractor
Thomson Sintra Activités Sous-Marines.

Simrad SA 950

Minesweepers only. SA 950 is a mine-detection and mine-avoidance sonar developed specifically for the 'Alta' classs minesweepers. It uses a retractable hull-mounted transducer, operationg at 95 kHz.

Manufacturer/Contractor
Simrad Subsea A/S, Norway.

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

Mistral

One Sadral twin launcher for IR-homing missiles. Sadral is a remotely operated system on a two-axis stabilised mount for six launcher-containers and a closed-circuit television camera.

Specifications
Length: 1.81 m (6.0 ft)
Diameter: 9.2 cm (3.6 in)
Wing span: 1.9 cm (0.7 in)
Weight: 18.4 kg (40.5 lb)
Speed: Mach 2.6
Range: 700 m to 5 km (2,296 to 16,400 ft)

Manufacturer/Contractor
Matra, France.

GUNS

20 mm KV-SV-20

One or two per ship. KV-SV-20 is a low-cost, light calibre weapon, for use against enemy attack craft in confined waters, which is derived from the single-barrelled Rh 202 which had been produced by Kongsberg as FK 20-2.

Specifications
Calibre: 20 mm
Length of barrel: 85 calibres
Muzzle velocity: 1,050-1,250 m/s (3,445-4,101 ft/s)
Rate of fire: 800-1,000 rds/min
Traverse: 360°
Elevation: −15 to +70°
Mounting weight: 418 kg (921.5 lb) (loaded)
Crew: 1-2
Range: 1 n mile (2 km)

Manufacturer/Contractor
Rheinmetall, Germany.

M2HB 12.7 mm machine guns

Two M2HB are carried. This is a selective short recoil automatic operation weapon with a 1,143 mm (45 in) long barrel.

Specifications
Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

COMMAND AND CONTROL SYSTEMS

RADARS

Racal-Decca RN-80

I-band navigation radar.

Racal-Decca surface search

There is a single Racal-Decca surface seach radar.

OTHER EQUIPMENT

Other MCM equipment includes:
Simrad Albatross tactical system including mapping
Cast/Del Norte mobile positioning system with GPS.
Two-man diver's decompression chamber

PROPULSION

Specifications
System: Diesel
Main machinery:
propulsion: 2 MTU 12V 396 TE84 diesels, 2.72 MW (3,700 hp(m)) sustained; 2 Kvaerner Eureka water-jets
lift: 2 MTU 8V 396 TE54 diesels, 1.28 MW (1,740 hp(m)/60Hz) sustained

---

FURTHER INFORMATION

PROGRAMME

Orders for nine were placed with Kvaerner on 9 November 1989, of which four are minehunters ('Oksøy' class), and five minesweepers ('Alta' class). An option on a tenth of class will not be taken up.

DESIGN

The design of these unique MCMVs was developed by the Norwegian Navy in consultation with the Defence Research Institute and Norsk Veritas. It uses an air cushion created by the surface effect between two hulls. The hull is built of Fibre-Reinforced Plastics (FRP) in sandwich configuration. All machinery is mounted on the maindeck, which reduces the ship's acoustic signature.

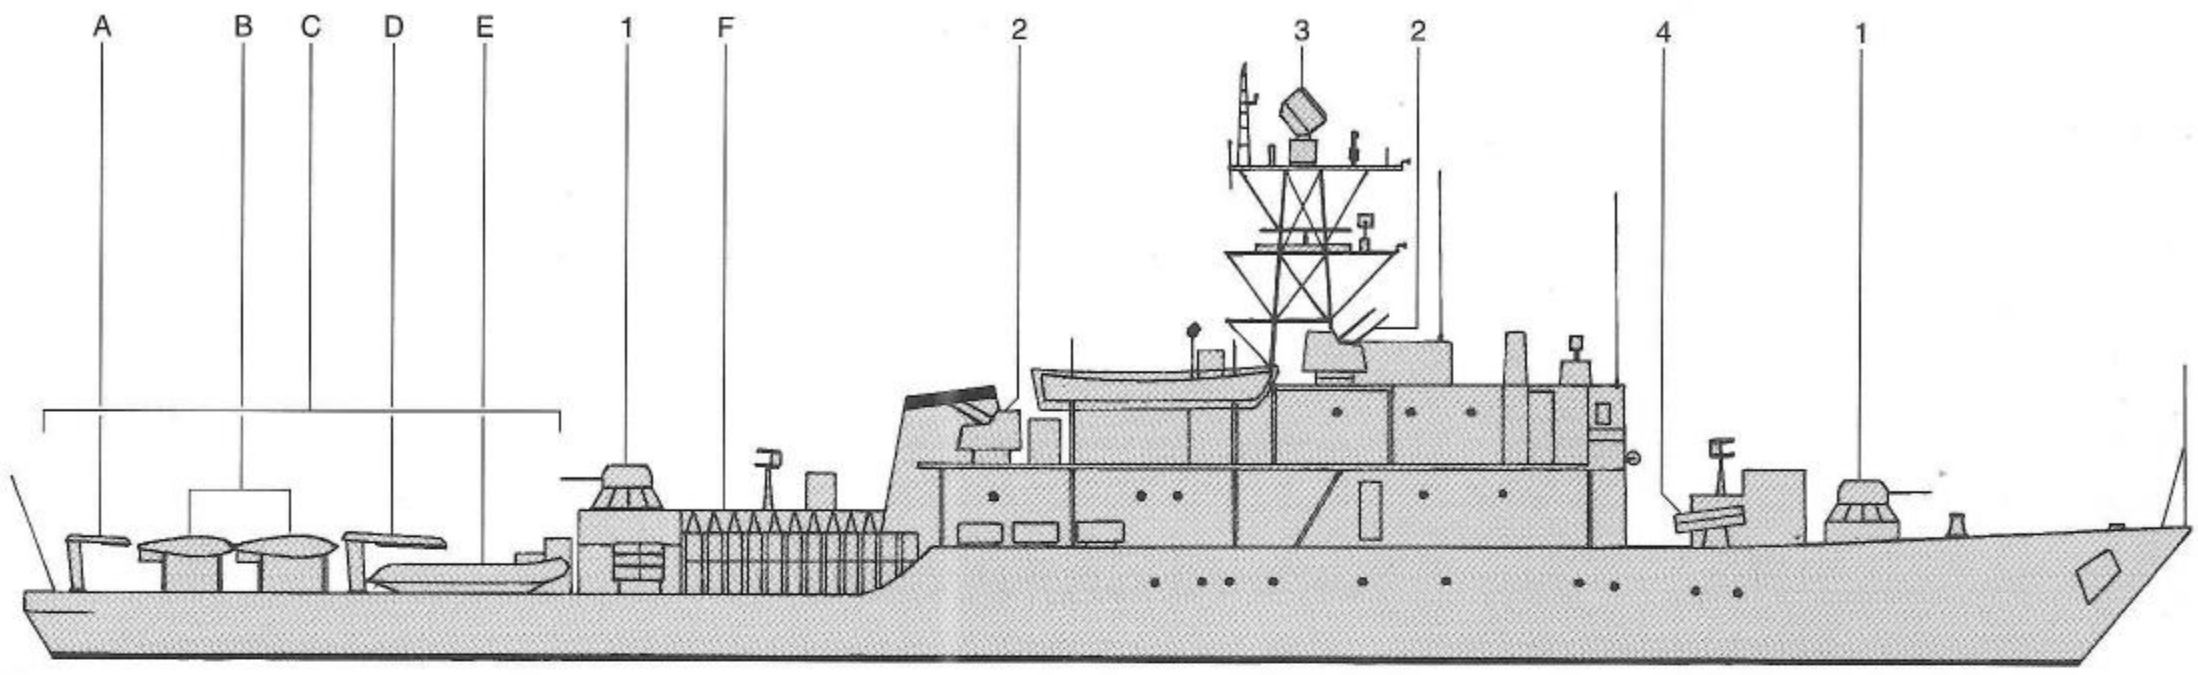
The unique design is the result of a requirement which stresses maximum transit speed between MCM operations along the long Norwegian coastline. The catamaran design also reduces water disturbance and magnetic and acoustic signatures, while also enhancing sonar response and shock resistance. There is also a large deck area, especially aft; an important consideration in an MCMV.

The SAM launcher is mounted forward of the bridge. The catamaran design is claimed to give higher transit speeds with lesser installed power than a traditional hull design. Other advantages are lower magnetic and acoustic signatures, more comfortable motion, clearer water for sonar operations, and less susceptibility to shock.

First of class, Oksøy *(M 340). These new Norwegian surface-effect ships represent a totally new approach to the MCMV requirement. Their high speed enables them to move very rapidly from one MCM operation to another* (Kvaerner Mandal)

The ROVs are carried in a large hangar and are launched by two hydraulic cranes. The minesweeper has an A-frame aft for the sweep gear.

MUSCA



'Musca' class (Ian Sturton)
MCM A *Sweep davit (2)* **B** *Oropesa floats* **C** *Sweep deck* **D** *Davit* **E** *Divers' boat* **F** *Swept-channel markers*

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

Details of the minesweeping equipment cannot be confirmed but they appear to carry mechanical sweeps, and may also be equipped with acoustic and magnetic sweeps. They are probably of Russian design.

These ships have a particularly long sweep deck, and one slightly unusual feature is the large number of swept-channel markers (dan buoys).

MINEHUNTING SONARS

These ships are fitted with hull-mounted, active, high-frequency, minehunting sonar.

WEAPONS SYSTEMS

30 mm/65 AK 230

There are two twin 30 mm AK-230 mounts; one on the foredeck, the second aft.

Specifications

NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,444 ft/s)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,120 ft)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to + 87° at 50°/s
Mounting weight: 1,857-1,905 kg (4,094-4,200 lb)
Crew: 2 (off mount)

Ammunition
BR-83
Type: Armour-piercing tracer
Weight (complete round): 1.47 kg (3.24 lb)
Weight (projectile): 0.35 kg (0.77 lb)

OF-83D
Type: High explosive
Weight (complete round): 1.40 kg (3.08 lb)
Projectile: 0.27 kg (0.59 lb)
Explosive: 30 g (A-XI-2)

ASW MORTARS

RBU 1200

There are two five-tube RBU-1200s, sited on the foredeck. The tubes cannot be trained and have a maximum elevation of +65°. Each tube has a diameter of 250 mm, is 1.4 m (4.6 ft) long and is reloaded manually. The 70 kg (154 lb) RGB-12 rocket has a 34 kg (75 lb) warhead and a range of about 0.8 n miles (1.48 km).

MACHINE GUNS

There are four quad 14.5 mm machine gun mountings.

COMMAND AND CONTROL SYSTEMS

RADARS

Krivach
There is one I-band, Krivach, surface search/navigation radar.

Drum Tilt
The ship carries one Drum Tilt H/I-band fire-control radar, which is mounted at the masthead. The cylindrical radar is permanently tilted upwards at 30° and approximate ranges are reported to be: acquisition 21.6 n miles (40 km); tracking 12.4 n miles (23 km). Russian name is *Rys*.

PROPULSION

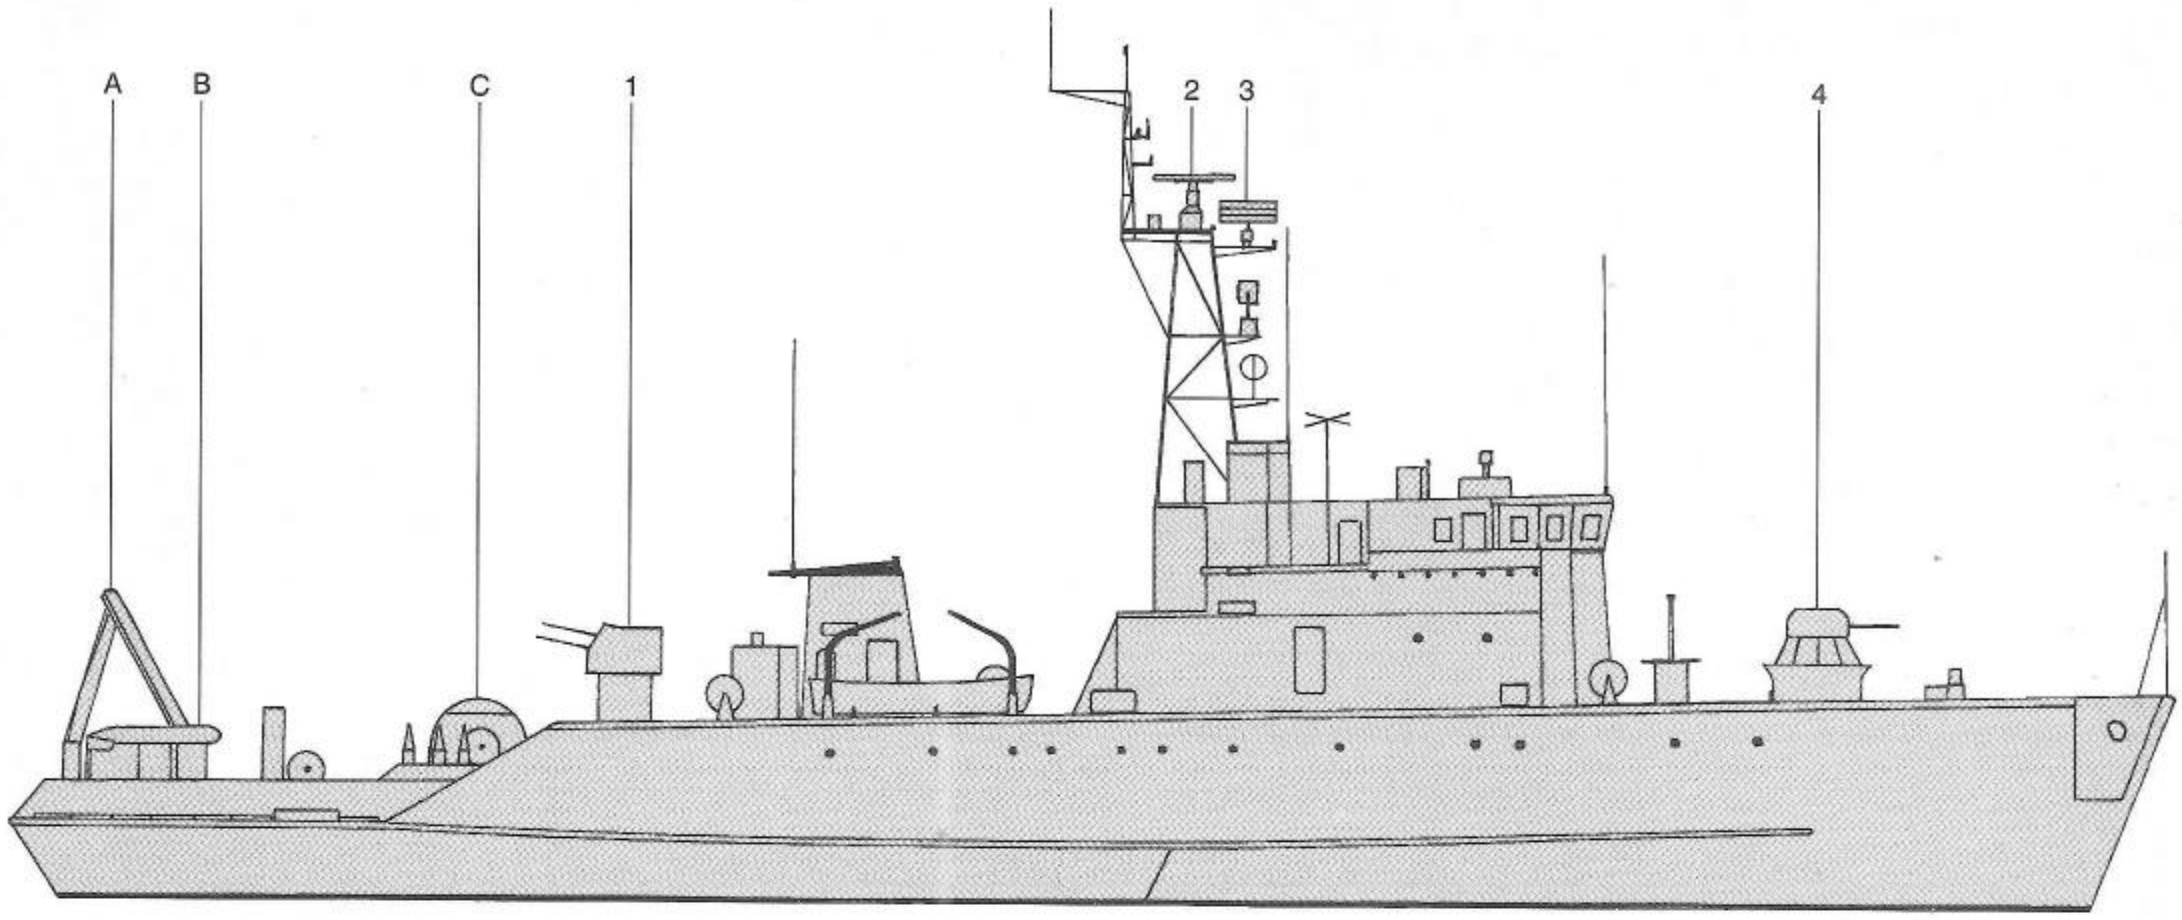
Specifications
System: Diesel
Main machinery: 2 diesels; 3.5 MW (4,800 hp(m))
Shafts: 2

FURTHER INFORMATION

These four ships were part of the Romanian fleet expansion during the 1980s and were built at the same time as the 'Cosar' class minelayers. They are steel-hulled and appear to be conventional sweepers.

As the Romanian Navy has used either Russian ships or built its own ships based on Russian naval ideas, it would be surprising if these ships did not have two mine rails, to enable them to lay mines at the start of a conflict. It also seems likely that, as with most other small surface combatants, they will include in their armament at least one SA-N-5 'Grail' SAM launcher.

SONYA (TYPE 1265/1265M)



'Sonya' class (later Russian Navy version) (Ian Sturton)
MCM A *Swan-neck crane* **B** *Floats* **C** *Main winch*

General 1 *2-M-3 twin 25 mm/80* **2** *Don-2 navigation radar* **3** *Square Head IFF (two)* **4** *AK-630 twin 30 mm*

GENERAL SPECIFICATIONS

Operator: Russia
Type: Coastal minehunter/sweeper

Class: SONYA

National designation: *bazovy tralshchik* (base minesweeper)

Built: 72
Active: 62

Displacement:
standard: 430 t
full load: 450 t

Dimensions
Length: 48 m (157.4 ft)

Beam: 8.8 m (28.9 ft)
Draught: 2 m (6.6 ft)

Speed: 15 kts
Range: 3,000 n miles at 10 kts

Complement: 43

SHIPS

72 were built for the Russian Navy between 1971 and 1991.

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

Russian minesweeping gear to be found in the 'Sonya' class MCMV includes:

- Mechanical sweep. One set per ship.
- Acoustic sweep. One set per ship. A low-frequency 'fish' can be seen on the quarterdeck of most Sonyas.
- Magnetic sweep. One set per ship.

Deck gear includes:

- A single davit with 2,250 kg (4,960 lb) capacity and jib reach of 4.73 m (15.5 ft)
- A drum winch for contact and acoustic sweeps.
- Cable reel for the magnetic sweep.

MINEHUNTING SONAR

MG 69/79
A hull-mounted, high-frequency, active minehunting sonar.

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

Igla-1 (SA-N-5 Grail)
Some ships carry the Igla-1 system using the Strela 2 9M43M missile (NATO = SA-N-5), which is housed in a glass fibre launcher-container; these ships carry a total of 18 missiles. The missile has an uncooled lead sulphide infra-red seeker, operating in the 1.7 to 2.8 µm range and with a spinning reticle, centre-null tracking system with a 1.9° field of view. On acquiring the target the operator activates the thermal battery and when the seeker has acquired the target an audio signal is received telling the operator to take the first pressure on the trigger and activate the missile gyros which warm up in four to six seconds. The operator uses stadia reference marks in the optical sight to compute the lead angle to the target and then takes the second pressure on the trigger to launch the missile. The booster burns for 0.05 seconds to eject the missile from the launch tube at a speed of 28 m/s (91.8 ft/s) and spin it up and then, at a distance of 6 m (19.6 ft), the sustainer ignites and the trailing fins pop out. The missile homes on the 'hottest' part of the target and has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead. In Strela 2M the warhead has improved fragmentation uniformity.

Specifications
Length: 1.45 m (4.75 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (22 lb)

Speed: Mach 1.7
Range:
anti-surface: 2.6 n miles (4.8 km)
anti-air: 18-4,500 m (59-14,764 ft)

Manufacturer/Contractor
Fakel, Russia.

GUNS

Earlier units have two twin AK-230 30 mm/65, with two twin 25 mm guns. Later units have two AK-630 30 mm Gatling, but neither 25 mm guns nor Drum Tilt radar.

30 mm/65 AK 230

Specifications
NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,445 ft/s)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,120 ft)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s
Mounting weight: 1,857-1,905 kg (4,094-4,200 lb)
Crew: 2 (off mount)

Ammunition
BR-83

Type: High explosive
Weight (complete round): 1.40 kg (3.0 lb)
Projectile: 0.27 kg (0.6 lb)
Explosive: 30 g (A-XI-2)

30mm AK-630

Specifications
Calibre: 30 mm
Length of barrel: 65 calibres
Number of barrels: 6
Muzzle velocity: 890 m/s (2,920 ft/s)
Traverse: 360° (depending on location of turret) at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range:
radar fire control: 4,000 m (13,120 ft)
electro-optic fire control: 5,000 m (16,400 ft)
Rate of fire: 4,000-5,000 rds/min
Ammunition:
round: 1.224 kg (2.7 lb)
projectile weight:
UOF-84: 384 g
UOR-84: 388 g

25 mm/80 2-M-3

Specifications
2-M-3
Calibre: 25 mm
Length of barrel: 60 calibres
Traverse: 360°at 25°/s
Elevation: −10 to +85°at 15°/s
Rates of fire: 450 rds/min/barrel
Projectile: 0.28 kg (0.6 lb) HEI-T
Range:
anti-surface: 1.5 n miles (2.75 km)
anti-air: 2,800 m (9,184 ft)

25 mm/60 (2-M-3)

MINES

Eight mines are carried.

COMMAND AND CONTROL SYSTEMS

RADAR

Don 2/Kivach/Nayada
I-band surface search/navigation radars.

IFF
Square Head (2 per ship)
High Pole B.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Kolomna Type 9-D-8 diesels; 1.47 MW (2,000 hp(m)) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME

This class was first reported in 1973 and was built at a rate of about two per year over a period of some 20 years in two yards (one in St Petersburg, the other at Vladivostok). The last was commissioned in January 1995.

DESIGN

The Sonya is a conventional minesweeper with a wooden hull and a GRP sheath. There are minor differences in the armament, with some having two twin 30 mm Gatling guns, others one 30 mm/65 (twin) plus one 25 mm (twin). An unusual feature is that the AK-630 installation is not accompanied by the Drum Tilt fire-control system.

Deployment
Current deployment is:
Pacific Fleet — 28
Northern Fleet — 10
Baltic Fleet — 15
Black Sea Fleet — 4
Caspian Fleet — 3 (shared with Azerbaijan)
Early models are being scrapped.

Sales
Sales comprise:
Bulgaria — 4 (1981-85)
Cuba — 4 (1980-85)
Syria — 1 (1986)
Vietnam — 4 (1987-1990)
Ethiopia — 1 (1991)

MINESWEEPING

Russian minesweeping gear to be found in the 'Sonya' class MCMV includes:

- Mechanical sweep. One set per ship.
- Acoustic sweep. One set per ship. A low-frequency 'fish' can be seen on the quarterdeck of most Natyas.
- Magnetic sweep. One set per ship.

Deck gear includes:

- A single davit with 2,250 kg (4,960 lb) capacity and jib reach of 4.73 m (15.5 ft)
- A drum winch for contact and acoustic sweeps.
- Cable reel for the magnetic sweep.

MINEHUNTING SONARS

MG 69/79
A hull-mounted, high-frequency, active minehunting sonar.

WEAPONS SYSTEMS

GUNS

30 mm/65 AK 230
Bulgarian Sonyas are armed with two twin 30 mm/65 mounts.

Specifications
NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,444 ft/s)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,120 ft)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s
Mounting weight: 1,857-1,905 kg (4,094-4,200 lb)
Crew: 2 (off mount)

Ammunition
BR-83
Type: Armour-piercing tracer
Weight (complete round): 1.47 kg (3.2 lb)
Weight (projectile): 0.35 kg (0.77 lb)

OF-83D
Type: High explosive
Weight (complete round): 1.40 kg (3.0 lb)
Projectile: 0.27 kg (0.6 lb)
Explosive: 30 g (A-XI-2)

MINES

Eight mines can be carried.

COMMAND AND CONTROL SYSTEMS

RADARS

Kivach
I-band surface search/navigation radar.

IFF
Square Head (two per ship)
High Pole B

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Kolomna Type 9-D-8 diesels; 1.47 MW (2,000 hp(m)) sustained
Shafts: 2

FURTHER INFORMATION

These are very similar to the Russian ships. They were transferred in 1981-84 and are all in service, based at Atiya.

532 (SONYA TYPE 1265)

GENERAL SPECIFICATIONS

Country of origin: Russia
Operator: Syria
Type: Coastal minehunter/sweeper (1265)

Class: SONYA

Acquired: 1
Active: 1

Displacement:
standard: 430 t
full load: 450 t

Dimensions
Length: 48 m (157.4 ft)
Beam: 8.8 m (28.9 ft)
Draught: 2 m (6.6 ft)

Speed: 15 kts
Range: 3,000 n miles at 10 kts

Complement: 43

FURTHER INFORMATION

These are standard, new-production ships. The first transferred from Russia on 16 February 1987, followed by the second in February 1988, the third in July 1989, and the fourth in March 1990.

T 43 (TYPE 254, 254A)

OVERVIEW

Several hundred of these ocean minesweepers were built in various yards in the (then) Soviet Union between 1948 and 1957. A further twelve were built in Poland ('Zubr' class, now deleted) and 21 were built in China between 1956 and 1966. In a surprising sequel to that, however, the Chinese shipyards restarted production of the T 43 in the mid-1980s with 20 or so being produced by 1996, and an export order for four has recently been placed by Bangladesh. If the type is still being built in China in two years' time it will have been in production for 40 years, which must be some sort of a record.

The type designation in the (then) Soviet Union was *morskoy tralshchik* (seagoing minesweeper) and they were given 'MK' pennant numbers, but the class was given the reporting designation 'T 43' by NATO, rather than a name.

As with other minesweepers the type has proved readily adaptable to other uses and a number of this class have been converted into radar pickets, diving ships, tenders and patrol ships.

Exports
A number was exported abroad:

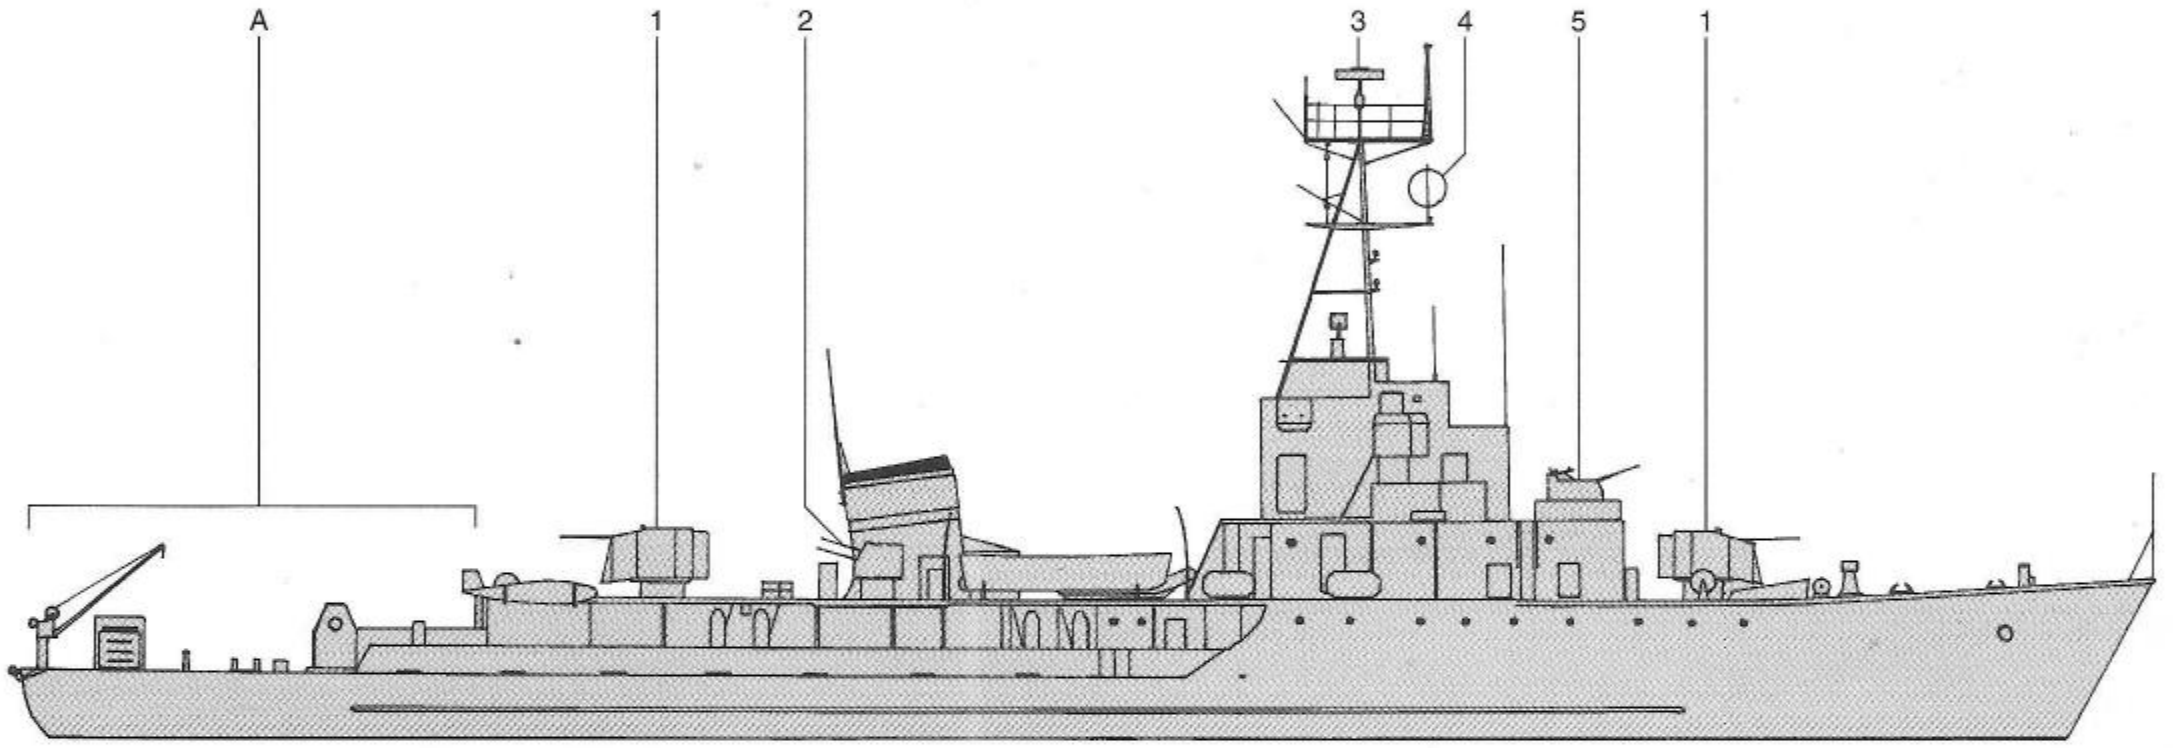
Algeria (two)
Albania (two)
Bulgaria (three)
China (four) (two later returned)
Egypt (seven)
Indonesia (six)
Iraq (two)
Syria (two)

Overseas construction

12 were built in Poland for the Polish Navy, one of which was converted to a radar picket in the late 1970s.

All have been stricken.

T 43 (TYPE 254)



T 43 (Type 254) (Ian Sturton)

MINEHUNTING SONAR

Stag Ear
Stag Ear is a hull-mounted, minehunting sonar derived from the Russian Tamir sonar, itself derived from British wartime searchlight sonars.

WEAPONS SYSTEMS

GUNS

37 mm/63 (W-11-M)
Two twins in open 'tub'-type mounts.

Specifications
Calibre: 37 mm
Length of barrel: 62.8 calibres

Muzzle velocity: 880 m/s (2,887 ft/s)
Traverse: 360°
Elevation: −10 to +85°
Traverse speed: 17°/s
Elevation speed: 13°/s
Rate of fire: 80 rds/min/barrel
Ammunition (projectile): 0.732 kg (1.6 lb)

Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 3,000 m (9,842 ft)
Crew: 3

14.5 mm machine guns
One or two twin heavy machine guns.

DEPTH CHARGES

Two projectors.

MINES

Sixteen mines can be carried.

COMMAND AND CONTROL SYSTEMS

RADARS

Ball End
Ball End is a 1950s-vintage surface search radar.

Specifications
Frequency: E/F-band (2,950-3,020 MHz)
Beam: 7°
Peak power: 150 kW
Pulsewidth: 1 µs
PRF: 430 pps

Don 2 or Spin Trough
I-band navigation radars

IFF
Square Head.
High Pole A.

The Russian 'T 43' class was produced in greater numbers than any other post-Second World War MCMV
(H & L van Ginderen Collection)

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Kolomna Type 9-D-8 diesels; 1.47 MW (2,000 hp(m)) sustained
Shafts: 2

FURTHER INFORMATION

Three of the survivors are in the Caspian Sea, one of which belongs to Azerbaijan. These are used as radar picket ships (PGR).

501 (T 43)

- MPT-3 mechanical sweep
- Acoustic and magnetic gear

MINEHUNTING SONAR

Tamir II
Tamir II is a hull-mounted, high-frequency sonar derived from British Second World War searchlight sonars.

WEAPONS SYSTEMS

GUNS

Chinese 37 mm/63
Two twin mounts. The 37 mm gun is a 62.8 calibre weapon with 2.32 m (7.6 ft) long barrel at the end of which is a flash suppressor. In the air-cooled single mounting there is an enclosed spring recuperator while in the twin mounting the barrels are enclosed in separate water jackets with exposed spring recuperators. Both weapons have a hydraulic recoil buffer underneath the barrel.

Specifications
Calibre: 37 mm
Length of barrel: 62.8 calibres
Traverse: 360°
Elevation: −10 to +85°
Traverse speed: 17°/s
Elevation speed: 13°/s
Rate of fire: 80 rds/min/barrel
Ammunition (projectile): 0.732 kg (1.6 lb)

Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 3,000 m (9,842 ft)
Crew: 3

25 mm/80 2-M-3
Two twin mounts.

Specifications
2-M-3
Calibre: 25 mm
Length of barrel: 60 calibres
Traverse: 360° at 25°/s
Elevation: −10 to +85° at 15°/s
Rates of fire: 450 rds/min/barrel
Projectile: 0.28 kg (0.6 lb) HEI-T
Range:
anti-surface: 1.5 n miles (2.75 km)
anti-air: 2,800 m (9,186 ft)

China 14.5 mm/93
Two twin mounts.

DEPTH CHARGES

BMB-2 projectors
Two projectors for total of 20 depth charges.

MINES

12 to 16 mines can be carried.

COMMAND AND CONTROL SYSTEMS

RADAR

Fin Curve
I-band surface search radar.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 PRC/Kolomna Type 9-D-8 diesels; 1.47 MW (2,000 hp(m))
Shafts: 2

FURTHER INFORMATION

These four ships were ordered from China in 1993 and are expected to be delivered at a rate of one a year.

These are new build ships but the details given are for those in service in the Chinese Navy. There may be some changes.

TYPE 010 (T 43)

GENERAL SPECIFICATIONS

Country of origin: Russia
Operator: People's Republic of China
Type: Ocean minesweeper
Chinese Type: Type 010

Class: T 43

Acquired from USSR: 4
Built in PRC: 21 (1956-66); 20 plus (1985-)

Active: 28
Reserve: 6

Displacement:
standard: 520 t
full load: 590 t

Dimensions
Length: 60 m (196.8 ft)

Beam: 8.8 m (27.6 ft)
Draught: 2.3 m (6.9 ft)

Speed: 14 kts
Range: 3,000 n miles at 10 kts

Complement: 70 (10 officers)

SHIPS

Among the pennant numbers known to exist are: 364-6, 377-9, 386-9, 396-9, 801-3, 807-9, 821-3, 829-832, 853-4, 863, 994-6

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

Minesweeping gear includes:

- MPT-1 mechanical sweep (paravanes)
- MPT-3 mechanical sweep
- Acoustic and magnetic gear

MINEHUNTING SONAR

Tamir II
Tamir II is a hull-mounted, active search and attack, high-frequency, minehunting sonar derived from British wartime searchlight sonars.

WEAPONS SYSTEMS

GUNS

Armament in this class varies considerably:

37 mm/63. All ships have a twin 37 mm aft in 'X' position, and all except the three with the 85 mm (below) have a second twin 37 mm forward in 'A' position.
85 mm/52 Mk 90K. There are reports that some carry an 85 mm. This is presumably the same mounting/weapon that used to be seen aboard 'Kronshtadt' class patrol craft.
25 mm/60. All have two twin 25 mm/60 mounts
14.5 mm machine guns. All have two twin 14.5 mm machine guns

Chinese 37 mm/63
One or two twin mounts. The 37 mm gun is a 62.8 calibre weapon with 2.32 m (7.6 ft) long barrel at the end of which is a flash suppressor. In the air-cooled single mounting there is an enclosed spring recuperator while in the twin mounting the barrels are enclosed in separate water jackets with exposed spring recuperators. Both weapons have a hydraulic recoil buffer underneath the barrel.

Specifications
Calibre: 37 mm
Length of barrel: 62.8 calibres
Traverse: 360°
Elevation: −10 to +85°
Traverse speed: 17°/s
Elevation speed: 13°/s
Rate of fire: 80 rds/min/barrel
Ammunition (projectile): 0.732 kg (1.6 lb)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 3,000 m (9,840 ft)
Crew: 3

25 mm/80 2-M-3
Two twin mounts.

Specifications
2-M-3
Calibre: 25 mm
Length of barrel: 60 calibres
Traverse: 360° at 25°/s
Elevation: −10 to +85° at 15°/s
Rates of fire: 450 rds/min/barrel
Projectile: 0.28 kg (0.6 lb) HEI-T
Range:
anti-surface: 1.5 n miles (2.75 km)
anti-air: 2,800 m (9,186 ft)

Chinese 14.5 mm/93
Two twin 14.55 mm machine guns.

85 mm L/55.2 (90K)
Some of these ships mount a single 85 mm/52 gun in 'A' position. This Russian-designed weapon was found mainly in Russian-built 'Kronshtadt' class patrol boats, a number of which served in the PLA-N, and these weapons may have come from those boats when they were scrapped in the later 1980s. The 90K 85 mm mounting weighs 5.5 t, is 2.7 m (8.85 ft) high, 6 m (19.7 ft) long (including the barrel) and 3 m (9.8 ft) wide. It is of monobloc construction with vertical sliding wedge breech and a muzzle brake. The barrel fits into a cradle on a powered, turntable mounting which incorporates reflector sights and transmitters. The weapon fires a 9.54 kg (21 lb) fixed round with about 0.75 kg (1.6 lb) bursting charge of TNT. The mount is locally controlled.

Specifications
85 mm L/55.2 (90K)
Calibre: 85 mm
Length of barrel: 55.2 calibres
Muzzle velocity: 825 m/s (2,707 ft/s)
Traverse: 360°
Elevation: −5 to +75°
Ammunition (total): 9.54 kg (21.0 lb)
Rate of fire: 18 rds/min
Range:
anti-surface: 7 n miles (14 km)
anti-air: 8,400 m (27,559 ft)

DEPTH CHARGES

BMB-2
Two projectors per ship for 20 depth charges.

MINES

12 to 16 mines can be carried.

COMMAND AND CONTROL SYSTEMS

RADARS

Fin Curve or Type 756
I-band surface search radar.

IFF
High Pole or Yard Rake.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 PRC/Kolomna Type 9-D-8 diesels; 1.47 MW (2,000 hp(m))
Shafts: 2

FURTHER INFORMATION

PROGRAMME

The PLA-N received four T 43 MCMVs from the (then) Soviet Navy in the mid-1950s, of which two were later returned in 1960. 21 were then produced between 1956 and 1966, of which three were later converted to survey ships and three became civilian-manned research ships.

Unconfirmed reports in the late 1980s said the PLA-N was considering building 'Lerici' class MCMVs under licence, but if this was true it came to naught. It does, however, indicate a requirement for MCMVs and the fact that the T 43 was placed back in production at the end of the 1980s must be directly related to this.

The type is still in production at Wuzhang and at Guangzhou, and is also being exported to Bangladesh.

DEPLOYMENT

There are between 30 and 40 in service. Of these ten are in the North Sea Fleet, nine in the East Sea Fleet and eight in the South Sea Fleet, and some of these are employed as patrol ships with the sweep gear removed. Six are in reserve.

GHARBIYA (T 43)

Specifications
System: Diesel
Main machinery: 2 Kolomna Type 9-D-8 diesels; 1.47 MW (2,000 hp(m)) sustained
Shafts: 2

FURTHER INFORMATION

The T 43s were delivered from the (then) Soviet Union in the early 1970s. Others of the class have been sunk or used as targets or cannibalised for spares. The plan to fit these ships with VDS sonars and ROVs has been shelved in favour of new minehunters, although there may well be funding problems for such a plan. All were still in service in 1995.

T 43 #513 of the Egyptian Navy. Note the quad 12.7 mm machine guns before the bridge and the absence of any sensors on the mast except for one navigation radar at the masthead (H & L van Ginderen Collection)

T 43

GENERAL SPECIFICATIONS

Country of origin: Russia
Operator: Indonesia
Type: Ocean minesweeper

Class: T 43

Acquired: 6
Active: 2

Displacement:
standard: 500 t
full load: 580 t

Dimensions
Length: 58 m (190.2 ft)
Beam: 8.4 m (27.6 ft)
Draught: 2.1 m (6.9 ft)

Speed: 15 kts
Range: 3,000 n miles at 10 kts; 2,000 n miles at 14 kts

Complement: 77

SHIPS

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

Minesweeping gear includes:

- MPT-1 mechanical sweep (paravanes)
- MPT-3 mechanical sweep
- Acoustic and magnetic gear

MINEHUNTING SONAR

Stag Ear
Tamir II (NATO = Stag Ear) is a hull-mounted, high-frequency sonar developed from the Russian Tamir I sonar, which was itself derived from British wartime searchlight sonars.

WEAPONS SYSTEMS

GUNS

37 mm/63
Two twin mounts. The 37 mm gun is a 62.8 calibre weapon with 2.32 m (7.6 ft) long barrel at the end of which is a flash suppressor. In the air-cooled single mounting there is an enclosed spring recuperator while in the twin mounting the barrels are enclosed in separate water jackets with exposed spring recuperators. Both weapons have a hydraulic recoil buffer underneath the barrel.

Specifications
Calibre: 37 mm
Length of barrel: 62.8 calibres
Traverse: 360°
Elevation: −10 to +85°
Traverse speed: 17°/s
Elevation speed: 13°/s
Rate of fire: 80 rds/min/barrel
Ammunition (projectile): 0.732 kg (1.6 lb)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 3,000 m (9,842 ft)
Crew: 3

12.7 mm machine guns
The ships are reported to have four twin 12.7 mm machine guns each.

MINES

20 mines can be carried.

COMMAND AND CONTROL SYSTEMS

RADAR

Racal-Decca 110
I-band navigation radar.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Kolomna Type 9-D-8 diesels; 1.47 MW (2,000 hp(m)) sustained
Shafts: 2

FURTHER INFORMATION

The Indonesian Navy received four T 43 MCMVs from the (then) USSR in 1962, followed by a further two in 1964. Only two now remain and both are used primarily as patrol craft. Both were at sea in 1995.

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

Fitted for wire, magnetic and acoustic sweeping.

MINEHUNTING SONAR

Tamir II
Tamir II (NATO = Stag Ear) is a hull-mounted, active, high-frequency, minehunting sonar. It is a development of the Russian Tamir I series sonars, which was, itself, derived from British wartime searchlight sonars.

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

Igla-1 (SA-N-5 Grail)
Some ships carry the Igla-1 system using the *Strela 2* 9M43M missile (NATO = SA-N-5), which is housed in a glass fibre launcher-container; these ships carry a total of 18 missiles. The missile has an uncooled lead sulphide infra-red seeker, operating in the 1.7 to 2.8 µm range and with a spinning reticle, centre-null tracking system with a 1.9° field of view. On acquiring the target, the operator activates the thermal battery and when the seeker has acquired the target an audio signal is received telling the operator to take the first pressure on the trigger and activate the missile gyros which warm up in four to six seconds. The operator uses stadia reference marks in the optical sight to compute the lead angle to the target and then takes the second pressure on the trigger to launch the missile. The booster burns for 0.05 seconds to eject the missile from the launch tube at a speed of 28 m/s (91.8 ft/s) and spin it up and then, at a distance of 6 m (19.6 ft), the sustainer ignites and the trailing fins pop out. The missile homes on the 'hottest' part of the aircraft and has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead. In Strela 2M the warhead has improved fragmentation uniformity.

Specifications
Length: 1.45 m (4.7 ft)
Diameter: 7 cm (2.7 in)
Weight: 9.97 kg (22 lb)
Speed: Mach 1.7
Range:
anti-surface: 2.6 n miles (4.8 km)
anti-air: 18-4,500 m (59-14,764 ft)

Manufacturer/Contractor
Fakel, Russia.

GUNS

30 mm/65 AK 230
Two twin AK-230.

Specifications
30 mm/65 AK 230
NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,444 ft/s)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,120 ft)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s
Mounting weight: 1,857-1,905 kg (4,094-4,200 lb)
Crew: 2 (off mount)

Ammunition
BR-83
Type: Armour-piercing tracer
Weight (complete round): 1.47 kg (3.2 lb)

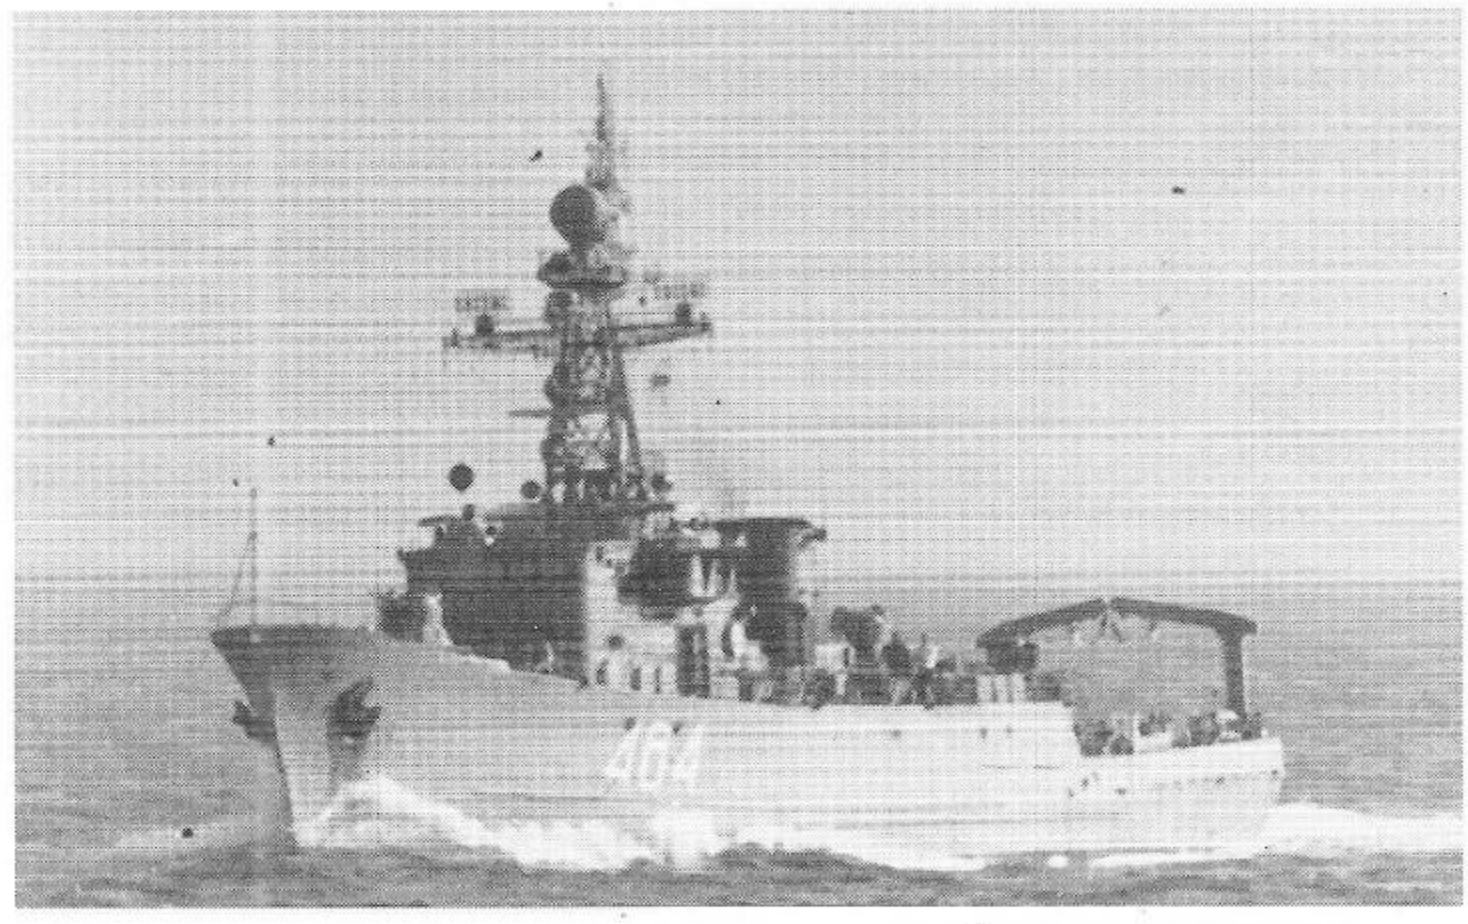
FURTHER INFORMATION

This class of medium-sized ocean-going minesweepers was built between 1963 and 1972 at Kolpino and Khabarovsk. A total of 42 was built. They have a hull constructed of low-magnetic steel and an unusual wide stack, indicating that the two deisel engines are situated side by side.

One sank in the Black Sea in August 1989 after an explosion. There are just two survivors in the Russian Navy and of those only one is in an operational state. Six were exported: Egypt — 4 (1969); Vietnam — 2 (1979).



Yurka *at sea. Note the swan-neck cranes afts, Drum Tilt at masthead and two Square Head IFF on yardarms* (H & L van Ginderen Collection)

FURTHER INFORMATION

These steel-hulled ocean-going minesweepers were built between 1963 and 1969 and were transferred from the (then) Soviet Union in 1969. The Egyptian 'Yurka' class does not carry Drum Tilt fire-control radar and has a number of ship's-side scuttles (possibly to improve ventilation in the hot climate). A plan was made at one stage to equip them with VDS, but this has been shelved in favour of new minehunters. At least one operates an ROV of an unknown type.

Centre is one of the four Egyptian Navy 'Yurka' class ocean minesweepers. Others in the picture are (left to right): Romeo submarine #855; 'Shanyha II' class FAC #795; (Yurka); 'Polnocny A' class LSM. Note that the 'Yurka' MCMV does not have a Drum Tilt fire-director radar

MINE COUNTERMEASURES SYSTEMS

These expensive ships appear to have been designed and built to counter a specific US/NATO threat. They carry:

- Two remotely controlled submersibles which are launched/recovered through large sliding doors in the superstructure beneath the after AKG-630 mount. These submersible carry large demolition charges.
- Special sweeping gear, which is launched and recovered using the large crane on the quarterdeck.
- The ships may also be fitted with accurate positional fixing equipment.

MINEHUNTING SONAR

It is a reasonable assumption that these ships are fitted with a hull-mounted, high-frequency, active search, mine detecting sonar.

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

SA-N-5 Grail

Two SA-N-5 Grail launchers are carried. The Strela 2 9M43M missile uses an infra-red seeker, operating in the 1.7 to 2.8 µm range and with a spinning reticle, centre-null tracking system with a 1.9° field of view. On acquiring the target, the operator activates the thermal battery and when the seeker has acquired the target an audio signal is received, which tells the operator him to take the first pressure on the trigger. This activates the missile gyros which warm up in four to six seconds. The operator uses stadia reference marks in the optical sight to compute the lead angle to the target then fully engages the trigger to launch the missile.

The booster ejects the missile from the launch tube and spins it up, and when it has travelled some 6 m (19.6 ft), the sustainer ignites and the trailing fins pop out. The missile homes on the 'hottest' part of the aircraft and probably has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead. In Strela 2M the warhead has improved fragmentation uniformity.

Specifications
Length: 1.45 m (4.7 ft)
Diameter: 7 cm (2.7 in)
Weight: 9.97 kg (22 lb)
Speed: Mach 1.7
Range: 2.6 n miles (4.8 km)
Altitude: 18-4,500 m (59-14,760 ft)

Manufacturer/Contractor
Fakel, Russia.

GUNS

AK-176 76 mm (3 in)/60

There is one AK-176 in 'A' position, which can be operated from the weapon control centre or under local control.

Specifications
Calibre: 76 mm
Length of barrel: 59 calibres
Traverse: 360°
Elevation: −3 to +85°
Traverse speed: 35°/s
Elevation speed: 30°/s
Ammunition (total): 16 kg (35.3 lb)
Rate of fire: 120 rds/min
Range:
anti-surface: 3.75 n miles (7 km)
anti-air: 10,000 m (32,800 ft)

30 mm/65 AK 630

One AK 630 CIWS is mounted aft, consisting of a water-cooled, six-barrelled, Gatling-principle, AO-18, high volume-of-fire gun system, a separate fire-control radar and a below-deck control station with remote optical and/or electro-optical sensor. It has four roles; engaging anti-ship missiles, engaging aircraft, engaging small surface vessels and drifting mines and engaging unprotected targets ashore.

Specifications
Calibre: 30 mm
Length of barrel: 65 calibres
Muzzle velocity: 890 m/s (2,920 ft/s)
Traverse: 360°
Elevation: −12 to +88°
Traverse speed: 70°/s
Elevation speed: 50°/s
Crew: 1 (off mount)
Range:
radar fire control: 4,000 m (13,120 ft)
electro-optic fire control: 5,000 m (16,400 ft)
Rate of fire: 4,000-5,000 rds/min

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES (ESM)

Cross Loop; Long Fold
These ships have two ESM devices identified as Cross Loop and Long Fold.

DECOYS

PK-16
Two PK-16 decoy launchers for chaff.

COMMAND AND CONTROL SYSTEMS

RADARS

Palm Frond
I-band surface search radar.

Nayada
I-band navigation radar.

Bass Tilt fire-control radar
Bass Tilt is the NATO reporting name for the Russian H-band naval fire-control radar which directs the fire of the AK-630 30 mm guns. The weapon system and director are mounted on a pedestal, with the drum-shaped antenna radome, 1.2 m (3.9 ft) in diameter, inclined at an angle of approximately 45°. The director is 2 m (6.56 ft) high and 1.45 m (4.7 ft) long. The radar is probably linked to a ballistic computer and each director controls one or two gun mountings.

IFF
Salt Pot C
Square Head

PROPULSION

Specifications
System: Diesel
Main machinery: Probably four diesel engines
Shafts: Probably 2

FURTHER INFORMATION

PROGRAMME

The 'Gorya' class was originally intended to be some 20 strong, but construction ended with the completion of the second, although it is reported that a third was partially built at the time the programme was cancelled

DESIGN

The Goryas are very sophisticated and therefore expensive, and appear to have been intended — at least in part — to counter the US Navy's CAPTOR mines which are designed to be moored at depths exceeding 300 m (1,000 ft). The hull is constructed of steel and the superstructure may be aluminium alloy.

The principal MCM system is a submersible ROV, two of which are housed in a hangar at the after end of the supersturcture. They are launched and recovered through two large side doors using either extending rails or an overhead crane. The ROVs carry two 100 kg (220 lb) demolition charges.

The sweep deck aft is very small, although the presence of a large swan-neck crane and a winch indicate that at least one mechanical sweep can be deployed.

DEPLOYMENT

Zheleznyakov is used for training in the Black Sea. *Gumanenko* conducted sea trials in 1992 in the Baltic but has not been seen since then.

Zheleznyakov, *one of two 'Gorya' class MCMVs completed before this very expensive programme was abandoned* (US Navy)

VANYA

OVERVIEW

The 'Vanya' class was a completely new design which first appeared in 1960 and, at the time, was felt to bear a more than passing resemblance to the NATO coastal minesweepers then under construction in US and European shipyards. Like Western designers, the Russians wanted to reduce the magnetic, acoustic and hydrodynamic signatures of these MCMVs and two versions of the same design were produced, one with a wooden hull the other with amagnetic steel hull. The wooden version, Type 257D, was selected for production.

As with the NATO designs there is a long forecastle with a relatively short sweepdeck on which the gear is stored. One unusual feature of the Russian design is the absence of a stack, the diesel exhausts using vents in the hull and accounting for the extensive black stains to be seen on the after part of the hull of most Vanyas. The only weapon to be carried is a special low-magnetic signature AK-230 on the forecastle.

The early ships (Type 257D) carried only two types of sweeping equipment, a mechanical sweep and an electromagnetic sweep, only one of which could be used at a time. A later version (Type 257DM) could handle combination sweeps and an improved mechanical sweep. This version was also exported as Type 257DME.

Another version, given the reporting name Vanya II by NATO, and with the Russian designation Type 699, was developed later, and three were built. These have an extended superstructure, a 25 mm mounting on the forecastle in place of 30 mm, a lattice mast at the break amidships and two boats stowed on the quarterdeck.

A total of 44 Vanya Is were built, plus three Vanya IIs. The majority of these have been deleted, starting in 1988, and in early 1997 only 13 Vanya Is and two Vanya IIs remain in service, and these are expected to be stricken in the near future.

EXPORTS

The only model to be exported was Type 257DME, of which Bulgaria received six between 1970 and 1985, and two went to Syria in 1973.

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

Type 257D
The earlier ships, Type 257D, carry a mechanical sweep and an electromagnetic sweep, only one of which can be used at a time.

Type 257DM/Type 257DME
The later ships, Type 257DM, and those built for export (Type 257DME) carry several types of combination sweeps, and an improved mechanical sweep.

MINEHUNTING SONAR

MG 69/79 hull-mounted minehunting sonar.

WEAPONS SYSTEMS

GUNS

30 mm/65 AK 230

Vanya I only. One twin AK 230 – 30 mm/65 is mounted on the foredeck. It is used for self-defence but is also used to detonate buoyant mines which have been brought to the surface.

Specifications

AK-230
NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,444 ft/s)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,120 ft)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s
Mounting weight: 1,857-1,905 kg (4,094-4,200 lb)
Crew: 2 (off mount)

Ammunition
BR-83
Type: Armour-piercing tracer
Weight (complete round): 1.47 kg (3.2 lb)
Weight (projectile): 0.35 kg (0.77 lb)

OF-83D
Type: High explosive
Weight (complete round): 1.40 kg (3.1 lb)
Projectile: 0.27 kg (0.6 lb)
Explosive: 30 g (A-XI-2)

2-M-3 25 mm/60

Vanya II only. The Vanya IIs have one twin 25 mm/60 mount in place of the AK-230 in the Vanya Is. As in the earlier ships, this weapon is also used for mine destruction.

Specifications
Calibre: 25 mm
Length of barrel: 60 calibre
Traverse: Unlimited
Elevation: −10 to +85°
Traverse speed: 25°/s
Elevation speed: 15°/s
Rates of fire: 450 rds/min/barrel
Projectile: 0.28 kg (0.6 lb) HEI-T
Range:
anti-surface: 1.5 n miles (2.75 km)
anti-air: 2,800 m (9,186 ft)

MINES

These MCMVs can also be used to carry and lay mines: eight in Vanya I and twelve in Vanya II.

COMMAND AND CONTROL SYSTEMS

RADARS

Don 2

Vanya I only. One of the standard Russian, I-band navigation radars.

Don Kay

Vanya II only. The later ships mount the Don Kay I-band navigation radar.

Vanya I: 2 M 503 diesel; 1.84 MW (2,502 hp(m))
Vanya II: 2–2,500 hp diesels, type unknown
Shafts: 2

FURTHER INFORMATION

Only 13 Vanya I plus two Vanya II remain in service and are likely to be deleted in the near future. Five are based in the Caspian Sea.

ISCAR (TYPE 257DME)

GENERAL SPECIFICATIONS

Country of origin: Russia
Operator: Bulgaria
Type: Coastal minesweeper

Class: ISCAR (VANYA, TYPE 257DME)

Purchased: 6
Active: 4

Displacement:
full load: 245 t

Dimensions
Length: 40 m (131.2 ft)
Beam: 7.3 m (23.9 ft)
Draught: 1.8 m (5.9 ft)

Speed: 16 kts
Range: 1,400 n miles at 14 kts; 2,400 n miles at 10 kts

Complement: 36

SHIPS

ZIBAR 32
DOBROTICH 33
EVSTATI VINAROV 34

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

Type 257DME

The ships built for export (Type 257DME) carry several types of combination sweeps, and an improved mechanical sweep.

MINEHUNTING SONAR

MG 69/79 hull-mounted minehunting sonar.

WEAPONS SYSTEMS

GUNS

30 mm/65 AK 230

One twin AK 230 30 mm/65 is mounted on the foredeck. It is used for self-defence but is also used to detonate buoyant mines which have been brought to the surface.

Specifications

AK-230
NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,444 ft/s)

Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,120 ft)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s
Mounting weight: 1,857-1,905 kg (4,094-4,200 lb)
Crew: 2 (off mount)

Ammunition
BR-83
Type: Armour-piercing tracer

Weight (complete round): 1.47 kg (3.2 lb)
Weight (projectile): 0.35 kg (0.77 lb)

OF-83D
Type: High explosive
Weight (complete round): 1.40 kg (3.0 lb)
Projectile: 0.27 kg (0.6 lb)
Explosive: 30 g (A-XI-2)

MINES

These MCMVs can also be used to carry and lay eight mines.

COMMAND AND CONTROL SYSTEMS

RADARS

Don 2

I-band surface search radar.

IFF

Square Head
High Pole B

PROPULSION

Specifications

System: Diesel
Main machinery: 1 M 503 diesel; 1.84 MW (2,502 hp(m))
Shafts: 1

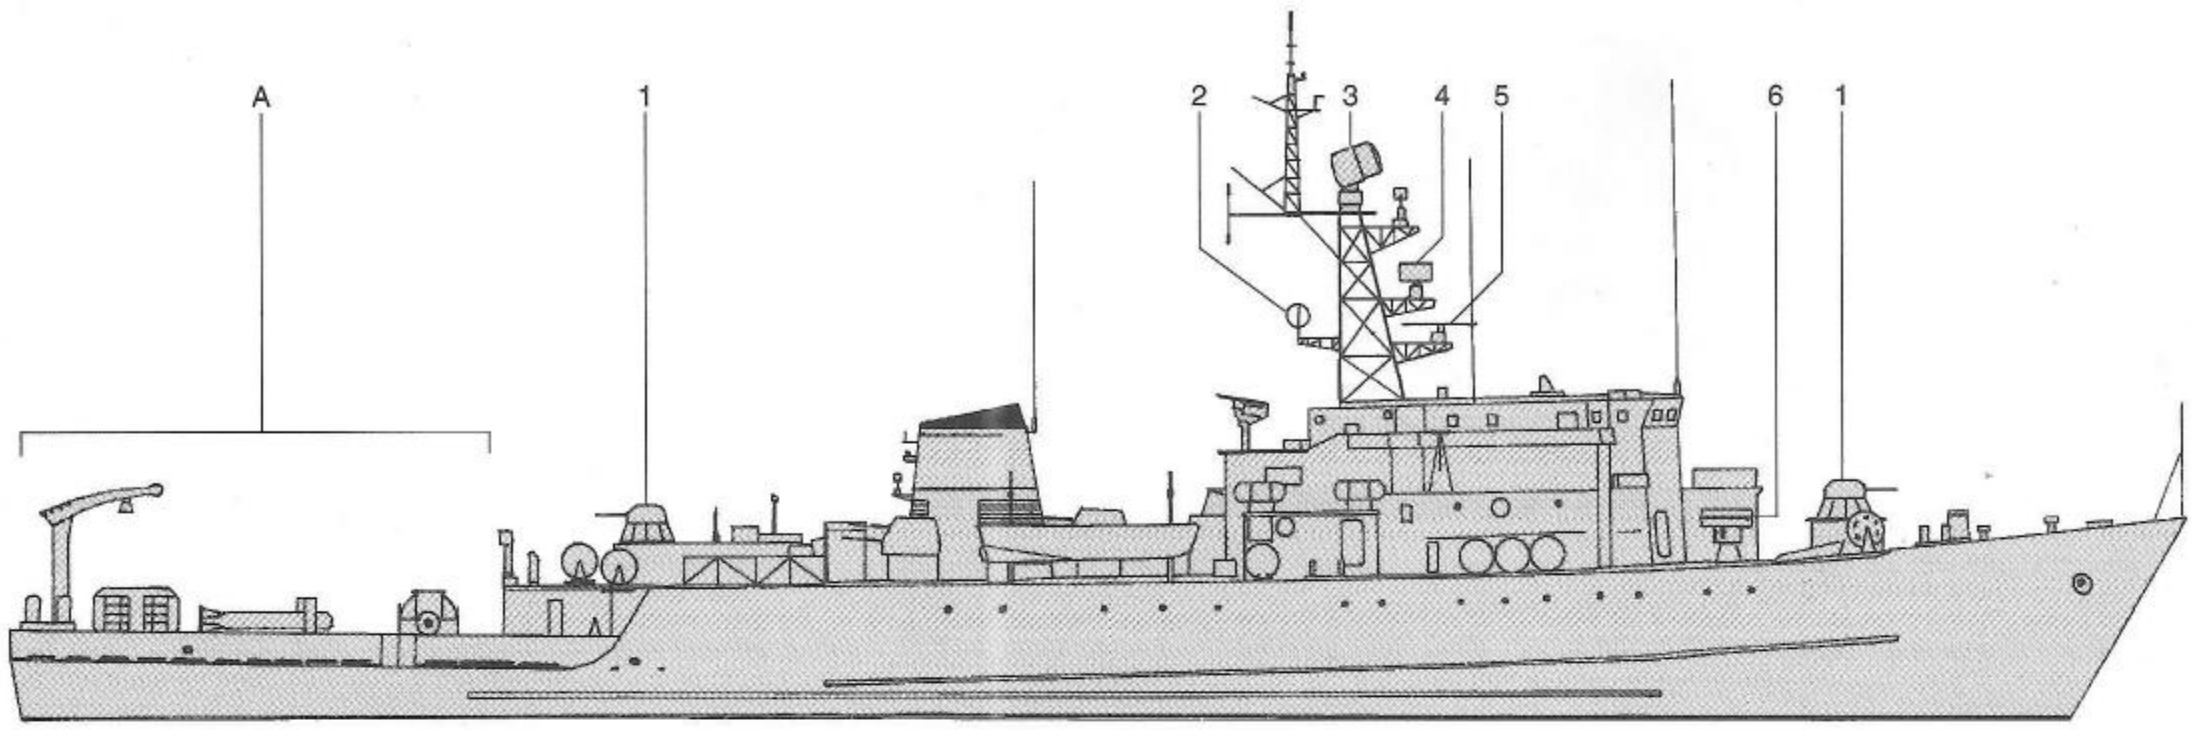
FURTHER INFORMATION

These ships were transferred from the (then) Soviet Union: two in 1970, two in 1971 and two in 1985. Two were paid off into reserve in 1992, only to return to service briefly in 1994-95 and were then scrapped.

The survivors are all based at Varna and can be employed as minehunters as well as minesweepers.

NATYA

OVERVIEW



Natya I (Ian Sturton)
MCM A *Sweep deck*

General 1 *AK-230 twin 30 mm CIWS* **2** *Cross Loop DF* **3** *Drum Down Tilt fire-control radar* **4** *Low Trough surface search radar* **5** *Don 2 navigation radar* **6** *RBU-1200 ASW rocket launcher*

The 'Natya' class ocean minesweeper was first observed in the West in 1970, following which 31 were built at Kolpino and Khabarovsk as successors to the 'Yurka' class. Construction for the Russian Navy ended in 1980 with the single Natya II, although the last two for the export versions of the Natya I were not completed until 1991.

	Natya I Type 266M		Natya I Type 266ME		Natya II Type 266DM

Totals	31		23		1	

NATYA I

These ships all have an aluminium/steel alloy hull, with a built-in degaussing system. A particular advance over the 'Yurka' class was the greatly improved layout and handling arrangements for the sweeping gear, with a ramp inset in the transom, making it much easier to set and recover sweeps. There are some relatively minor differences between early and late production ships. Earlier ships have rigid, goose-neck gantries aft, later ships have articulated, hydraulic gantries. Also, the earlier ships have two AK-230 guns with Drum Tilt, while the final three ships (sometimes referred to as 'Natya III') have an AK-630 Gatling turret, and neither 25 mm guns nor the Drum Tilt radar.

NATYA II

The single Natya II appears to have been a development ship for a new minehunting system. It has no minesweeping gear, the space thus freed aft being used for a lengthened superstructure. In addition, the transom has been cut away amidships to take a 1.5 m (5 ft) sheave.

NATYA I — TYPE 266ME

This is the export version which is basically the Natya I but with minor amendments: there is, for example, no ramp on the stern.

NATYA I AND II

GENERAL SPECIFICATIONS

Operator: Russia
Type: Ocean minesweeper

Classes: NATYA I (AKVAMAREN) (TYPE 266M); NATYA II (MINER) (TYPE 266DM)

National designation: *Morskoy tralshchik* (sea-going minesweeper)

Natya I
Built: 31
Active: 26

Natya II
Built: 1
Active: 1

Displacement:
standard: 750 t
full load: 804 t

Dimensions
Length: 61.0 m (200.1 ft)
Beam: 10.2 m (33.5 ft)
Draught: 2.98 m (9.78 ft)

Speed: 16.5 kts
Range:
two engines: 3,000 n miles at 12 kts
one engine: 5,500 n miles at 12 kts
Endurance: 15 days

Complement: 67

SHIPS

DIZELIST, SNAYPR, SOKOLOV, SVYAZIST, ELEKTRIK, TURBINIST, URKOVSKY, DESANTNIK, POLEMETCHIK, ZENITCHIK, SABANYEV, RAKETCHIK, RADIST, ARTILLERIST, KHOROSHKIN, SEMEN, ROSHALB, NAVODCHIK, ZHUKOV, PERSHIN, DMITRY, LBISOV, MINER, VINOGRADOV, RAZVEDCHIK, MACHINIST, MOTORIST, VLASOV, KOMENDOR

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

Russian minesweeping gear to be found in the 'Natya' class MCMV includes:

- GKT-2 mechanical sweep. One or two sets per ship. This deep-water mechanical system sweeps an effective width of 260 to 280 m (853 to 918 ft) at a depth of 200 m (656 ft).
- AT-2 acoustic sweep. One set per ship. A low-frequency 'fish' can be seen on the quarterdeck of most Natyas.
- TEM-3 magnetic sweep. One set per ship. The feeder is 455 m (1,492 ft) long and the ship operates at a speed of 10 knots.

Deck gear includes:

- Two davits with 2,250 kg (4,960 lb) capacity and jib reach of 4.73 m (15.5 ft)
- Three-drum winch for contact and acoustic sweeps
- Cable reel for the TEM-3 magnetic sweep.

MINEHUNTING SONAR

MG 79/89

MG 79/89 is a hull-mounted, high-frequency, active minehunting sonar. The ship's claimed capabilities include detection of mines at 800 m (2,624).

WEAPONS SYSTEMS

SURFACE-TO-AIR MISSILES (SAM)

Igla-1 (SA-N-5 Grail)

The Igla-1 system uses the Strela 2 9M43M missile (NATO = SA-N-5) and is housed in a glass fibre launcher-container; these ships carry a total of 18 missiles. The missile has an uncooled lead sulphide infrared seeker, operating in the 1.7 to 2.8 micron range and with a spinning reticle, centre-null tracking system with a 1.9° field of view. On acquiring the target, the operator activates the thermal battery and when the seeker has acquired the target, an audio signal is received informing the operator to take the first pressure on the trigger and activate the missile gyros which warm up in four to six seconds. The operator uses stadia reference marks in the optical sight to compute the lead angle to the target and then takes the second pressure on the trigger to launch the missile. The booster burns for 0.05 seconds to eject the missile from the launch tube at a speed of 28 m/s (92 ft/s) and spin it up and then, at a distance of 6 m (19.7 ft), the sustainer ignites and the trailing fins pop out. The missile homes on the 'hottest' part of the aircraft and has an impact fuze on its 1.1 kg (2.4 lb) armour-piercing RDX warhead. In Strela 2M the warhead has improved fragmentation uniformity.

Specifications

Length: 1.45 m (4.75 ft)
Diameter: 7 cm (2.75 in)
Weight: 9.97 kg (22 lb)
Speed: Mach 1.7
Range:
anti-surface: 2.6 n miles (4.8 km)
anti-air: 18-4,500 m (59-14,760 ft)

Manufacturer/Contractor

Fakel, Russia.

GUNS

Earlier units have two twin AK-230 30 mm/65, with two twin 25 mm guns, together with a Drum Tilt fire-control radar. Other units have two AK-630 30 mm Gatling, but no 25 mm guns and no Drum Tilt radar.

30 mm/65 AK-230

Specifications

NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,444 ft/s)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,120 ft)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s
Mounting weight: 1,857-1,905 kg (4,094-4,200 lb)
Crew: 2 (off mount)

Weight (complete round): 1.40 kg (3 lb)
Projectile: 0.27 kg (0.6 lb)
Explosive: 30 g (A-XI-2)

30mm AK-630

Specifications

Calibre: 30 mm
Length of barrel: 65 calibres
Number of barrels: 6
Muzzle velocity: 890 m/s (2,919 ft/s)
Traverse: 360° (depending on location of turret) at 70°/s
Elevation: −12 to +88° at 50°/s
Crew: 1 (off mount)
Range:
radar fire control: 4,000 m (13,120 ft)
electro-optic fire control: 5,000 m (16,400 ft)
Rate of fire: 4,000-5,000 rds/min

Ammunition:
Round: 1.224 kg (2.7 lb)
Projectile weight:
UOF-84: 384 g
UOR-84: 388 g

25 mm/80 2-M-3

All Natya I. There are two twin 25 mm mounts

Specifications

(2-M-3)
Calibre: 25 mm
Length of barrel: 60 calibre
Traverse: 360°at 25°/s
Elevation: −10 to +85°at 15°/s
Rate of fire: 450 rds/min/barrel
Projectile: 0.28 kg HEI-T
Range:
anti-surface: 1.5 n miles (2.75 km)
anti-air: 2,800 m (9,184 ft)

ANTI-SUBMARINE MORTARS

RBU 1200

Natya I only. There are two five-tube mountings. Each is about 1.5 m high (4.9 ft) and has a pyramid-shaped pintle with five rocket launcher tubes; a row of three along the top and one each on either side. The tubes cannot be trained and have a maximum elevation of +65°. Each tube has a diameter of 250 mm, is 1.4 m (4.6 ft) long and is reloaded manually. The 70 kg (154 lb) RGB-12 rocket has a 34 kg (75 lb)warhead and a range of about 0.8 n miles (1.48 km).

DEPTH CHARGES

32 BB-1 depth charges.

MINES

10 mines can be carried.

COMMAND AND CONTROL SYSTEMS

RADARS

Don 2/Low Trough

I-band surface search radars.

Drum Tilt

The ships with AK-230 have one Drum Tilt H/I-band fire-control radar. The cylindrical radar is permanently tilted upwards at 30° and approximate ranges are reported to be: acquisition — 21.6 n miles (40 km); tracking 12.4 n miles (23 km). Russian name is *Rys*.

IFF

Two Square Head.
High Pole B.

PROPULSION

Specifications
System: Diesel
Main machinery:
temperate climate version: Type M 504 diesels; 3.73 MW (5,000 hp(m)) sustained
tropical version: 3.36 MW (4,500 hp) diesels
Shafts: 2
Propellers: 2, three-bladed, shrouded, cp

Auxiliary power:
temperate climate version: 3 200 kW diesel-generator sets
tropical version: 3 180 kW diesel-generator sets

FURTHER INFORMATION

PROGRAMME

First observed in the West in 1970, 31 of these ocean-going minesweepers were built for the Russian Navy at Kolpino and Khabarovsk as successors to the 'Yurka' class. Construction for the Russian Navy ended in 1980 with the single Natya II.

DESIGN

Natya I
The Type 266 was designed at the Western Design Bureau at St Petersburg. These ships have a hull and main superstructure constructed of austenitic (low magnetic) steel, with aluminium-magnesium alloys used elsewhere. Transverse hull frames are used, with the decks and bottom reinforced by longitudinal ribs.

There is a built-in degaussing system and a particular advance over the 'Yurka' class was the greatly improved layout and handling arrangements, with a ramp inset in the transom, making it much easier to set and recover sweeps. There are some relatively minor differences between early and late production ships. Earlier ships have rigid, goose-neck gantries aft, later ships have articulated, hydraulic gantries. Also, the earlier ships are two AK-230 guns with Drum Tilt, while the final three ships (sometimes referred to as 'Natya III') have an AK-630 Gatling turret, and neither 25 mm guns nor the Drum Tilt radar.

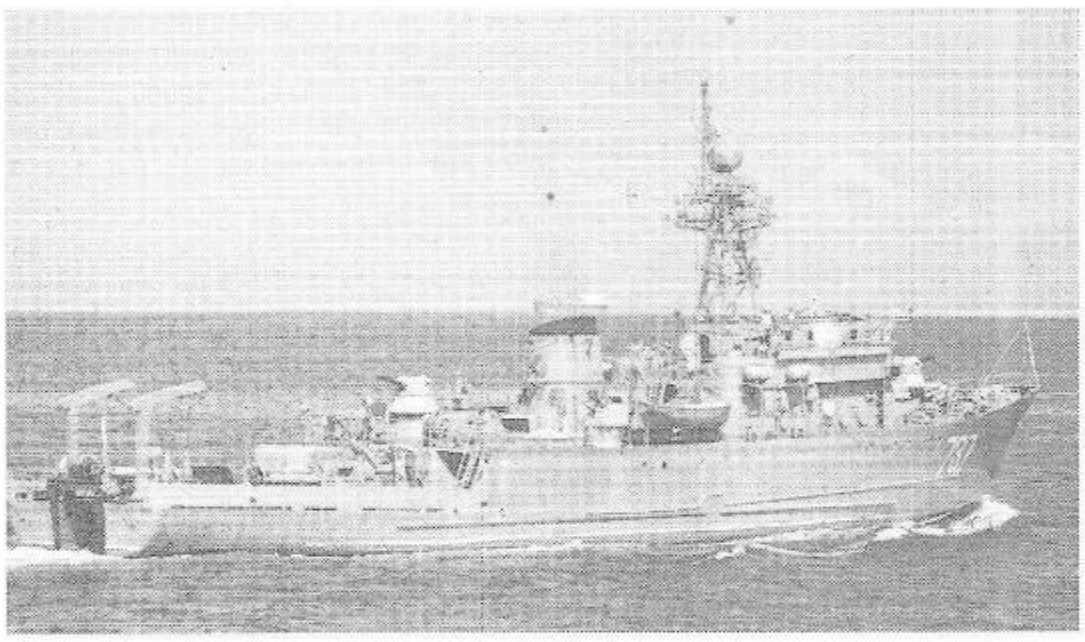
Natya II
The single Natya II appears to have been a development ship for a new minehunting system. It has no minesweeping gear, the space thus freed aft being used for a lengthened superstructure. In addition, the transom has been cut away amidships to take a 1.5 m (5 ft) sheave.

DEPLOYMENT

The Natyas usually operate in home waters but on occasions have deployed to the Mediterranean, Indian Ocean and West Africa. Sweep speed is 14 kts.

FUTURE

Earlier ships are being paid off and a new type, fitted for minehunting, is expected in due course, possibly developed from the Natya II.



Natya I with a good view of the sweep deck (US Navy)

System: Diesel
Main machinery: 2 Type M 504 diesels; 3.67 MW (5,000 hp(m)) sustained
Shafts: 2
Propellers: cp

FURTHER INFORMATION

PROGRAMME

The first six were delivered at a rate of two per year in 1978, 1979 and 1980. There was then a gap and the last six were delivered: 1986 — 1; 1987 — 3; 1988 — 2.

DESIGN

These are the Type 266ME export version. They have steel hulls and the two AK-230 and two 2-M-3 25 mm armament as in the Russian ships, but do not have a stern ramp. Some are fitted with two quad SA-N-5 systems.

The ships can be used as ASW escorts, but would not appear to be particularly well equipped for the task, lacking effective sonars and ASW weapons.

DEPLOYMENT

Pondicherry (M 61) was painted white and used as the Presidential yacht for the Indian Fleet Review by President R Venkataramen on 15 February 1989; it reverted to its normal role and colour on completion. One serves as an AGI.

FURTHER INFORMATION

PROGRAMME

The ships were delivered from Russia: 1981 — 2; February 1983 — 2; August 1983 — 1; January 1984 — 1; January 1985 — 1; October 1986 — 1.

DESIGN

These are to the standard Type 266ME export design.

DEPLOYMENT

At least one of this class was painted in green striped camouflage in 1991, and others have been seen with the hull painted a deep blue and the superstructure white.

Although capable of magnetic, acoustic and mechanical sweeping, these ships have never been seen minesweeping and appear to be used primarily for coastal patrols. Most ships in the class have been seen at sea in 1994 and 1995.

Ras Al Massad (123) has been used for training cruises.

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

Russian minesweeping gear to be found in the 'Natya' class MCMV includes:

- GKT-2 contact sweeps. One or two sets per ship.
- AT-2 acoustic sweep. One set per ship. A low-frequency 'fish' can be seen on the quarter-deck of most Natyas.
- TEM-3 magnetic sweep. One set per ship.
- RBU-1200. The ASW rocket launcher is used to destroy mines brought to the surface by the GKT-2 sweep.

MINEHUNTING SONAR

MG 89
MG 89 is a hull-mounted, high-frequency, active mine-hunting sonar.

WEAPONS SYSTEMS

GUNS

The Yemeni ship has two twin AK-230 30 mm/65, with two twin 25 mm guns, together with a Drum Tilt fire-control radar.

30 mm/65 AK 230

Specifications
NN-30 gun
Calibre: 30 mm
Length of barrel: 64.2 calibres
Muzzle velocity: 1,050 m/s (3,444 ft/s)
Range:
anti-surface: 2.2 n miles (4 km)
anti-air: 4,000 m (13,120 ft)
Rate of fire: 1,000 rds/min/gun

Mounting
Traverse: 360° at 70°/s
Elevation: −12 to +87° at 50°/s
Mounting weight: 1,857-1,905 kg (4,094-4,200 lb)
Crew: 2 (off mount)

Ammunition
BR-83:
Type: Armour-piercing tracer
Weight (complete round): 1.47 kg (3.2 lb)
Weight (projectile): 0.35 kg (0.77 lb)

OF-83D:
Type: High explosive
Weight (complete round): 1.40 kg (0.6 lb)
Projectile: 0.27 kg
Explosive: 30 g (A-XI-2)

2-M-3 25 mm/60

Specifications
Calibre: 25 mm
Length of barrel: 60 calibres
Traverse: Unlimited
Elevation: −10 to +85°
Traverse speed: 25°/s
Elevation speed: 15°/s
Rate of fire: 450 rds/min/barrel
Projectile: 0.28 kg (0.6 lb) HEI-T
Range:
anti-surface: 1.5 n miles (2.75 km)
anti-air: 2,800 m (9.186 ft)

COMMAND AND CONTROL SYSTEMS

RADARS

Don 2
I-band navigation radar.

Drum Tilt
The ship has one Drum Tilt H/I-band fire-control radar. The cylindrical radar is permanently tilted upwards at 30° and approximate ranges are reported to be: acquisition 21.6 n miles (40 km) tracking 12.4 n miles (23 km). Russian name is *Rys*.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Type M 504 diesels; 3.67 MW (5,000 hp(m)) sustained

Shafts: 2
Propellers: cp

IFF
Square Head.
High Pole B.

FURTHER INFORMATION

PROGRAMME

This ship was supplied by Russia and delivered in February 1991.

Ethiopian Natya
Reports that a second 'Natya' class ship had been seen in Aden in early 1992 led to the conclusion that another had been supplied to the Yemeni Navy from Russia. It transpired, however, that it was an Ethiopian Navy 'Natya' class ship which had taken refuge in Aden for what appear to have been political reasons. The ship returned to Massawa in July 1992 and was subsequently based at Djibouti. It was, presumably, one of the ships offered for sale in 1996 when the assets of the now-disbanded Ethiopian Navy were auctioned off.

CME

GENERAL SPECIFICATIONS

Operator: Spain

MINE COUNTERMEASURES SYSTEMS

Gaymarine Pluto Plus ROV

Two per ship. The basic configuration of Pluto Plus is the same as the standard Pluto, but with a number of improvements.

The vehicle has been redesigned to have an improved hydrodynamic design with the lowest possible drag factor, which has enabled speed to be increased to 7 knots, while these improvements allied to a doubling of the battery capacity, has increased endurance from six to ten hours. Observation capabilities have also been improved, this increasing the standoff range. Pluto Plus also uses a new type of fibre optic floating, reusable, 2 km long, cable.

The vehicle is fitted with sonar sensors for navigation, search, obstacle avoidance and identification. The sensors are all mounted in a single package featuring ±100° tilt and ±80° pan. A single control console monitor gathers and displays the video picture, navigational data, sonar graphics and maps of the investigated area.

The vehicle has low-magnetic and acoustic signatures and is resistant to shock and vibration to MIL-SPEC standards for minehunting.

Specifications
(Pluto Plus)
Length: 1,950 mm (77 in)
Width: 510 mm (20 in)
Height: 550 mm (22 in)
Weight: 200 kg (441 lb)
Service depth: 400 m (1,312 ft)
Payload: 15 kg (33.0 lb)

Manufacturer/Contractor
Gaymarine, Italy.

MINEHUNTING SONAR

AN/SQQ-32

AN/SQQ-32 consists of two separate sonars: a search sonar for initial detection; and a high-frequency, high-resolution sonar for classification of the targets. The detection sonar, designed and manufactured by Raytheon, detects mines over a wide range of distances and bottom conditions. This system incorporates a computer-aided detection facility which is designed to help the sonar operator to discard non-mine objects detected by the sonar. Raytheon is also providing the computer facilities and display consoles and is responsible for overall system integration. The classification sonar, designed and fabricated by Thomson Sintra ASM, is based on its experience with the DUBM 21 and TSM 2022 minehunting sonars. The classification sonar provides very high-resolution transmission and reception of underwater signals to enable targets to be identified with near-picture quality. The AN/SQQ-32 has two identical operator consoles with high-resolution displays. Search and classification data can be displayed simultaneously or independently. Automated detection and control functions are performed by two AN/UYK-44 computers.

Manufacturer/Contractor
ENOSA, Spain.

WEAPONS SYSTEMS

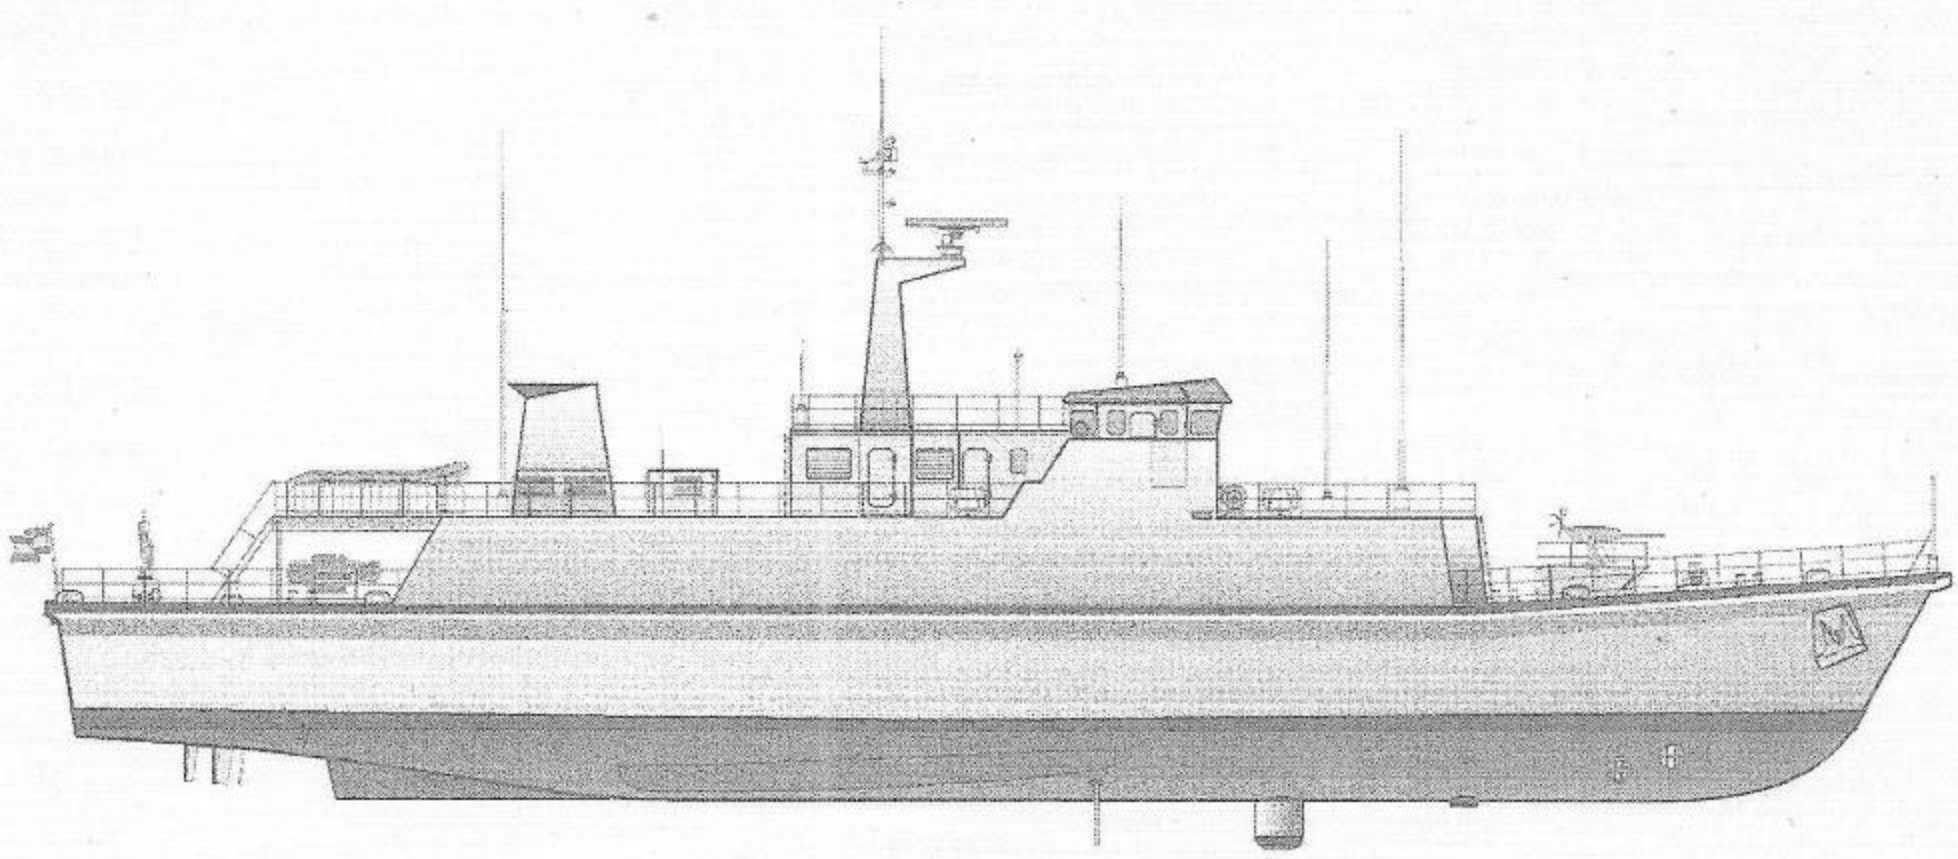
GUNS

Bazan/Oerlikon 20 mm GAM-BO1.

There will be one manually operated Oerlikon cannon on the foredeck.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range
anti-surface: 0.8 n miles (1.5 km)
anti-air: 1,150 m (3,773 ft)

Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g



CME (Bazan)

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

FABA/GEC-Marconi Nautis M

NAUTIS-M can be a one, two or three console system, to provide support for operational planning, ship control guidance, underwater and surface picture compilation and command and control for mine disposal together with a real-time MCM database. The version of NAUTIS M for the CME is likely to be based on the three-console (minehunting, operations, bridge) monochrome system that has been purchased for the UK Royal Navy, Royal Saudi Arabian Navy and US Navy for the 'Avenger' class MCM ships.

Manufacturers/Contractors
FABA, Spain/GEC-Marconi, UK.

RADAR

Navigation/Surface Search

There will be one navigation/surface search, I-band radar. Type is not yet known.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU-Bazan 6V 396 TB83 diesels, 1.12 MW (1,523 hp(m)); two electric motors (for hunting), 200 kW
Propellers: 2 Voith Schneider
Thrusters: 2 side thrusters, 110 kW (150 hp(m))
Shafts: 2

FURTHER INFORMATION

Spain currently operates a number of elderly ex-US minesweepers and has been searching for a replacement vessel for some years. Current designs from foreign nations were examined, including Eridan (Tripartite), Lerici (Italy), Avenger (USA), Sandown (UK), and a Spanish design. A contract was signed with Vosper Thornycroft on 4 July 1989 for a technology transfer, to enable Bazan to design a new MCM vessel based on the 'Sandown' class. The order for four of the class was authorised on 7 May 1993 and it was reported that the programme involved eight minehunters and four minesweepers, all based on the UK Sandown design.

On 26 November 1993, however, a further agreement was signed between DCN and Bazan, which provides for training in GRP technology and the design appears to have changed, with four minehunters of a Bazan design being produced. The eventual requirement is reported to be still for eight minehunters and four minesweepers.

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

The Landsort MCMVs are fitted for:

- Mechanical sweeps for moored mines
- Magnetic sweeps
- Acoustic sweeps
- It is also possible to operate two SAM drones for remotely controlled preliminary sweeps.

SAM remote-control minesweeping drone

The remote-control SAM uses a diesel-powered rudder propeller to drive the GRP catamaran hull. The craft is fully equipped for power supply, sweeping of acoustic and magnetic mines, navigation and remote-control from a 'Landsort' class MCMV, which can control a number of the unmanned sweeps, providing remote control of the diesel engine, steering, minesweeping equipment, control and monitoring. The hull of the SAM is fitted with a number of coils which are used for sweeping magnetic mines, and a towed acoustic transmitter is used to counter acoustic mines. A number of buoys is carried to mark the swept passage. A digital GPS and microplotter is also installed to monitor the sweeping track.

Onboard power is provided by a Volvo Penta TAMD 70D diesel engine with a continuous output of about 159 kW at 2,200 rpm, to give the craft a speed of 8 knots. Power is fed to a Schottel-type propeller unit via reversing gear couplings and a shaft. The diesel and reversing gear are mounted on a girder framework which is shockmounted in an aluminium structure onto the main platform. Although the machinery is normally remotely controlled from the MCMV, it can also be controlled at the engine or from the operating platform. Remote-control functions include diesel engine control, steering control, minesweeping equipment control and monitoring.

Specifications

Length: 18.2 m (59.7 ft)
Beam: 6.2 m (20.3 ft)
Draught: 1.6 m (5.2 ft)
Displacement: 27 m^3 (953 ft^3)
Speed: 8 kts
Range: 330 n miles at 7 kts
Engine: Volvo Penta TAMD 70D diesel engine, 159 kW at 2,200 rpm

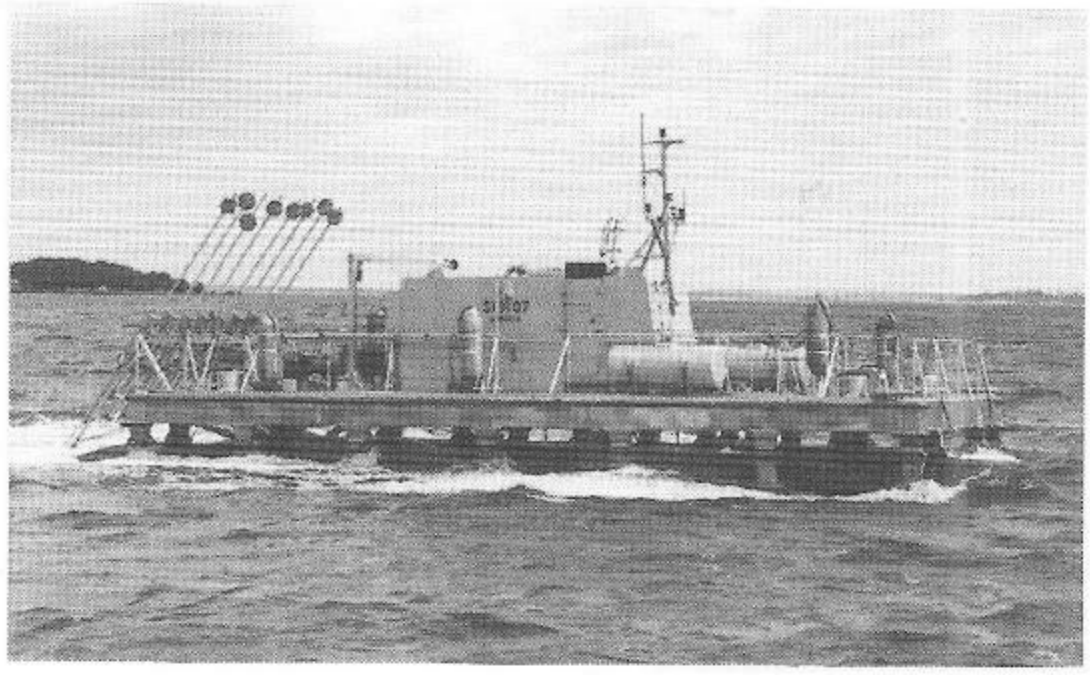
Manufacturer/Contractor

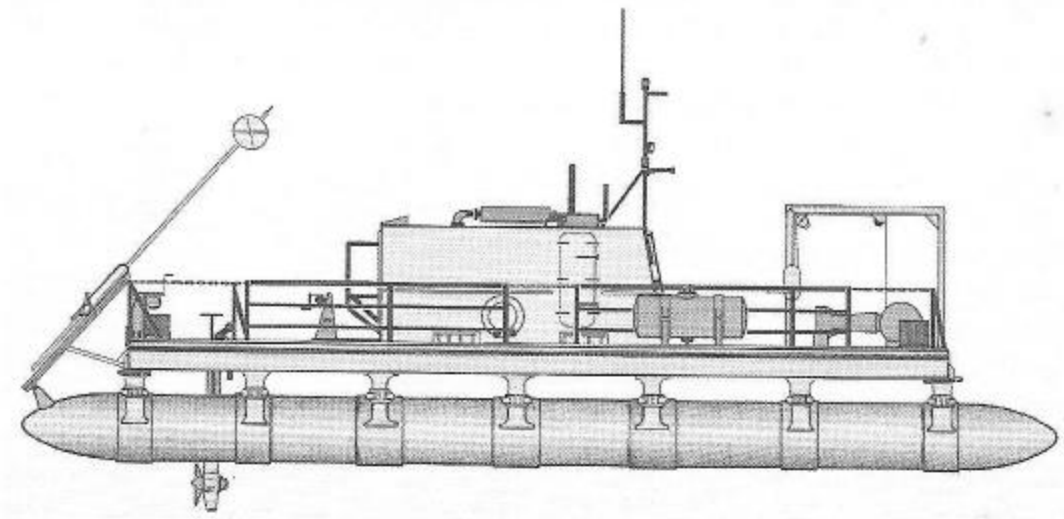
Karlskronavarvet, Karlskrona.

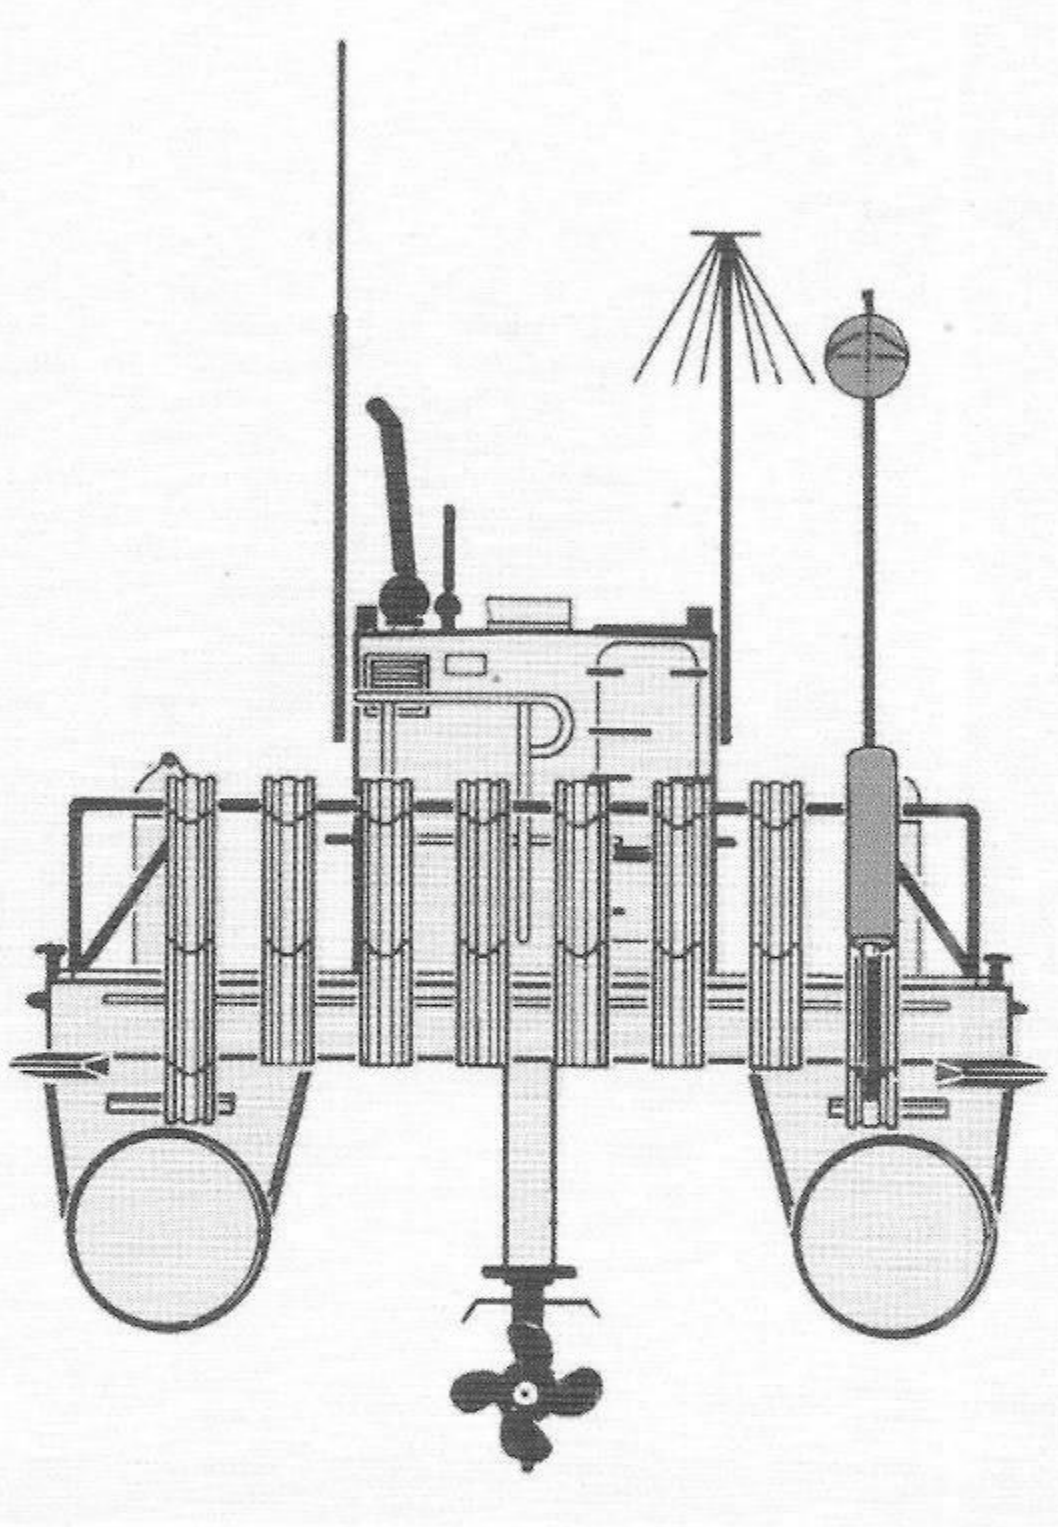
MINEHUNTING

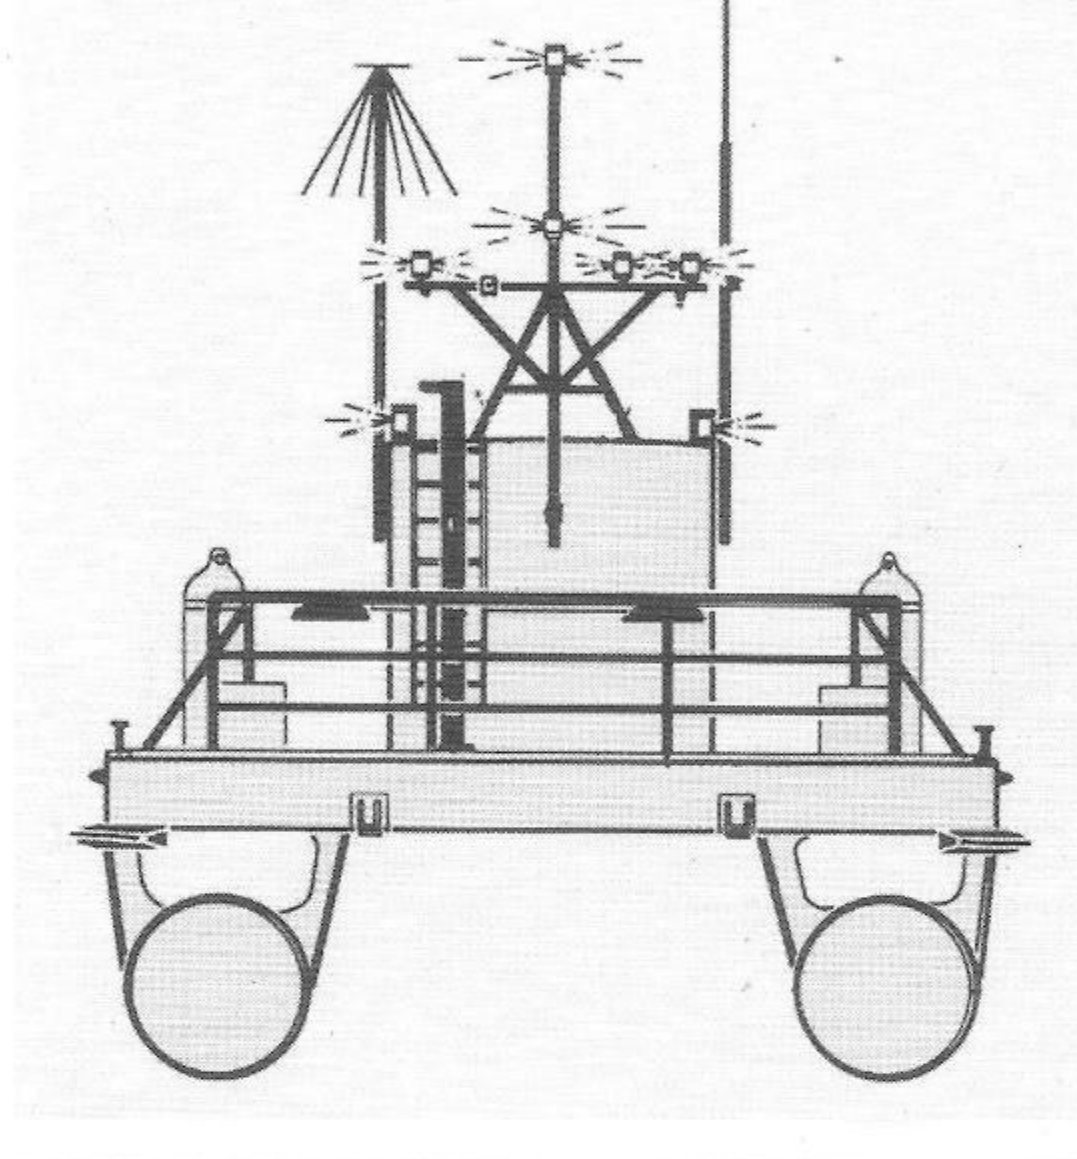
CelsiusTech 9 MJ 400 minehunting AIO system

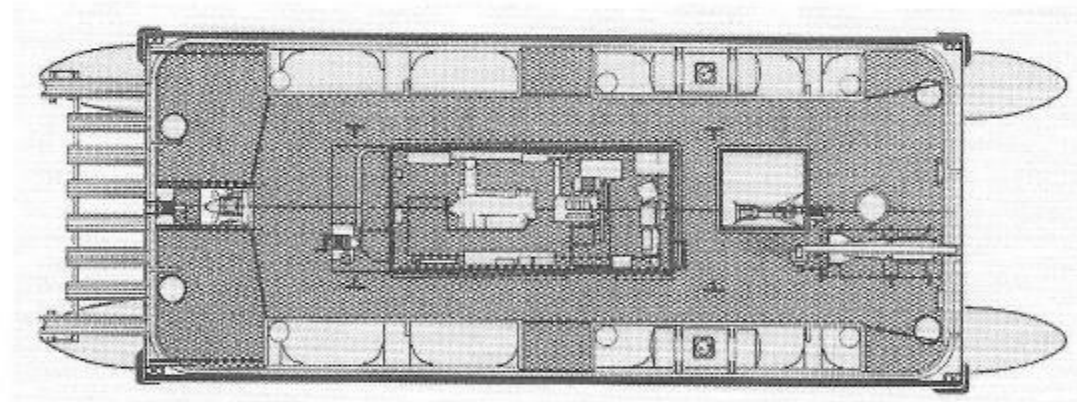
The CelsiusTech 9 MJ 400 AIO system incorporates a Racal Minehunting Action & Navigation System (MAINS) and the 9LV100 optronic director. The 9LV100 uses the minehunting target plot for target detection, designation and tracking to control the main gun. A common display presents both radar and sonar data. The 9MJ 400 also controls the SAM remote-controlled minesweeping system.

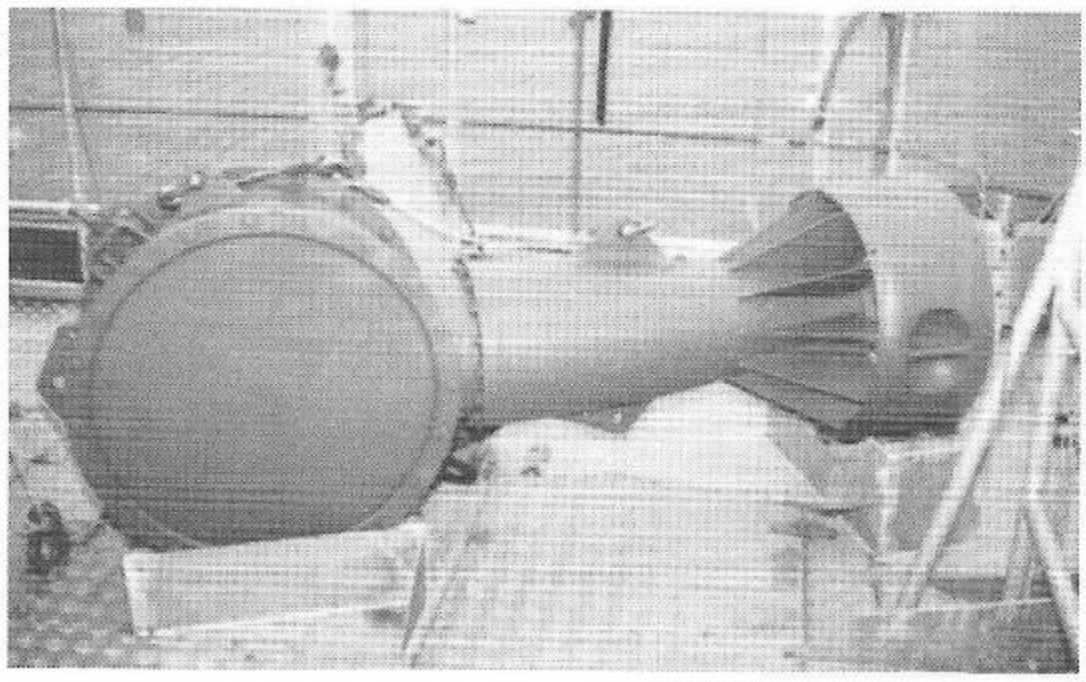


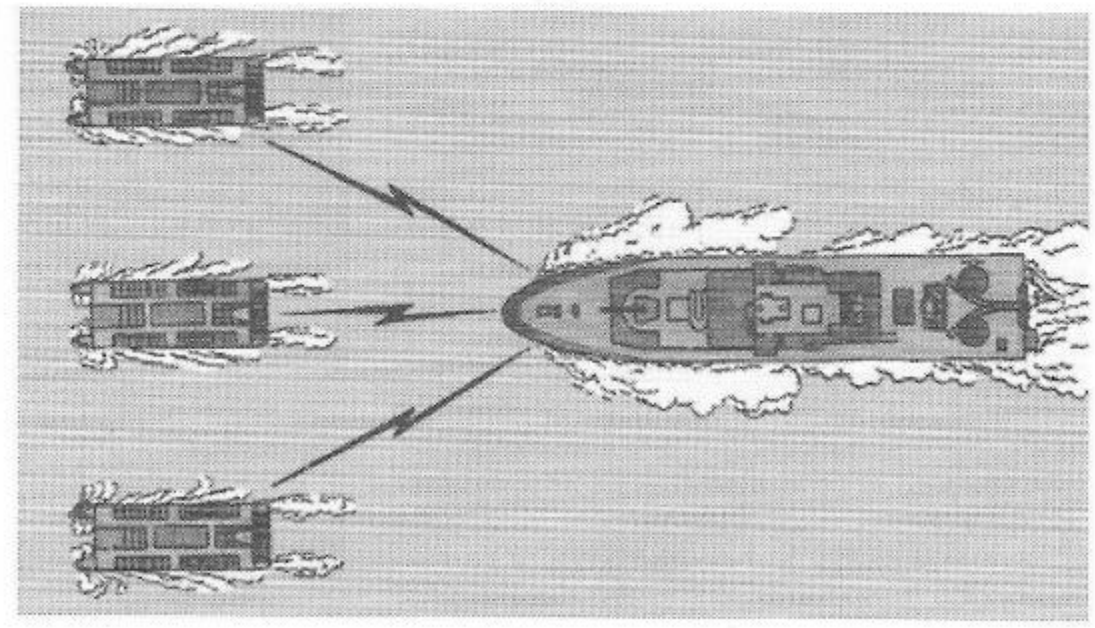












The Swedish SAM is a diesel-driven, catamaran ROV which has been selected for the Singaporean and Swedish navies and has been bought in small numbers for the US Navy. It is 18.2 m (59.7 ft) long and 6.2 m (20 ft) wide and is powered by a Volvo Penta 159 kW diesel driving a Schottel propeller unit. Up to three SAMs can be controlled by one MCMV mothership (below right). The SAM can undertake a number of tasks, including towing an acoustic transmitter (below left), and magnetic sweeping (using on-board coils), and is also capable of deploying marker buoys from the stern

Manufacturer/Contractor
CelsiusTech, Sweden.

Bofors SUTECH Double Eagle ROV

Double Eagle is fitted with powerful high-speed thrusters for use in currents up to at least 3 knots, the eight thrusters giving over 5 knots forward, 3 knots astern, 3 knots lateral and 1 knot vertical movement. The ROV is fitted with a computerised stabilisation control system and is extremely manoeuvrable, exhibiting unlimited movement in six degrees of freedom (pitch ±180°, roll ±180°).

There are two monitors, one displaying the picture from a colour TV camera, the other the picture from a monochrome TV camera mounted at the tip of a telescopic arm. Digital data such as heading, depth, pitch and roll angle, cable twist, leakage warnings, real-time clock with date and time and diagnostics are superimposed on the TV monitor. High-quality video is available using the fibre optic link in the umbilical cable. The standard umbilical is 600 m (1,968 ft) long, but there is

also an optional 1,000 m (3,280 ft) cable. The vehicle is fitted with one colour CCD camera as standard, and tilt arrangement with colour and SIT camera is available as an optional extra. Optional sensors include echo-sounder, and electronic scanning or conventional sonar.

The vehicle uses a unique precision charge placement technique using a small mine disposal charge which also features several advantages. The vehicle can also carry a heavy standard NATO mine disposal charge as well as cable cutters.

Specifications
(Double Eagle)
Length: 1.90 m (6.23 ft)
Width: 1.30 m (4.26 ft)
Height: 0.80 m (2.62 ft)
Weight: 400 kg (882 lb)
Payload: 80 kg (176 lb)
Speed: 5 kts
Service depth: 500 m (1,640 ft)

Manufacturer/Contractor
Bofors Underwater Systems, Sweden.

MINEHUNTING SONARS

Thomson-CSF TSM 2022
TSM 2022 is a hull-mounted high-frequency minehunting sonar, which can also be used for mine avoidance on minesweepers. It is based largely on experience gained with the French DUBM 21B in the field of high-resolution beam-forming techniques. It is a hull-mounted equipment intended also for use in conjunction with precision display and navigation equipment and a mine countermeasures system.

The main feature of the TSM 2022 is its small-size retractable single array assembly, used for both detection and classification, which enables easy installation and maintenance. The high-resolution features of the DUBM 21 are maintained and improvements are mainly in the field of digital processing technology. The main functions of the sonar are: detection and classification of moored and bottom mines, detection at distances up to 600 m (1,968 ft), and classification of targets by analysis of the shape of their echo or shadow at distances up to 250 m (820 ft). In the classification mode, horizontal beamwidth is 7°; in detection mode either 14° or 28° beamwidth can be selected. In both modes the vertical beamwidth is 15°. In the Mk II configuration the TSM 2022 is equipped with a 19 in high-resolution colour console and specific sonar processing such as computer-aided detection (CAD), computer-aided classification (CAC) and performance indicator (PI).

Manufacturers/Contractors
Thoray, US/Thomson Sintra ASM, France.

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/70 SAK 48
Not *Vinga* (M 75). The SAK 48 is a manually laid mounting in which the cupola-covered gun platform is on a pedestal. The mounting has a protective shield and includes ammunition racks for 96 rounds.

Specifications
Traverse: 360° (nominal) at 30°/s
Elevation: −3 to +85° at 24°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Max range:
anti-surface: 6.5 n miles (12 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

Manufacturer/Contractor
Bofors Weapon Systems, Sweden.

Bofors Sea Trinity CIWS
Vinga (M 75) only. The trials of the new Bofors Sea Trinity mount are being carried out aboard *Vinga* (M 75), in which it replaces the Bofors SAK 40 mm/70.

Specifications
(Sea Trinity)
Calibre: 40 mm
Length of barrel: 70 calibres
Traverse: 360° at 90°/s
Elevation: −20 to +80° at 55°/s
Firing dispersion: 0.7 mrad
Crew: 1
Range:
anti-surface: 1.61 n miles (3 km)
anti-air: 6,000 m (19,685 ft)
Rate of fire: 330 rds/min
Ammunition: 2.8 kg (6.1 lb) (3P)

Manufacturer/Contractor
Bofors Ordnance, Sweden.

7.62 mm MGs
Two per ship; model unknown

ANTI-SUBMARINE MORTARS

Elma ASW grenade-launching system
The ship system comprises four Saab nine-tube LLS-920 launchers, control electronics and a power supply. The tubes and support structure are of non-magnetic stainless steel, and the launchers are mounted on deck with a tube elevation of 30°. Tubes are loaded from the muzzle with the grenades, and from the rear with the propulsive charges. Grenade firing is initiated from the combat information centre in a programmable pattern when a submarine target has been identified and located. A carpet of 9, 18, 27 or 36 grenades can be laid over a pinpointed submarine within a range of 350 m (1,148 ft). The Elma grenade carries a shaped charge specially designed for good submarine hull penetration qualities. The blast jet makes a hole in a boat's pressure hull after passing through the water-filled superstructure. The grenade has a patented feature that prevents it bouncing or tumbling when striking a hard surface moving through the water.

Specifications
Launcher weight: 103 kg (227 lb)
Tube calibre: 100 mm (4.0 in)
Grenade weight: 4.35 kg (9.58 lb)
System range: 250-350 m (820-1,148 ft) (adjustable)

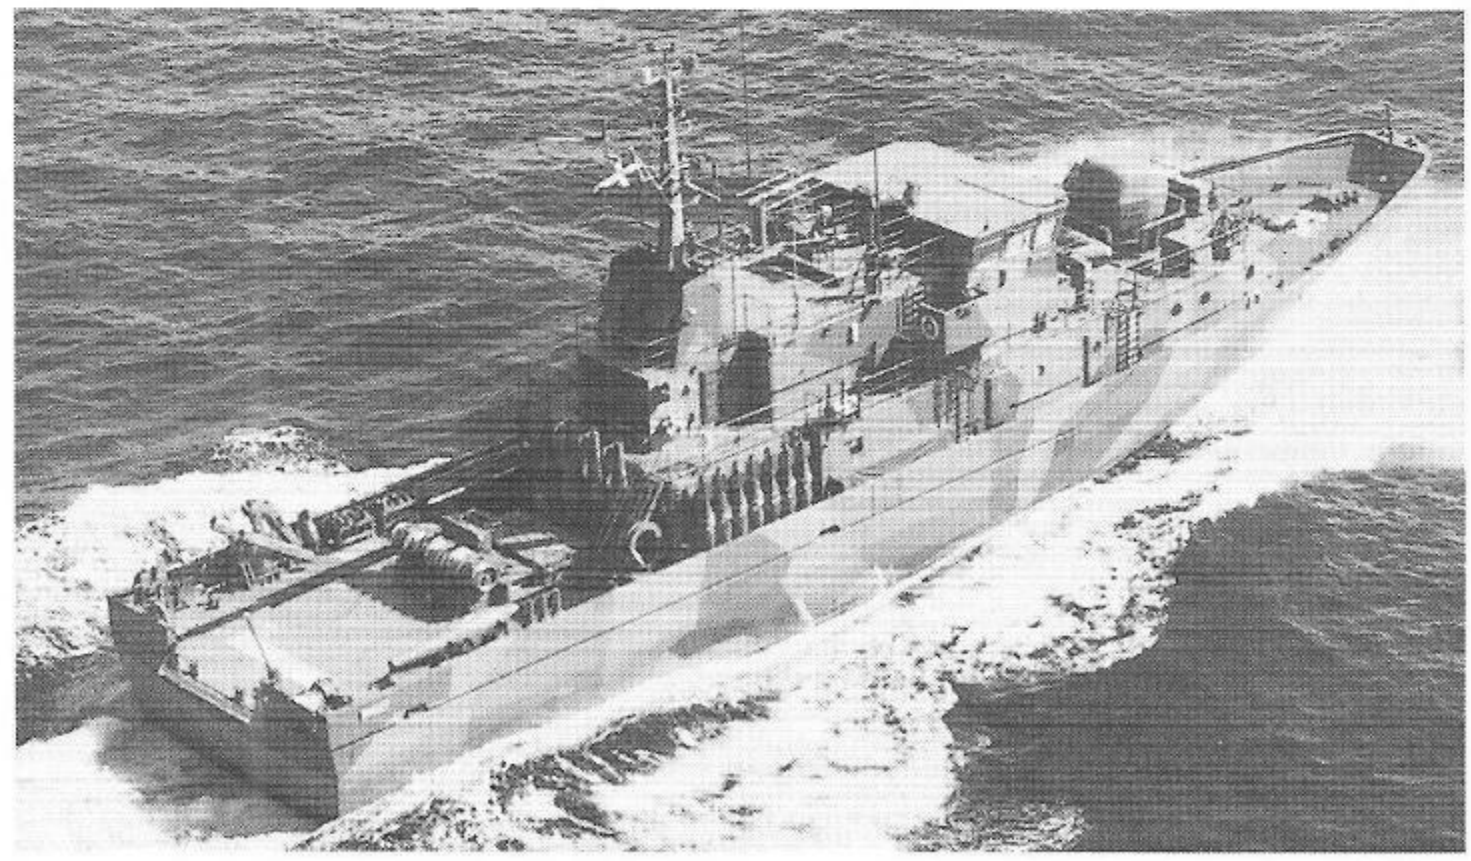
Manufacturers/Contractors
Saab Missiles (launchers).
FFV Ordnance (grenades).

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES

Thorn EMI MATILDA radar threat warning receiver.
MATILDA (Microwave Analysis Threat Indication and Launch Direction Apparatus) (known as Outfit UAR in the UK Royal Navy) covers the frequency range 7.5 to 18 GHz, and is intended to act primarily as a trigger for short-range chaff systems. It detects and recognises the threat, indicates bearing and, if required, activates chaff launchers. There are three elements: a small, lightweight antenna covering 360° in azimuth; a processing unit; and a display. The antenna unit consists of four antenna horns which are circularly polarised for the detection of vertical, horizontal and circular polarised signals. The warning unit consists of a small indicator panel designed to be located at any convenient position in the operations room. On detecting a threat, the unit sounds an audio warning and provides an indication of the threat and bearing sector channel. Total processing/warning time is claimed to be under one second.

Specifications
(MATILDA)
Frequency range: 7.5-18 GHz
Frequency resolution: 1.5 GHz
Pulsewidth range: 100 ns-6.4 µs
Pulsewidth resolution: 200 ns
Bearing coverage: 360°
Bearing resolution: 45°
Sensitivity (referred to isotropic): −30 dBm
Dynamic range: 40 dB



An aerial picuture of a 'Landsort' class MCMV showing the general layout and the large, uncluttered sweep deck aft (Karlskronavarvet)

Antenna gain: 6-8 dB
Voice module: Programmable to any warning required in any language

Manufacturer/Contractor
Thorn EMI Electronics Ltd, Sensors Group, Crawley, West Sussex, UK

DECOYS

Philax (Protean) 9CM/100 decoy launchers
The 9CM system is based upon the Philax fixed launcher which consists of four magazines similar to those used in DAGAIE and also uses Lacroix munitions. Usually the magazines contain chaff munitions but one

may be replaced by an infra-red (IR) munitions magazine. The munitions are fired by a single cartridge in each of the four chaff groups or each of the three to six IR containers. Each chaff magazine has 36 × 40 mm grenades which are fired at an interval of 0.1 second per group and within 1 second begin to create a cloud with a 1,000 m² (3,280 sq ft) radar cross-section which is complete within <5 seconds at a height of 40-60 m (131-196 ft). The IR container is 131 × 468 × 357 mm (5 × 18 × 14 in) and weighs 28.5 kg (62.8 lb), the munitions covering the 3 to 5 and 8 to 14 µm bands.

The 9CM100 system in the 'Landsort' class MCMVs controls two fixed launchers and is integrated with the MATILDA radar threat warning receiver.

Specification
(Philax)
Length: 87.5 cm (34.4 in)
Height: 72 cm (28 in)
Width: 95 cm (37 in)
Weight (unloaded): 180 kg (397 lb)

Manufacturer/Contractor
CelsiusTech, Sweden.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Philips 9LV 100
Optronic director. The system is intended to control medium-calibre guns against air and surface targets as well as surface-to-surface missiles. It can track up to two air or surface targets and can receive designation from search and navigation radars or designators as well as being capable of being slaved to other types of directors.

The main elements of the 9LV 100 are an electro-optic director weighing 140 kg (308 lb) with Saab TV camera and Ericsson 1.06 µm laser with optional infra-red tracker, a control and display console with a 41 cm (16 in) screen, gun and director controls, two bridge pointers for designation, and the fire-control computer.

Specifications
(9 LV 100)
Director
Azimuth: 360° at 85°/s
Elevation: −25 to + 80°
Angular acceleration: 400°/s²

TV camera
Type: Vidicon
Field of view: 32 × 42 mrad
Scanning: 625 lines, 25 frames/s

IR camera
Wavelength: 8-12 µm
Field of view: 52 × 35 mrad; 157 × 105 mrad
Cooling: Stirling closed cycle
Detector: Cadmium Mercury Telluride

Laser rangefinder
Type: Nd:YAG
Wavelength: 1.06 µm
Peak power: 4 MW
Pulse repetition frequency: 10 Hz

Manufacturer/Contractor
CelsiusTech, Sweden.

RADARS

Terma Skanter
I-band navigation radar.

Manufacturer/Contractor
Terma, Denmark.

PROPULSION

Specifications
System: Diesel
Main machinery: 4 Saab-Scania DSI 14 diesels; 1.17 MW (1,592 hp(m)) sustained
Propellers: The four diesels are coupled in pairs to two Voith Schneider props
Ships services: 2—225 kVA diesel-generator sets; 1—135 kVA emergency diesel generator set

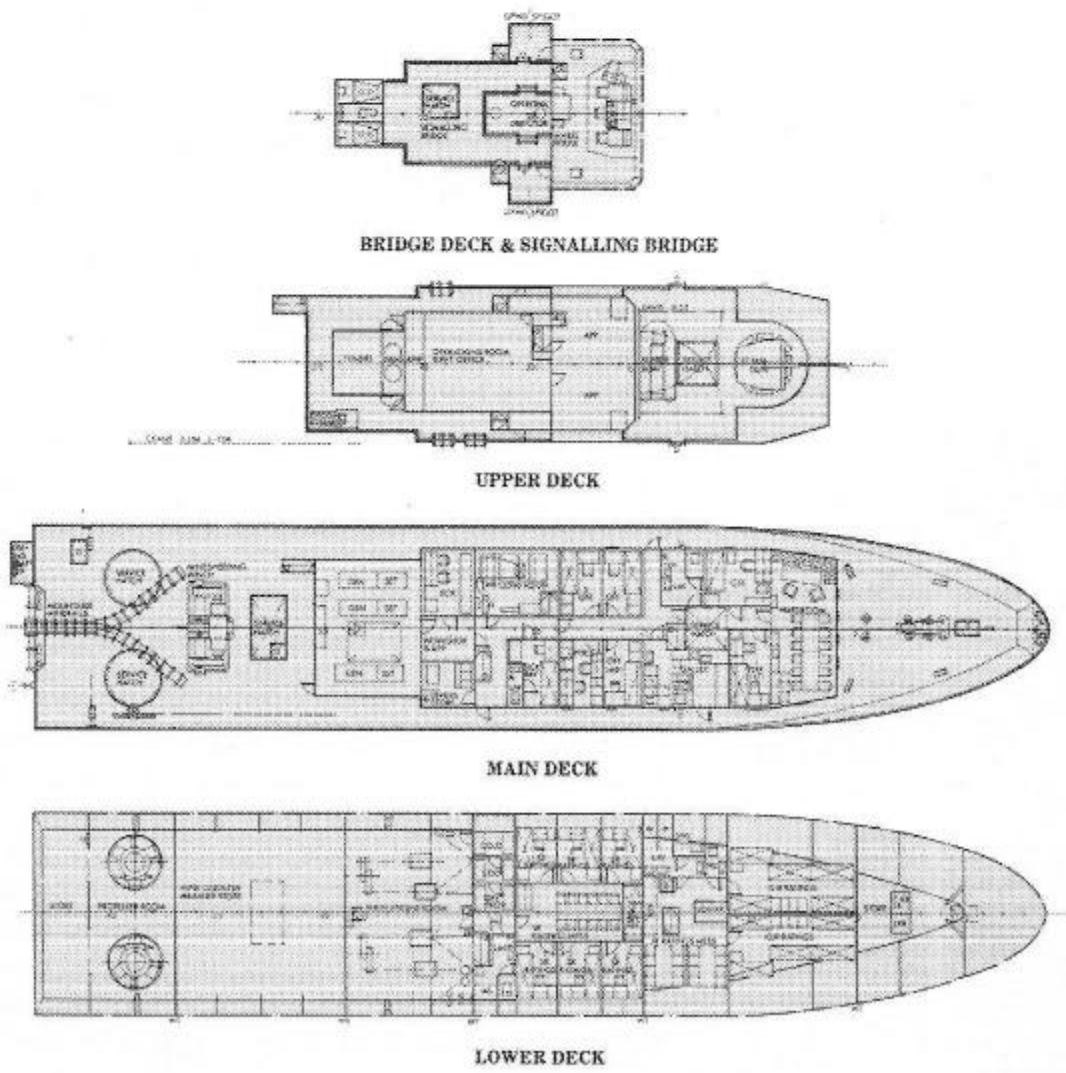
FURTHER INFORMATION

PROGRAMME

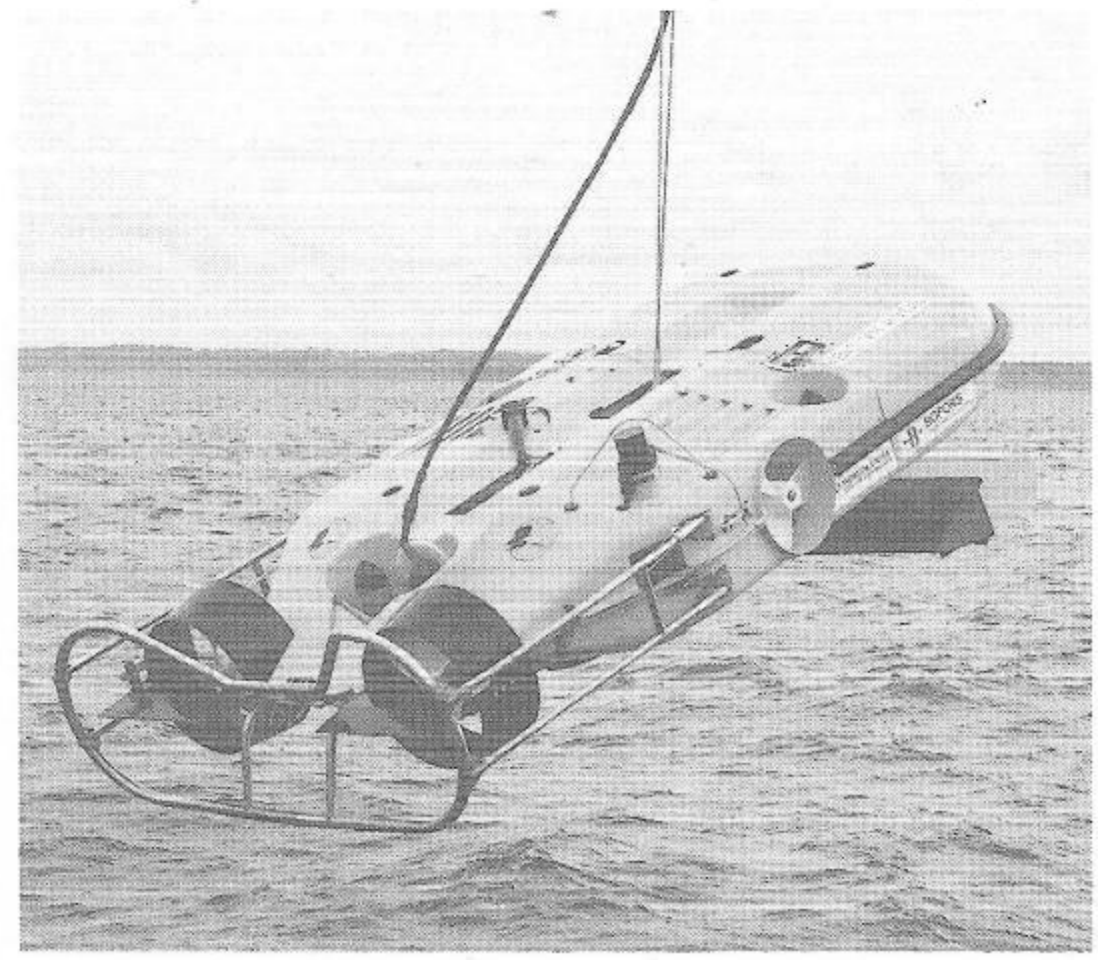
The orders for this class were placed: two in early 1981; four in 1984; and one in 1989. A projected eighth of the class was cancelled. Four, to the same design, have been built in Singapore.

DESIGN

The hull is constructed of double-skinned GRP sandwich. The face material is made of E-type glass fibre woven with an isophthalic polyester resin, while the core is a rigid PVC foam. The hull is of conventional design and is fabricated on a wooden, frame; this is coated with the GRP sandwich and, on completion, the mould is inverted and removed, leaving the hull to receive its internal lamination and have the bulkheads fitted. This hull mould has also been used for the Swedish coastguard's KBV 171 class.



Views of the decks of the export version of the 'Landsort'. The version for the Royal Swedish Navy is slightly different (Karlskronavarret)



Sutech Double Eagle ROV has eight thrusters giving unlimited movement in six degrees of freedom (pitch ±180°; roll ±180°) (Jane's/David Miller)

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

The Landsort MCMVs are fitted for:

- Mechanical sweeps for moored mines
- Magnetic sweeps
- Acoustic sweeps
- It is also possible to operate two SAM drones for remotely controlled preliminary sweeps.

MINEHUNTING

Thomson-CSF TSM 2061 Mk II

TSM 2061 Mk II is a minehunting and mine disposal system, which includes on board, real-time analysis.

PAP Mk 5 ROV

The Singaporean MCMs will carry two PAP Mk 5 (PAP = *poisson auto-propulsé*) ROVs, which have the capability simultaneously to hunt and destroy ground mines and tethered mines either by placing and remotely detonating a charge or by cutting the mooring rope of tethered mines. The vehicle is powered by onboard batteries, but is guided from a control console in the operations centre, with signals being passed via either a tether, which can be either a 2,000 m (6,562 ft) fibre optic cable or a 1,000 m (3,280 ft) coaxial cable. It is horizontally propelled by means of two side thrusters.

In the bottom-following mode a constant altitude can be achieved by instructing the vehicle to deploy a 'guide-rope'. The winch in the PAP is instructed to deploy a selected length of rope and the operator then uses return signals from the vehicle to maintain the vehicle at the desired selected height; limits are 2 m (6.56 ft) minimum and 8 m (25.25 ft) maximum.

The PAP Mk 5 is able to carry the 126 kg (278 lb) charge necessary to ensure the total destruction of a mine. Cutters can be carried with the charge. The front section of the vehicle carries a sonar, either a high-resolution nearfield sonar or a mid-range relocation sonar. Identification is carried out by a tiltable low-light TV camera and/or by a tiltable colour TV camera. Vertical thrusters are used to achieve mid-water navigation. Alternative payloads include: explosive charges, cutters (frontal, lateral mechanical and lateral explosive) and a manipulator with a variety of tools.

Specifications
PAP Mk 5
Length: 3 m (9.8 ft)
Diameter: 1.2 m (3.9 ft)
Height: 1.3 m (4.2 ft)
Performance
Max vehicle velocity:
mid-water transit: 6 kts (3 m/s)
bottom-following mode: 5.5 kts (2.75 m/s)
Vehicle incidence: ±20° (max)
Vertical velocity with charge: 0.7 m/s
Ascent velocity (charge released): 1.5 m/s
Payload:
NATO charge: 100 kg (220 lb)
Small charge: 30 kg (66 lb)
Horizontal range:
with fibre optic cable: 2,000 m (6,560 ft)
with coaxial cable: 1,000 m (3,280 ft)
Max continuous endurance: 2 h (depending on type of mission)
Max operating depth: 300 m (984 ft)
Watertight integrity: 36 bars

Manufacturer/Contractor
Societé ECA, 92707 Colombes, France.

SAM remote-control minesweeping drone

The RSN has bought SAMs for use with its 'Bedok' class MCMVs. The remote-control SAM uses a diesel-powered rudder propeller to drive the GRP catamaran hull. The craft is fully equipped for power supply, sweeping of acoustic and magnetic mines, navigation and remote control from a 'Landsort' class MCMV, which can control a number of the unmanned sweeps, providing remote control of the diesel engine, steering, minesweeping equipment, control and monitoring. The hull of the SAM is fitted with a number of coils which are used for sweeping magnetic mines, and a towed acoustic transmitter is used to counter acoustic mines. A number of buoys is carried to mark the swept passage. A digital GPS and microplotter is also installed to monitor the sweeping track.

Onboard power is provided by a Volvo Penta TAMD 70D diesel engine with a continuous output of about 159 kW at 2,200 rpm, to give the craft a speed of 8 knots. Power is fed to a Schottel-type propeller unit via reversing gear couplings and a shaft. The diesel and reversing gear are mounted on a girder framework which is shockmounted in an aluminium structure onto the main platform. Although the machinery is normally remotely controlled from the MCMV, it can also be controlled at the engine or from the operating platform. Remote-control functions include diesel engine control, steering control, minesweeping equipment control and monitoring.

Bedok *(M 105), the first of four 'Landsort' class MCMVs for Singapore was completely built in Sweden*
(H & L van Ginderen Collection)

Specifications
Length: 18.2 m (59.7 ft)
Beam: 6.2 m (20.3 ft)
Draught: 1.6 m (5.2 ft)
Displacement: 27 m³ (953 ft³)
Speed: 8 kts
Range: 330 n miles at 7 kts
Engine: Volvo Penta TAMD 70D diesel engine, 159 kW at 2,200 rpm

Manufacturer/Contractor
Karlskronavarvet, Karlskrona.

MINEHUNTING SONAR

Thomson-CSF TSM 2022

TSM 2022 is a hull-mounted high-frequency minehunting sonar, which can also be used for mine avoidance on minesweepers. It is based largely on experience gained with the French DUBM 21B in the field of high-resolution beam-forming techniques. It is a hull-mounted equipment intended also for use in conjunction with precision display and navigation equipment and a mine countermeasures system.

The main feature of the TSM 2022 is its small-size retractable single array assembly, used for both detection and classification, which enables easy installation and maintenance. The high-resolution features of the DUBM 21 are maintained and improvements are mainly in the field of digital processing technology. The main functions of the sonar are: detection and classification of moored and bottom mines, detection at distances up to 600 m (1,968 ft), and classification of targets by analysis of the shape of their echo or shadow at distances up to 250 m (820 ft). In the classification mode, horizontal beamwidth is 7°; in detection mode either 14° or 28° beamwidth can be selected. In both modes the vertical beamwidth is 15°. In the Mk II configuration the TSM 2022 is equipped with a 19 in high-resolution colour console and specific sonar processing such as computer-aided detection (CAD), computer-aided classification (CAC) and performance indicator (PI).

Manufacturers/Contractors
Thoray, US.
Thomson Sintra ASM, France.

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/70

The SAK 40L/70-315 is a manually laid mounting in which the gun platform is on a pedestal. The total height to the centre of the barrel from the deck when the gun is horizontal is 1.36 m (4.5 ft). The mounting weighs 2.87 t unloaded, is 1.83 m (6.00 ft) long and has a training radius of 3.31 m (10.9 ft). The mounting has a protective shield and includes ammunition racks for 96 rounds.

Specifications
Traverse: 360° (nominal) at 30°/s
Elevation: −3 to +85° at 24°/s
Rate of fire: 300 rds/min
Muzzle velocity: 1,005-1,025 m/s (3,297-3,363 ft/s)
Max range:
anti-surface: 6.5 n miles (12 km)
anti-air: 2.2 n miles (4,000 m)
Ammunition weight: 2.4 kg (5.29 lb)
Projectile weight: 0.96 kg (2.11 lb)
Crew: 4

Manufacturer/Contractor
Bofors Weapon Systems, Sweden.

12.7 mm machine guns

Each ship carries four 12.7 mm machine guns; model not known.

MINES

There are two mine rails.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Signaal WM20 director

WM20 is designed to control two to three light or medium calibre guns and can engage one air and/or one surface target simultaneously while the torpedo control system can engage two targets simultaneously. The optional third gun can be used to engage a second surface target. The radar can track one air and three surface targets simultaneously and there is input from a ×8 magnification optical sight with 8° field of view.

Manufacturer/Contractor
Signaal, Hengelo, The Netherlands.

RADARS

Navigation

There is one I-band navigation radar.

Signaal WM20

Specifications
Role: Surface search/fire control
Frequency: I/J-band
Range: 25 n miles (46 km)
Beam:
search: 1.5 × 4/7°
track: 2.4°
Peak power: 200 kW
Gain: 33.5 dB
Pulsewidth: 0.22/4.5 µs
PRF: 3,600/1,800 pps
Scan rate: 60 rpm

Manufacturer/Contractor
Signaal, Hengelo, The Netherlands.

PROPULSION

Specifications
System: Diesel
Main machinery: 4 Saab Scania diesels; 1.17 MW (1,592 hp(m))

Propellers: The 4 diesels are coupled in pairs to 2 Voith Schneider props
Ships services: 2—225 kVA diesel-generator sets; one 123 kVA emergency diesel generator set

FURTHER INFORMATION

PROGRAMME

The Republic of Singapore Navy (RSN) ordered this design from Karlskrona in February 1991. The first ship, *Bedok* (M 105) was built at Karlskrona and started trials in Sweden in December 1993; it was then shipped to Singapore in early 1994 for completion. Prefabrication work for the other three was done in Sweden with assembly and fitting out in Singapore at Benoi Basin.

DESIGN

The hull is constructed of double-skinned GRP sandwich. The face material is made of E-type glass fibre woven with an isophthalic polyester resin, while the core is a rigid PVC foam. The hull is of conventional design and is fabricated on a wooden frame; this is coated with the GRP sandwich and, on completion, the mould is inverted and removed, leaving the hull to receive its internal lamination and have the bulkheads fitted.

Katong *(M 107). Note that in the Singapore version the superstructure extends further aft than the Swedish version (resulting in a much smaller sweep deck) and there is also a large rectangular recess in the port side of the transom* (H & L van Ginderen Collection)

OPERATIONAL

Based at Tuas.

TON

OVERVIEW

The 'Ton' class was a direct outcome of the threat posed to NATO shipping by the Soviet magnetic influence mine, which was perceived to pose a major threat to European ports and coastal waters. NATO nations co-operated to modernise their MCM fleets to meet this new threat and one of the types produced in large numbers was the British 'Ton' class, the first of which was launched in 1952. A number of those built in the UK were exported, either as direct sales or at the completion of their service with the UK Royal Navy. As part of the NATO programme, however, the drawings were provided to Canada, France and The Netherlands.

Converted to minehunter 1968

MINE COUNTERMEASURES

MINESWEEPING

Oropesa Sweep, Mk 3 Mod 2
The Mk 3 Mod 2 Oropesa is a conventional wire sweeping system designed to cut the wires on buoyant mines, thus releasing them so that they return to the surface where they can be destroyed. The system can be configured with either one or two Oropesa floats, using kite and otters to maintain the depth and direction.

Magnetic Sweep LL Mk 2 Mod 3
The LL Mk 2 Mod 3 (LL = double longitudinal) consists of two cables streamed side by side. The cables are of differing lengths and currents are passed between them to create a magnetic field.

AD Mk 3 acoustic
The AD Mk 3 (AD = Acoustic Displacer) is a large device which is slung beneath the ship, which contains a simple electrically powered noise-maker vibrating at very low frequencies, typically between 10 and 30 Hz.

MINEHUNTING SONAR

GEC-Marconi Type 193
Chaco and *Formosa* only. Type 193 is installed in the two minehunters. It is a British hull-mounted, short-range, high-definition, sector-scanning sonar, operating at two frequencies, providing detection and classification of both moored and ground mines. The sonar provides both bearing and range data; the fine range and bearing resolution enable the operator to assess accurately the shape of a target and hence its nature. Since the resolution depends both on operating frequency and pulse length, two selectable frequencies are provided, with a choice of pulse lengths in the classification mode.

Range and bearing data appear on two displays: in the search mode one display shows the total range covered; in the classification mode, a 27 m (30 yd) section of the search display is expanded to fill the second display screen and permit close examination of the target. Two frequencies are employed by the 193M sonar: 100 kHz for long-range search and 300 kHz for short-range search and classification. The transducers

Neuquen *(M 1). The Argentine Navy has six of these vessels which were bought from the UK in 1968. All are active* (Argentine Navy)

for these signals are carried beneath the ship on a stabilised, steerable mounting, the whole assembly contained within a dome.

Manufacturer/Contractor
GEC-Marconi Sonar Systems, UK.

WEAPONS SYSTEMS

GUNS

Bofors 40 mm/60 (UK Mk 7 mount)
1 or 2 mounts per vessel in some.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 × Paxman Deltic/Mirrlees JVSS-12 diesels; 2.24 MW (3,000 hp)
Shafts: 2

FURTHER INFORMATION

DESIGN

These ships are of composite wooden and non-magnetic metal construction. Shortly after being taken over by the Argentine Navy, *Chaco* and *Formosa* were converted into minehunters in HM Dockyard, Portsmouth, while the other four were refitted and modernised as minesweepers by the Vosper Thornycroft Group, the work including installing Vosper activated roll damping equipment.

OPERATIONAL

All are active in spite of reports that they had been paid off.

Shafts: 2

FURTHER INFORMATION

PROGRAMME

The Republic of South Africa Navy purchased ten 'Ton' class minesweepers from the UK. Of these, two (*Windhoek* (M 1214) and *Durban* (M 1499)) were built for and commissioned directly into the RSAN, and were given both South African names and pennant numbers. The other eight were all originally bought by and spent some time serving with, the UK Royal Navy before being sold to the RSAN. On transfer, they were given new South African names but six retained the same pennant numbers that they had carried in the UK Royal Navy, while two were given both South African names and South African pennant numbers. The reason for these anomalies is not known.

Two of the ten were converted into minehunters: *Kimberley* (M 1210) in 1977-78, and *Port Elizabeth* (M 1212) in 1979-80.

Six were paid off in 1987, primarily because of a shortage of trained South African Navy personnel to man them.

Four now survive, of which one, *Kimberley* (M 1210), was one of those converted to a minehunter, but has now reverted to minesweeping configuration.

MODERNISATION

A two year major modernisation programme started in 1991 at the RSAN's base at Simon's Town. The first ship, *Walvisbaai* completed this process on 13 April 1993 and is now considered to be good for another 20 years. The second of class started modernisation in mid-1993.

The work started with stripping down the wooden-hulled ship, where it was found that the ship's condition was worse than had been expected, particularly in the accumulation of hydrated aluminium oxide between the aluminium hull frames and the wooden planking. The work involved stripping out the internal equipment and removing items such as the keel, connecting rivets and the plate work. The ship then received a new upper deck, new aluminium plating, new hull and deck planking (6,000 m (19,685 ft) in overall length), and all rivets and plank fastening bolts. Much electronic equipment was replaced by new equipment of South African design and manufacture. Total cost was $7 million.

FURTHER INFORMATION

PROGRAMME

32 'Western Union'-type coastal minesweepers were built in the Netherlands, being launched in 1954-56. They were based closely on the British 'Ton' class design , but with certain Dutch equipment, including the diesel engines. Eighteen of these ships, known as the 'Dokkum' class, were procured using Mutual Defense Aid Pact (MDAP) funds and were powered by Fijenoord diesels. A further 14 ships, known as the 'Wilderwank' class, were procured under Dutch Government funding and were essentially identical to the MDAP group, except that they were powered by Werkspoor diesels.

Two of the 'Dokkum' class remain in service.

MODERNISATION

The entire 'Dokkum' class was subject to a fleet rehabilitation and modernisation (FRAM) programme, which was completed in 1977. Six ships underwent a 'life prolonging' refit between the mid-1980s and 1991, which included updating equipment and the installation of a deckhouse to provide additional accommodation.

Naarden *(M 823) is one of two 'Dokkum' class MCMVs still in service with the RNethN. The deckhouse forward of the bridge was fitted as part of 1970s 'Fleet Rehabilitation and Modernisation' (FRAM) programme* (Audio Visual Dienst, MoD Netherlands)

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING

Oropesa Sweep, Mk 3

The Mk 3 Oropesa is a conventional wire sweeping system designed to cut the wires on buoyant mines, thus releasing them so that they return to the surface where they can be destroyed. The system can be configured with either one or two Oropesa floats, using kite and otters to maintain the depth.

Magnetic Sweep LL Mk 2

The LL Mk 2 (LL = double longitudinal) consists of two cables streamed side by side. The cables are of differing lengths and currents are passed between them to create a magnetic field.

AD Mk 3 acoustic

The AD Mk 3 (AD = Acoustic Displacer) is a large device which is slung beneath the ship, which contains a simple electrically powered noise-maker which is vibrated at very low frequencies, typically between 10 and 30 Hz.

MINEHUNTING

Thomson-CSF TSM 2022

***Blitvenica* only.** TSM 2022 is a hull-mounted high-frequency minehunting sonar which can also be used for mine avoidance on minesweepers. It is based largely on experience gained with the French DUBM 21B in the field of high-resolution beam-forming techniques. It is a hull-mounted equipment intended also for use in conjunction with precision display and navigation equipment and a mine countermeasures system.

The main feature of the TSM 2022 is its small-size retractable single array assembly, used for both detection and classification, which enables easy installation and maintenance. The high-resolution features of the DUBM 21 are maintained and improvements are mainly in the field of digital processing technology. The main functions of the sonar are: detection and classification of moored and bottom mines, detection at distances up to 600 m (1,968 ft), and classification of targets by analysis of the shape of their echo or shadow at distances up to 250 m (820 ft). In the classification mode, horizontal beamwidth is 7°; in detection mode either 14° or 28° beamwidth can be selected. In both modes the vertical beamwidth is 15°. In the Mk II configuration the TSM 2022 is equipped with a 19 in high-resolution colour console and specific sonar processing such as computer-aided detection (CAD), computer-aided classification (CAC) and performance indicator (PI).

Main machinery: 2 SEMT=Pielstick PA1 175 diesel; 1.9 MW (1,620 hp(m))
Shafts: 2

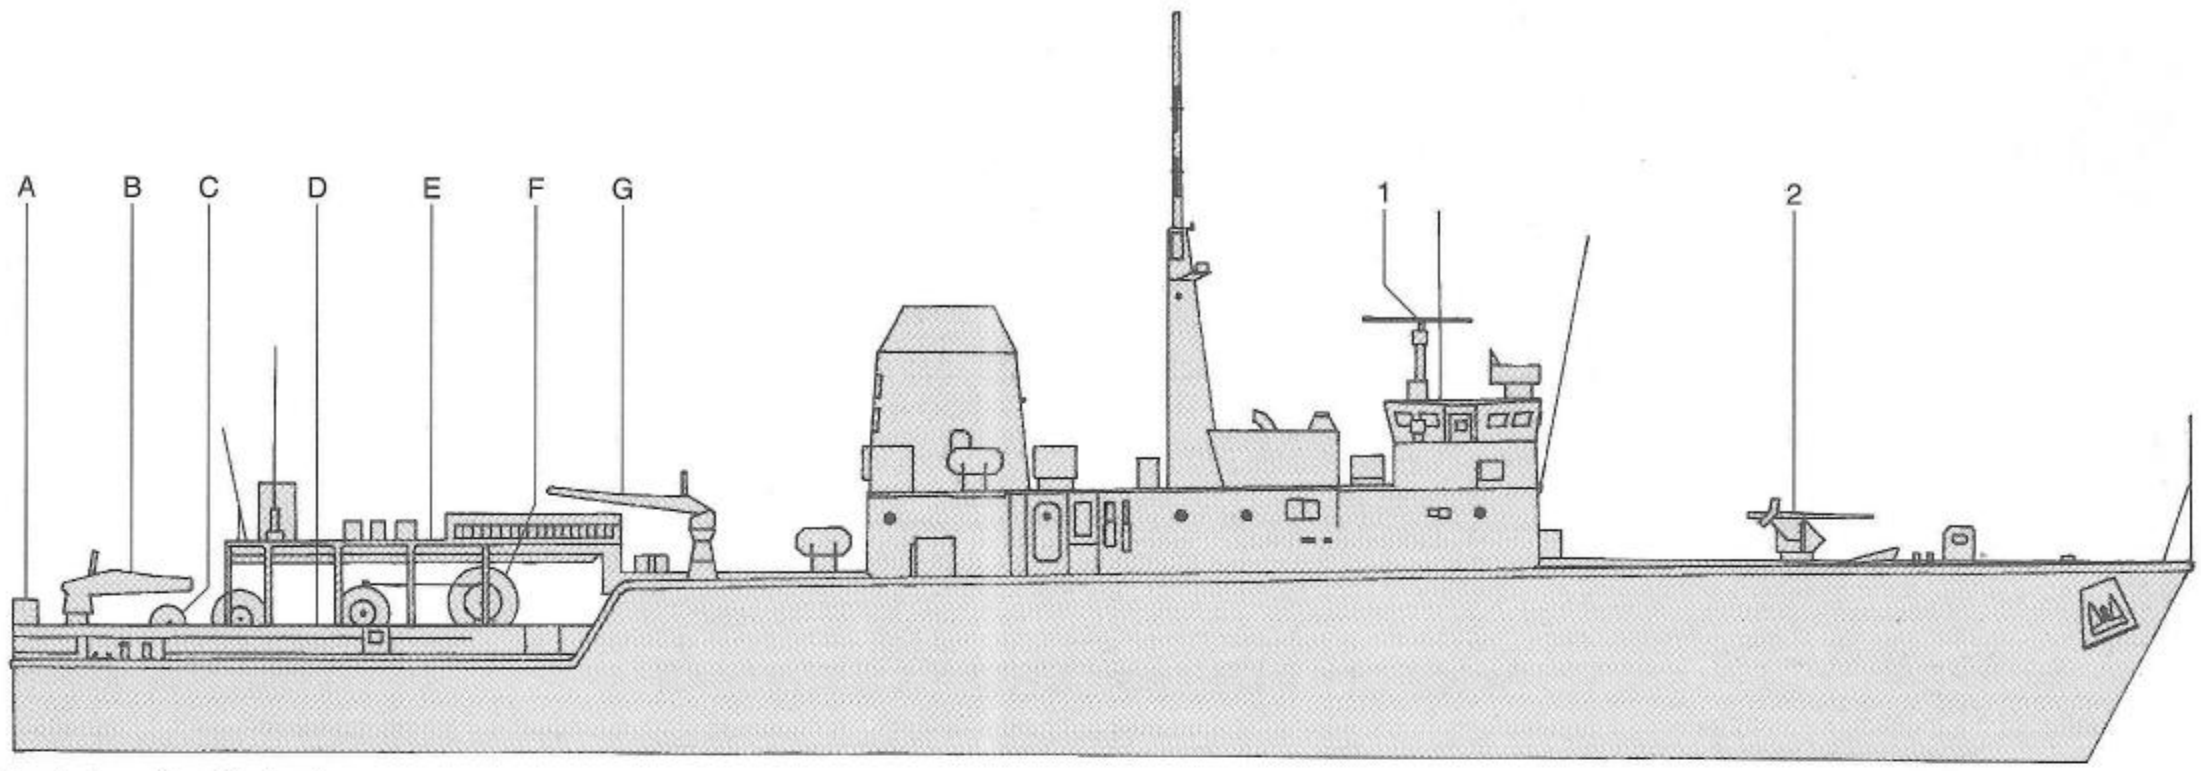
FURTHER INFORMATION

PROGRAMME

The Yugoslav Navy acquired three 'Sirius' class MCMVs in 1957, which were a French version of the British 'Ton' class design. These were paid for by the USA using 'offshore' funds and built in France to the 'Sirius' class design but, in addition, a fourth ship was then built in a Yugoslav yard to the same design, with French technical assistance.

One ship, *Blitvenica* was converted to a minehunter in 1981. Of the four ships, one was taken over by Croatia in 1991 and has since been scrapped, while three remain with the Yugoslav Navy. One of the three is being cannibalised for spares, but the other two are believed to be in service, based at Tivat.

HUNT



Hunt class (Ian Sturton)

QUORN (M 41)
Builder Vosper Thornycroft, Woolston, Hampshire, UK
Launched 23 Jan 1988
Commissioned 21 Apr 1989

MINE COUNTERMEASURES SYSTEMS

MINEHUNTING SYSTEMS

Combat Divers

Normal complement is five to seven combat divers.

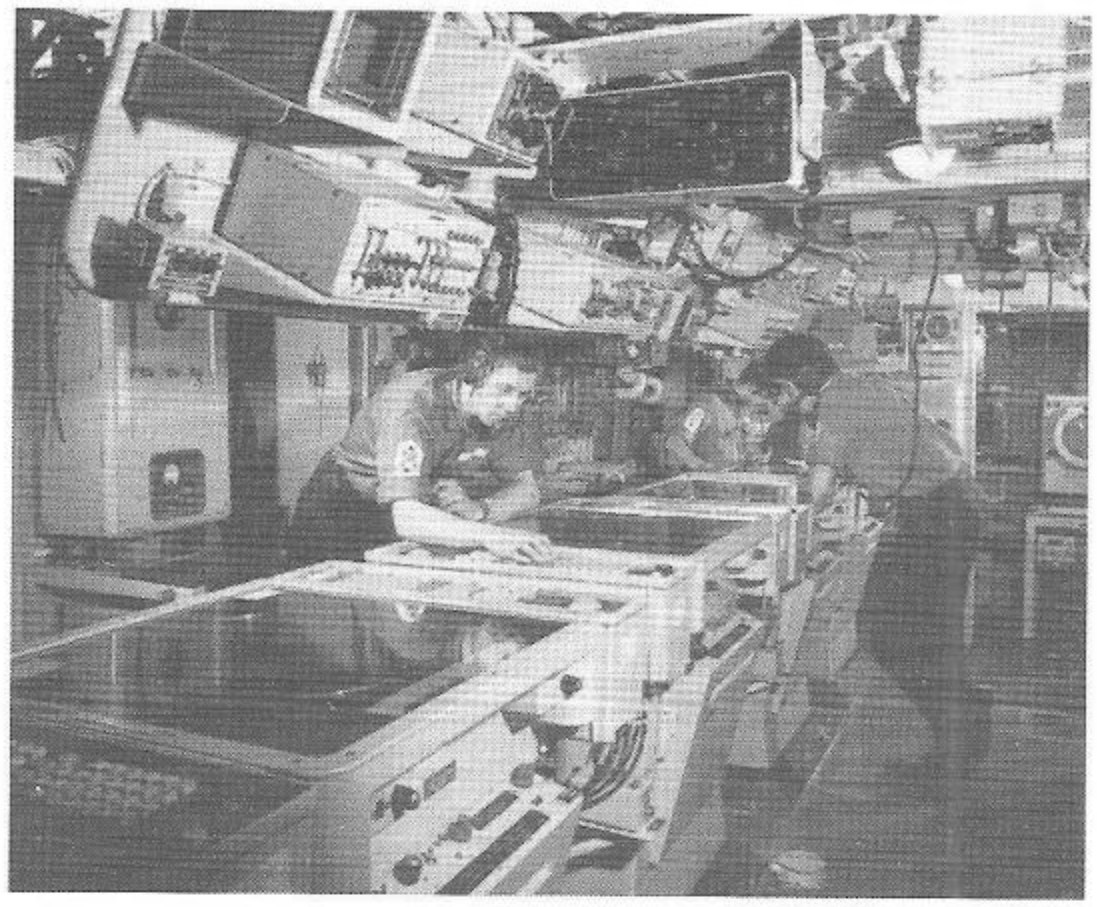
PAP 104/105 ROV

'Hunt' class MCMVs carry two PAP Mk 5 (PAP = *poisson auto-propulsé)* ROVs, which have the capability simultaneously to hunt and destroy ground mines and tethered mines either by placing and remotely detonating a charge or by cutting the mooring rope of tethered mines. The vehicle is powered by onboard batteries, but is guided from a control console in the operations centre, with signals being passed via a tether, which can be either a 2,000 m (6,562 ft) fibre optic cable or a 1,000 m (3,281 ft) coaxial cable. It is horizontally propelled by means of two side thrusters.

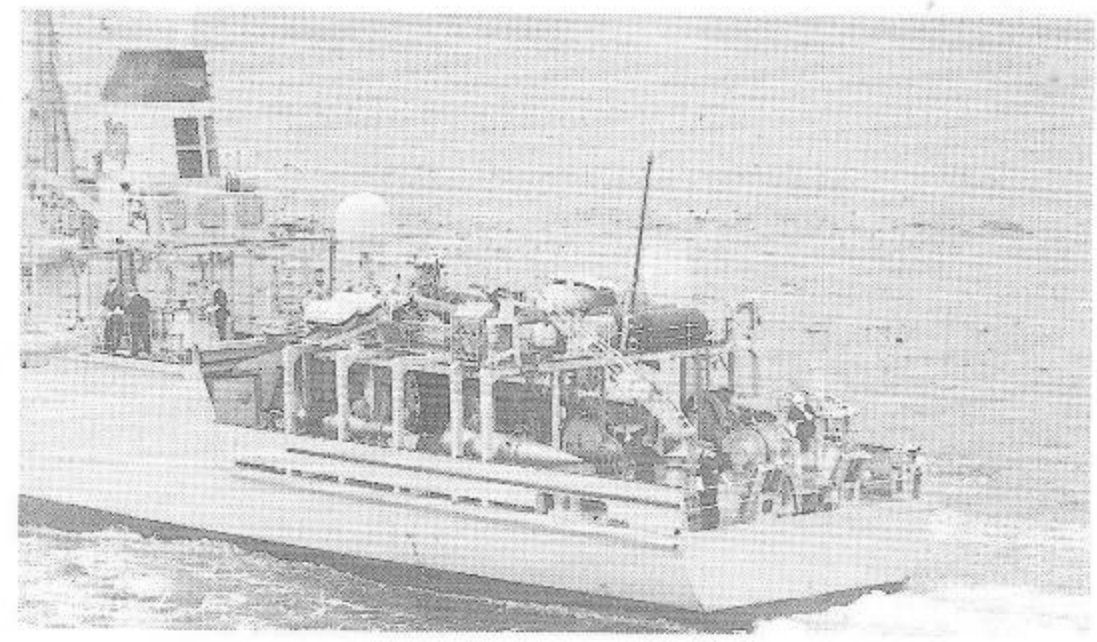
In the bottom-following mode a constant altitude can be achieved by instructing the vehicle to deploy a 'guide-rope'. The winch in the PAP then lowers a selected length of rope and the operator uses return signals from the vehicle to maintain the vehicle at the desired selected height; limits are 2 m (6.56 ft) minimum and 8 m (25.25 ft) maximum.

The PAP Mk 5 is able to carry the 126 kg (277 lb) charge necessary to ensure the total destruction of a mine. Cutters can be carried with the charge. The front section of the vehicle carries a sonar, either a high-resolution nearfield sonar or a mid-range relocation sonar. Identification is carried out by a tiltable low-light TV camera and/or by a tiltable colour TV camera. Vertical thrusters are used to achieve mid-water navigation. Alternative payloads include: explosive charges, cutters (frontal, lateral mechanical and lateral explosive) and a manipulator with a variety of tools.

The PAPs are stored in two large garages on the afterdeck when not in use.



A CAAIS (Outfit DBA) combat information centre



The sweep deck of a 'Hunt' class MCMV showing the wide variety of equipment carried by these relatively small ships. At the left of the picture is a PAP Mk 5 ROV. On the stern are five fairleads for the various sweeps, with two davits and, below the starboard davit, a Towed Acoustic Generator (TAG). Also at the main deck level are a number of floats and a wide variety of winches and cables. On the shutter above are a second PAP Mk 5 ROV, a dinghy for the combat divers, floats, buoys, fenders and Satcom antenna (Jane's/David Miller)

Specifications
PAP Mk 5
Length: 3 m (9.8 ft)
Diameter: 1.2 m (3.9 ft)
Height: 1.3 m (4.2 ft)
Performance:
Max vehicle velocity
mid-water transit: 6 kts (3 m/s)
bottom-following mode: 5.5 kts (2.75 m/s)
Vehicle incidence: ±20° (max)
Vertical velocity with charge: 0.7 m/s
Ascent velocity (charge released): 1.5 m/s
Payload:
NATO charge: 100 kg (220 lb)
Small charge: 30 kg (66 lb)
Horizontal range:
with fibre optic cable: 2,000 m (6,561 ft)
with coaxial cable: 1,000 m (3,280 ft)
Max continuous endurance: 2 h (depending on type of mission)
Max operating depth: 300 m (984 ft)
Watertight integrity: 36 bars

Manufacturer/Contractor
Societé ECA, 92707 Colombes, France.

MINESWEEPING SYSTEMS

Magnetic Sweep Mk 14 (MS Mk 14)
MS Mk 14 is designed to counter magnetic influence mines and consists of two longitudinal electrodes of unequal lengths, their outer ends being connected by a non-conducting loop. the MS Mk 14 can be used on its own, or in combination with MSSA Mk 1 to form a Combined Influence Sweep (CIS).

Manufacturer/Contractor
BAeSEMA, Bristol, UK.

Mine Sweeping System Acoustic Mk 1 (MSSA Mk 1)
MSSA Mk 1 (originally known as 'Osborn') uses a controllable, broadband noise generator to simulate any desired ship's acoustic signature. A monitor near the noise generator senses the noise level and, in conjunction with the shipboard control unit, optimises the signal output for sweeping a wide variety of mines, ensuring that the required amplitude at seabed level is maintained, regardless of variations in acoustic propagation conditions. It is used to activate all acoustic mines, including those with frequency-selective triggering characteristics, which are designed to be actuated only by certain types or classes of vessels. The system comprises a Towed Acoustic Generator (TAG), a Towed Acoustic Monitor (TAM) with a towed hydrophone array, and a shipboard control console. The system has been specially designed to withstand the repeated levels of explosive shock likely to be experienced in operation, and is normally deployed in association with a magnetic sweep.

Manufacturer/Contractor
BAeSEMA Marine Division, Bristol, UK.

Combined Influence Sweep (CIS)
The MS Mk 14 and MSSA Mk 1 can be combined to form a Combined Influence Sweep as shown in the accompanying diagram.

Wire Sweep Mk 8 (WS Mk 8)
Wire Sweep Mk 8 (WS Mk 8) is a low-magnetic signature wire sweep system, which was developed for the 'Hunt' class from the Mk 3 Mod 2 used on the 'Ton' class minesweepers. It has a low-magnetic signature in order to be compatible with the overall low-magnetic characteristics of modern mine countermeasure vessels and, for example, has floats, kites and otters made from Cellobond® GRP rather than aluminium. It will sweep most types of buoyant mines that are moored to the seabed with sinkers by severing the mine mooring chain or wires with explosive cutters fitted to the sweep wires. The Mk 8 can be deployed in three configurations: Single Oropesa, Double Oropesa and Team Sweep.

Manufacturer/Contractor
BAJ Limited, Weston-super-Mare.

GEC-Marconi Minehunting Performance Prediction System
The Minehunting Performance and Prediction System (MPPS) was developed to gather data on underwater environmental and operating conditions to enable sonar operators to select the optimum operating parameters and to derive a probability factor for detection and classification of perceived mines using those parameters. MPPS is a self-contained, computer-based system consisting of a variable depth sound velocity measuring probe which is lowered and raised by an outboard winch and jib assembly sited on the upper deck, and which is controlled either remotely from the operations room or from a local control panel on the winch. The computer, plotter and electronic panel and rack are located below deck in the operations room.

The probe measures the velocity of sound, pressure (indicating the depth) and temperature at intervals of time as the probe is raised from the operator-selected depth. An optional lightweight probe is available which can replace the winch and probe assembly.

Using these data, together with data keyed in by the operator and data received from minehunting sonar, the computer applies programmed algorithms to produce recommendations for the sonar parameters to be used, together with predictions of the classification and detection performance which can be obtained. The operator interacts with the menu-driven program software in the computer using a keyboard and screen displays to insert parameters, select options, deploy the probe and request recommendations and graphical and tabulated information.

In computing the recommended sonar parameters and performance predictions, the system takes account of the ship's sonar characteristics (frequency, pulse length and so on); underwater environment (reverberation, ambient noise, sound profile and so on); ship characteristics (flow/propulsion noise levels and so on); detection, classification and operator performance models; and specific mission inputs (that is, ship speed, sonar operating mode, target characteristics and deployment). The system computes and displays detection range and depth characteristics (detection contour); probability of detection against range; probability of classification against range for moored and ground mines; real-time monitoring of sonar conditions; performance summary; velocity of sound versus depth; ray trace display; optimum towed body height for the variable depth sonar; and data for mission planning, allowing selection of optimum operating modes.

Manufacturer/Contractor
GEC-Marconi Naval Systems, Templecombe, Somerset, UK.

SCARAB
Some Hunts carry the SCARAB remote control, floating mine-towing device to enable them to destroy mines safely once they have been cut from their moorings. It is a catamaran consisting of two pontoons and driven by a standard yacht engine, which is steered by remote control using closed-circuit television. Once near the floating mine, it is secured using a hydraulic grab, and then towed away to a safe distance, where it can be detonated or otherwise disposed of.

MINEHUNTING SONARS

Type 193M Mod 1
The 193M is a short-range, high-definition sector scanning sonar, operating at two frequencies, providing detection and classification of both moored and ground mines. The sonar provides both bearing and range data; the fine range and bearing resolution enables the operator to assess accurately the shape of a target and hence its nature. Since the resolution depends both on operating frequency and pulse length, two selectable frequencies are provided, with a choice of pulse lengths in the classification mode.

Range and bearing data appear on two displays: in the search mode one display shows the total range covered; in the classification mode, a 27 m (30 yd) section of the search display is expanded to fill the second display screen and permit close examination of the target.

Two frequencies are employed by the 193M sonar: 100 kHz for long-range search and 300 kHz for short-range search and classification. The transducers for these signals are carried beneath the ship on a stabilised, steerable mounting, the whole assembly contained within a dome.

Type 193M Mod 1 enhancements have been retrofitted as a modification to the 'Hunt' class.

Manufacturer/Contractor
GEC-Marconi Sonar Systems, UK.

Type 2059
Type 2059 is a special high-frequency (HF) sonar, which is used to track up to five underwater vehicles such as PAPs and submarine rescue vehicles. There are five discrete transmit frequencies (22 kHz, 23.5 kHz, 25 kHz, 26 kHz, and 28 kHz) which activate a transponder aboard each vehicle to respond at 30 kHz. Aboard the MCMV a computer uses the return signal to establish the precise position of each vehicle, which is then fed into the MCMV's command system.

Manufacturer/Contractor
EDO, USA.

WEAPONS SYSTEMS

GUNS

Oerlikon 30 mm/75 DS 30B
The DS 30B uses the Astra/Oerlikon KCB gun and has the UK Ministry of Defence designation 'Single 30 mm Gun Mounting Mk 1.' It has replaced the Bofors 40 mm previously mounted in the 'Hunt' class.

Specifications
Gun
KCB
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Rate of fire: 650 rds/min
Ammunition: 870 g

Mounting
DS 30B
Traverse: 230° at 55°/s
Elevation: −25 to +70° at 55°/s
Mounting weight (loaded): 1,463 kg (3,225 lb)
Crew: 1
Power requirement: 440/415/380 V, 50-60 Hz, three phase (4 kVA)

Manufacturer/Contractor
MSI Defence Systems Ltd.

Oerlikon 20mm GAM-CO1
The GAM-CO1 mount features the KAD gun and has an elevation of −15 to +60°.

Specifications
Calibre: 85
Muzzle velocity: 1,040-1,100 m/s (3,412-3,609 ft/s)
Range:
anti-surface: 1.7 km
anti-air: 1,700 m (5,577 ft)
Rate of fire: 950 rds/min
Round weight: 306-321 g
Projectile: 110-125 g

Manufacturer/Contractor
Royal Ordnance, UK.

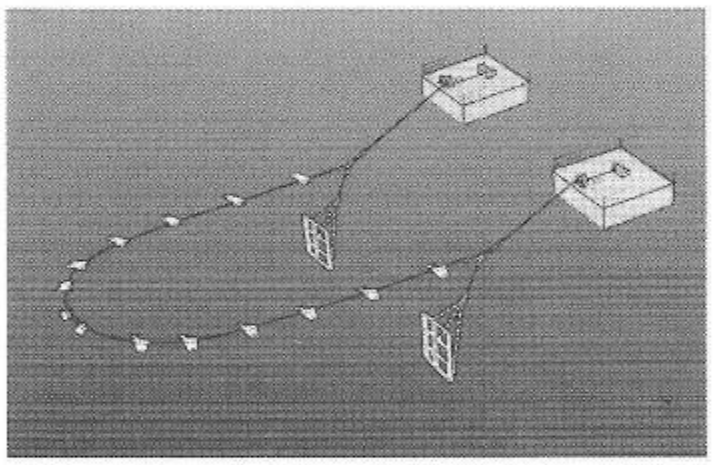
ELECTRONIC WARFARE SYSTEMS

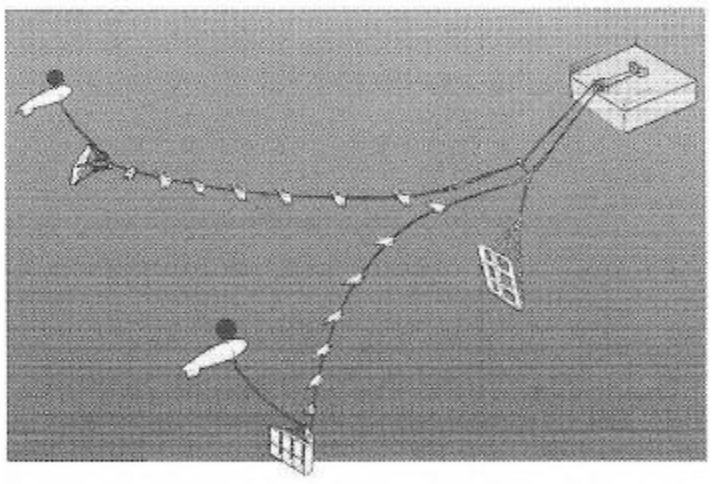
ELECTRONIC SUPPORT MEASURES

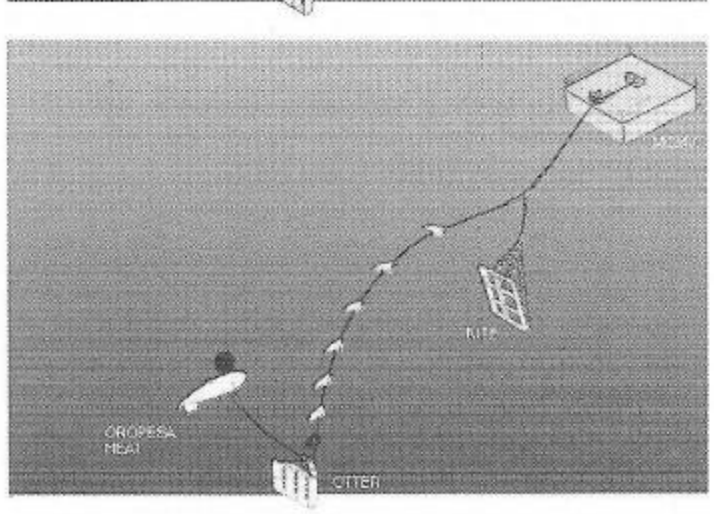
Outfit UAR radar threat warning receiver.
Outfit UAR, also known as MATILDA (Microwave Analysis Threat Indication and Launch Direction Apparatus) covers the frequency range 7.5 to 18 GHz, and is intended to act primarily as a trigger for short-range chaff systems. It detects and recognises the threat, indicates bearing and, if required, activates chaff launchers. There are three elements: a small, lightweight antenna covering 360° in azimuth; a processing unit; and a display. The antenna unit consists of four antenna horns which are circularly polarised for the detection of vertical, horizontal and circular polarised signals. The warning unit consists of a small indicator panel designed to be located at any convenient position in the operations room. On detecting a threat, the unit sounds an audio warning and provides an indication of the threat and bearing sector channel. Total processing/warning time is claimed to be under one second.

Specifications
Frequency range: 7.5-18 GHz
Frequency resolution: 1.5 GHz
Pulsewidth range: 100 ns-6.4 µs
Pulsewidth resolution: 200 ns
Bearing coverage: 360°
Bearing resolution: 45°
Sensitivity (referred to isotropic): −30 dBm
Dynamic range: 40 dB
Antenna gain: 6-8 dB
Voice module: Programmable to any warning required in any language

Manufacturer/Contractor
Thorn EMI Electronics Ltd, Sensors Group, Crawley, West Sussex, UK.







The Wire Sweep Mk 8 (WS Mk 8) was developed specifically for the 'Hunt' class MCMVs. It uses low-magnetic materials and the floats, kites and otters are all made from Cellobond® GRP rather than aluminium. There are three configurations: Team Sweep (top); Double Oropesa (centre); and Single Oropesa (bottom) (BAeSEMA)

Mentor A
In some ships only. Some, but not all, 'Hunt' class MCMVs are equipped with the GEC-Marconi Mentor A ESM system. Mentor is designed around a 32-bit signal processor with software written in Ada and can operate in either automatic or manual modes. The display shows raw and synthetic formats on a dynamic cartesian display, using colour coding to differentiate between friendly, neutral, unknown or hostile emitters. Details of new emitters are shown in tabular form, while areas of particular interest can be expanded for detailed viewing. The simultaneous tracking capability is 200 emitters. Mentor provides immediate warning of missile attacks, with radars being detected, analysed and full information displayed in less than one second, with both audible and visual warnings given. Mentor also triggers the deployment of offboard countermeasures.

Specifications
Mentor
Frequency range: D-J bands
Bearing accuracy: 3-6°
Channels: 6
Sensitivity: −60 dBm
Dynamic range: 60 dB
Emitter library: 3,000
Response time: 1 s
Scan types: Circular, sector, steady, conscan, raster, complex
Track file: >200
Pulsewidth range: <100 ns to 100 µs/CW
PRF range: 100-130 kHz
Elevation coverage: −10 to +50°
Azimuth coverage: 360°

Manufacturer/Contractor
GEC-Marconi Defence Systems, Stanmore, Middlesex, UK.

DECOYS

Barricade (Outfit DLK)
The 'Hunt' class has two Barricade launchers per ship. Barricade (designated Outfit DLK in the UK Royal Navy) is designed to provide ships with an effective and lightweight means of deploying chaff and infra-red decoys as countermeasures to missile attack. The system gives a layered defence against the various phases and types of anti-ship missile attack, ranging from the long-range confusion mode, through medium-range distraction and dump modes to the close in centroid mode. It was originally produced by Wallop Systems (and now by ML Aviation).

The complete system consists of port and starboard launchers, safety switches, a control unit, ready-use ammunition lockers (27 rockets) and rockets. The launcher consists of six sets of triple cells, the outer three sets being angled 60° from the next in bearing so that the launchers provide all-round coverage. The inner three sets are preset to point to the same bearing, as required but in different elevations. The inner three sets fire short-range Palisade rockets in centroid mode, while the outer barrels fire medium- and long-range Stockade rockets in dump, distraction and confusion modes.

Manufacturer/Contractor
M L Aviation, UK.

Irvin Replica chaff buoys
Replica (also known as Rubber Duck) is a rapidly deployed, passive naval decoy which presents a ship-like image to the radar seeker of an incoming anti-ship missile. The equipment consists of a launcher and a pair of liferaft-type containers, each housing one octahedral-shaped radar reflector. The two reflecting bodies start to inflate as they leave the ship and, once in the water, they are linked to each other by a 5 m (16 ft) line with one of the container lids acting as a sea-anchor to ensure that they remain apart. The distance between the opposite tips of the decoy is approximately 2.5 m (8.2 ft) and it contains metal-coated nylon mesh curtains, which are suspended from aluminium alloy tubes.

Manufacturer/Contractor
Irvin, Letchworth, UK.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

CAAIS (Outfit DBA (4))

CAAIS (Computer Assisted Action Information System) is a British-developed system in service in a variety of RN ships as Outfit DBA; Outfit DBA (4) (known colloquially as 'CAAIS for MCMV') is the version developed specifically for the 'Hunt' class MCMVs. CAAIS is a mainframe system using the FM1600B computer and Coral 66 software language. The hardware includes a three-cabinet digital suite which houses a 24-bit computer, operating at 200 Kips and with a 780 k memory, as well as a datalink terminal. In addition there are peripheral control units which include radar extraction units, encoder/decoders, display drive unit and the MMI control units. The last two elements support the display system which, in the CAAIS 400 series, can include up to six CA 1600 horizontal displays.

The search radars have two methods of tracking, LAX (Limited Area automatic eXtraction) and LFX (Limited output Full area automatic eXtraction), either of which involves tracking up to 20 air and surface targets. LAX exploits the capabilities of E/F- and I/J-band radars to produce a combined tracking capability but it is normally used in conjunction with surface search radars. Tracks are initiated manually and the area around the target is highlighted. Where several targets overlap, this limits the data rate of position extraction. LFX is similar but is usually used with air search radars and initially merely indicates the presence of such targets. Location data is not automatically provided to the computer until the operator requests it to form a track.

Manual rate-aided tracking is also available in severe clutter or ECM conditions. Automatic tracking may also be transferred by manual order from one radar to another as well as between manual and LAX. The displays may also accept inputs from ESM and optical/electro-optical systems.

Data from up to three sonars may be accepted by a CAAIS system with data fed to the computer semi-automatically by means of synchro-resolvers at the sonar operator's controls. Initially they are displayed as unassociated points which are 'rippled' in time sequence to assess the tactical position. When a submarine is believed to be in the area an automatic investigation is initiated by the operator around its suspected location. The computer then checks records to see if a track can be initiated and monitored by the sonars. There is provision for the 'rippled' display of up to 16 unassociated points, 32 associated detections shared by up to four tracks.

The CAAIS hardware had to be re-engineered to meet the low-magnetic signature requirements of MCMVs.This involved replacing mild steel components with similar items made of stainless steel, while the power supply units had to be totally redesigned.

Manufacturer/Contractor

Ferranti Naval Systems, UK.

COMMUNICATIONS AND DATALINKS

Satcom
Inmarsat

RADARS

Type 1006 or Type 1007.

Specifications

Type 1006
Role: Navigation
Frequency: I-band
Beam: 1 × 18°/0.75 × 18°
Peak power: 25 kW
Gain: 31 dB/34 dB
Pulsewidth: 0.8 or 0.25 µs/0.75 µs
PRF: 1,600/800 pps
Scan rate: 24 rpm
Typical range: 64 n miles

Manufacturer/Contractor

Kelvin Hughes, UK.

PROPULSION

Specifications

System: Diesel
Main machinery: 2 Ruston-Paxman 9-59K Deltic diesels; 1.42 MW (1,900 hp)
Shafts: 2
Thruster: 1 APE-Allen bow thruster
Pulse generator/auxiliary power: 1 Ruston-Paxman Deltic Type 9-55B diesel, 582 kW (780 hp)
Auxiliary power: 3—200 kW Foden FD 12 Mk 7 amagnetic diesel generators; APE-Allen 60 kW emergency generator (with Lucas gas turbine)

FURTHER INFORMATION

PROGRAMME

The first 11 ships were ordered on 19 June 1980, entering service between 1980 and 1985. A further two were ordered on 4 June 1985 and were commissioned in 1988 and 1989. All were built by Vosper Thornycroft except for two of the first batch, which were built by Yarrow.

DESIGN

The hull and superstructure were fabricated from layers of 800 g/m² Tyglas woven glass roving, bonded with BP Chemicals Cellebond® isophthalic-polyester resin. External surfaces were given a high-grade silane finish, while internal non-structural bulkheads are made of sandwich construction using end-grain balsa cores and thin-glass, phenolic-resin veneered cases. Exhaust uptakes are made from titanium, while the rudder frames are made from GRP-coated phosphor bronze.

Main power is provided by two Ruston-Paxman diesels, while a third diesel set (Ruston-Paxman Deltic Type 9-55B) is used for:

- Four Dowty hydraulic swash pumps which power hydraulic motors to drive propellers at 'creep' speeds of up to 8 kts during minehunting operations
- Seawater pump to drive bow thruster.
- Sweep winches
- Magnetic sweep current alternator (480 kW)
- Sweep cable winch

MODERNISATION

The ships were originally equipped with PAP Mk 4, but these have been replaced by ten PAP 104 Mk 5, acquired in 1988-89. The ships have also received a 30 mm gun in place of the Bofors 40 mm and the Racal Mk 53 navigation system has recently been installed.

A mid-life update was planned, which was to have included VDS sonar, NAUTIS-M command system and a replacement PAP or mine disposal UUV, but this has been cancelled in favour of a less wide-ranging modernisation, which, it is reported, may include the Australian ADI AMASS influence sweep.

Quorn *(M 41) final MCMV of the 'Hunt' class* (Jane's/H M Steele)

SANDOWN

GENERAL SPECIFICATIONS

Operator: UK
Type: Single-role minehunter

Class: SANDOWN

MINE COUNTERMEASURE SYSTEMS

MINEHUNTING SONAR

GEC-Marconi Type 2093

The Type 2093 sonar is designed to operate in either hull-mount or variable depth mode, deployed through the ship's centre well, and will detect, localise and classify all current and future mine threats. Total system weight is 13,000 kg (28,660 lb). The variable depth, dual-frequency search and dual-frequency classification capability provides a sonar able to operate under all bottom and sea conditions at a range claimed to be twice that of hull-mounted sonar and with an increase of three times detection depth.

The towed body of the 2093 is cylindrical with hemispherical ends. The sonar arrays within the body consist of two 360° rings for LF and VLF operation, hydrophones for HF and VHF reception, and separate HF and VHF projectors. Below is a cylindrical VLF projector and finally a VLF depth sounder. LF and VLF are used for search, survey and moored mine classification; HF and VHF for classification and survey.

Sonar 2093 employs multiple operating modes which offer the MCM commander a choice of operational configurations to match the prevailing threat and environment. These multiple operating modes comprise VLF and LF search and moored mine classification, VLF and LF search, search and ground mine classification, also search and route survey. Sonar 2093 can combine these modes to enable concurrent operation.

Manufacturer/Contractor

GEC-Marconi, UK.

Other MCM features

Racal Hyperfix.
Decca Navigation Mk 21.
Kelvin Hughes NAVPAC system integrates all navigational aids to give an accuracy of 9 m (29.5 ft).

REMOTE CONTROL MINE DISPOSAL

PAP Mk 5 ROV

The 'Sandown' class carries two PAP Mk 5 (PAP = poisson auto-propulsé) ROVs, which have the capability simultaneously to hunt and destroy ground mines and tethered mines either by placing and remotely detonating a charge or by cutting the mooring rope of tethered mines. The vehicle is powered by onboard batteries, but is guided from a control console in the operations centre, with signals being passed via either a tether, which can be either a 2,000 m (6,562 ft) fibre optic cable or a 1,000 m (3,281 ft) coaxial cable. It is horizontally propelled by means of two side thrusters.

In the bottom-following mode a constant altitude can be achieved by instructing the vehicle to deploy a 'guide rope'. The winch in the PAP is instructed to deploy a selected length of rope and the operator then uses return signals from the vehicle to maintain the vehicle at the desired selected height; limits are 2 m (6.56 ft) minimum and 8 m (25.25 ft) maximum.

The PAP Mk 5 is able to carry the 126 kg (277 lb) charge necessary to ensure the total destruction of a mine. Cutters can be carried with the charge. The front section of the vehicle carries a sonar, either a high-resolution nearfield sonar or a mid-range relocation sonar. Identification is carried out by a tiltable low-light TV camera and/or by a tiltable colour TV camera. Vertical thrusters are used to achieve mid-water navigation. Alternative payloads include: explosive charges, cutters (frontal, lateral mechanical and lateral explosive) and a manipulator with a variety of tools.

Specifications

PAP Mk 5
Length: 3 m (9.8 ft)
Diameter: 1.2 m (3.9 ft)
Height: 1.3 m (4.2 ft)
Performance:
Max vehicle velocity
mid-water transit: 6 kts (3 m/s)
bottom-following mode: 5.5 kts (2.75 m/s)
Vehicle incidence: ±20° (max)
Vertical velocity with charge: 0.7 m/s
Ascent velocity (charge released): 1.5 m/s
Payload:
NATO charge: 100 kg (220 lb)
Small charge: 30 kg (66 lb)
Horizontal range:
with fibreoptic cable: 2,000 m (6,561 ft)
with coaxial cable: 1,000 m (3,281 ft)
Max continuos endurance: 2 h (depending on type of mission)
Max operating depth: 300 m (984 ft)
Watertight integrity: 36 bars

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC COUNTERMEASURES

Outfit DLK (Barricade)

The 'Sandown' class carries two Barricade launchers per ship on operational deployments. Outfit DLK (designated Barricade for export) is designed to provide ships with an effective and lightweight means of deploying chaff and infra-red decoys as countermeasures to missile attack. The system gives a layered defence against the various phases and types of anti-ship missile attack, ranging from the long-range confusion mode, through medium-range distraction and dump modes to the close in centroid mode. It was originally produced by Wallop Systems (and now by ML Aviation).

The complete system consists of port and starboard launchers, safety switches, a control unit, ready-use ammunition lockers (27 rockets) and rockets. The launcher consists of six sets of triple cells, the outer three sets being angled 60° from the next in bearing so that the launchers provide all-round coverage. The inner three sets are preset to point to the same bearing, as required but in different elevations. The inner three sets fire short-range Palisade rockets in centroid mode, while the outer barrels fire medium- and long-range Stockade rockets in dump, distraction and confusion modes.

Manufacturer/Contractor
M L Aviation.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

GEC-Marconi NAUTIS M

The NAUTIS-M system is based upon the NAUTIC (Naval AUTonomous Intelligent Console) multifunction intelligent workstation.

The NAUTIC itself uses the Intel iAPX-86 processor with 3 Mbyte RAM together with 2 Mbyte non-volatile magnetic bubble memory. Dual iAPX-286 microprocessors are used in Multibus configurates, while iAPX-186 microprocessors are used for intelligent interfaces. The system capacity is 200 air, surface and submarine tracks and reference points with integral radar autotracking for up to 80 air and surface targets. The HCI consists of 32 software-defined function keys with a separate numeric keypad and a rollerball. A dual-redundant MIL-STD-1553B highway links the workstations, each of which uses some 150,000 lines of Ada-language software code to support NAUTIS.

The monochrome system used in the 'Sandown' class features a 4,096 pixel monochrome 40 cm (16 in) System 90 screen and displays raw radar, graphics, alphanumeric totes and an interactive menu. Display scales are from 0.25 to 1,000 n miles (1,852 km) and six labelled electronic range and bearing lines can be attached to moving tracks. An extensive system database, replicated in each console, can typically cover an area of 2,000 × 2,000 n miles (3,704 km) and can include radar and sonar tracks, route/search plans, user-designated tactical maps and synthetic charts. Manually initiated automatic radar tracking is possible for a minimum of 20 tracks.

The NAUTICs are networked into a system designed to meet customer requirements with the workstations configured to meet specific tasks such as radar displays, automatic target tracking, tactical picture compilation, weapon direction and navigation. These roles are software driven and the workstations may be easily reconfigured in the event, for example, of damage or breakdown. Such reconfiguration is based upon a priority decided by the customer. The Military Standard-1553B 1 MHz bandwidth (of which 300 kHz is used) data highway system consoles can interface directly with one or more radars, IFF, navigation sensors, electro-optic and electronic warfare systems but may also be used with Ethernet standard local area networks. Optional facilities include an interactive chart table, automatic tactical plotter/printer as well as data storage and retrieval using magnetic tape cartridges.

NAUTIS-M mine countermeasures (MCM) system provides support for operational planning, ship control guidance, underwater and surface picture compilation, command and control for mine disposal, together with a real-time MCM database. The three-console (minehunting, operations, bridge) monochrome system has been purchased for the Royal Navy and the Royal Saudi Arabian Navy for use with 'Sandown' minehunters. The

Sonar 2093 is the first variable depth, multimode minehunting sonar in any navy and is deployed through the ship's central sonar trunk
(Vosper Thornycroft)

'Sandown' class has the Type 1007 navigation radar, Type 2093 variable depth sonar and PAP 104 Mk 5 remotely operated vehicles.

Manufacturer/Contractor

GEC-Marconi Naval Systems, Combat Systems Division.

RADAR

Kelvin Hughes Type 1007

Navigation radar is the Kelvin Hughes Type 1007.

Specification

Type 1007
Role: Navigation
Frequency: H/I-band (9,410 MHz)
Beam: 1.0 × 18°/0.75 × 18°
Peak power: 25 kW
Pulsewidth: 0.08/0.3/0.8 µs
PRF: 1,600/800/400 pps
Scan rate: 26 rpm

Manufacturer/Contractor

Kelvin Hughes Ltd, Hainault, Essex, UK.

Nautis-M command system aboard a 'Sandown' class SRMH (Vosper Thornycroft)

PROPULSION

Specifications

System: Diesel
Main machinery: 2 × Paxman Valenta 6RP200m diesels; 1.12 MW (1,500 hp) sustained

Propellers: 2 Voith-Schneider cycloidal units
Thrusters: 2 Schottel bow thrusters
Auxiliary power: 3 Perkins V8-250G diesels (335 bhp) plus Maudsley generator sets

FURTHER INFORMATION

PROGRAMME

The 'Sandown' class is designated the Single-Role Minehunter (SRMH) in the UK Royal Navy and is designed to hunt and destroy mines and for operations in deep and exposed waters. Thus, in the UK Royal Navy it complements the 'Hunt' class MCMVs. The Vosper Thornycroft design for this class was approved on 9 January 1984 and the first one was ordered in August 1985, followed by an order for four more on 23 July 1987.

This should have been followed by a contract for a second batch in 1990, but this was deferred twice, until an order for seven more was finally placed in July 1994, with the first Batch 2 ship, *Penzance,* being laid down on 25 September 1995.

DESIGN

The Sandown hull uses a unidirectionally stiffened, single skin GRP structure, which is claimed to be lighter and more cost-effective than previous methods, particularly sandwich. The Batch 2 ships will incorporate a number of modifications, including larger diameter (1.8 m (5.9 ft)) Voith Schneider units, a two-man decompression chamber and a different stern davit.

Numerous MCMV designs use the Voith-Schneider cycloidal propulsion system, which is capable of both propelling and manoeuvring a ship in any chosen direction. The Sandown design is unique in combining the Voith-Schneider units with twin bow-mounted thrusters. The Voith-Schneider units are used for normal passage, but in the minehunting mode the ship is required to manoeuvre regardless of wind and tidal conditions in order to detect, classify and dispose of mines.

The Ship Positioning and Control System (SPCS) is computer-controlled and has two modes of automatic hover:

Dynamic Positioning (DP) uses the bow thrusters and the Voith-Schneider units to manoeuvre the ship towards the hover position and then to maintain it in these low environmental conditions.

Position Control Management (PCM) uses the Voith-Schneider units alone to orientate the ship so that the resultant effect of wind and tide produces the necessary forces to maintain the ship in the required position. Using the environment in this way requires less power and thus reduces the acoustic signature.

Bridport *(M 105) one of the five Sandown Batch 1 single-role minehunters serving with the UK Royal Navy* (Jane's/H M Steele)

DEPLOYMENT

All current Batch 1 'Sandown' class MCMVs are in service with 3rd MCM Squadron.

MINE COUNTERMEASURE SYSTEMS

MINEHUNTING SONAR

GEC-Marconi Type 2093

The Type 2093 sonar is designed to operate in either hull-mount or variable depth mode, deployed through the ship's centre well, and will detect, localise and classify all current and future mine threats. Total system weight is 13,000 kg (28,659 lb). The variable depth, dual-frequency search and dual-frequency classification capability provides a sonar able to operate under all bottom and sea conditions at a range claimed to be twice that of hull-mounted sonar and with an increase of three times detection depth.

The towed body of the 2093 is cylindrical with hemispherical ends. The sonar arrays within the body consist of two 360° rings for LF and VLF operation, hydrophones for HF and VHF reception, and separate HF and VHF projectors. Below is a cylindrical VLF projector and finally a VLF depth sounder. LF and VLF are used for search, survey and moored mine classification; HF and VHF for classification and survey.

Sonar 2093 employs multiple operating modes which offer the MCM commander a choice of operational configurations to match the prevailing threat

Shaqra *(422). Apart from the armament, these Saudi ships are virtually identical with the UK Royal Navy 'Sandown' class (*Vosper Thornycroft)

and environment. These multiple operating modes comprise VLF and LF search and moored mine classification, VLF and LF search, search and ground mine classification, also search and route survey. Sonar 2093 can combine these modes to enable concurrent operation.

Manufacturer/Contractor
GEC-Marconi, UK.

Other MCM features
Racal Hyperfix.
Decca Navigation Mk 21.
Kelvin Hughes NAVPAC system integrates all navigational aids to give an accuracy of 9 m (29.5 ft).

REMOTE CONTROL MINE DISPOSAL

PAP Mk 5 ROV
The 'Sandown' class carries two PAP Mk 5 (PAP = poisson auto-propulsé) ROVs, which have the capability simultaneously to hunt and destroy ground mines and tethered mines either by placing and remotely detonating a charge or by cutting the mooring rope of tethered mines. The vehicle is powered by onboard batteries, but is guided from a control console in the operations centre, with signals being passed via either a tether, which can be either a 2,000 m (6,562 ft) fibre optic cable or a 1,000 m (3,281 ft) coaxial cable. It is horizontally propelled by means of two side thrusters.

In the bottom-following mode a constant altitude can be achieved by instructing the vehicle to deploy a 'guide rope'. The winch in the PAP is instructed to deploy a selected length of rope and the operator then uses return signals from the vehicle to maintain the vehicle at the desired selected height; limits are 2 m (6.56 ft) minimum and 8 m (25.25 ft) maximum.

The PAP Mk 5 is able to carry the 126 kg (277 lb) charge necessary to ensure the total destruction of a mine. Cutters can be carried with the charge. The front section of the vehicle carries a sonar, either a high-resolution nearfield sonar or a mid-range relocation sonar. Identification is carried out by a tiltable low-light TV camera and/or by a tiltable colour TV camera. Vertical thrusters are used to achieve mid-water navigation. Alternative payloads include: explosive charges, cutters (frontal, lateral mechanical and lateral explosive) and a manipulator with a variety of tools.

Specifications
PAP Mk 5
Length: 3 m (9.8 ft)

WEAPONS SYSTEMS

GUNS

ESCO 30 twin 30 mm mounting
There are one twin ESCO (formerly Emerson) 30, 30 mm cannon on the foredeck. The ESCO 30 is a twin 30 mm, 70 calibre weapon designed for air defence, surface engagement and anti-missile operations, using either local or remote control. The ESCO 30 employs two Oerlikon KCB positively locked, gas-operated cannon with the gunner's cabin between them, and forward of the elevating mass. Behind the cabin, and in a sealed compartment, are the elevating and training drives together with flexible chutes to channel ammunition from the magazine. The gunner's cabin is equipped with a daylight reflex, or an image intensifier sight, together with gyro-assisted line of sight stabilisation. Ready-use ammunition is stored in an integral, below-deck, drum magazine with a capacity of 985 rounds for each barrel in a continuous, disintegrating- link belt. These are transferred to the guns through separate chutes by means of electrically operated drives which automatically respond to the individual demand for ammunition supply. Normally, the mount uses ship's power supplies, but this is backed up by an on-mount battery, providing sufficient power to fire a full complement of ammunition and, finally, there is the traditional hand-crank mechanism operated by the gunner.

Specifications
Calibre: 30 mm
Length of barrel: 75 calibres
Muzzle velocity: 1,080 m/s (3,543 ft/s)
Traverse: 360° at 80°/s
Elevation: −15 to +80° at 80°/s
Crew: 1
Range: 3.25 n miles (6 km) (anti-surface) (max)
Rate of fire: 600 rds/min/barrel (nominal) or 140 rds/min/barrel (nominal)
Ammunition: 870 g (31 oz) (HEI/HEI-T, SAPHEI, TP/TP-T)

Manufacturer/Contractor
Electronics & Space Corporation (ESCO), St Louis, Missouri, USA.

ELECTRONIC WARFARE SYSTEMS

ELECTRONIC SUPPORT MEASURES

Thomson-CSF Shiploc radar warning receiver
Shiploc is a shipborne Radar Warning Receiver (RWR) which covers D to J frequency bands to provide warning against threat radar systems, and is designed for smaller vessels such as FACs and MCMVs. It has a very high sensitivity and provides instantaneous and accurate threat identification. Software-controlled Shiploc is fully reprogrammable during the mission and will carry out target designation for countermeasures equipment such as chaff launchers. Display of threat information can be either on a CRT or LED display or a combined CRT/LED display giving the direction, type and level of threat.

Manufacturer/Contractor
Thomson-CSF, Radio and Countermeasures Division, Elancourt, France.

DECOYS

Loral Hycor SRBOC Mk 36 6-barrelled Chaff Launcher
There are four Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) units, two mounted on either side of the forward Vulcan Phalanx CIWS.

Specifications
Launcher
Dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Weight: 173 kg (381.4 lb)
Range: 2.2 n miles (4 km)

Rounds
Diameter: 130 mm (5.1 in)
Length, weight:
Mk 182: 1,209 mm; 22.7 kg

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

GEC-Marconi NAUTIS M
The NAUTIS-M system is based upon the NAUTIC (Naval AUTonomous Intelligent Console) multifunction intelligent workstation.

The NAUTIC itself uses the Intel iAPX-86 processor with 3 Mbyte RAM together with 2 Mbyte non-volatile magnetic bubble memory. Dual iAPX-286 microprocessors are used in Multibus configurates, while iAPX-186 microprocessors are used for intelligent interfaces. The system capacity is 200 air, surface and submarine tracks and reference points with integral radar autotracking for up to 80 air and surface targets. The HCI consists of 32 software-defined function keys with a separate numeric keypad and a rollerball. A dual-redundant MIL-STD-1553B highway links the workstations, each of which uses some 150,000 lines of Ada-language software code to support NAUTIS.

The monochrome system used in the 'Sandown' class features a 4,096 pixel monochrome 40 cm (16 in) System 90 screen and displays raw radar, graphics, alphanumeric totes and an interactive menu. Display scales are from 0.25 to 1,000 n miles (1,852 km) and six labelled electronic range and bearing lines can be attached to moving tracks. An extensive system database, replicated in each console, can typically cover an area of 2,000 × 2,000 n miles (3,704 km) and can include radar and sonar tracks, route/search plans, user-designated tactical maps and synthetic charts. Manually initiated automatic radar tracking is possible for a minimum of 20 tracks.

The NAUTICs are networked into a system designed to meet customer requirements with the workstations configured to meet specific tasks such as radar displays, automatic target tracking, tactical picture compilation, weapon direction and navigation. These roles are software driven and the workstations may be easily reconfigured in the event, for example, of damage or breakdown. Such reconfiguration is based upon a priority decided by the customer. The Military Standard-1553B 1 MHz bandwidth (of which 300 kHz is used) data highway system consoles can interface directly with one or more radars, IFF, navigation sensors, electro-optic and electronic warfare systems but may also be used with Ethernet standard local area networks. Optional facilities include an interactive chart table, automatic tactical plotter/printer as well as data storage and retrieval using magnetic tape cartridges.

NAUTIS-M mine countermeasures (MCM) system provides support for operational planning, ship control

guidance, underwater and surface picture compilation, command and control for mine disposal, together with a real-time MCM database. The three-console (mine-hunting, operations, bridge) monochrome system has been purchased for the Royal Navy and the Royal Saudi Arabian Navy for use with 'Sandown' minehunters. The 'Sandown' class has the Type 1007 navigation radar, Type 2093 variable depth sonar and PAP 104 Mk 5 remotely operated vehicles.

Manufacturer/Contractor
GEC-Marconi Naval Systems, Combat Systems Division.

COMMAND AND CONTROL SYSTEMS

WEAPONS CONTROL

Sea Hawk Mk II

Sea Hawk Mk II is a lightweight electro-optical fire-control/surveillance system consisting of an electro-optical director, an operator control console (OCC), a weapon control module (WCM) and a pedestal electronics cabinet (PEC). The director has three sensors:

An Nd-YAG laser with a 1 mrad 10 Hz pulsed beam and a measuring range of between 280 m and 20.5 km.

A ruggedised, high-resolution vidicon TV camera with a focal length of 32 to 320 mm (1.2 to 12.5 in) and a CCIR output, housed in an environmental protection container with its own washer/wiper mechanism for the window.

A FLIR dual field of view unit (12 × 8° and 3.16 × 2.1°), operating in the 8-12 µm wavelength, with the same environmental protection as the TV camera and cooled by a split Stirling engine.

The PEC has a 16- or 32-bit microcomputer and supports the pedestal electronics. The OCC is used to monitor the system and to insert data on calibration and ammunition. The WCM houses a 32-bit processor and interfaces with the director and the weapon or weapons. The WCM filters engagement data and also provides trajectory prediction, aiming point calculation and fire restriction data.

The Sea Hawk can designate its own targets through automatic horizon/sector scans or by manual input using the MMI. Alternatively targets may be designated either by the ship's radar through a tactical data handling system or by a bridge target indicator system. With radar designation the Sea Hawk conducts a search by means of an elevation scan while, with a target indicator system, the search is conducted in elevation and azimuth. There are four tracking modes; two for air targets, one each for surface targets and auto-track. Air targets may be tracked either with the full range of electro-optics (3D tracking) or by using the TV and FLIR sensors (2D tracking). The latter is also used for surface target tracking although this may also be performed manually with the aid of the joystick. The auto-track mode, using the TV sensor, is used against both air and surface targets.

Manufacturer/Contractor
Contraves Corp, USA.

RADARS

Kelvin Hughes Type 1007

Navigation radar is the Kelvin Hughes Type 1007.

Specification
Type 1007
Role: Navigation
Frequency: H/I-band (9,410 MHz)
Beam: 1.0 × 18°/0.75 × 18°
Peak power: 25 kW
Pulsewidth: 0.08/0.3/0.8 µs

General 1 *Racal-Decca 1229 navigation radar* **2** *Twin 12.7 mm machine guns*

The 'Aggressive' class was constructed in the United States between 1952 and 1956 as part of the NATO response to the mining threat posed by the (then) Soviet Union. 62 were for the US Navy, but 26 went to NATO allies under the Mutual Defense Aid Pact (MDAP): Belgium — 4; France — 8; Italy — 2; Netherlands — 6; Norway — 2; Portugal — 4. They were built of wood, with fittings of either bronze or non-magnetic stainless steel, and were fitted with an automatic degaussing system. The diesel engines were made of non-magnetic stainless steel alloy and drove LIPS controllable-pitch propellers.

As built, they carried a new mine locating sonar, AN/UQS-1, although this was eventually replaced by another new system, AN/SQQ-14. The 'Aggressive' class remained in service with the US Navy for a remarkably long time, although many were stricken in the 1970s (some of which were transferred abroad), but the last few remained in service until replaced by the 'Avenger' class in the early 1990s. They were capable of sweeping mines of all types.

MINE COUNTERMEASURE SYSTEMS

MINEHUNTING SONAR

Lockheed Martin AN/SQQ-14 (IT)
Variable depth sonar. The AN/SQQ-14 system is essentially a variable depth, dual-frequency sonar for detecting and classifying bottom mines in shallow water. It utilises a towed body in the shape of an elongated sphere towed through a centre well on a mine countermeasures vessel.

The AN/SQQ-14 can operate down to 45 m (148 ft). It transmits at 80 kHz and 350 kHz respectively for search and classification, scanning over azimuths of 100° and 18°, and through an elevation of 10° in each case. Azimuth and range resolutions are 1.5° and 1 m (3.28 ft) for search, and 0.3° and 8 cm (3.1 in) for classification. Under the SQQ-14 IT programme FIAR has produced new dry and wet end electronics for the SQQ-14 for the Belgian and Italian navies.

Manufacturers/Contractors
Lockheed Martin, US/FIAR Italy.

Scan rate: 25 rpm

Manufacturer/Contractor

Racal-Decca, UK.

PROPULSION

Specifications

System: Diesel
Main machinery: 4 × GM 8-268A diesels; 1.3 MW (1,760 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

M 908 was one of four supplied new to the Belgian Navy in 1955-56. M 903, however, was one of a pair supplied at the same time to the Royal Norwegian Navy, but in 1966 the Norwegians exchanged their two 'Aggressive' class ocean minesweepers for three Belgian 'Adjutant' class inshore minesweepers.

DEPLOYMENT

Both these ships are based at Zeebrugge and are to be kept operational for the foreseeable future. There are two other survivors of this class in the Belgian Navy: M 902 is used as a base ship for divers and M 909 is cocooned in reserve.

GUADALETE (AGGRESSIVE)

GENERAL SPECIFICATIONS

Country of origin: USA
Operator: Spain
Type: Aggressive (Ocean minesweepers)

Class: GUADALETE

Acquired: 4
Active: 4

Displacement:
full load: 817-853 t

Dimensions
Length: 52.6 m (172.5 ft)
Beam: 10.7 m (32.1 ft)
Draught: 4.3 m (14.1 ft)

Speed: 14 kts
Range: 3,000 n miles at 10 kts

Complement: 74 (6 officers)

SHIPS

GUADALETE (M 41)
Builder Colbert, Stockton, California, USA
Commissioned (US Navy) 15 Dec 1953 (*Dynamic* (MSO 432))
Transferred (Spain) (MDAP) 1 Jul 1971
Purchased (Spain) 1974

GUADALMEDINA (M 42)
Builder Wilmington BW, California, USA
Commissioned (US Navy) 12 Jul 1954 (*Pivot* (MSO 463))
Transferred (Spain) (MDAP) 1 Jul 1971
Purchased (Spain) 1974

GUADALQUIVIR (M 43)
Builder Tacoma, Seattle, Washington, USA
Commissioned 3 Feb 1956 (*Persistant* (MSO 491))
Transferred (Spain) (MDAP) 1 Jul 1971
Purchased (Spain) 1974

GUADIANA (M 44)
Builder Burgess Boat Co, Manitowoc
Commissioned (US Navy) 8 Nov 1954 (*Vigor* (MSO 473))
Transferred (Spain) (MDAP) 4 Apr 1971
Purchased (Spain) 1974

MINE COUNTERMEASURES SYSTEMS

Gaymarine Pluto ROV

Fitted in some. Pluto is available in three configurations: battery-powered with a 6 mm, 500 m (1,640 ft) long umbilical cable; battery-powered with a 3 mm, 2,000 m (6,561 ft) long fibre optic umbilical cable; or remotely powered, unlimited endurance with 8 mm, 500 m (1,640 ft) long umbilical cable. The vehicle is powered by five thrusters: two horizontal for forward/reverse, two vertical for vertical and lateral shift, and a transversal thruster. The thrusters are controlled by two joysticks. The vehicle can maintain automatic depth control within ±10 cm (4 in). Maximum speed forwards is 4 knots and vertical speed 1 knot. Sensors are mounted in the forward tiltable section of the vehicle. Optional equipment includes black and white LLTV, colour TV or still camera, search or scanning sonar, acoustic pinger, strobe flash, measuring instruments, manipulators and so on. There are 10 free channels for remote control and two four-digit telemetry channels for measurements. The console incorporates a 9 in TV monitor for display of information showing TV image, depth, compass, head tilt angle, elapsed time and sonar diagram. All displayed data can be video recorded.

Specifications

Length: 1,680 mm (66 in)
Width: 600 mm (24 in)
Height: 630 mm (25 in)
Weight: 160 kg (353 lb)
Service depth: 400 m (1,312 ft)
Payload: 15 kg (33 lb)

Manufacturer/Contractor

Gaymarine, Italy.

MINEHUNTING SONAR

Lockheed Martin AN/SQQ-14

Variable depth sonar. The AN/SQQ-14 system is essentially a variable depth, dual-frequency sonar for detecting and classifying bottom mines in shallow water. It utilises a towed body in the shape of an elongated sphere towed through a centre well on a mine countermeasures vessel. The AN/SQQ-14 can operate down to 45 m (148 ft). It transmits at 80 kHz and 350 kHz for search and classification respectively, scanning over azimuths of 100° and 18°, and through an elevation of 10° in each case. Azimuth and range resolutions are 1.5° and 1 m (3.28 ft) for search, and 0.3° and 8 cm (3.1 in) for classification.

Manufacturer/Contractor

Lockheed Martin, USA.

WEAPONS SYSTEMS

GUNS

Oerlikon 20 mm twin mounting

The Spanish ships are armed with one twin Oerlikon mounting. The Mk 24 20 mm mounting was designed primarily for air defence and features two Mk 2 or Mk 4 guns which are 165 mm (6.5 in) apart. The muzzle arc clearance is 138 cm (54 in) and the working circle is 141 to 152 cm (55.5 to 60 in). The mounting has a crew of three. Elevation of −15 to +90°.

Specifications

Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,739 ft/s)
Range
anti-surface: 1.5 km
anti-air: 1,150 m (3,773 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g

COMMAND AND CONTROL SYSTEMS

RADAR

Racal-Decca 1226

The Type 1226 radar is used for surface search. This model is part of the Solid State series with a maximum power output of 25 kW. They have 30 cm (11.8 in) PPI (Plan Position Indicator) displays and come with 1.83 m (6.0 ft) antennas.

Specifications

Type 1226
Role: Navigation
Frequency: I-band
Range: 48 n miles (81 km)
Beam: 1.2°
Peak power: 25 kW
Gain: 30 dB
Pulsewidth: 0.05/0.25/1.0µs
Scan rate: 28 rpm

Manufacturer/Contractor

Racal-Decca, UK.

Racal-Decca 626

Navigation radar is Racal-Decca, I-band, Model 626.

PROPULSION

Specifications

System: Diesel
Main machinery: 4 Packard ID-1700 diesels; 1.7 MW (2,280 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

The first three were transferred from the USA under the MDAP and commissioned on 1 July 1971, followed by the fourth ship on 4 April 1972. All were purchased outright in August 1974. Modernisation was completed in 1984-86 to extend their service lives. At least two Pluto ROVs were acquired in 1989 in order to gain experience while the new MCMVs are being built.

DEPLOYMENT

All four ships are based at Cartagena.

THE FUTURE

These four MCMVs, plus a number of smaller but equally old vessels, will be replaced by four new Spanish GRP minehunters in 1997-98, which will be built in Spain by Bazan. The Spanish Navy hopes to order a further four of the same type (see CME).

YUNG YANG (AGGRESSIVE)

MINE COUNTERMEASURE SYSTEMS

MINEHUNTING SONAR

Lockheed Martin AN/SQQ-14

Variable depth sonar. The AN/SQQ-14 system is essentially a variable depth, dual-frequency sonar for detecting and classifying bottom mines in shallow water. It utilises a towed body in the shape of an elongated sphere towed through a centre well on a mine countermeasures vessel.

The AN/SQQ-14 can operate down to 45 m (148 ft). It transmits at 80 kHz and 350 kHz respectively for search and classification, scanning over azimuths of 100° and 18°, and through an elevation of 10° in each case. Azimuth and range resolutions are 1.5° and 1 m (3.28 ft) for search, and 0.3° and 8 cm (3.1 in) for classification.

Manufacturer/Contractor
Lockheed Martin, USA.

WEAPONS SYSTEMS

GUNS

M2HB 12.7 mm machine guns

Two M2HB are carried. This is a selective short recoil automatic operation weapon with a 1,143 mm (45 in) long barrel.

Specifications
Gun
Weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

COMMAND AND CONTROL SYSTEMS

RADAR

Sperry AN/SPS-53L

AN/SPS-53 is a Raytheon, I-/low J-band, high resolution search radar which employs a 1.5 m slotted array antenna. SPS-53 radars are now to be found only in a few, mainly elderly, warships.

Specifications
AN/SPS-53L
Role: Surface search
Frequency: I-band
Beam: 1.6 × 20°
Peak power: 40 kW
Gain: 30 dB
Pulsewidth: 0.5/1.0 µs
PRF: 750/1,500 pps
Scan rate: 15 rpm
Maker: Raytheon

PROPULSION

Specifications
System: Diesel
Main machinery: 4 × Packard ID-1700 or Waukesha diesels; 1.7 MW (2,280 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These four ships were transferred by sale to Taiwan from the US Navy on 3 August and 30 September 1994, although actual delivery was delayed into 1995 while replanking work was carried out in the USA. All were recommissioned on 1 March 1995. All are fitted with SLQ-37 mechanical acoustic and magnetic sweeps and can carry an ROV.

These ships represent a substantial addition to the 'Adjutant' class which forms the backbone of the Taiwanese MCM flotilla, although it was reported that the RoCN was not best pleased to receive such elderly boats at a time when the rest of the navy is receiving modern ships at last.

SWIFTSHIPS CMH

MINE COUNTERMEASURES SYSTEMS

UniSys Command System

These ships are fitted with a Unisys minehunting command data handling system, which is an improved version of AN/SYQ-12.

General facilities

- GPS
- Line of sight navigation system.
- Dynamic positioning.
- Side-scan sonar body and the Pluto ROV can be streamed from a deck crane.
- Portable decompression chamber.

Gaymarine Pluto ROV

The Pluto ROV is available in three configurations: battery-powered with a 6 mm, 500 m (1,640 ft) long umbilical cable; battery-powered with a 3 mm, 2,000 m (6,561 ft) long fibre optic umbilical cable; or remotely powered with an 8 mm, 500 m (1,640 ft) long umbilical cable, giving virtually unlimited endurance. There are five thrusters: two horizontal for forward/reverse, two vertical for vertical and lateral shift, and a transverse thruster. The thrusters are controlled by two joysticks. The vehicle can maintain automatic depth control within ±10 cm (4 in). Forward maximum speed is 4 knots and vertical speed 1 knot.

Sensors are mounted in the forward tiltable section of the vehicle. Optional equipment includes black and white LLTV, colour TV or still camera, search or scanning sonar, acoustic pinger, strobe flash, measuring instruments, manipulators and so on. There are ten free channels for remote control and two four-digit telemetry channels for measurements.

The console incorporates a 9 in TV monitor for display of information showing TV image, depth, compass, head tilt angle, elapsed time and sonar diagram. All displayed data can be video recorded.

Specifications

Pluto ROV
Length: 1,680 mm (66 in)
Width: 600 mm (23.6 in)
Height: 630 mm (24.8 in)
Weight: 160 kg (353 lb)
Service depth: 400 m (1,312 ft)
Payload: 15 kg (33 lb)

Manufacturer/Contractor

Gaymarine, Italy.

MINEHUNTING SONAR

Thomson-CSF TSM 2022

TSM 2022 is a hull-mounted high-frequency minehunting sonar, which can also be used for mine avoidance on minesweepers. It is based largely on experience gained with the French DUBM 21B in the field of high-resolution beam-forming techniques. It is a hull-

The Egyptian coastal minehunter is based on a US commercial fishing boat (Swiftships)

mounted equipment intended also for use in conjunction with precision display and navigation equipment and a mine countermeasures system.

The main feature of the TSM 2022 is its small-size retractable single array assembly, used for both detection and classification, which enables easy installation and maintenance. The high-resolution features of the DUBM 21 are maintained and improvements are mainly in the field of digital processing technology. The main functions of the sonar are: detection and classification of moored and bottom mines, detection at distances up to 600 m (1,968 ft), and classification of targets by analysis of the shape of their echo or shadow at distances up to 250 m (492 ft). In the classification mode, horizontal beamwidth is 7°; in detection mode either 14° or 28° beamwidth can be selected. In both modes the vertical beamwidth is 15°. In the Mk II configuration the TSM 2022 is equipped with a 19 in high-resolution colour console and specific sonar processing such as computer-aided detection (CAD), computer-aided classification (CAC) and performance indicator (PI).

Manufacturers/Contractors

Thoray.
US/Thomson Sintra ASM, France.

WEAPONS SYSTEMS

GUNS

M2HB 12.7 mm machine gun

Two M2HB 12.7 mm (0.50 in) machine guns are carried in each ship. The M2HB is a selective short recoil automatic operation weapon using 110-round belts.

Specifications
M2HB
Calibre: 12.7 mm
Barrel: 90 calibres
Gun weight: 38.1 kg (84.0 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

COMMAND AND CONTROL SYSTEMS

RADAR

Sperry

One Sperry I-band navigation radar is mounted.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 MTU 12V 183 TE61 diesels; 786 kW (1,068 hp(m))
Shafts: 2
Propellers: 2 Schottel steerable propellers
Thruster: 1 White Gill thruster, 224 kW (300 hp)

FURTHER INFORMATION

PROGRAMME

These MCMVs were ordered from Swiftships in the USA in December 1990, using FMS (Foreign Military Sales) funding. The first of class passed its acceptance trials in June 1994 and was completed in August 1994. The other two followed in November 1995 and February 1996, respectively.

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING GEAR

AN/SLQ-37(V)3

A modular magnetic/acoustic influence sweep equipment developed specifically for the 'Avenger' class. Modules include:

- Acoustic (A) sweeps:
  - A Mk 2. An acoustic noise-maker.
  - A Mk4(V). A towed, hydraulically operated hammer device transmitting at 60-600 Hz.
  - A Mk 6B. A towed device, which uses a diaphragm driven by pistons, operated by an electric motor.
- Magnetic (M) sweeps:
  - M Mk 5. Two-legged sweep of uneven lengths.
  - M Mk 6. Two-legged sweep in which the end of the longer leg is diverted inwards towards the shorter leg.
  - M Mk 7.
  - Two MagneTek solid-state 2,500 amp magnetic-pulse sweep generators.

AN/SLQ-38 Oropesa sweep Type O Size 1

A standard mechanical sweep, this is the largest in the US Navy inventory. It is streamed with 550 m (300 fathom) wires at about 8.5 kts. The swept path is roughly 230 m (250 yd) wide for a side-sweep, and 460 m (500 yd) for a double sweep.

MINEHUNTING SONARS

AN/SQQ-30

AN/SQQ-30 is the successor to the AN/SQQ-14 system and consists of two sonars: a search sonar for initial detection; and a high-frequency, high-resolution sonar for classification of targets. The two sonars are separated to give the area coverage needed. They are housed in a hydrodynamically shaped vehicle and towed at various speeds by the minehunter. The towed body is streamed from a well in the forward part of the ship, using a winch driving a 3 m (9.8 ft) diameter cable drum on the foredeck. Two display consoles are provided for the search and classification sonars, which have ranges of 600 m (1,968 ft) and 200 m (656 ft), respectively.

Manufacturer/Contractor

Lockheed Martin.

AN/SQQ-32

The AN/SQQ-32 was fitted in MCM 10 onwards and is being retrofitted to the rest. SQQ-32 consists of two separate sonars: a search sonar for initial detection; and a high-frequency, high-resolution sonar for classification of the targets. The detection sonar, designed and manufactured by Raytheon, detects mines over a wide range of distances and bottom conditions. This system incorporates a computer-aided detection facility which is designed to help the sonar operator to discard non-mine objects detected by the sonar. Raytheon is also providing the computer facilities and display consoles and is responsible for overall system integration. The classification sonar, designed and fabricated by Thomson Sintra ASM, is based on its experience with the DUBM 21 and TSM 2022 minehunting sonars. The classification sonar provides very high-resolution transmission and reception of underwater signals to enable targets to be identified with near-picture quality. The AN/SQQ-32 has two identical operator consoles with high-resolution displays. Search and classification data can be displayed simultaneously or independently. Automated detection and control functions are performed by two AN/UYK-44 computers.

Manufacturers/Contractors

Raytheon Company, US.
Thomson Sintra Activités Sous-Marines, France.

ROV

Alliant Techsystems AN/SLQ-48 ROV

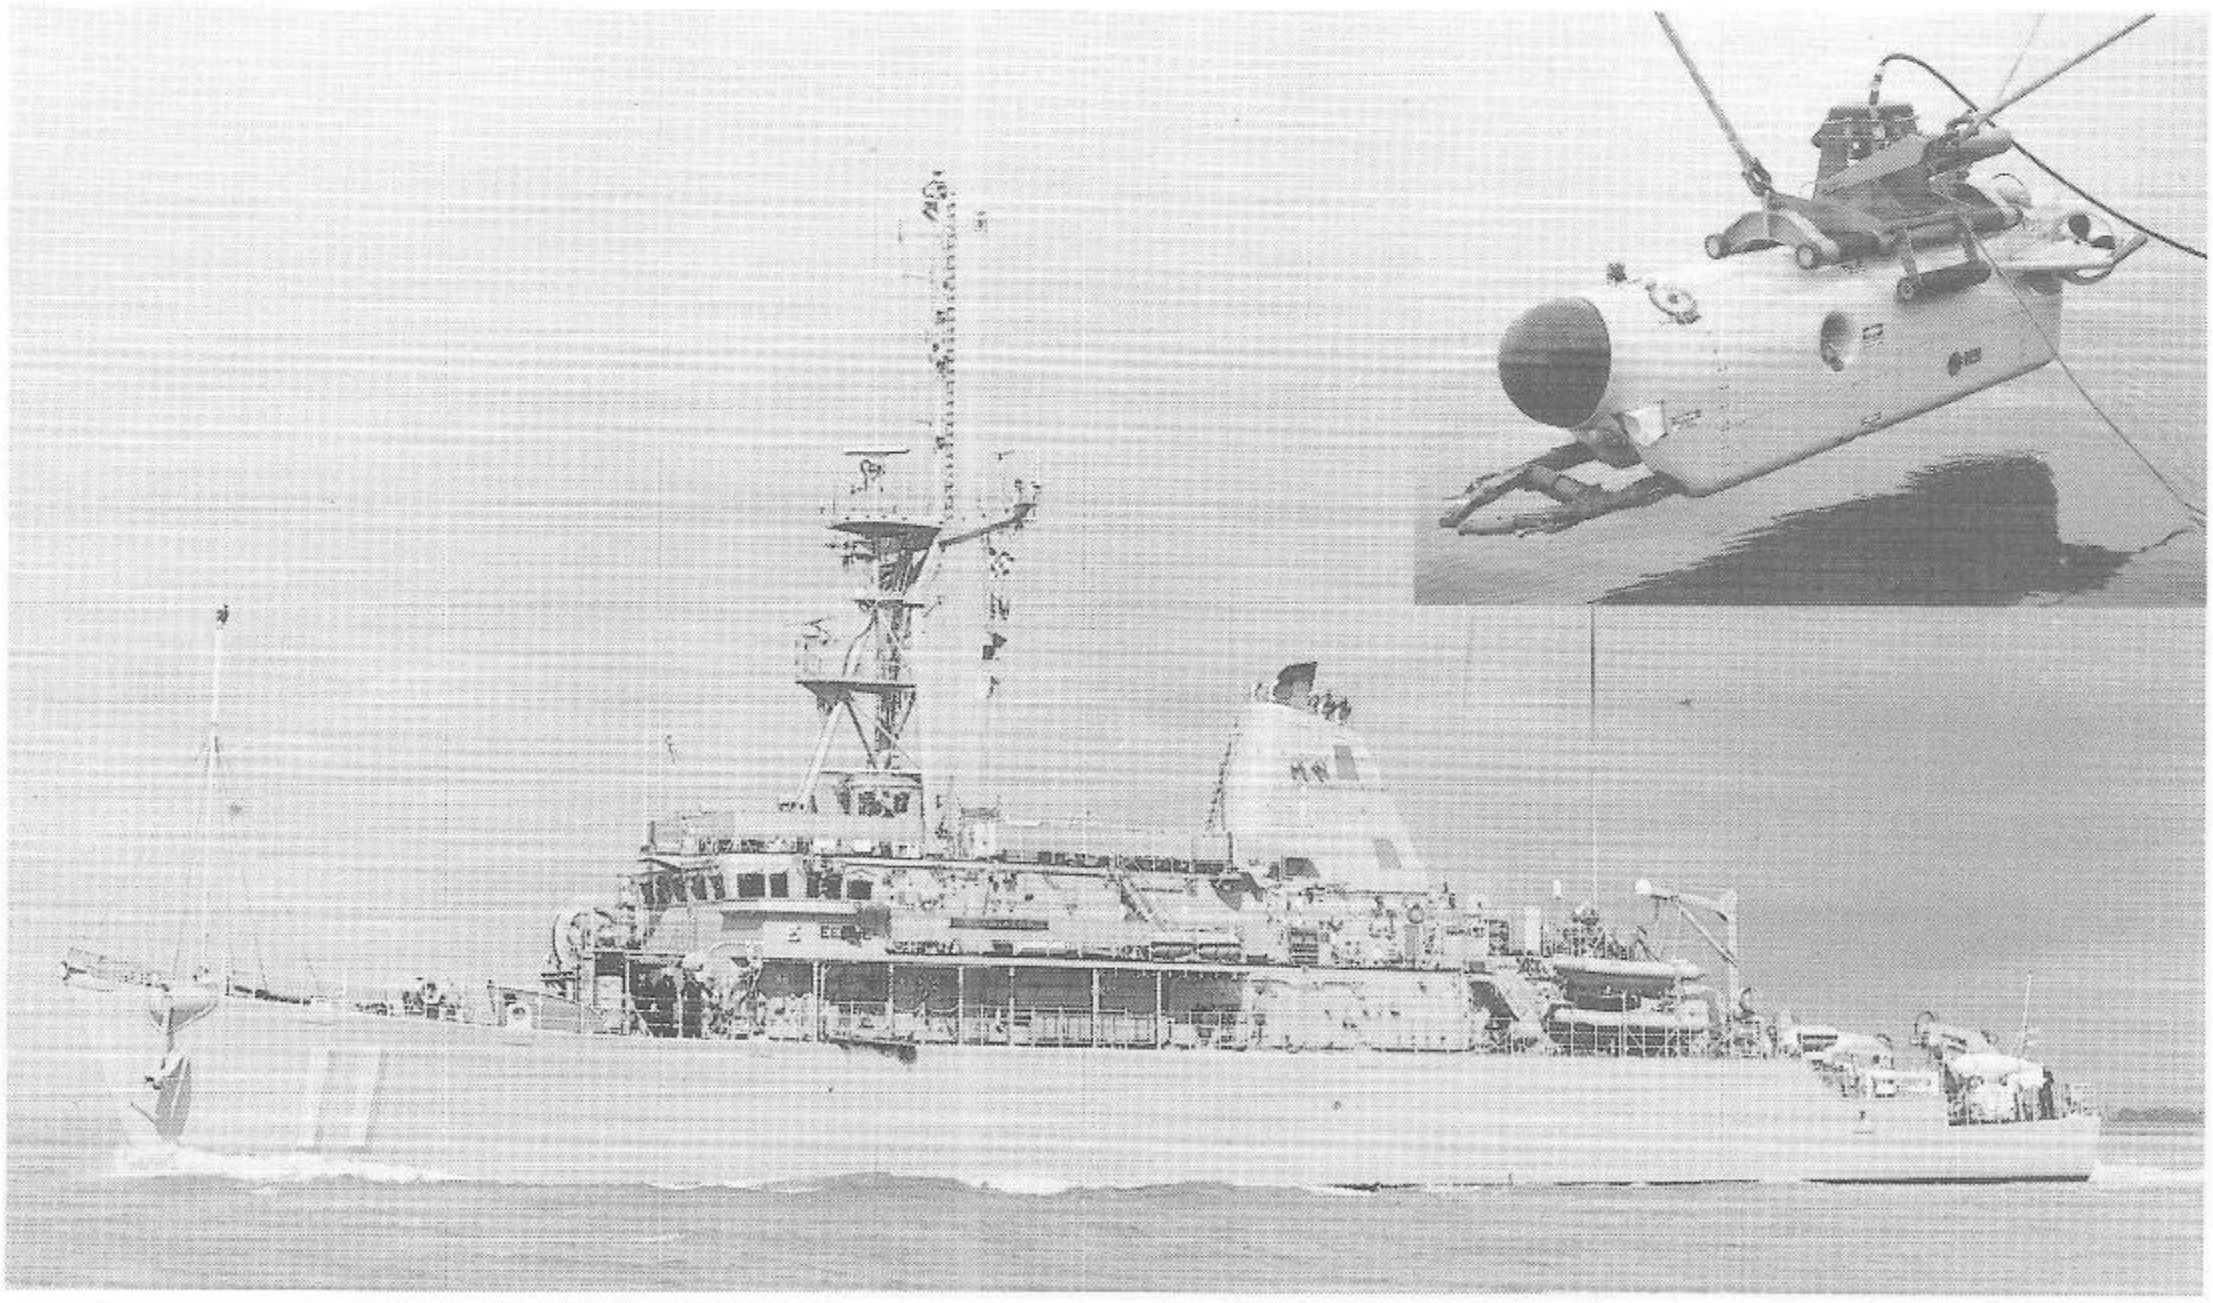
There are two AN/SLQ-48 ROV (remotely operated vehicle) or mine neutralisation systems (MNS), which are designed to detect, locate, classify and neutralise moored and bottom mines, using high-resolution sonar, low-light level TV, cable cutters and mine destruction charges. The tethered underwater vehicle carries these sensors and countermeasures and is controlled from the parent vessel. Initial target detection and vehicle guidance information is provided by the ship's sonar. Initial vehicle navigation is plotted and monitored within the MNS acoustic tracking system. Vehicle sonar is used during the mid-course search and final homing phases, and high resolution enables operations in poor visibility by sonar guidance alone. Low-light TV is used in conjunction with sonar during the precision guidance phase near the target.

Specifications

Length: 3.8 m (12.4 ft)
Width: 0.9 m (3.0 ft)
Height: 1.2 m (3.9 ft)
Speed: 6 kts
Vehicle weight: 1,247 kg (2,749 lb) (in air)
Propulsion: Hydraulic, twin 15 hp
Thrusters: Horizontal/vertical/lateral
Cable length: 1,070 m (3,510 ft)
Power requirements: 43 kVA

Manufacturer/Contractor

Alliant Techsystems, USA.



Gladiator *(MCM 11). All metallic elements in the ship are made from stainless steel, aluminium, copper, brass, or bronze. The large winch before the bridge is for lowering and raising the AN/SQQ-32 variable depth sonar* (H & L van Ginderen Collection)

WEAPONS SYSTEMS

GUNS

Mk 26 Mod 17 12.7 mm machine guns

Two Mk 26 Mod 17 machine guns are carried. This is a selective-fire, short-recoil, automatic weapon with a 1,143 mm (45 in) long barrel.

Specifications

Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

GEC-Marconi AN/SYQ-15 NAUTIS-M

Fitted in last two ships (and to be fitted in all), NAUTIS-M is a one, two or three console system to provide support for operational planning, ship control guidance, underwater and surface picture compilation, command and control for mine disposal, together with a real-time MCM database. The three-console (minehunting, operations, bridge) monochrome system is the version purchased for the US Navy for the 'Avenger' class MCM ships. In the 'Avenger' class, the AN/SYQ-15 integrates the outputs from the AN/SPS-55 search radar; either AN/SQQ-30 (MCM 1-9) or AN/SQQ-32 (MCM 10-14) variable depth sonar; and the AN/SLQ-48 remotely operated vehicle.

Manufacturer/Contractor
GEC-Marconi, UK.

Thruster: 1 Omnithruster hydrojet; 257 kW (350 hp)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These ships are the result of a protracted programme, which had more than its fair share of problems. A programme for a new class of 19 MCMVs was approved in 1976, the ships being mainly intended to counter new Soviet deep-water mines, but the programme was cancelled on the grounds of cost. Subsequently, another programme was started which led to the 'Avenger' class, with the contract for the prototype MCM being awarded in June 1982, followed by contracts for MCM 2 in May 1983; MCM 3-5 in December 1983 and MCM 6-8 in August 1986. MCM 9 was funded in the FY85 programme and MCM 10-11 in the FY86 programme, but contracts for their construction were not awarded until January 1989. The last three were funded in FY90.

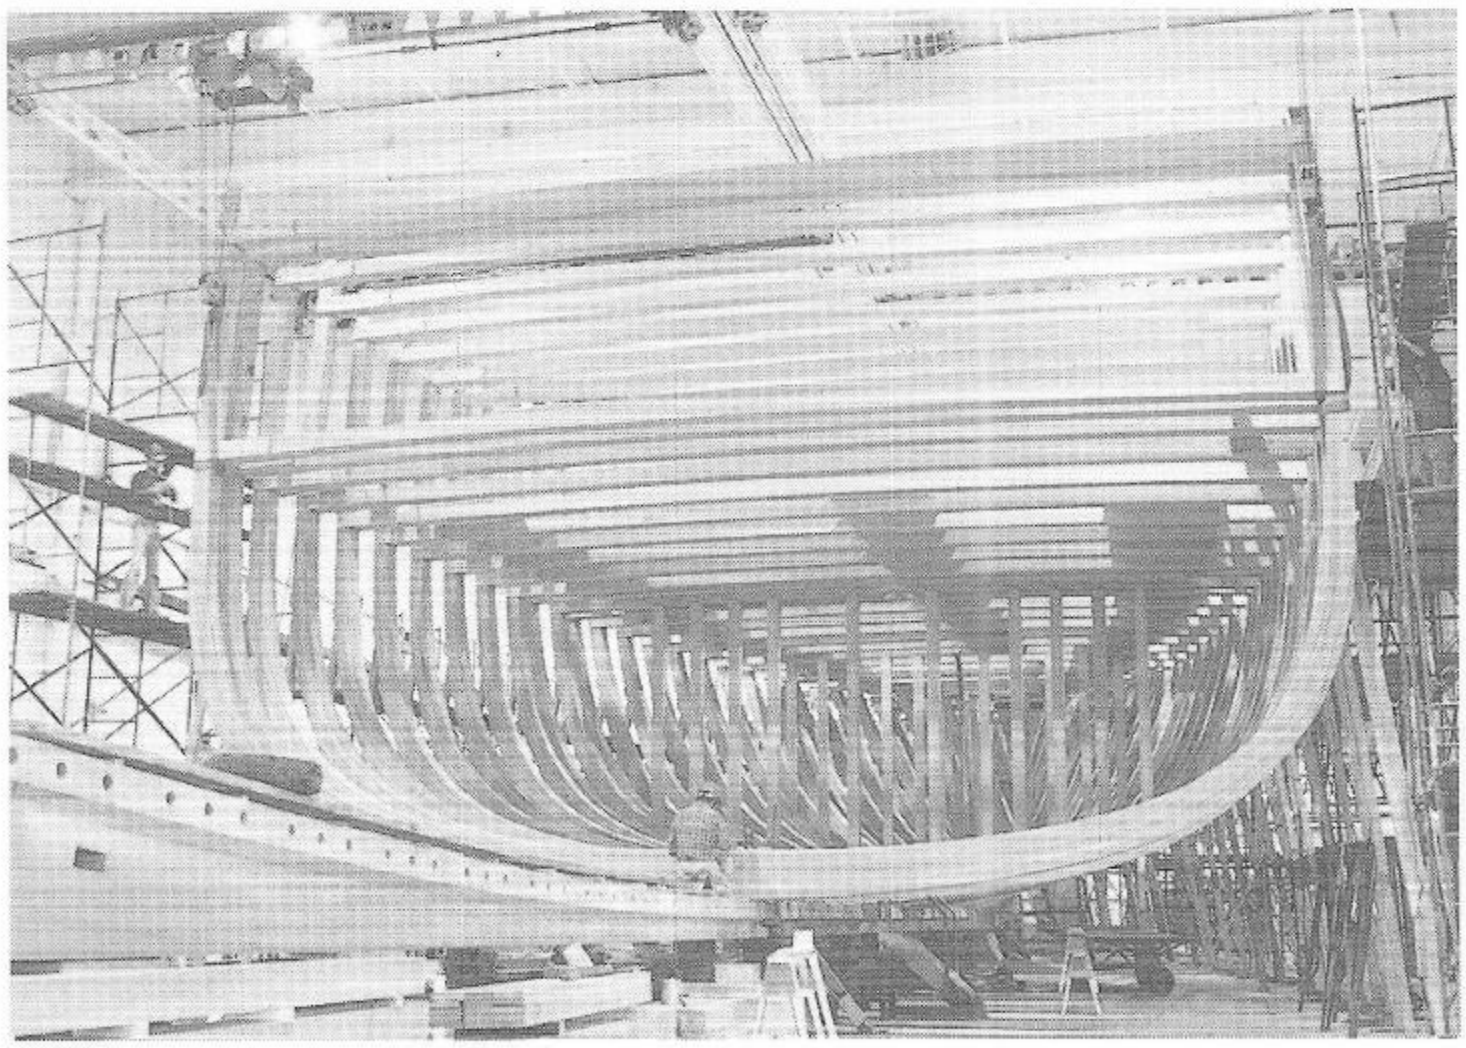
DESIGN

These are the most sophisticated wooden ships ever built, constructed for strategic reasons entirely from North American timbers. The single-piece keel is fabricated from laminated Douglas fir, upon which transverse 254 × 457 mm laminated white oak frames are laid at 1.07 m intervals, followed by longitudinal girders of laminated Douglas fir. The hull structure is then covered with three inner layers of 127 mm thick, diagonally laid, Alaskan cedar planking, followed by an outer, longitudinally laid layer, also 127 mm thick, of Douglas fir planking. Phenol/resorcinol glue is used throughout.

The main deck and 01 level planking are constructed from tongued-and-grooved, laminated Douglas fir and sheathed with Douglas fir plywood. The superstructure is constructed from a mix of laminated and solid woods, with plywood sheathing. Finally, the entire exterior surface is covered with GRP to give environmental protection.

There was a problem of engine rotation on the Waukesha diesels fitted in MCM 1-2. This has been resolved, but those engines have been replaced in the rest of the class by low-magnetic engines manufactured by Isotta-Fraschini of Milan, Italy (despite instructions from Congress that the last five were to be powered by US-made engines).

Another problem with MCM 1 occurred when it was discovered that the entire class needed to be lengthened by 1.8 m (5.9 ft) to overcome potential stability problems. MCM 1 was already under construction and the hull had to be lengthened before work could continue.



These are the most sophisticated wooden ships ever built. The single-piece keel is made from Douglas fir, the frames are of white oak and the girders of Douglas fir. The hull is then covered with three layers of diagonally laid Alaskan cedar planking with an outer layer of 127 mm thick Douglas fir planking (Peterson Builders Inc.)

DEPLOYMENT

Avenger (MCM 1) was fitted with the AN/SQQ-32 for Gulf operations in 1991 and all others in the class are being retrofitted.

Avenger (MCM 1) and *Defender* (MCM 2) were transferred to the Naval Reserve Force in 1995 and two more were scheduled to join them in 1996.

Ardent (MCM 12) and *Dextrous* (MCM 13) have been permanently stationed in the Gulf since March 1996 with crew rotation. *Guardian* (MCM 5) and *Patriot* (MCM 7) are homeported at Sasebo, Japan. The remainder is based at Ingleside, Texas.

BLUEBIRD/ADJUTANT

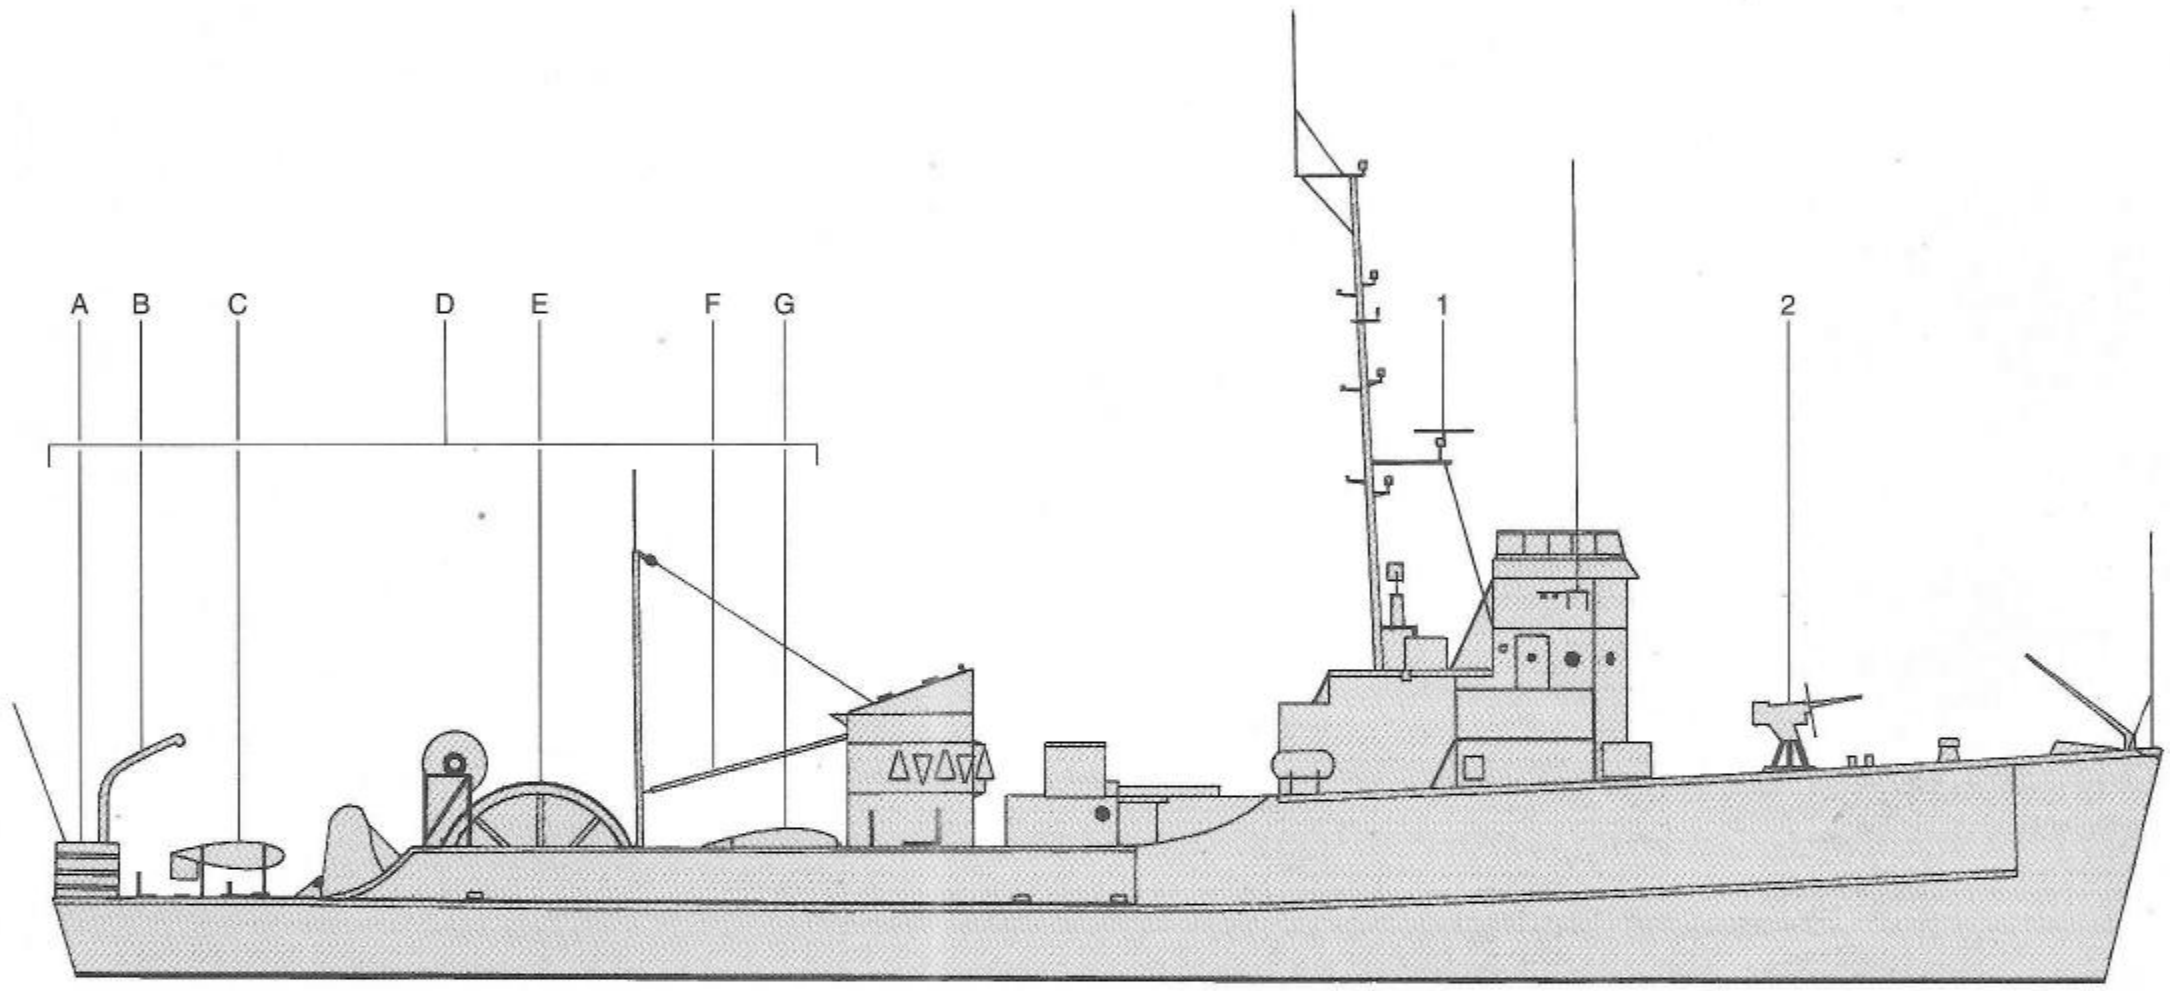
OVERVIEW

Frequent references have been made elsewhere in this book to the NATO reaction in the 1950s to the threat posed by Soviet minelaying capabilities, which was first properly appreciated during the Korean War. As has frequently happened in the MCM field, there was a sudden burst of activity and numerous MCMVs were designed and constructed, before the threat was once again allowed to recede into the background.

One of the designs produced during the mid-1950s was the US Navy wooden-hulled coastal minesweeper. Some of these served in the US Navy and were later sold abroad, while others were either constructed in the USA for direct export under the Mutual Defense Aid Pact (MDAP), or were constructed abroad, but with MDAP funding. These were originally designated AMS (auxiliary minesweepers), but this was later changed to the current designation: MSC (minesweeper, coastal).

There were a number of minor variations on the original design and a variety of designations are used for them, including 'Bluebird', 'Redwing', 'Adjutant', MSC 268, MSC 292 and MSC 294. In this book it is intended to use the designation 'Bluebird/Adjutant' class to cover all these types.

GRØNSUND (BLUEBIRD/ADJUTANT)



Adjutant (Ian Sturton)
MCM A *Kite* **B** *Davit* **C** *Float* **D** *Sweep deck* **E** *Main winch* **F** *Float*

GENERAL SPECIFICATIONS

Country of origin: USA
Operator: Denmark
Type: Bluebird/adjutant (Coastal minesweeper)

Class: GRØNSUND

Aquired (MDAP): 8
Active: 1

Displacement:
standard: 350 t
full load: 376 t

Dimensions
Length: 45 m (147.6 ft)
Beam: 8.5 m (27.9 ft)
Draught: 2.6 m (8.5 ft)

Speed: 13 kts
Range: 3,000 n miles at 10 kts

Complement: 31 (4 officers)

SHIPS

GRONSUND (M 574)
Builder Stephen Bros Shipyard, California, USA
Commissioned (Denmark) 21 Sep 1956 (ex-MSC 256)

WEAPONS SYSTEMS

GUNS

1 Bofors 40 mm/60 (US Mk 3)

The US Mk 3 version of Bofors 40 mm/60 is an army mounting adapted for naval use. It is hand operated although many were fitted for electrically powered, oil hydraulic elevation and training. There is an RPLS Mk 3 which is fitted with remote power control from a Kerrison predictor and Mk 3 CN which has a shield and has been slightly navalised while the Mk 3* is a fully navalised mounting with Type 6 gyro sights for the layer and trainer. It is not clear which version is fitted to the 'Grønsund' class.

Specifications
Weight empty: 1.03 t
Traverse: Nominal 360° at 12°/s
Elevation: −6 to +90° at 25°/s
Crew: 5

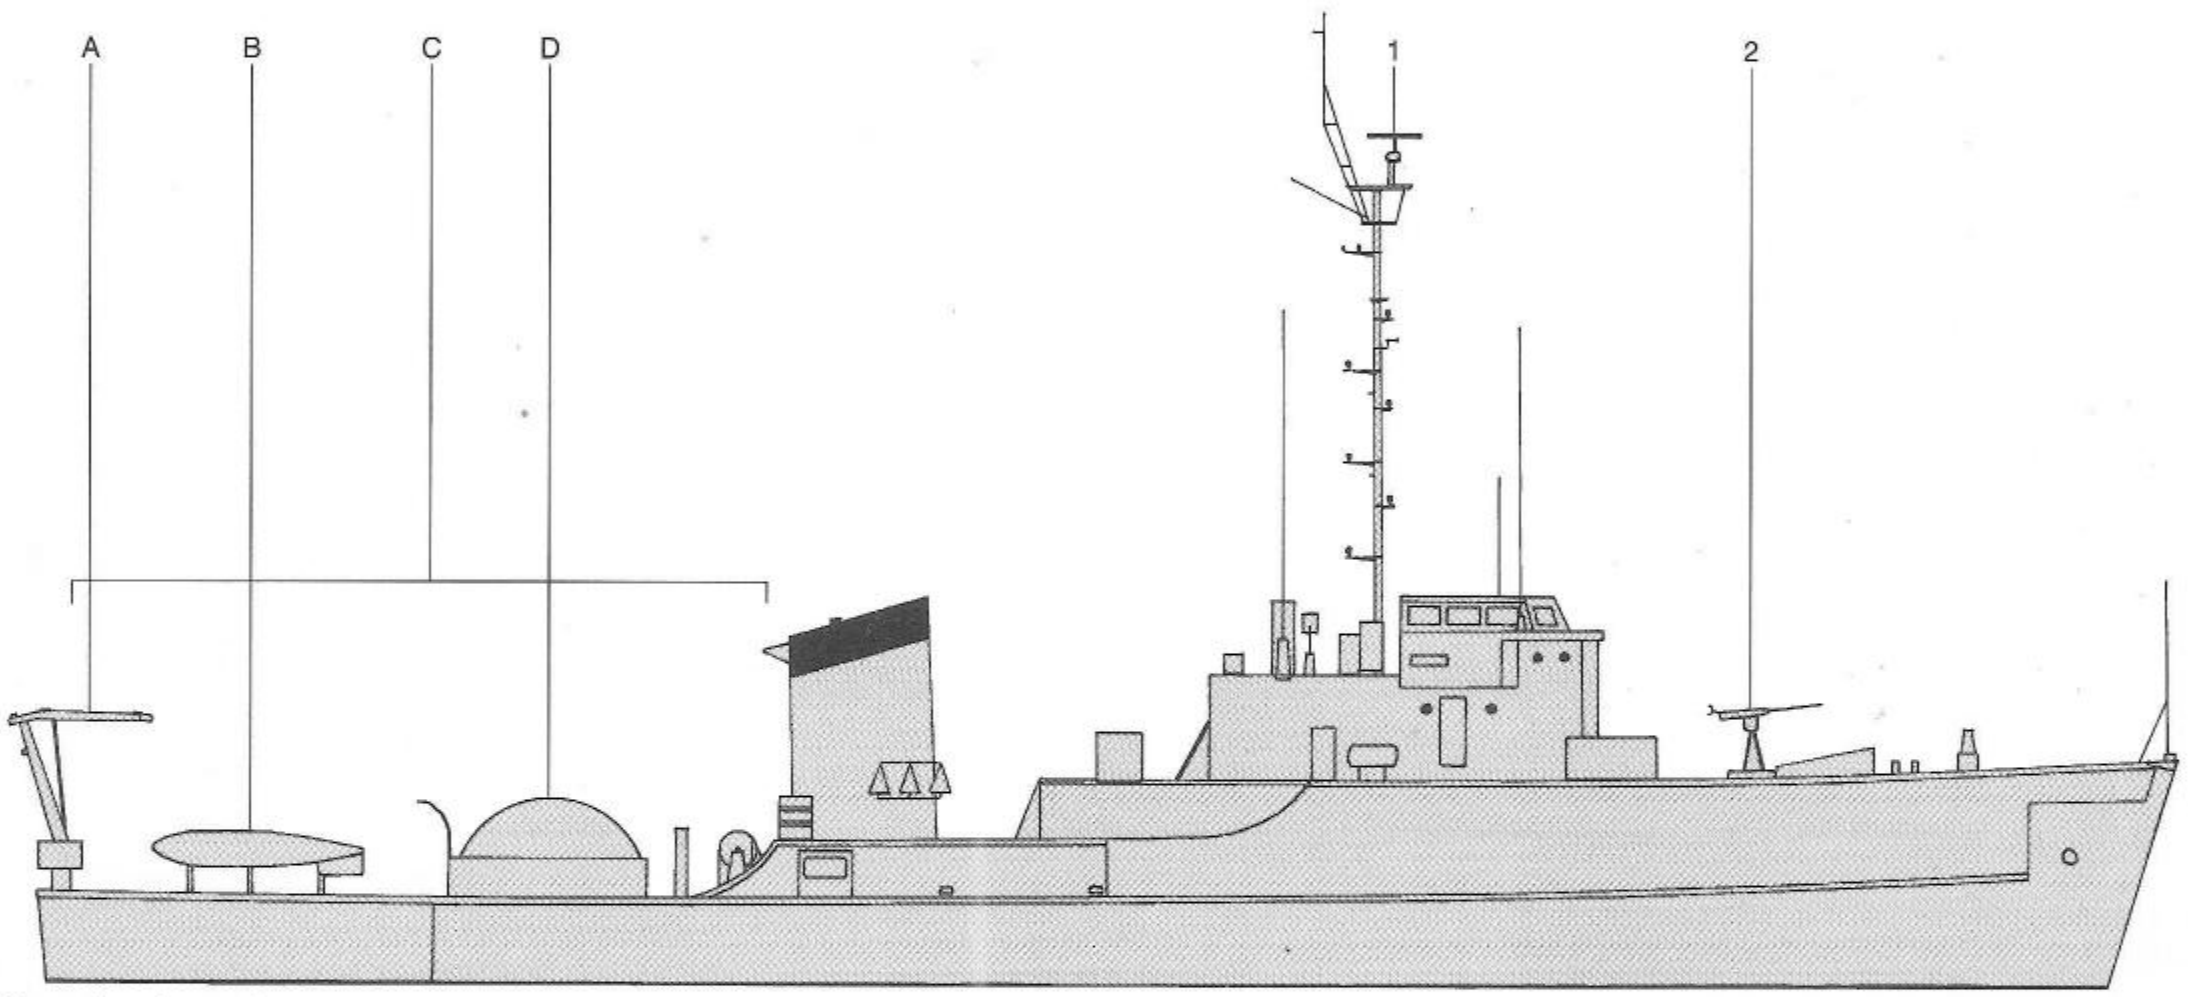
PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors GM 8-268 diesels, 656 kW (880 hp)
Shafts: 2

FURTHER INFORMATION

This is the last survivor of eight 'Bluebird/Adjutant' class minesweepers supplied to Denmark in the 1950s. It is fitted with a charthouse between the bridge and the small stack and has been employed on surveying duties.

ALKYON (BLUEBIRD/ADJUTANT)



Alkyon (Ian Sturton)
MCM A *Crane* **B** *Float* **C** *Sweep deck* **D** *Main winch*

General 1 *Racal-Decca navigation radar* **2** *Oerlikon 20 mm cannon*

Purchased (Greece) 10 Oct 1995

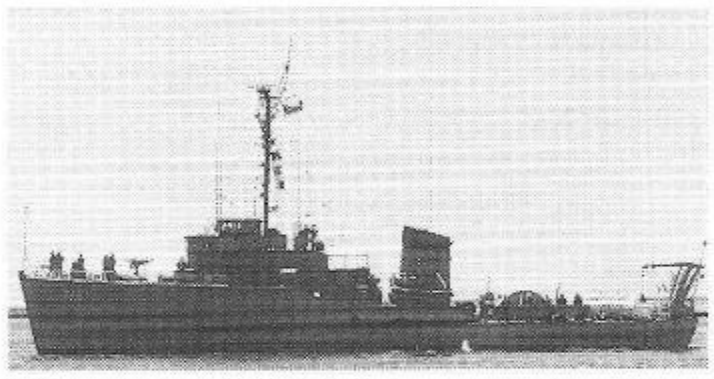
MINE COUNTERMEASURES SYSTEMS

MINESWEEPING GEAR

These MSCs were originally outfitted with US minesweeping equipment, which included:

- **Mechanical sweeps.** Oropesa Wire Sweeps Size 4. These sweeps have 300 fathom (1,800 ft) sweep wires on each side of the MCMV, clearing a path 384 m (420 yd) wide at a speed of advance of 8 kts.
- **Acoustic sweeps.** Sweep A Mk 6. This consists of a 'fish' containing a diaphragm activated by pistons driven by an eccentric cam on an electric motor. It is towed by a wire some 1,100 m (1,200 yd) long.
- **Magnetic sweeps.** Sweep M Mk 5. This consists of two buoyant, conducting cables streamed astern of the minesweeper. One leg is 205 m (675 ft) long, the other 460 m (1,500 ft) long and a magnetic field is set up between the two which activates magnetic mines



Dafni *(M 247) is one of the 'MSC 294' class coastal minesweepers of the Hellenic Navy* (H & L van Ginderen Collection)

MINESWEEPING SONARS

AN/UQS-1
All ships were originally equipped with AN/UQS-1, hull-mounted minehunting sonar, which dates from the 1950s. A short pulse electronically scanned sonar, the UQS-1 is not a stabilised system and cannot therefore provide the mine-like image required for classification purposes. Some still retain this set.

Lockheed Martin AN/SQQ-14
Some of the original Greek and former Belgian ships have been refitted with AN/SQQ-14, an active, high-frequency variable depth minehunting sonar developed from the UQS-1 in the 1960s. AN/SQQ-14 is carried on a rigid retractable boom rather than a cable and has a maximum operating depth of about 45 m (148 ft). It comprises an 80 kHz search sonar and 350 kHz sonar for classification.

Lockheed Martin/FIAR AN/SQQ-14 (IT)
***Erato* (M 60) and *Evniki* (M 61) only.** These two ex-Italian ships were fitted, while in Italian service, with the AN/SQQ-14(IT) variable depth sonar. The AN/SQQ-14 system is essentially a variable depth, dual-frequency sonar for detecting and classifying bottom mines in shallow water. It utilises a towed body in the shape of an elongated sphere towed through a centre well on a mine countermeasures vessel.

The AN/SQQ-14 can operate down to 45 m (148 ft). It transmits at 80 kHz and 350 kHz respectively for search and classification, scanning over azimuths of 100° and 18°, and through an elevation of 10° in each case. Azimuth and range resolutions are 1.5° and 1 m (3.28 ft) for search, and 0.3° and 8 cm (3.1 in) for classification. Under the SQQ-14 IT programme FIAR produced new dry and wet end electronics for the SQQ-14 for the Belgian and Italian navies.

Manufacturers/Contractors
Lockheed Martin, USA.
FIAR, Italy.

WEAPONS SYSTEMS

GUNS

Oerlikon 20 mm (US Mk 24)
All ships can carry one or two Oerlikon 20 mm cannon.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range
anti-surface: 1.5 km
anti-air: 1,150 m (3,773 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g

COMMAND AND CONTROL SYSTEMS

RADARS

Racal-Decca
All except M60, M 61. All have a Decca I-band navigation radar; model is not known.

SMA 3RM 20R
M 60, M 61. These two ex-Italian ships have the SMA 3RM 20R, I-band navigational radar.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors GM-268A diesels; 1.3 MW (1,760 hp)
Shafts: 2

FURTHER INFORMATION

Although all these ships are of US origin, Greece has obtained them in three different ways:

- One group of nine ships was built in the USA for direct export to Greece in the 1960s
- The second group of four ships was built in the USA for Belgium and transferred to Greece in 1969
- The third group of two minehunters was built in the USA for Italy and was sold by Italy to Greece in 1995.

MODERNISATION

A modernisation programme for the original Greek ships was begun in 1990 and completed in 1995. The work included replacing the main engines and navigation radar. A new sonar is under consideration. Having bought two ships from Italy in 1995, it appears that the Greek Navy intends to keep these ships in service for some years to come.

SHAHROKH (BLUEBIRD/ADJUTANT)

GENERAL SPECIFICATIONS

Country of origin: USA
Operator: Iran
Type: Bluebird/Adjutant (Coastal minesweeper)

Class: SHAHROKH

Transferred (MDAP): 4

Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g

COMMAND AND CONTROL SYSTEMS

RADAR

Racal-Decca
There is one Racal-Decca, I-band navigation radar, type unknown.

PROPULSION

Specifications
System: Diesel
Main machinery:
Shahrokh: 2 General Motors GM 8-268A diesels, 656 kW (880 hp)
Others: 4 General Motors GM 6-71 diesels; 519 kW (696 hp) sustained
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These four ships were built specifically for export to Iran and were transferred under the MDAP in 1959-62.

DEPLOYMENT

Shahrokh operates in the Caspian Sea as a training ship. *Simorgh* and *Karkas* are based at Boushehr, where *Karkas* is still active, although it is rarely seen at sea. *Simorgh* paid off some years ago but was reactivated in 1992.

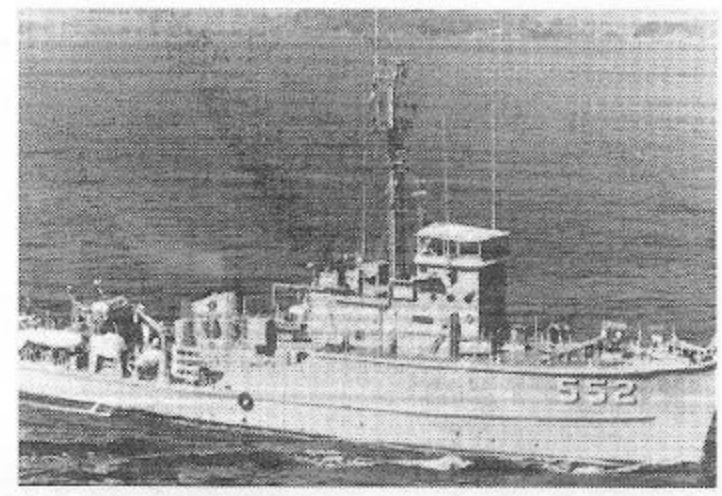
MINE COUNTERMEASURES SYSTEMS

MINESWEEPING GEAR

These MSCs were originally outfitted with US minesweeping equipment, which included:

- **Mechanical sweeps.** Oropesa Wire Sweeps Size 4. These sweeps have 300 fathom (1,800 ft) sweep wires on each side of the MCMV, clearing a path 384 m (420 yd) wide at a speed of advance of 8 kts.
- **Acoustic sweeps.** Sweep A Mk 6. This consists of a 'fish' containing a diaphragm activated by pistons driven by an eccentric cam on an electric motor. It is towed by a wire some 1,100 m (1,200 yd) long.
- **Magnetic sweeps.** Sweep M Mk 5. This consists of two buoyant, conducting cables streamed astern of the minesweeper. One leg is 205 m (675 ft) long, the other 460 m (1,500 ft) long and a magnetic field is set up between the two which activates magnetic mines.



Ko Hung *(MSC 552). Eight of these small coastal minesweepers remain in service with the RoK Navy. They were expected to pay off as the 'Swallow' class entered service but this has not yet happened* (G Jacobs)

SONAR

AN/UQS-1

AN/UQS-1 is a hull-mounted, minehunting sonar dating from the 1950s. A short pulse, electronically scanned sonar, the UQS-1 is not a stabilised system and cannot therefore provide the mine-like image required for classification purposes.

Unconfirmed reports suggest that at least some of these Korean ships may have had their AN/UQS-1 sonars replaced by a Thomson-CSF model, possibly the TSM 2022.

WEAPONS SYSTEMS

GUNS

Oerlikon 20 mm

MSC 551, MSC 552, MSC 553 only. One twin Oerlikon 20 mm mounting.

MSC 555, MSC 556, MSC 557, MSC 558, MSC 559 only. Two single Oerlikon 20 mm mountings.

Specifications

Gun

Calibre: 20 mm

Length of barrel: 70 calibres

Muzzle velocity: 835 m/s (2,740 ft/s)

Range

anti-surface: 1.5 km

anti-air: 1,150 m (3,773 ft)

Rate of fire: 450 rds/min

Round weight: 241 g

Projectile: 122 g

Browning 12.7 mm machine guns

Three per ship.

Specifications

Gun weight: 38.1 kg (84 lb)

Muzzle velocity: 893 m/s (2,930 ft/s)

Cyclic rate of fire: 550 rds/min

Practical rate of fire: 70 rds/min

Effective range: 0.98 n miles (1.83 km)

COMMAND AND CONTROL SYSTEMS

RADAR

Decca 45

An I-band navigation radar.

PROPULSION

Specifications

System: Diesel

Main machinery:

MSC 551, MSC 552, MSC 553 only: 2 GM 8-268A diesels; 656 kW (880 hp) sustained

MSC 555, MSC 556, MSC 557, MSC 558, MSC 559 only: 4 GM 6-71 diesels; 519 kW (696 hp) sustained

Shafts: 2

FURTHER INFORMATION

It is reported, but not confirmed, that the last four of these ships may have been retrofitted with Thomson Sintra mine detection sonars.

The RoK Navy announced that it planned to pay off these ships as the 'Swallow' class MCMVs are commissioned, but there is no indication as yet that this process has started.

MAHMOOD (BLUEBIRD/ADJUTANT)

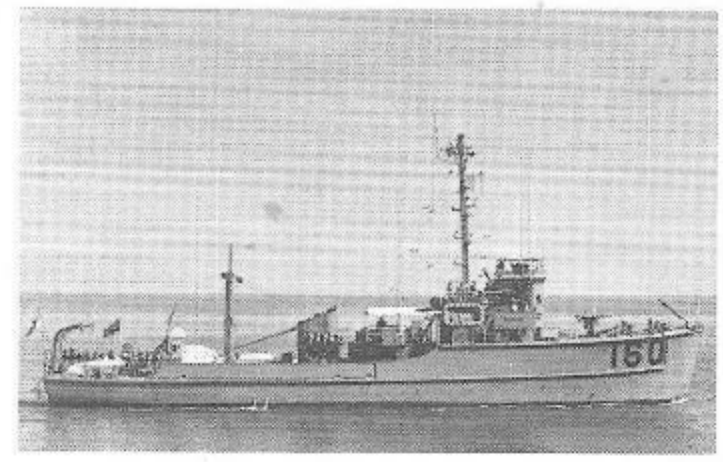
MINEHUNTING SONAR

AN/UQS-1

AN/UQS-1 is a hull-mounted, minehunting sonar dating from the 1950s. A short pulse, electronically scanned sonar, the UQS-1 is not a stabilised system and cannot therefore provide the mine-like image required for classification purposes.

Unconfirmed reports suggest that at least some of these Korean ships may have had their AN/UQS-1 sonars replaced by a Thomson-CSF model, posssibly the TSM 2022.



There are two of these US-built MSCs in the Pakistan Navy which are due to pay off in the near future (Pakistan Navy)

WEAPONS SYSTEMS

GUNS

Russian ZU-23-4 23 mm/80 in one quad mounting

These ships carry either a single Russian 23 mm/80 in ZU-23-4 mounting, or a single 20 mm Oerlikon. The Soviet Army ZU-23 was not produced for the Soviet Navy, which preferred 30 mm weapons, but the mounting has been adapted by a number of navies to produce a cheap, lightweight, short-range, point defence system on both large and small warships. The ZU-23-4 consists of four air-cooled 2A14 cannon fed from 50-round belts in boxes fitted to each side of the trunnions. A ZAP-23 optical sight is attached to the rear of the weapon which is on a manually operated firing platform. The whole mounting weighs 893 kg (1,969 lb) and it has a five-man crew, of whom two are on the mounting and three are ammunition carriers and loaders.

Specifications
Calibre: 23 mm
Length of barrel: 87 calibres
Traverse: 360°
Elevation: −10 to +90°
Rates of fire: 200 rds/min/barrel (practical)
Projectile: 0.19 kg (0.42 lb)
Range:
anti-surface: 1.1 n miles (2 km)
anti-air: 1,500 m (4,920 ft)

Oerlikon 20 mm

The Oerlikon 20 mm is sometimes mounted in place of the ZU-23-4.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,740 ft/s)
Range
anti-surface: 1.5 km
anti-air: 1,150 m (3,773 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g

COMMAND AND CONTROL SYSTEMS

RADAR

Racal-Decca 45

The Racal-Decca 45 is an I-band navigation radar.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors GM 8-268A diesels; 656 kW (880 hp) sustained
Shafts: 2

FURTHER INFORMATION

Both these ships are due to pay off as the 'Munsif Eridan' class comes into service.

ADDRIYAH (BLUEBIRD/ADJUTANT)

GENERAL SPECIFICATIONS

Country of origin: USA
Operator: Saudi Arabia
Type: Bluebird/Adjutant (Coastal minesweeper/hunter)

Class: ADDRIYAH

Purchased: 4
Active: 4

Displacement:
standard: 320 t
full load: 407 t

Dimensions
Length: 46.4 m (153 ft)
Beam: 8.2 m (26.9 ft)
Draught: 2.5 m (8.2 ft)

Speed: 13 kts

Complement: 39 (4 officers)

General 1 *ISC Cardion AN/SPS-55 surface search radar* **2** *Oerlikon 20 mm cannon*

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING GEAR

These MSCs were supplied with US minesweeping equipment, which included:

- **Mechanical sweeps.** Oropesa Wire Sweeps Size 4. These sweeps have 300 fathom (1,800 ft) sweep wires on each side of the MCMV, clearing a path 384 m (420 yd) wide at a speed of advance of 8 kts.
- **Acoustic sweeps.** Sweep A Mk 6. This consists of a 'fish' containing a diaphragm activated by pistons driven by an eccentric cam on an electric motor. It is towed by a wire some 1,100 m (1,200 yd) long.
- **Magnetic sweeps.** Sweep M Mk 5. This consists of two buoyant, conducting cables streamed astern of the minesweeper. One leg is 205 m (675 ft) long, the other 460 m (1,500 ft) long and a magnetic field is set up between the two which activates magnetic mines.

Lockheed Martin AN/SQQ-14

Some of the original Greek and former Belgian ships have been refitted with AN/SQQ-14, an active, high-frequency variable depth minehunting sonar developed from the UQS-1 in the 1960s. AN/SQQ-14 is carried on a rigid retractable boom rather than a cable and has a maximum operating depth of about 45 m (148 ft). It comprises an 80 kHz search sonar and 350 kHz sonar for classification.

WEAPONS SYSTEMS

GUNS

Oerlikon 20 mm (US Mk 10)

Specifications
Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,738 ft/s)

Range
anti-surface: 0.81 n miles (1.5 km)
anti-air: 1,150 m (3,772 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g

Safwa *(MSC 418), one of four built for Saudi Arabia, based on the Bluebird design but slightly longer* (H & L van Ginderen Collection)

COMMAND AND CONTROL SYSTEMS

RADAR

ISC Cardion AN/SPS-55

I/J-band surface search radar.

Specifications
AN/SPS-55)
Role: Surface search

Band: I/J (8-20 GHz)
Beam: 1.5 × 20°
Peak power: 130 kW
Gain: 31 dB
Pulsewidth: 1/12µs
PRF: 750/2,250 pps
Scan rate: 16 rpm

Manufacturer/Contractor
ISC Cardion

PROPULSION

Specifications
System: Diesel
Main machinery: 2 Waukesha L1616 diesels; 1,200 hp (895 kW)
Shafts: 2

FURTHER INFORMATION

PROGRAMME

These four ships were ordered on 30 September 1975 under the International Logistics Programme. They are different from other 'Bluebird/Adjutant' class ships in that they have roll dampers, and, in addition to wire and magnetic sweeps, they are also fitted for minehunting.

DESIGN

They are generally similar to other ships of the class, but are approximately 3 m (10 ft) longer.

DEPLOYMENT

Addriyah is based at Jiddah, the remainder at Al Jubail.

They appear to be used primarily as general-purpose patrol vessels rather than as minehunters

THE FUTURE

They will be replaced by the 'Sandown' class as these new vessels enter service.

YUNG CHOU (BLUEBIRD/ADJUTANT)

MINE COUNTERMEASURES SYSTEMS

MINESWEEPING GEAR

These MSCs were originally outfitted with US minesweeping equipment, which included:

- **Mechanical sweeps.** Oropesa Wire Sweeps Size 4. These sweeps have 300 fathom (1,800 ft) sweep wires on each side of the MCMV, clearing a path 384 m (420 yd) wide at a speed of advance of 8 kts.
- **Acoustic sweeps.** Sweep A Mk 6. This consists of a 'fish' containing a diaphragm activated by pistons driven by an eccentric cam on an electric motor. It is towed by a wire some 1,100 m (1,200 yd) long.
- **Magnetic sweeps.** Sweep M Mk 5. This consists of two buoyant, conducting cables streamed astern of the minesweeper. One leg is 205 m (675 ft) long, the other 460 m (1,500 ft) long and a magnetic field is set up between the two which activates magnetic mines.

MINEHUNTING SONAR

AN/UQS-1
All ships were originally equipped with AN/UQS-1, hull-mounted minehunting sonar, which dates from the 1950s. A short pulse electronically scanned sonar, the UQS-1 is not a stabilised system and cannot therefore provide the mine-like image required for classification purposes. Some still retain this set.

WEAPONS SYSTEMS

GUNS

Oerlikon 20mm (US Mk 24)
One twin mount per vessel. The Mk 24 mounting was designed primarily for air defence, and features two Mk 2 or Mk 4 guns which are 165 mm apart. The muzzle arc clearance is 138 cm and the working circle is 141-152 cm. The mounting is similar to the US Mk 10, but has a crew of three.

Specifications
Gun
Calibre: 20 mm
Length of barrel: 70 calibres
Muzzle velocity: 835 m/s (2,738 ft/s)
Range
anti-surface: 0.81 n miles (1.5 km)
anti-air: 1,150 m (3,772 ft)
Rate of fire: 450 rds/min
Round weight: 241 g
Projectile: 122 g

COMMAND AND CONTROL SYSTEMS

RADAR

Racal-Decca 45 or 707
These ships are fitted with Racal-Decca I-band navigation radars, either Model 45 or Model 707.

PROPULSION

Specifications
System: Diesel
Main machinery: 2 General Motors GM 8-268A diesels; 1,760 hp (1,312 kW)
Shafts: 2

FURTHER INFORMATION

All were refitted between 1984 and 1986. Only four of the class have operational sonars, and all are in very poor condition. Several have been deleted so far.

These MSCs were supplied with US minesweeping equipment, which included:

- **Mechanical sweeps.** Oropesa Wire Sweeps Size 4. These sweeps have 300 fathom (1,800 ft) sweep wires on each side of the MCMV, clearing a path 384 m (420 yd) wide at a speed of advance of 8 kts.
- **Acoustic sweeps.** Sweep A Mk 6. This consists of a 'fish' containing a diaphragm activated by a pistons driven by an eccentric cam on an electric motor. It is towed by a wire some 1,100 m (1,200 yd) long.
- **Sweep A Mk 4 (V).** The Sweep A Mk 4 consists of a towed body with fins and a large diameter diaphragm in the nose. The diaphragm is struck by a hydraulically activated hammer causing it to emit signals at frequencies between 40 and 600 Hz. It was probably supplied to the Royal Thai Navy to enable it to counter mines in the shallow waters of the Gulf of Thailand.
- **Magnetic sweeps.** Sweep Q2. This is a post-Second World War magnetic sweep, consisting of two buoyant, conducting cables streamed astern of the minesweeper. A magnetic field is set up between the two which activates magnetic mines.

MINEHUNTING SONAR

AN/UQS-1
All ships were originally equipped with AN/UQS-1, hull-mounted minehunting sonar, which dates from the 1950s. A short pulse electronically scanned sonar, the UQS-1 is not a stabilized system and cannot therefore provide the mine-like image required for classification purposes. Some still retain this set.

MCM SUPPORT FACILITIES

Mission

This unique ship provides three facilities:

- Command and control of an MCM force
- Support facilities for MCMVs
- Operation of Airborne Mine CounterMeasures (AMCM) helicopters.

MCM

- Can support to to eight Avenger or 'Osprey' class MCMVs, with alongside facilities for four at any one time.
- Mine Countermeasures Co-ordination Centre (MC^3)
- Helicopter Direction Centre

Airborne MCM (AMCM)

- Eight MH-53E Sea Dragon AMCM helicopters, whose equipment includes:
  - Mk 105 sleds (six carried)
  - Mk 103 mechanical sweep gear
  - Mk 104 acoustic device
  - SPU-1W Magnetic Orange Pipe (MOP)
  - Mk 2G rattle bars
  - AN/ALQ-41 acoustic device

  (See following entry for details)
- Three MH-53E employed in surveillance, reconnaissance and search-and-rescue (SAR), whose equipment includes:
  - AN/AQS-14 minehunting sonar

Explosive Ordnance Disposal (EOD)

- Inchon carries a maximum of four Explosive Ordnance Disposal (EOD) teams (approximately 70 personnel total)
- Two recompression chambers (one air-portable, one road transportable).

Inchon *(MCS 12) after conversion* (Ingalls Ship Building)

AVIATION

AVIATION FACILITIES

Specifications

Flight deck: 183.7 × 31.7 m (602.3 × 104 ft)
Hangar: 73 m (240 ft) long
Hangar: Accommodates 2 helicopters undergoing maintenance
EOD facilities and storage: 6 Mk 105 MCM sleds
Aircraft: 11 MH-53E Sea Stallions (8 MCM; 3 spotter/SAR)
Elevators: 2 deck-edge elevators: 1 port side opposite island; 1 starboard aft of island.

Capacity: 25 t each
Max activity level: Simultaneous take-off/landing of 4 MH-53E Sea Stallions
Aviation fuel: 152,930 litres (404,000 gal) JP-5 (sufficient for 7 to 10 days intensive MCM operations)

GENERAL FACILITIES

- Two cargo elevators operating between holds and flight deck; capacity: 7 t each.
- 517 m^2 (5,565 sq ft) MCM stores space (previously vehicle deck)
- Boats include:
  - Two LCVPs on davits retained from previous role as LPH.
  - Rigid Hull Inflatable Boats (RHIB) on sponsons.
- New, telescopic crane abaft island.
- Provision of mains electrical power for MCMVs alongside.
- Can replenish MCMVs at sea using over-the-stern method.

WEAPONS SYSTEMS

Hughes Mk 15 CIWS Phalanx

There are two Mk 15 CIWS: one is on a sponson on the starboard side forward, the other on another sponson on the port quarter. This CIWS was developed to provide fast reaction to submarine-launched anti-ship missiles and operates on a 'closed loop' system, tracking both the target and the stream of rounds, whilst seeking constantly to reduce the difference between the two. The gun is a six-barrelled 20 mm M61A1 Vulcan with extremely high firing rates.

Specifications

Gun
Calibre: 20 mm
Length of barrel: 53 calibres
Muzzle velocity: 1,030 m/s (3,379 ft/s)

Rate of fire (Block 0): 3,000 rds/min
Range (effective, horizontal): 0.75 n miles (1.47 km)

Mounting
Weight (Block 0): 5.42 t
Traverse: 310° at 126°/s
Elevation: −25 to +85° at 92°/s

25 mm Mk 38 Mod 0 automatic cannon (Sea Snake)

Four single Mk 88 mountings for Mk 38 Mod 0 25 mm cannon (Sea Snake). The Mk 88 mounting is replacing 20 mm mountings in many US Navy warships and is designed to engage surface and shore targets in low- and mid-intensity operational environments at ranges up to 1.33 n miles (2.47 km). The Mk 38/M-242 is a single barrel, externally powered weapon which incorporates a rotating bolt mechanism driven by a chain drive. The Mk 38 can fire single shots or 175 rds/min and features twin shoulder braces and an optical Aimpoint sight.

Specifications

Calibre: 25 mm
Length of barrel: 81 calibres
Muzzle velocity: 1,100 m/s (3,608 ft/s)
Traverse: 300°
Elevation: −20 to +55°
Crew: 1 (often supported by a spotter)
Range: 1.33 n miles (2.47 km)
Rate of fire: 175 rds/min (max)
Ammunition: 184 g HEI-T

M2HB 12.7 mm machine guns

Up to eight M2HB are carried. This is a selective short recoil automatic operation weapon with a 1,143 mm barrel.

Specifications

Gun weight: 38.1 kg (84 lb)
Muzzle velocity: 893 m/s (2,930 ft/s)
Cyclic rate of fire: 550 rds/min
Practical rate of fire: 70 rds/min
Effective range: 0.98 n miles (1.83 km)

ELECTRONIC WARFARE SYSTEMS

DECOYS

Mk 36 Mod 12 Loral Hycor SRBOC Mk 36 Chaff Launcher

There are four Mk 36 SRBOC Mod 12 launchers firing IR flares and chaff to 2.2 n miles (4 km). The Mk 36 SRBOC (Super Rapid Bloom Offboard Countermeasures) system consists of launcher, launcher control, power supplies, ready service lockers and munitions. The Mk 137 launcher has six 130 mm fixed tubes arranged in parallel rows at angles of 45 and 60°. The firing circuits use electromagnetic induction to initiate the propelling charges in the cartridges. The prime cartridge is the Mk 182 Torch with chaff payload.

Specifications

Launcher dimensions: 160 × 43 × 86 cm (63 × 17 × 34 in)
Launcher weight: 173 kg (381 lb)
Cartridge weight: 22.7 kg (50 lb)

AN/SLQ-25A Nixie noisemaker

AN/SLQ-25A Nixie is a solid-state, modular design electroacoustic countermeasures decoy system used to protect various classes of ships from acoustic homing torpedoes. It consists of a remote-control unit which can activate, deactivate and monitor (through an oscilloscope) the system, a countermeasures transmitter which generates and amplifies the signals, a power-operated double-drum winch for streaming and recovering the towed bodies (which are stored on racks attached to the winch), a coaxial switching unit which selects the appropriate cable or load, and towed bodies. The towed bodies convert the electrical signals to acoustic signals and project them while other elements of the system include three electronic dummies for testing the amplifier without streaming a towed body and either a deck edge tow chock or two CSL27 fleet angle compensators. Total weight of the system with the RL-272 winch is 2.75 tonnes.

ELECTRONIC SUPPORT/ELECTRONIC COUNTERMEASURES (ESM/ECM)

AN/SLQ-32(V)3 intercept and jammer

The AN/SLQ-32(V)3 is a combined ESM and ECM system, giving radar warning on B- to J-bands to give jamming and deception on H- to J-bands. The jammer has a maximum radiated power of 1 MW and is capable of forming 64 beams on either side of the ship, with jamming modes including Range Gate Pull Off (RGPO) and Azimuth Gate Pull Off (AGPO).

Manufacturer/Contractor

Raytheon, Electromagnetic System Division, Goleta, California, USA.

COMMAND AND CONTROL SYSTEMS

COMBAT DATA SYSTEMS

Command Systems

Command systems fitted or upgraded during the modification refit, include:

- Navy Tactical Command System — Afloat (NTCS-A)
- Joint Maritime Command Information System (JMCIS), including NAVMACS II processor.
- Link 11
- Navigation Sensor System Interface (NSSI)

Carrier Controlled Approach (CCA) — AN/SPN-35A

AN/SPN-35A is a carrier approach radar set providing precise range, altitude and heading information to guide both fixed-wing aircraft and helicopters along the final approach to the carrier deck. Aircraft are accepted from the surveillance radar systems and then controlled by the SPN-35 to a final transition point from which the recovery is made. SPN-35 is mounted on a gyrostabilised platform that keeps the radar level and accurately aligned to the horizon at all times.

Carrier Controlled Approach (CCA) — AN/SPN-43B

AN/SPN-43B is used to marshal aircraft prior to their negotiating final landings and is mounted on top of a stabilised platform that automatically compensates for the pitch and roll of the ship. SPN-43 detects aircraft at distances up to 50 n miles (93 km) and provides tracking data allowing the radar operator to control and transition the aircraft into the final approach area for carrier recovery. Operational frequency is 3.5 to 3.7 GHz, with a peak power output of 850 kW.

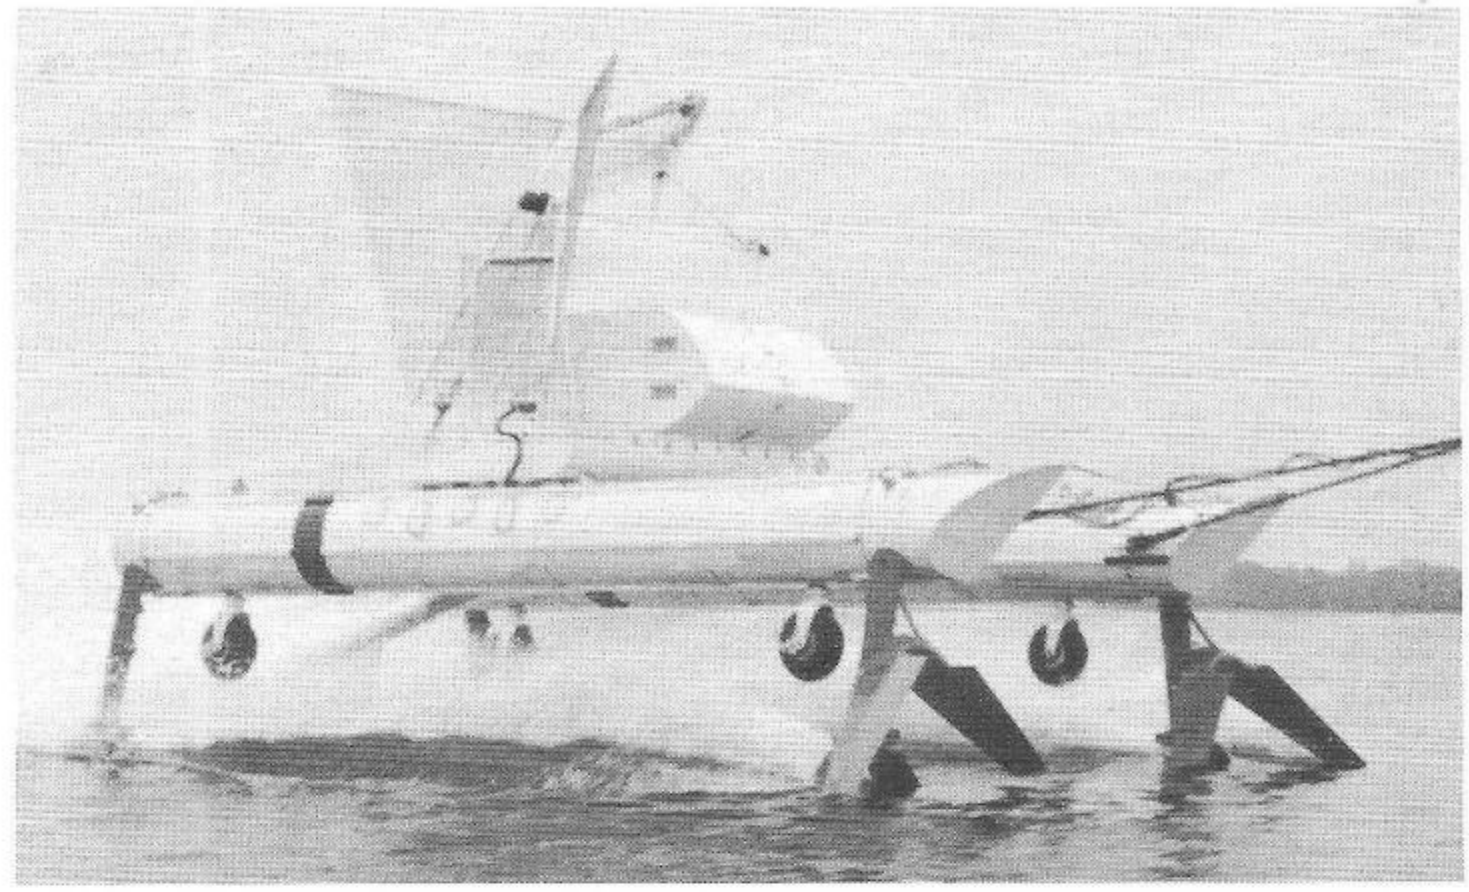
SIKORSKY MH-53E SEA DRAGON



Mk 105 minesweeping sled foilborne

Background

The Sikorsky MH-53E Sea Dragon is a three-engined heavy-lift Airborne Mine CounterMeasures (AMCM) helicopter able to tow a variety of mechanical, acoustic and magnetic MCM devices. In essence, it combines the AMCM gear of the earlier twin-engined RH-53D, with the much greater power, improved airframe and increased fuel capacity of the CH-53E.

The CH-53 attracted early interest as an AMCM platform and 15 of the original service model, CH-53A, were transferred from the US Marine Corps to the US Navy as RH-53As, and given T64-GE-413 engines. Even so, these were found to have insufficient power and were later returned to the Marines Corps. The navy then developed the RH-53D, which had T64-GE-415 engines, and was used in the MCM role for many years including the clearance of Haiphong harbour and the Suez Canal, although, ironically, the type's most famous moment came in its use from USS *Nimitz* for the abortive Delta Force rescue raid on Tehran (Operation Eagle Claw).

An MCM version of the -E model, designated MH-53E Sea Dragon, entered service in 1986 and by 1996, 48 out of a planned 50 had entered service. The minehunting equipment is little changed from that of the RH-53D, but additional huge sponsons house fuel tanks which greatly extended the aircraft's operational capabilities. The MH-53E is also equipped with improved hydraulic and electrical systems, together with minefield, navigation and automatic flight control systems, towing is automatic, as is the approach and departure from hover modes.

In 1993-94 one MH-53E was fitted with T64-GE-419 engines, which resulted in yet further performance gains, especially in recovery and flyaway capability in the event of engine failure in the hover. It is planned to retrofit the entire MH-53E fleet, the first eight engine kits having been due for delivery in October 1996.

The Japanese Maritime Self-Defense Force (JMSDF) purchased eleven aircraft, which are designated S-80M-1 by Sikorsky. They are virtually identical to the US Navy's MH-53E, but do not have a refuelling probe. The first was delivered in November 1989 and the eleventh in May 1994.

Specifications

MH-53E
Main rotor diameter: 24.08 m (79.0 ft)
Tail rotor diameter: 6.10 m (20.0 ft)
Dimensions:
Length overall (rotors turning): 30.19 m (99.05 ft)
Fuselage: 22.35 m (73.33 ft)
Height (top of main rotor head): 5.32 m (17.45 ft)
Weights:
empty: 16,482 kg (36,336 lb)
useful load, influence sweep mission: 11,793 kg (26,000 lb)
max take-off internal payload: 31,640 kg (69,750 lb)
max take-off external payload: 33,340 kg (73,500 lb)
Performance:
max level speed (sea level): 170 kts (315 km/h)
cruising speed (sea level): 50 kts (278 km/h)
max rate of climb (sea level): 762 m (2,500 ft)/min
service ceiling (max continuous power): 5,640 m (18,500 ft)
hovering ceiling in ground effect: 3,520 m (11,550 ft)
hovering ceiling out of ground effect: 2,895 m (9,500 ft)
Power plant: 3 General Electric T64-GE-416 turboshafts; max continuous rating 2,756 kW (3,696 shp). (Retrofit planned with T64-GE-419s, rated at 3,542 kW (4,750 shp)
Fuel: Total internal capacity to 12,113 litres (3,200 US gallons), plus seven internal range extension tanks, total capacity 7,949 litres (2,100 US gallons)
Accommodation: 3 flight deck crew; 5 cabin crew

MCM CAPABILITIES

Specific AMCM features of the MH-53E include:

- 13,610 kg (30,000 lb) tension tow boom.
- Hydraulic winch with 137 m (450 ft) steel towing cable.
- A cabin crew of five persons to deploy and retrieve the MCM equipment and to monitor its function. They also operate the two 0.5 in machine guns which are used to explode buoyant mines brought to the surface by the mechanical sweeps.
- Large sponsons which increase the fuel capacity from 3,850 to 12,113 litres (1,017 to 3,200 US gallons).
- Two external rear-view mirrors to enable the pilot and copilot to observe the sweeps.

AMCM EQUIPMENT

AMCM equipment operated by the MH-53E includes:
Mk 105 sled
Mk 103 mechanical sweep gear
Mk 104 acoustic device
SPU-1W Magnetic Orange Pipe (MOP)
Mk 2G rattle bars
AN/AQS-14 minehunting sonar
AN/ALQ-141 acoustic device

Mk 105 Airborne Minesweeping System

The Mk 105 Airborne Minesweeping System consists of a towing helicopter, a hydrofoil sled, sweeping cable arrays and a gas-turbine generator set which provides onboard electrical power for magnetic sweeping. The sled consists of two lightweight tubular floats mounted on cavitating hydrofoils and connected by an aerofoil-shaped cross-beam. The surface-piercing, tandem hydrofoil configuration features two inverted V-shaped foils forward, with another two aft for balance. High-riding, pitch-control, subfoils of similar configuration are located ahead of the two bow foils. For landing and ground manoeuvres the foils are rotated upwards and parallel to the floats by a self-contained hydraulic system and four small, fixed, castored wheels then facilitate ground or deck handling. There is also a retrieval system mounted on the platform for helicopter recovery operations. The two floats also contain fuel for the turbine, and there are two tow cable attachment points on the forward inward faces of each float. Once launched, the sled is towed by the helicopter's 137 m (450 ft) tow cable, which also carries electronic control signals.

The gas-turbine-driven generator set is mounted on a cross-beam, together with a rectifier, a controller containing the waterborne electronics, and batteries to power the electronic system. The sweep cables are attached to the aft end of the sweep boom, which is located on the centreline of the sled, aft of and below the cross-beam assembly. The sweep boom comprises an upper electrode attached to the end of a trailing cable and a lower electrode fitted to the boom fin. Using the water as a conductor, the potential between the electrodes produces a magnetic field that simulates the magnetic signature of a ship.

The only person involved in the system is the sweep controller in the helicopter, who operates the 'control programmer', which houses the airborne electronics, controls and instrumentation necessary to operate the Mk 105. The control programmer console includes the fuel transfer control panel, turbine indicators, hydrofoil and boom actuators and the generator controls and indicators. The operator can start and stop the turbine, raise and lower the foils and control the magnetic influences generated through the sweep cables trailing behind the sled.

Specifications

Mk 105
Length overall: 8.38 m (27.5 ft)
Beam
catamaran structure only: 3.53 m (11.58 ft)
across foils: 6.4 m (21 ft)
Height (foils extended)
to top of retrieval rig: 5.26 m (17.25 ft)
to top of nacelle: 4.11 m (13.5 ft)
Height (foils retracted): 3.5 m (11.5 ft)
Weights
empty: 2,504 kg (5,520 lb)
gross: 2,917 kg (6,432 lb)

Manufacturer/Contractor

EDO Corporation, Government Systems Division, College Point, New York, USA.

AN/AQS-14 helicopter-towed sonar

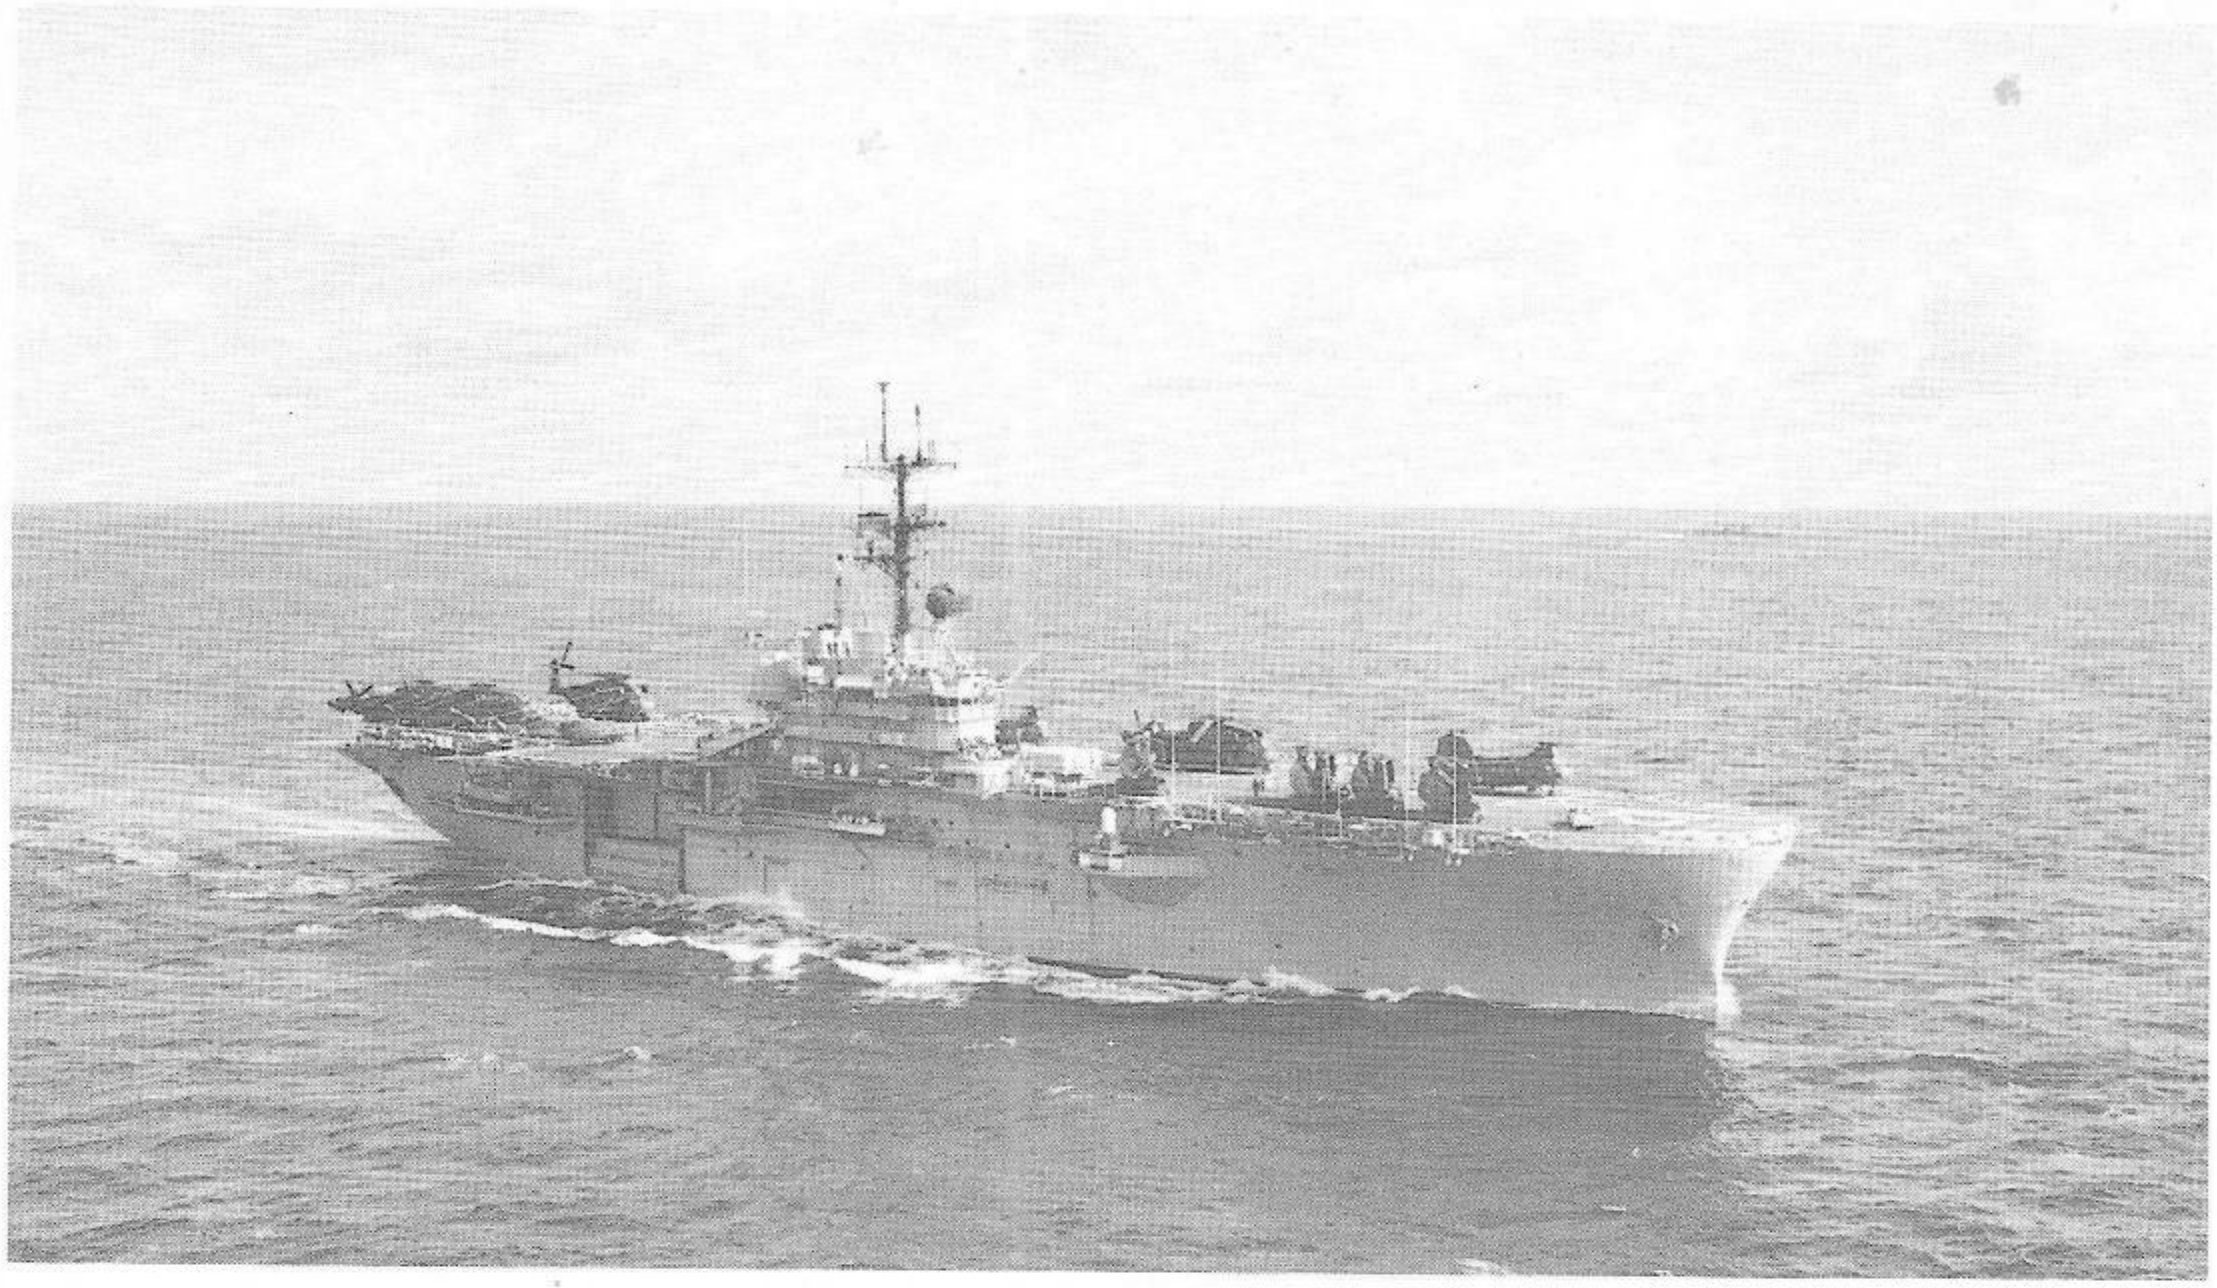
AN/AQS-14 is the helicopter-towed, sideways-looking, multibeam sonar used by the US Navy's MH-53E Sea Dragon helicopters. The 3 m (9.84 ft) long, underwater vehicle is towed on an armoured, non-magnetic cable, and has an active control system enabling the operator in the helicopter to select either fixed height above the seabed or a fixed depth beneath the water surface. Controls in the helicopter include a TV-type moving window sonar display, underwater vehicle controls and status displays, system status indicators and a magnetic tape recorder for sonar data recording. The system functions include all that is needed to locate, classify, mark, permanently record and review records of mines, mine-like objects and underwater features in the search area. Because the sonar employs electronic multiple beam-forming, all-range focusing and an adaptive processor, a rapid search speed is possible. At lower tow speeds the towed sonar automatically reduces the number of transmitted beams.

Manufacturer/Contractor

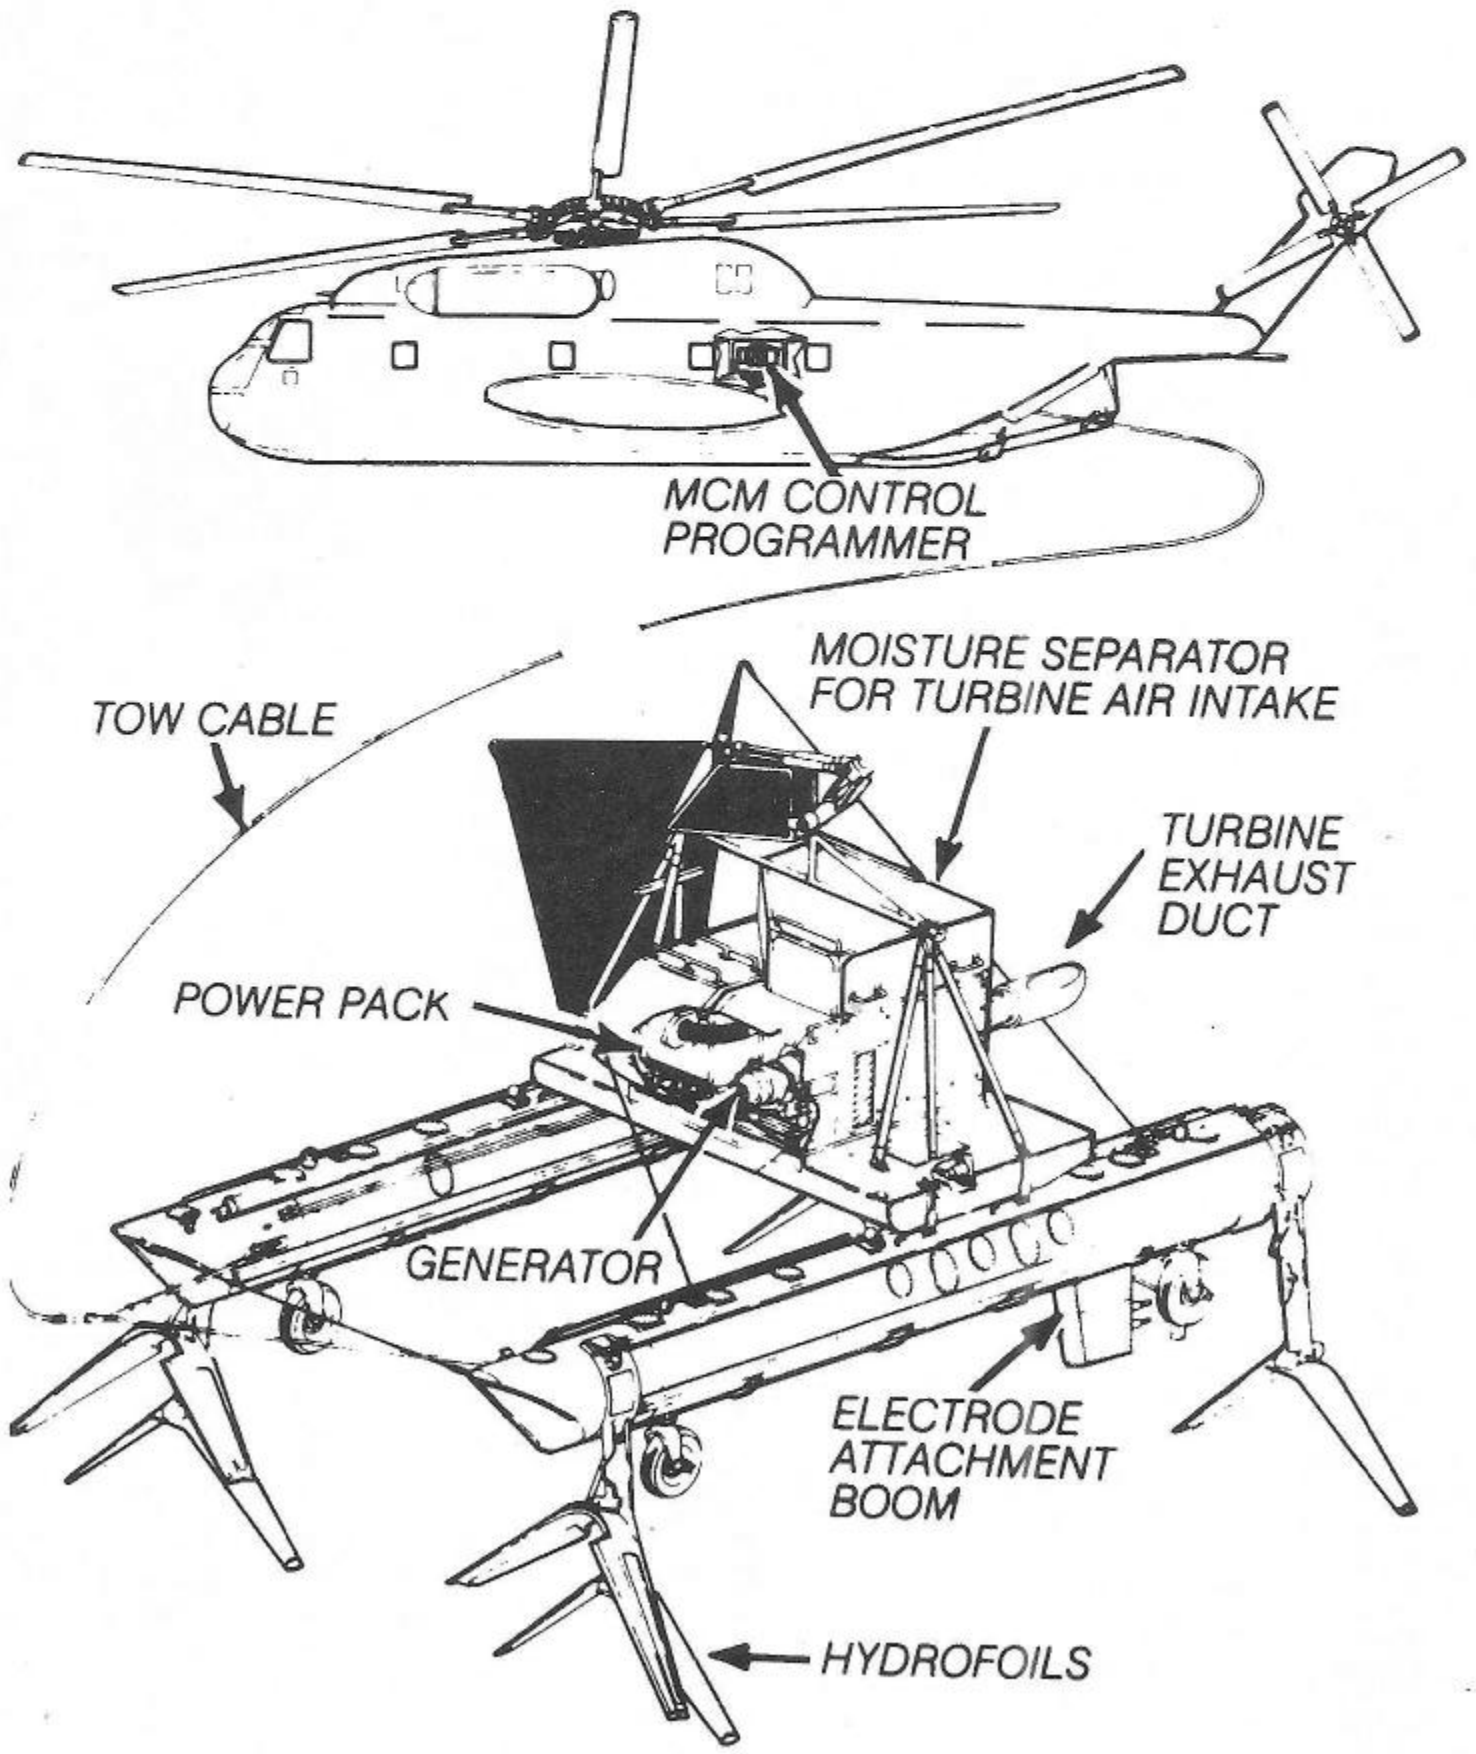
Westinghouse Electric Corporation, Annapolis, Maryland, USA.

SPU-1/W

SPU-1/W, also known as 'Magnetised Orange Pipe' (MOP), is a helicopter-towed device with two functions: the first is to explode sensitive magnetic mines in deeper waters and the second to operate against all types of magnetic mines in waters too shallow for the sled to be used. The MOP is a magnetised steel tube some 9.14 m (30 ft) long and 25.4 cm (10 in) in diameter, which is filled with styrofoam to make it buoyant. Up to three can be towed behind an MH-53E.



Inchon



Schematic of Mk 105 system

AMCM System Mk 103 (mechanical sweep gear)

The Mk 103 system is similar to the mechanical gears used by MCM ships to sweep buoyant mines and consists of sweep wires with spaced explosive cutters, floats with pendants, a depressor and otters. Total weight is approximately 544 kg (1,200 lb). The usual method of deploying the Mk 103 is to position the helicopter at the extreme after end of the flight deck, stream the gear and then lift off, which must be one of the more challenging manoeuvres undertaken by helicopter pilots.

Manufacturer/Contractor
Boeing-Vertol.

AMCM System Mk 104 (acoustic sweep gear)

Mk 104 is an acoustic influence sweep, consisting of a towing cable and a venturi tube 124 cm (49 in) long, 66 cm (26 in) wide and 89 cm (35 in) deep, containing a rotating disc powered by a water-activated turbine, which reproduces a ship's acoustic signature. The sweep operates at a minimum depth of 9.1 m (30 ft) and is operated by the forward motion imparted by the helicopter.

Mk 2G rattle bars

This was developed from the Rotating Acoustic Pipe, which was produced very rapidly for use in the clearance of Haiphong harbour. This consisted of a similar 25 cm (10 in) pipe to that used for MOP, but only 1.2 m (4 ft) long, and containing several short lengths of iron bar. When towed by the helicopter, asymmetric vanes welded to the side of the pipe cause it to rotate haphazardly, causing the iron bars to rattle. This extremely low-tech device is claimed to be effective against both seismic and magnetically fuzed mines.

Rheinmetall Rh-202 20 mm cannon (NBFAP)

Contractors List

Where a discrepancy exists between data on the text pages and in this listing, the listing should be accepted as the most up to date and correct version as it is composed after the text has been completed, and there are often last-minute changes which cannot be included in the text.
